

NOTICE OF LODGMENT
AUSTRALIAN COMPETITION TRIBUNAL

This document was lodged electronically in the AUSTRALIAN COMPETITION TRIBUNAL and has been accepted for lodgment pursuant to the Practice Direction dated 3 April 2019. Filing details follow and important additional information about these are set out below.

Lodgment and Details

Document Lodged: Affidavit

File Number: ACT 5 of 2021

File Title: RMSANZ APPLICATION FOR REVIEW OF AUTHORISATION
AA1000542 DETERMINATION MADE ON 21 SEPTEMBER 2021

Registry: VICTORIA – AUSTRALIAN COMPETITION TRIBUNAL

REGISTRAR

Dated: 14/06/2022 12:17 PM

Important information

This Notice has been inserted as the first page of the document which has been accepted for electronic filing. It is now taken to be part of that document for the purposes of the proceeding in the Tribunal and contains important information for all parties to that proceeding. It must be included in the document served on each of those parties.

COMMONWEALTH OF AUSTRALIA

Competition and Consumer Act 2010 (Cth)

IN THE AUSTRALIAN COMPETITION TRIBUNAL

File No: ACT 4 of 2021 and ACT 5 of 2021

Re: Application for review of authorisation AA1000542 lodged by nib Health Funds Ltd and Honeysuckle Health Pty Ltd and the determination made by ACCC on 21 September 2021.

Applicants: National Association of Practising Psychiatrists and Rehabilitation Medicine Society of Australia and New Zealand

AFFIDAVIT OF DAVID MALCOLM DU PLESSIS

I, David Malcolm Du Plessis, of 1/6 Newcomen St, Newcastle NSW 2300, affirm:

1. I am the Head of Health Service Contracting at Honeysuckle Health Pty Ltd (**HH**).
2. HH, together with nib health funds limited (**nib**), were the original applicants (**Authorisation Applicants**) for authorisation (AA10000542-1) (**Authorisation Application**) currently the subject of review before the Tribunal pursuant to proceedings ACT 4 and ACT 5 of 2021 (**Review Applications**).
3. I am authorised by the Authorisation Applicants to make this affidavit on their behalf.
4. I make this affidavit in support of the Authorisation Applicants' position that:
 - (a) the Proposed Conduct, as described in paragraphs 165 to 169, meets the public benefits test prescribed by section 90(7)(b) of the Competition and Consumer Act (**CCA**);
 - (b) accordingly, the Proposed Conduct should be authorised under section 88(1) of the CCA; and
 - (c) it is otherwise appropriate that:
 - (i) authorisation be granted for a period of 10 years;
 - (ii) Major PHIs be included in the Proposed Conduct, insofar as their participation is limited to BCPP.
5. I previously affirmed an affidavit in these proceedings on 28 January 2022, in support of the Authorisation Applicants' application for confidentiality orders to be made in respect of certain aspects of their submissions to the ACCC (**First Affidavit**).

A handwritten signature in cursive script, appearing to read "David Malcolm Du Plessis".

AR

6. I have had the opportunity to review the witness statements filed on behalf of the National Association of Practising Psychiatrists and the Rehabilitation Medicine Society of Australia and New Zealand (the **Applicants**).
7. Except where I otherwise indicate, I make this affidavit from my own knowledge. Where I state matters on the basis of information provided to me, I believe those matters to be true and correct.

Background and professional experience

8. nib is a major private health insurer which supplies private health insurance policies to Australian and New Zealand residents.
9. HH is a health services and data science company founded in December 2019 as a joint venture between nib and Cigna Corporation (**Cigna**). HH provides services to healthcare payers in Australia and New Zealand, including nib. These services currently include health analytics (e.g. measurement of impact of health interventions, population risk stratification and provider benchmarking), health management programs (e.g. telephonic programs to support patients transition from hospital and manage chronic diseases) and contract negotiation and management services for nib.
10. Cigna is a global health services company with a network spanning over 30 countries across North America, Europe, Asia and the Pacific offering an integrated suite of health services, such as medical, dental, behavioural health, pharmacy, vision, supplemental benefits, and other related products including group life, accident and disability insurance. Cigna has invested significant resources into data science, including digital health and utilising data analytics to improve the diagnosis and treatment of patients.
11. In October 2020, nib appointed HH to provide contract negotiation and drafting, data analytics, contract administration and management, dispute resolution and performance and compliance assessment services for nib's contracts and arrangements with hospitals, medical specialists and other healthcare providers.
12. I have held the position of Head of Health Service Contracting at HH since October 2020. I held the same position at nib from July 2018 to October 2020. In total, I have been responsible for overseeing hospital and health contracting for the Authorisation Applicants for approximately six years.

13. Prior to my involvement with HH and nib, I had worked in the health services industry more broadly for over 12 years, including in roles at Health Care Australia, Hunter Nursing and Edisse.
14. I hold a Bachelor of Science from the University of New South Wales and spent five years as an Officer in the Royal Australian Air Force.
15. As set out in paragraph 6 of my First Affidavit, in my current role, I am responsible and accountable for managing the hospital, medical and general treatment network development and relationship teams. These teams are responsible for engaging in contract negotiation with providers such as hospitals, medical specialists and allied health professionals to develop, manage and maintain agreements with hospital, medical gap and allied health networks for nib members. In addition to these traditional private health insurance networks, I also have led, and continue to lead, the development and implementation of the nib Clinical Partners Program. Finally I continue to be involved with Private Health Australia including through my participation in industry forums on reform to the sector.
16. By reason of this role and my long term experience in the health services industry, I have a sound understanding of:
 - (a) the private healthcare and private health insurance markets;
 - (b) the statutory regime and specific obligations private health insurers are subject to;
 - (c) health services contracting with medical specialists and hospitals, including:
 - (i) standard terms and obligations;
 - (ii) fee arrangements;
 - (iii) the practicalities of negotiating and entering into these contracts;
 - (d) the current role of and services provided by other private health insurers and buying groups;
 - (e) the ways in which private health insurers can and do utilise data analytics and value-based contracting to improve their service offerings.
17. In this affidavit, I describe:
 - (a) in **Part A**, private healthcare and the private health insurance market;

- (b) in **Part B**, funding and fees for medical specialists and hospitals and the way these are set through the Medicare Benefits Schedule and contracting with private health insurers;
- (c) in **Part C**, value based care and contracting;
- (d) in **Part D**, the application for authorisation and the Proposed Conduct;
- (e) in **Part E**, the benefits of the Proposed Conduct;
- (f) in **Part F**, aspects of the contracting arrangements proposed for the Broad Clinical Partners Program (or **BCPP**);
- (g) in **Part G**, why the Authorisation Applicants seek a 10 year authorisation;
- (h) in **Part H**, the conduct the Authorisation Applicants will engage in with and without authorisation.

Part A: Private healthcare and private health insurance market

Overview of private healthcare in Australia

18. In Australia, private healthcare operates alongside the public Medicare system. Medicare provides free hospitalisation in public hospitals as well as subsidised medical care. The Medicare system means that all eligible Australians are able to access hospital treatment as a public patient in a public hospital. However, public patients in public hospitals are not able to choose the hospital they are admitted to or the medical practitioners who will treat them.
19. Private healthcare provides two main types of cover.
 - (a) The first, cover for hospital treatment, provides cover for the cost of fees charged by a hospital for medical services and accommodation. Australians who have private hospital cover can elect to undergo hospital treatment in either a public or private hospital as a private patient.
 - (b) The second, cover for general treatment (or 'extras cover'), provides cover for a range of ancillary services not covered by Medicare including dental, optical and allied health.

AR

20. As at December 2021, approximately 44.9 per cent of the Australian population have hospital treatment cover and 54.7 per cent have general treatment cover. A copy of APRA's quarterly private health insurance statistics is at '**Annexure DD-4**'.
21. The private health insurance sector provides a number of benefits to the general public, including that it:
- (a) relieves pressure on the public health system: for example, private health insurance currently funds around 40 per cent of hospital admissions in Australia that would otherwise be funded solely by the public system; further, around 67 per cent of elective surgeries in Australia are performed in private hospitals, which reduces waiting times for elective surgery and lowers demand for hospital beds in the public system;
 - (b) reduces costs which would otherwise be paid for by taxpayers through the public health system;
 - (c) provides consumers with greater choice than in the public system, including choice of doctor, hospital and timing of health procedures, subject to:
 - (i) the medical practitioner of their choice being credentialed to work in a particular hospital;
 - (ii) the treating surgeons' choice of the medical practitioners who work with the treating surgeon during an episode of medical care (for instance, providing surgical assistance and anaesthesia);
 - (d) provides cover for hospital services that are partially paid for by Medicare and for extras services that are not paid for by Medicare;
 - (e) enables access to technologies and devices which may not be available otherwise to the patient in the public system due to cost constraints. For example not all devices on the Prostheses List are available to surgeons in public hospitals because of the cost of the device; likewise, access to robotics for certain procedures is limited in the public setting.
22. Patients receiving care in a hospital will often first consult with their general practitioner who identifies the need for treatment and makes a referral. In making a referral, the general practitioner will have regard to, among other things, whether the patient:

- (a) has private health insurance or is willing to self-fund the procedure;
- (b) is willing and able to cover any out-of-pocket expenses; and
- (c) wishes to be treated through the private or public system, including the patient's preferences (if any) as to their treating specialist.

Private hospitals and medical practitioners

23. As of 2 June 2022, there are 640 declared private hospitals in Australia and approximately 220 hospital groups. A hospital group is where a corporate entity owns and operates a group of private hospitals. For example, Ramsay Healthcare Ltd operates 72 hospitals in Australia. A list of all Commonwealth declared hospitals is at '**Annexure DD-5**'.
24. The top five hospital groups collectively control 61% of the private beds in Australia, with Ramsay holding 26.18%, Healthscope holding 15.36%, St John of God holding 9.48%, Epworth holding 5.57% and Aurora holding 4.07%. A table showing the market share of hospital groups in Australia is at '**Annexure DD-6**'.
25. There are approximately 100,000 medical specialists in Australia. Medical specialists practice in different specialties, including surgery (within which there are a range of different sub-specialities such as orthopaedic surgery), psychiatry and rehabilitation medicine.
26. As at 2016, of these medical specialists:
- (a) there were 1,236 orthopaedic surgeons employed in Australia, of whom 76.2% worked in the private sector;
 - (b) there were 3,327 psychiatrists employed in Australia, of whom 49.7% worked in the private sector;
 - (c) there were 451 rehabilitation medicine specialists employed in Australia, of whom 37.7% worked in the private sector.
27. A copy of the Department of Health fact sheet on each of these specialties is at '**Annexure DD-7**'.

PHIs and other healthcare payers

28. Section 10 of the *Private Health Insurance (Prudential Supervision) Act 2015* (Cth) prescribes that private health insurance can only be provided by a registered health fund. Health funds can either be open to all members or have restricted membership. Restricted membership funds are generally union or employer based and provide insurance to certain professions such as teachers and the defence force. Health funds providing private health insurance are referred to as private health insurers (**PHIs**).
29. There are 34 PHIs (including nib) supplying private health insurance in Australia. Of these 34 funds:
- (a) 9 have restricted membership;
 - (b) 5 are for profit and 29 are not for profit.
30. Of this 34, five health funds hold 78.6% of the market share in provision of hospital treatment cover: Medicare Private Limited, Bupa HI Pty Ltd (**Bupa**), Hospitals Contribution Fund of Australia Limited (**HCF**), or HBF Health Limited in respect of its operations in Western Australia (collectively the **Major PHIs**) and nib.
31. There are also a number of other healthcare payers in the market, including:
- (a) international medical and travel insurance companies who provide hospital coverage to overseas tourists and short-term overseas workers in Australia. Typically, tourists and short-term workers take out insurance in their home country before travelling to Australia. If the traveller requires medical services whilst in Australia, they will be required to pay the “rack rate” for the service out-of-pocket and then seek reimbursement from their insurer when they arrive home;
 - (b) government and semi-government payers of healthcare services such as:
 - (i) workers' compensation scheme operators: each of the eight Australian states and territories has their own workers' compensation scheme and the Commonwealth has three separate schemes. Each scheme manages their own contracts with medical and hospital providers;
 - (ii) transport accident scheme operators: each Australian state runs its own compulsory transport accident insurance scheme. In New South Wales, Queensland, South Australia and the ACT, drivers can choose from a

panel of compulsory third party providers. In the other states, transport accident schemes are provided by a state-owned or government-licensed insurer. Similar to workers compensation schemes, transport accident insurers typically manage their own contracts with medical and hospital providers;

- (iii) Department of Veterans Affairs (**DVA**) scheme: under the DVA scheme, eligible veterans are able to receive hospital services free with no gap expenses.

32. The market shares of PHIs and other healthcare payers in Australia are set out at '**Annexure DD-8**'.
33. PHIs can operate nationally or be based in a particular jurisdiction or region. Currently, each of the 34 PHIs is registered to operate on a national basis. A register of PHIs which lists the states they operate in and any restrictions on membership is at '**Annexure DD-9**'.
34. The market share of each PHI varies in each state. For example, as at 2019, Bupa had a 23.10% market share in Victoria and a 47.80% market share in South Australia. A table summarising the market share of each Major PHI in each state is at '**Annexure DD-10**'.
35. Some of the smaller PHIs have a greater market share in particular geographic areas. For example, Cessnock District Health fund is mostly based around the Hunter Valley whilst People Care has very strong representation on the South Coast of NSW.

Switching between PHIs

36. Section 78-1 of the PHI Act obliges PHIs to recognise waiting periods that have been served for hospital treatment with a previous PHI. This means that customers of PHIs can switch PHIs without being subject to any additional waiting times or exclusions. This is commonly referred to as the 'portability rule'.
37. Switching PHIs is an option that is utilised by customers. Between 2016 and 2021, the average number of customers that switched to or from nib each year was 53,203 and 40,444, respectively.
38. When a customer chooses to switch PHIs, their previous fund is required to send the new fund a transfer certificate within 14 days which outlines details of their previous cover, including any waiting periods served, the type of cover and claims history.

39. In circumstances where a customer is moving from a lower benefit to a higher benefit policy:
- (a) they will have to serve waiting periods for anything that was not covered by the previous policy (with the exception of mental health through the Mental Health waiver which permits a person, once in their lifetime, to upgrade their policy and be immediately covered for mental health services); and
 - (b) with respect to extras, the new health fund will match a customer's benefit in the first 12 months before the customer is entitled to the higher benefit. e.g. if a customer has \$800 for Major Dental on their old policy and they are moving to a new policy with \$1100 for Major Dental, then the new fund will match \$800 in the first 12 months before it is increased.
40. Private PHIs are unable to contract out of these portability rules and they must be clearly disclosed to customers. By way of example, materials used by nib to inform customers of its portability obligations are at '**Annexure DD-11**'.

Private health insurance products

41. PHIs (and in particular the Major PHIs) broadly offer the same types of products – hospital cover and extras cover.
42. Pursuant to Part 2B of the *Private Health Insurance (Complying Product) Rules 2015* which are made under the PHI Act, PHIs are required to classify their private hospital cover products as one of four tiers: Gold, Silver, Bronze or Basic. What is covered in each of those tiers is based on a pre-determined minimum standard of clinical categories. An example of a clinical category is 'bone, joint and muscle' or 'heart and vascular system'. Where a tier is required to cover a clinical category, it must cover all services relating to that category, either on a restricted or unrestricted basis. Covering services on a restricted basis means that PHIs are only required to pay the minimum benefits prescribed under the *Private Health Insurance (Benefit Requirements) Rules 2011* (made under the PHI Act) for hospital treatment and customers will still likely face significant out of pocket expenses. Unrestricted cover is a higher level of cover and other than their hospital excess, customers are likely to incur no or only small out of pocket expenses for their hospital stay.
43. The tiers of private health insurance have the following coverage requirements:

- (a) *basic cover*: must cover 3 clinical categories; this is the lowest level of hospital cover a health cover can offer under the legislation and it must offer rehabilitation, hospital psychiatric services and palliative care at least on a restricted basis;
- (b) *bronze cover*: covers the same benefits as the basic tier and provides unrestricted hospital cover for an additional 18 treatments and services (covering 21 clinical categories in total);
- (c) *silver cover*: covers the same hospital treatments found in Basic and Bronze policies. Silver health insurance also covers eight additional clinical categories on an unrestricted basis (covering 29 clinical categories in total);
- (d) *gold cover*: includes unrestricted cover for all clinical categories (38 clinical categories in total).

A table summarising the clinical categories required to be covered by each of the hospital product tiers is at '**Annexure DD-12**'.

- 44. PHIs can also offer policies that cover more treatments than required by the standard health insurance tiers. If they do so, these policies will include a '+' or 'plus' in the name and fall under one of three subset health insurance tiers: Basic+, Bronze+ and Silver+.
- 45. The level of cover selected by a customer is based on their needs, and policy characteristics such as cost and perceived quality of the cover provided. This may include considerations of financial limits and gaps, treatments and procedures covered, and the network of hospitals and healthcare providers available under a policy.
- 46. The Silver, Bronze and Basic tiers exclude or restrict benefits for some clinical categories in return for a lower premium payable. An exclusion is where a customer agrees not to be covered for certain services and a restriction is where a customer agrees that they will only be covered for certain services to a limited extent.
- 47. PHIs compete with each other in relation to price and additional services covered over and above the pre-determined minimum standard of the clinical categories for that product tier. A table which sets out the relative product pricing for NSW single \$500 excess payable showing pricing across products with all funds is at '**Annexure DD-13**'.
- 48. Section 66-10 of the PHI Act requires PHIs to apply to the Minister for Health for approval of any proposed increase to insurance premiums. Approval is subject to a public interest test pursuant to section 66-10(3). The approved form requires PHIs to

AR

justify the proposed increase, including by providing information on the products for which the premium change applies and relevant financial data, including forecasts of financial and operating data, such as contribution income, gross and net margins, management expenses, dividend payments, policy excesses and membership numbers. A copy of the Approved Form is '**Annexure DD-14**'.

49. The Minister actively relies on this provision and often rejects proposed premium increases where they are not satisfied that the increase is in the public interest (see for example '**Annexure DD-14A**'). Where premium increases are rejected by the Minister, this forces PHIs to better manage their operational costs and more efficiently administer services to their members. This, in turn, directly benefits members by ensuring that any premium increase in the future is lower than what it otherwise would have been.
50. The Minister has, in the past, written to the PHIs and communicated that the Minister has an expectation that the industry will limit premium increases to a target percentage.
51. Pursuant to section 93-25 of the PHI Act, where a proposed change to coverage will or might be detrimental to the interests of members, PHIs must ensure that its members are informed of this proposed change a reasonable time before the change takes effect.
52. The Private Health Insurance Code of Conduct (**PHI Code of Conduct**), was developed by Private Healthcare Australia and the Members Health Fund Alliance as the membership bodies which represent health funds and is a self-regulatory code promoting informed relationships between PHIs, consumers and intermediaries. It provides that in the context of hospital or general treatment coverage, the following are examples of 'significant' detrimental changes:
 - (a) where closing a product has a significant detrimental effect to a policy holder e.g. when they are required to move to an alternative product;
 - (b) a change in which an excess or co-payment may apply;
 - (c) the reduction of a limit or change to entitlement of such limit for an extras benefit.
53. Where a detrimental change is proposed, the PHI must give the affected customers at least 30 days' notice. Where that change is a significant detrimental change, 60 days' notice must be given.
54. A copy of the PHI Code of Conduct is at '**Annexure DD-15**'.

55. In addition, the Office of the Commonwealth Ombudsman's Termination and Transition Guidelines for Hospitals and Insurers (**PHIO Guidelines**) provides guidance around contractual disputes between insurers and hospitals and minimising disruption following a termination of contract. The guidelines are not legally enforceable but act as a guide for best practice. A copy of the PHIO Guidelines is at '**Annexure DD-16**'.

Part B: Funding and fees for hospitals, medical specialists and other health professionals

56. In this part of my affidavit, I describe:
- (a) funding and fees payable under the Medicare Benefits Scheme;
 - (b) fee arrangements between PHIs and medical specialists, hospitals and other health professionals;
 - (c) contracting services for PHIs;
 - (d) the clinical independence of practitioners in arrangements with PHIs.

Medicare Benefits Scheme

57. The *Health Insurance Act 1973* (Cth) and the Medicare Benefits Schedule (**MBS**) together regulate the Medicare benefits payable in Australia for medical services. The MBS lists a range of medical services which are subsidised by the Australian Government, allocating a unique provider number and a fee payable to each (referred to as a 'Schedule Fee'). Broadly, the types of services on the MBS include consultation and procedural services (including surgical), as well as diagnostic services. The MBS does not cover services provided by the hospital (e.g. accommodation and theatre fees).
58. The Schedule Fee is determined by the Medical Services Advisory Committee (**MSAC**) by reference to the average time involved in performing the service as well as its complexity and technical difficulty. MSAC is responsible for reviewing existing services funded under the MBS as well as appraising new medical services proposed for public funding. One of its key purposes is to ensure that the government funds cost-effective, evidence-based, best practice health care. In determining whether services should be funded, MSAC assesses the comparative safety, clinical effectiveness, cost-effectiveness and total cost of the service.

AR

59. The MBS also sets the rate at which the benefit for that service is to be calculated. Generally, consumers can claim from Medicare:
- (a) 100 per cent of the Schedule Fee for services provided by a general practitioner;
 - (b) 85 per cent of the Schedule Fee for other out of hospital services provided by a medical practitioner;
 - (c) 75 per cent of the Schedule Fee for in-hospital services provided by a medical practitioner to patients admitted to hospital as private patients.
60. Out of hospital services are services provided by medical specialists in the community (for instance, where a patient visits a dermatologist for a skin consultation). Pursuant to section 69-1 of the PHI Act, PHIs are not permitted to cover customers for out of hospital services listed on the MBS.
61. In-hospital services are all services that are provided by a medical practitioner during an episode of hospital treatment when the patient is admitted as a private patient. Pursuant to section 72-1 of the PHI Act, PHIs must pay 25 per cent of the Schedule Fee for in-hospital services. This means that where a customer has private health insurance, Medicare and the customer's PHI together pay 100 per cent of the Schedule Fee.
62. Medical specialists are not limited to charging the Schedule Fee. The Schedule Fee is a government subsidy and often materially lower than the prevailing market rate. The amount ultimately received by a medical specialist for their services depends on the amount, if any, the medical specialist charges in addition to the Schedule Fee and the arrangement, if any, between the medical specialist and a patient's PHI.
- (a) In out of hospital settings, medical specialists may accept 85 per cent of the Schedule Fee as full payment from Medicare without requesting any further payment by patients or PHIs. This is referred to as 'bulk billing'.
 - (b) Alternatively and more commonly, medical specialists may set a higher fee than the Schedule Fee. The difference between the Schedule Fee and the actual fee charged by the medical specialist is known as a 'gap', 'medical gap' or 'gap fee' and must be paid by the patient or, depending on the patient's private health insurance coverage, their PHI.

- (c) Medical specialists also enter arrangements with PHIs that limit the amount of 'medical gap' or 'gap fee' they charge. I discuss these further below in paragraphs 67 to 80.
63. Where a patient has private health insurance, they assign their right to the Medicare component of the Schedule Fee to the PHI. The PHI collects the Medicare component of the Schedule Fee on behalf of the patient. The PHI then pays to the medical specialist as one lump sum:
- (a) the Medicare component of the Schedule Fee;
 - (b) the 25 per cent of the Schedule Fee required to be paid by the PHI; and
 - (c) any additional component, depending on the type of private health cover the patient has purchased as well as the terms of any agreement entered into by the PHI and relevant medical specialist.

Arrangements between PHIs and medical specialists

Legislative provisions

64. Since 1995, and the introduction of the *Health Legislation (Private Health Insurance Reform) Amendment Act 1995* (Cth) (the **Reform Act**), PHIs and medical specialists have been permitted to enter into medical purchaser provider agreements (**MPPAs**) where the PHI agreed to pay the medical specialist an amount in excess of 25 per cent of the Schedule Fee, in return for the specialist agreeing to charge the patient:
- (a) no extra fees (referred to as a "no gap contract");
 - (b) a fixed extra fee (referred to as a "known gap contract").
65. At this time, the take up of MPPAs was very low. This was because doctors were initially reluctant to enter into MPPAs with PHIs in circumstances where the negotiation and execution process was complex, administratively burdensome and time consuming. There was also a general reluctance to be seen to be contracting with a PHI.
66. Due to these apprehensions, in 2000, the *Health Legislation Amendment (Gap Cover Schemes) Act 2000* (Cth) (**Gap Cover Act**) was introduced and broadened the scope of MPPAs to enable PHIs to cover the gap without the need for a negotiated agreement between the PHI and medical specialist through 'gap cover schemes'. This allowed PHIs to enter into arrangements with medical specialists through a simple registration process

AR

with standard terms and conditions instead of needing to have individual contracts with doctors.

Gap cover schemes

67. Under gap cover schemes, PHIs publish their terms and conditions and medical specialists may choose to register for the scheme and, additionally, opt in or out of the scheme on a case by case basis per patient or procedure. This creates a network of providers that PHIs can promote as offering their customers a no gap or known gap experience.
68. Like no gap or known gap contracts, gap cover schemes may provide for the PHI to cover, and the medical specialist to charge:
 - (a) no extra fees (referred to as a “no gap scheme”);
 - (b) a fixed extra fee (referred to as a “known gap scheme”).
69. Medical specialists can sign up to a PHI's gap scheme by registering directly with the PHI. For example, a copy of the form medical specialists can use to register with nib's MediGap scheme is at '**Annexure DD-17**'.
70. Each PHI offering a gap scheme will have its own terms and conditions that the medical specialist is required to adhere to. A copy of the terms and conditions for nib's MediGap scheme is at '**Annexure DD-18**'. The MediGap rates paid to medical specialists for provision of services are generally based on a percentage of the MBS Schedule Fee. This is a lever PHIs can use to encourage high value care or discourage low value care (concepts I explain further in Part **C** below): for instance where PHIs determine procedures to be low value care they have capacity to either freeze or reduce the rates paid.
71. Unless the PHI and medical specialist have another arrangement, if a specialist does not register and opt in to the gap scheme for a particular patient and procedure, the PHI will pay 25 per cent of the Schedule Fee to the medical specialist and the patient will be liable to pay any gap charged by the medical specialist.
72. Initially, the introduction of gap cover schemes was opposed by a number of peak medical bodies, including the Australian Medical Association, on the basis that it was perceived to undermine the clinical autonomy of medical specialists and 'invite the introduction of US-style managed care concepts into the Australian health system'. A

copy of the Australian Parliamentary report into the Reform Act insofar as it relates to MPPAs is at '**Annexure DD-19**'.

73. Today, these arrangements are very prevalent in the private health market. This can be seen in a table extracted from the Private Health Insurance Ombudsman State of the Health Funds Report 2021, outlining the level of gap schemes open member health funds provide in each state, which is at '**Annexure DD-20**'.
74. The gap cover schemes benefit PHIs in that they:
- (a) give PHIs additional certainty about the amounts owing to medical specialists;
 - (b) assist PHIs to attract customers by offering known or no gap fees across a broader treatment network;
 - (c) improve relationships with medical specialists through providing higher fees to keep pace with the cost of providing services.
75. No gap schemes offer substantial utility to both customers and providers. In particular, no gap schemes:
- (a) provide financial certainty to customers and help avoid the financial stress of being charged an unexpected gap fee;
 - (b) give greater certainty to medical specialists that the gap fee will be covered and paid quickly (by the relevant PHI rather than by the customer). This also allows medical specialists to minimise administrative costs as they do not have to issue accounts to patients nor follow up late payments with patients.
76. The uncertainty around the extent of gaps that consumers face in the private healthcare system is one of the major concerns or causes of dissatisfaction for consumers. For example, according to IPSOS' 2019 Healthcare & Insurance Australia Study, the most important driver for customer satisfaction with respect to their health insurer is 'Rebates on Services' (i.e. out-of-pocket costs) with the average fund scoring 5.8 out of 9 on this aspect. This uncertainty is partly derived from the multitude of contractual relationships that are created when a patient receives hospital treatment – separate contracts between the patient and the private hospital, medical specialist, anaesthetist, assistant surgeon, radiologist and pathologist.

77. A table comparing payments made by the Major PHIs pursuant to their existing gap schemes is set out in '**Annexure DD-21**'. As is apparent from that Annexure:
- (a) nib's medical gap scheme does not allow a medical specialist to charge a gap to its members whereas the Major PHIs allow medical specialists to collect up to \$500 in gap payments from their members; and
 - (b) this means that the surgeon is likely to be able to earn more in fees under the medical gap schemes of the Major PHIs than with nib.
78. As I stated in paragraph 67 above, medical specialists can choose to opt in or out to gap cover schemes on a patient by patient and procedure by procedure basis. This means that while the gap cover schemes offer specialists a higher guaranteed minimum payment than would otherwise be available, they fail to provide certainty or complete protection for the insured consumer in every case. A consumer could undergo a routine procedure one year with a specialist, and the specialist could use and cover them under the gap scheme. The subsequent year they could face an out-of-pocket with the same specialist for the same procedure. Whether a specialist chooses to opt out of the no gap scheme in a particular instance is closely linked to what a specialist thinks the patient can pay. Patients who come from more affluent postcodes are more likely to be charged an out of pocket fee or a higher out of pocket fee by a specialist than if they came from less affluent areas. For example, electorates with the lowest portion of bulk billing in the country include Canberra, Curtin, Brisbane, Warringah, Goldstein and Higgins, whereas electorates with the highest proportion of bulk billed patients include Chifley, Fowler, Werriwa, Parramatta and Lalor. A table of the highest and lowest bulk-billing rates across Australia by electorate is at '**Annexure DD-22**'.
79. Under the current gap cover schemes, in order to access surgical procedures, patients are required to deal with multiple medical specialists, including an initial interaction with their specialist and then independent interactions with the hospital, anaesthetist, assistant surgeon, as well as radiology and pathology providers who may be involved in the surgical treatment and hospital stay. While all these providers (other than the hospital) may be registered for the PHI's medical gap scheme, not all of them will opt in to the scheme in relation to each of their patients because of the variation in the complexity of each patient's condition and the discretion the providers have to charge higher fees. This means that the patient may be faced with one or more out of pocket bills associated with the treatment. For patients, this makes it difficult to understand the amount that they will have to contribute and they may not have an understanding of this

until after the treatment is complete and they receive a bill. Even if a patient can access information from their PHI about the surgeon's and other specialists' participation with their PHI's gap cover scheme, these secondary provider interactions are often not transparent as patients usually have no engagement with those medical specialists ahead of receiving treatment from them. It is highly unlikely that a consumer will have the entire episode of care completely covered without one or more of these providers charging out of pocket costs.

80. By way of example, a patient may have a knee joint replaced. When they meet the surgeon, the surgeon agrees to use the medical gap scheme of the fund which allows them to charge a \$500 known gap. The patient then undergoes the procedure and is discharged a week later from hospital. A few weeks later the patient receives an invoice from the anaesthetist for \$1,500 as this anaesthetist does not use their PHI's gap cover scheme. A week later the patient then receives a number of small bills from radiologists and pathologists for the X-ray and blood work completed as part of the surgery. The patient anticipated originally that they would have to pay a \$500 excess at the hospital and a \$500 known gap with their surgeon. They now have out of pocket costs totalling \$3,000 when they had originally anticipated and budgeted for \$1,000.

MPPAs, including the BCPP and similar programs

81. In addition to gap cover schemes, some PHIs offer MPPAs directly to medical specialists. Unlike under medical gap schemes, medical specialists generally do not opt out of MPPAs on a patient-by-patient basis as they are designed to eliminate gap payments for patients and provide funding certainty for these specialists. MPPAs can contain price and non-price terms.
82. For instance, nib has MPPAs with medical specialists that fall into two categories – MPPAs with radiologists and pathologists and the MPPAs for the Broad Clinical Partners Program (**BCPP**).
83. nib has MPPAs with radiologists and pathologists in relation to members with GU health policies who provide services such as x-rays, ultrasounds and blood tests to customers during their admission at a private hospital that is part of nib's network (i.e. nib has an HPPA with that private hospital). These services are not included in the scope of services that are provided to patients by the private hospital. They are services provided directly to the patient by the radiologist or pathologist under separate contractual arrangements with the customer. Without an MPPA, patients may incur out-of-pocket

expenses for the radiology and pathology services received during a hospital admission. These kinds of MPPAs are commonly entered into by nib and some of the other Major PHIs.

84. nib also has MPPAs with medical specialists who provide services for hip and knee joint replacement surgery through the Clinical Partners Program (CPP), which I refer to as the **Broad Clinical Partners Program** or **BCPP** (as nib and HH intend to broaden the scope of the program as I discuss in paragraph 85 below). The BCPP provides a “no gap experience” to nib customers for a single course of treatment involving multiple specialists while enabling providers to refer clinically appropriate patients to in-home rehabilitation which in turn reduces the cost of treatment. nib and HH achieve this through entering into MPPAs with all the associated specialists (surgeon, anaesthetist and assistant surgeon if required). These MPPAs require that all nib patients having hip and knee joint replacements are not charged an out-of-pocket fee and obligate nib to pay medical specialists a higher rate than would otherwise be paid under the standard nib Medigap program. At present, the BCPP has a narrow scope in terms of the treatment it provides (hip and knee joint replacement surgery), its geographic location (it presently only operates in NSW and QLD) and the number of providers it engages (currently 35).
85. nib is currently in the process of expanding the program to cover other orthopaedic procedures provided by the same surgeons such as ACL repairs, knee arthroscopes and shoulder procedures. This is to make it easier for referring general practitioners, who know that all procedures with these specialists are covered under the BCPP (not just total joint replacements), and it also extends the benefits of this program (which I discuss in Part E below) to a wider group of procedures and thus customers. Ultimately, nib and HH propose to expand the BCPP to cover a broader group of medical specialists covering more types of treatments and geographical areas. At this stage, nib and HH see opportunities to expand to broader orthopaedic surgeries, cardiac procedures, obstetrics, ENT, Gastroenterology and vascular surgeries.
86. The BCPP is different from no or known gap schemes because it:
- (a) provides a guaranteed no-gap experience in relation to all medical specialists involved in an episode of care;
 - (b) requires participating medical specialists to treat all relevant customers of a PHI under the program (that is, the medical specialist cannot opt in or out of the BCPP on a patient by patient basis).

AR

87. I am aware that some of the Major PHIs use MPPAs incorporating a similar model for hip and knee replacement surgeries. These are Medibank's Zero Out of Pocket (**ZOOP**), and HCF's No Gap Joints Program which I describe under paragraphs 88 to 89 below).
88. Medibank's ZOOP was established in 2021, for no out of pocket costs hip and knee replacement surgeries, which are performed as a short stay hospital admission with rehabilitation provided in the patient's home. Based on my discussions with a medical specialist involved in this program, I understand that in return, Medibank pays the medical specialists a higher rate than the Medibank Known Gap Fee. A description of this program as described on its website is at '**Annexure DD-23**'.
89. Similarly, HCF's No Gap Joints Program, was established in 2021 for no gap hip and knee replacement surgeries. The program is currently available in four participating hospitals in NSW and Victoria, and patients can experience no out of pocket costs from hospital admission through to discharge and post-surgery rehabilitation (whether at-home or in-clinic). A description of this program as described on its website is at '**Annexure DD-24**'.
90. PHIs have focused on these areas as they have provided the best opportunity to improve value through avoiding known and quantifiable low value care associated with longer than required lengths of stay and excessive conversion of patients to in-patient rehabilitation. This, combined with the large expense and volume of these procedures, makes it the obvious place to start in developing and testing models of care that improve value through direct partnership with surgeons.
91. These programs are not offered by all PHIs. For example, I understand that Major PHI HBF does not have a program equivalent to the BCPP which provides a no-gap experience for their customers for an entire episode of hospital treatment.

Arrangements between PHIs and hospitals

92. The Reform Act also enabled PHIs and private hospitals to enter into hospital purchaser provider agreements (**HPPAs**) with PHIs. Under HPPAs:
- (a) PHIs generally agree to pay private hospitals:
- (i) higher daily rates than the minimum benefits under the *Private Health Insurance (Benefit Requirements) Rules 2011* for the cost of hospital accommodation (determined by reference to the MBS procedure number

and inclusive of costs of allied health and nursing staff and normal use consumables);

(ii) rates for operating theatres determined by reference to MBS surgical items (again inclusive of staff and consumable costs);

(iii) specific high cost consumable items for specific procedures; and

(b) hospitals agree to limit or not charge the patient any out of pocket costs, aside from any co-payment specified in the HPPA.

93. Where a customer attends a private hospital with which their PHI has a HPPA, the customer will have certainty about any hospital related costs arising from their stay (but not medical costs). This agreement will dictate whether the customer has to pay any out of pocket expenses at a standard rate, a lower agreed rate or none at all.

94. If a private hospital does not have an HPPA with a PHI, the hospital is free to set its own charges and the PHI is liable to pay:

(a) benefits at least equal to the “minimum benefits” also known as “basic default benefits” under the *Private Health Insurance (Benefit Requirements) Rules 2011* (Cth);

(b) alternatively, if the private hospital has applied and been approved under section 121-8 of the PHI Act to be a “second tier default benefits eligible hospital”, at least 85 per cent of the average payment payable for the relevant treatment under the PHI's HPPAs with comparable private hospitals in the same state.

95. In either case, the customer will be liable to pay any “gap” between the minimum benefits or second tier benefits and the fees charged by the hospital. Where no HPPA exists, this will generally mean that the customer of the PHI will be liable to pay a gap fee or at least a higher gap fee than they otherwise would be required to.

Arrangements between PHIs and other health professionals (general treatment networks)

96. PHIs also contract separately with allied health and other providers of 'extras' services which are not provided in hospitals, such as physiotherapists, dentists and optometrists. The types of extras services which are covered will depend on the level of cover the customer has.

97. I describe these arrangements as 'general treatment networks', where the PHI and provider agree to a standard set of rates and terms for each type of service. The out of pocket cost, if any, that a customer will have to pay will depend on the rates agreed as well as the level of cover the customer has purchased.
98. Generally there are two types of product which cover these services. "Percentage back" products where the fund will cover a specified percent of the covered services and "fixed cover" products, where the fund will pay a set amount for each visit and the remainder of what the provider charges is paid by the customer. Some products include both types of funding models for different types of services.
99. For example, if nib and a physiotherapist have agreed that a consultation will cost \$100 and a customer has purchased cover which gives them 50% or more back when they make a claim, nib will be obligated to pay \$50 or more towards the consultation.
100. Most PHIs have limits on the amount of extras that can be claimed on an annual basis. Some types of cover also implement sub-limits which is a maximum amount of money that can be claimed for a specific service, deducted from the annual limit.
101. If there is an arrangement between a PHI and the health professional and the health professional is part of the PHI's general treatment network, the customer will have access to no-gap services such as dental check-ups or reduced pricing on certain services.

Contracting services for PHIs

102. "Contracting services" for PHIs include:
- (a) contract negotiation and drafting;
 - (b) data analytics;
 - (c) contract administration and management;
 - (d) dispute resolution (in relation to contractual arrangements);
 - (e) management of complaints; and
 - (f) performance and compliance assessment (reporting and oversight of parties' adherence to terms and conditions of contractual arrangements).

103. The Major PHIs (as well as the PHIs acquired by and operated by the Major PHIs), other than nib, undertake their contracting services with medical specialists and hospitals networks internally.
104. The remaining 27 PHIs use buying groups to undertake some of their contracting services:
- (a) 23 use buying group Australian Health Services Alliance (**AHSA**);
 - (b) four use buying group Australian Regional Health Group (**ARHG**);
- (together, **existing buying groups**).
105. I understand that HBF contracts directly with hospitals in Western Australia and indirectly through the AHSA in all other states.
106. The AHSA and ARHG were formed in 1994 and 1995, respectively. Both were formed for the purpose of increasing the bargaining power of smaller funds. They are the only two buying groups that have been established in Australia for PHIs. In its promotional materials, AHSA has described its strength as *'the combined market share of the participating funds which enables [it] to negotiate commercial advantageous relationships on their behalf'*. A copy of these promotional materials are at '**Annexure DD-25**'.
107. The ARHG primarily services health funds operating predominantly in regional areas, whereas the AHSA is much broader.
108. Over its history, the AHSA has had minor changes of membership mostly related to small funds selling to larger funds (e.g. when GU Health was sold to nib in 2018). The most significant change to membership was when nib exited the AHSA in 2010 after being a member since August 2005. At the time, nib was the largest fund in the AHSA and this significantly impacted the size of the insurer population controlled by the AHSA. nib withdrew from AHSA because it built its own internal contracting function.
109. Existing buying groups charge members an annual fee to provide contracting services on their behalf. These fees are generally based on rate per member insured to scale the fee to the relative size of the insurer.
110. Existing buying groups use collective bargaining to negotiate contracts on behalf of their members with hospitals and, to a limited extent, with medical specialists. I understand that AHSA offers hospital contracting services and limited medical specialist contracting

services to its members, and ARHG only offers the former. The AHSA's medical contracting is predominantly limited to known gap schemes which the participant funds can elect to join as part of their buying group services. In contrast, I understand that ARHG provides some administrative support services for its members' gap schemes but that each member PHI runs its own bespoke no gap or known gap schemes. I understand that limited MPPAs are also in place for radiology and pathology services however, programs such as the BCPP or value based contracting with medical specialists are not offered by either of the existing buying groups. I am not aware of any MPPAs between individual buying group member funds and medical specialists.

111. I estimate that the cost of building an internal contracting function today would be approximately \$2 to \$3 million and would cost approximately \$4.5 million per annum to run. The size and cost of this function is largely independent of the size of the health insurer. Any health insurer that has national coverage and maintains its own health services contracting function would need to support a function of a similar size due to the breadth of the provider networks (that is, the number of hospitals and medical specialists).
112. For instance, nib's network of providers consists of 565 private hospitals, 21,764 medical specialists, 3,049 general treatment clinics and over 15,900 providers. This requires nib to negotiate over 500 contracts per year and manage over 3,500 agreements.

Clinical independence of practitioners

113. Section 172-5(1) of the PHI Act requires that agreements between PHIs and medical practitioners do not limit medical practitioners' clinical autonomy and independence, by providing that if a private health insurer enters into an agreement with a medical practitioner for the provision of treatment to persons insured by the insurer, the agreement must not limit the medical practitioner's professional freedom, within the scope of accepted clinical practice, to identify and provide appropriate treatments.
114. This provision was introduced by the Private Health Insurance Bill 2006 to ensure '*that the contracts that doctors have with insurers may not limit the clinical freedom of doctors to choose the most appropriate treatment for their patients*'. A copy of the Bill's Second Reading Speech is at **Annexure DD-26**.
115. I am not aware of any investigation or action in relation to a breach of section 172-5 being commenced or taken against a PHI.

116. Where a breach of a provision in the PHI Act is suspected, the Minister is permitted to begin an investigation into the operations of a PHI via which a PHI can be compelled to give evidence or produce documents (see Division 194 of the PHI Act). Where the Minister is satisfied that a PHI has failed to comply with an obligation under the Act (such as section 172-5), they may apply to the Federal Court for a number of remedies including a declaration of contravention and/or compensation order (see Division 203-1 of the PHI Act).

Part C: Value based care and value based funding and contracting

117. In this section of my affidavit, I describe:

- (a) value based care;
- (b) how value based care informs value based funding and contracting in the public and private healthcare systems in Australia;
- (c) the role and current use of data collection and analytics in value based care and value based funding and contracting, including by the Authorisation Applicants.

Value based care

118. Value based care is described by the Australian Commission on Safety and Quality in Health Care (**ACSQHC**) as “achieving the best care possible for each patient while maintaining an efficient use of resources”: ACSQHC, *'The State of Patient Safety and Quality in Australian Hospitals'* (2019) (**2019 ACSQHC Report**). The benefits of value based care are described in the 2019 ACSQHC Report. A copy of this report is at **'Annexure DD-27'**.

119. Value based care distinguishes between:

- (a) high value care, which improves outcomes for patients for the same relative cost or provides equitable outcomes for lower costs;
- (b) low or no value care, which is care that is ineffective, harmful or provides equitable outcomes for higher costs.

120. High value care can reduce both immediate and longer term costs for PHIs and other healthcare payers. Fundamentally this is care with clear evidence and research to support that it materially improves the conditions and/or disease state of the patient and which, when compared with alternative forms of treatment, is cost effective relative to

these outcomes. An example of high value care would be the use of a weight bearing x-ray to diagnose osteoarthritis of the knee. This procedure is relatively inexpensive to provide and, compared with the alternative invasive knee arthroscopy procedure, holds significantly lower risk to the patient and cost to the health system. Where clinically indicated, the use of a weight bearing x-ray instead of knee arthroscopy is an example of how high value care brings improved efficiency to the health care system and reduces risks of complication to patients. Improved outcomes for patients may result in shorter hospital stays, reduced rates of complications or re-admission to hospital rates. Consequentially, this may result in overall improved health outcomes with a longer term consequence of reduced cost to the health care system and health insurance premiums.

121. Conversely, low or no value care can increase both immediate and longer term costs for PHIs and other healthcare payers by requiring longer hospital stays, or leading to complications or readmissions. Fundamentally, low value care is care which is provided where there is no clear evidence or research to support that it will improve the condition and/or illness of the patient and which will use resources in the health care system that could otherwise have been directed towards more effective treatment. Generally low value care occurs where providers are able to apply care to receive benefits with limited or no requirement to evidence clinical need for the care. It is also more generally associated with treatments or care where limited evidence exists of its effectiveness or, alternatively, the cost to deliver the care is disproportionately higher than other treatments which have equitable or better outcomes. A copy of an article in the Medical Journal of Australia describing the risks of low value care and the relative merits of high value care is at '**Annexure DD-28**'.
122. By way of example, a 2017 study found that rehabilitation pathways incorporating inpatient rehabilitation did not achieve better joint-specific outcomes or health scores than alternatives not including inpatient rehabilitation. The study found that given the substantial cost differences, better value alternatives should be considered for patients after uncomplicated total knee arthroplasty. In circumstances where, in-patient rehabilitation is likely to cost approximately \$10,000 per treatment, compared with other forms of in-home rehabilitation, which cost around \$2,000, this relative cost for in-patient care is disproportionately high to achieve the same outcomes as home base alternatives. A copy of this study is at '**Annexure DD-29**'.
123. There are numerous other examples of changes to clinical advice being made as a direct consequence of low-value care being identified. For example:

- (a) in February 2018, the Australian Rheumatology Association released a statement warning against unnecessary arthroscopic knee surgery in circumstances where "the research shows that arthroscopic surgery for knee osteoarthritis does not seem to affect a patient's outcome and in some cases, the procedure can actually do more harm than good". A copy of the relevant media release is at '**Annexure DD-30**'. As noted in this media release, despite the lack of scientific evidence that the procedure works, approximately 43,000 Medicare Benefit Scheme funded arthroscopic knee surgeries were performed in the 2016-2017 financial year, costing around \$22 million in Medicare benefit payments.
- (b) the National Health and Research Council released guidelines on the clinical indication for frequency of colonoscopy for diagnostic investigations to reduce risk to patients from complications associated with the procedure. A copy of these updated guidelines and analysis about issues arising from repeat colonoscopies are at '**Annexure DD-31**' and '**Annexure DD-32**';
- (c) Choosing Wisely Australia is part of a global healthcare initiative to improve the safety and quality of healthcare. Its website contains multiple examples of clinical guidelines and recommendation issued in consultation with peak medical bodies which have arisen by reason of low value care being identified. An example of this is the recommendations for rehabilitation medicine produced in conjunction with the Australasian Faculty of Rehabilitation Medicine at '**Annexure DD-33**'.

Value based funding and contracting

- 124. Value based funding and value based contracting is one way to identify and promote high value care and discourage low value care. Under these models, the funding or price paid to medical specialists or hospitals for services is adjusted to match the value of those services.
- 125. Value based funding and contracting is intended to be distinguished from the existing "fee for service" model under the MBS. The term "fee for service" is used to describe where medical specialists and hospitals receive payment from government agencies and insurance companies for each service they provide to patients. The number of services and procedures performed on the patient determines the amount of payment the doctor bills for. These payments are not bundled and every item is billed and paid separately.
- 126. Under the MBS fee for service model, medical practitioners are paid for particular services provided to patients, regardless of the outcomes of those services. The more

AR

services, and the more high-cost services that are provided, the more the medical practitioner is paid. Conversely, practitioners who provide fewer or low-cost services are paid less and practitioners who provide services that are not funded under the MBS cannot receive payment for those services. For example, if an orthopaedic surgeon wishes to run a pre-admission patient clinic to enable a short stay joint replacement model, this would erode the earnings of the surgeon as they would conduct more work with some work not paid for.

127. By using payment levers, value based funding and value based contracting encourages hospitals and medical specialists to provide and refer patients to high value care and avoid no or low value care. By doing so, it reduces both immediate and longer term costs for PHIs and other healthcare payers, as I described in paragraphs 120 to 123 above.
128. Value based funding or contracting can also facilitate (by providing or funding) the adoption of new technologies, products or care pathways that improve outcomes for patients (but that are not funded under the MBS). Again, by improving outcomes for patients, this reduces both immediate and longer term costs for PHIs and other healthcare payers.

Move towards value based funding in the public health system

129. Over the past five years, the public health system has begun to move towards a value based care funding model. For instance:
 - (a) In 2015, the ACSQHC and Independent Hospital Pricing Authority (**IHPA**), which is responsible for setting the national efficient price and cost for Australian public hospital services, investigated and reported on implementing national “best practice pricing” for hip fracture care in Australian public hospitals. “Best-practice pricing” is described in the report as “purchasing of healthcare services for a specific procedure or intervention at a price that reflects the elements that constitute best-practice”. The report recommended, amongst other things, that the IHPA develop a “national best practice price” to incentivise care that aligns with the ACSQHC’s clinical care standards for hip fracture. A copy of the report is at '**Annexure DD-34**'.
 - (b) The 2019 ACSQHC report noted that the ACSQHC supports value-based health care and describes the benefits value based care offers for patients, medical practitioners and governments (see '**Annexure DD-27**').

- (c) In 2019, IHPA engaged KPMG to prepare a report outlining key outcomes and suggestions for an Australian approach focused on value-based health care. A copy of that report is at '**Annexure DD-35**'.
- (d) In 2019, the Department of Health established the Practice Incentives Program Quality Improvement Incentive (**PIPQI**) for general practitioners, described as “a payment to encourage practices to participate in quality improvement activities, aimed at improving patient outcomes through the delivery of high-quality care”. A copy of the PIPQI Fact Sheet published by the Royal Australian College of General Practitioners is at '**Annexure DD-36**'.
- (e) In 2021, through the National Health Reform Agreement, the Commonwealth and State and Territory governments have committed to moving towards value based care in the Addendum to the National Health Reform Agreement 2020-2025 and Long-term Health Reform Roadmap. A copy of the agreement and addendum are at '**Annexure DD-37**' and '**Annexure DD-38**'.
- (f) At a state level, NSW Health has released the 'Commission for Better Value Strategy from 2021 to 2024'. This strategy is aimed at shifting the focus from outputs to outcomes and is aimed at accelerating the state wide move to value based care. The strategy is built off successful implementation to improve value base contracting in the northern NSW Local Health District which redesigned the medical imaging services to align with outcomes in 2020. The strategy aims to have embedded value based healthcare in and across the system by June 2023 and have monitored and evaluated the impacts by June 2024. A copy of this document is at '**Annexure 33-39**'.

Value based contracting in the private health system

130. PHIs, including nib and the Major PHIs, currently engage in limited value-based contracting with hospitals and with medical specialists in the programs I outlined in paragraphs 88 to 89 above. In respect of hospitals, this generally takes the form of increasing the fees payable under a HPPA by an additional amount if the hospital provider is able to evidence a reduction in the provision of low-value care. With respect to medical specialists this usually takes the form of requiring the sharing of additional outcomes and quality data and the use of best practice guidelines in the delivery of care, as I describe further in relation to nib's BCPP in paragraphs 264 to 272 below.

AR

131. Value based contracting either reduces the costs payable by PHIs and the out-of-pocket expenses experienced by consumers or increases the quality in the system for the same relative cost. In my experience, this in turn results in lower premium increases payable by PHI customers and/or provides more value for the customer without a corresponding premium increase (a “quality adjusted price”).
132. Reduced premium increases also encourages participation in the private health insurance system, which in turn reduces pressure on the public health system as described in paragraph 21 above.

BCPP value based contracting outcomes

133. nib’s BCPP (described in paragraph 84 above) is an example of a value based contracting model. The primary object of the BCPP is to provide a complete no gap experience for nib customers undergoing knee and hip replacement surgery. The secondary objective of the BCPP is to establish a high-quality post-surgery ‘at-home’ patient rehabilitation and support program, and make that program available to the relevant nib members, where clinically appropriate. This program is provided either as hospital substitution care or as part of a chronic disease management program (described further in paragraph 266 below) and is delivered under the direct clinical supervision of the admitting surgeon who remains responsible for the patient.
134. That objective is reflected in the MPPA, which requires, subject to clinical appropriateness, that providers admit eligible customers to undertake the post-surgery ‘at home’ Patient Rehabilitation Support Program (clause 7.1(g)) and work towards ensuring that admission to overnight inpatient programs are approximately 30 per cent of nib’s eligible customers undergoing joint replacement (clause 7.1(e)). Since its launch in 2019, the BCPP has achieved the following outcomes:
 - (a) reduced the average rate of inpatient rehabilitation following joint replacement from 33% to 13% of patients, consistent with rates seen in public hospitals system in Australia (circa 17%). A journal article which explores the high rates of inpatient rehabilitation in the Australian private health sector is at '**Annexure DD-40**';
 - (b) reduced the average acute length of stay of patients following joint replacement from 6 days to 4.6 days, consistent with public hospital acute lengths of stay for non-trauma joint replacements in the Independent Hospital Pricing Authority (IHPA) price determination for Total Hip and Total Knee Joint Replacements. A copy of this IHPA price determination for 2021-22 is at '**Annexure DD-41**';

AR

- (c) provided access to rehabilitation in the home (**RITH**) to 60% of members who have undergone a Total Hip or Total Knee Joint Replacement.

135. These objectives are consistent with both Commonwealth and State public health policy. For instance:

- (a) The 2020-2021 Commonwealth budget committed to expanding home and community based care to allow patients to recover and rehabilitate in their own homes, on the basis that most patients preferred at home rehabilitation, it was a more cost-effective option than in-hospital care, and would increase capacity in hospitals.
- (b) The 2020-2021 Victorian budget committed \$120.9 million to the 'Better at Home' initiative, which supports the delivery of more rehabilitation services in the home. Further funding of \$698 million was committed in the 2022-2023 Victorian Budget.

Copies of these announcements are at '**Annexure DD-42**' and '**Annexure DD-43**'.

136. HH has also provided BCPP providers with access to the following technologies or products with the goal of improving outcomes for patients:

- (a) the 'mymobility' application which provides personalised care plans including both pre and postoperative exercises, education, questionnaires, and reminder notifications;
- (b) the '360 Med Care' system, an application which, by inputting the patients' specific requirements allows:
 - (i) a "virtual operation" to be performed repeatedly to determine up with the best solution in terms of factors such as which implant to use, and how it is aligned;
 - (ii) operation planning, the details of which can be fed into computer navigation and robot systems to assist the surgeon;
 - (iii) a complete rehabilitation regime for a period of up to a year;
- (c) sophisticated post-operative compression devices.

137. The BCPP has been very popular with nib customers. The proportion of nib customers who choose to participate in the BCPP for knee or joint replacements is at present:

AR

- (a) nearly 20% annually of all joint replacements for nib customers nationally;
 - (b) approximately 65% annually of all major joint replacements for nib customers in the Hunter region of New South Wales (where most of the surgeons participating in the BCPP are located).
138. nib has received positive feedback from nib members about the BCPP since 2019. An subset of anonymous testimonials provided to nib about the BCPP are at '**Annexure DD-44**'. These testimonials are either unsolicited or provided in response to a request for feedback. I understand that at least one patient has flown interstate to intentionally book with a surgeon signed up to the BCPP so they could gain access to the guaranteed no out of pocket cost.
139. The net promoter score (**NPS**) is a market research metric used to measure a customer's willingness to return for another service as well as to make a recommendation to their family, friends or colleagues. Patients are asked to provide a rating from 1 to 10 and then grouped into 'promoters' (a score of 9 to 10), 'passive' (a score of 7 or 8) and 'detractors' (a score of 0 to 6). The NPS is calculated by subtracting the detractors from the promoters and the final score can range from -100 to 100. The NPS for nib with members who attended surgeons involved in the BCPP is 71 (which is very high) as compared to a score of 31 for nib with members who attended non-BCPP surgeons. Likewise, the NPS for surgeons with patients who received care under the BCPP is 86 compared to non-BCPP surgeons' NPS of 77 with patients.

Role and current use of data analytics, including to support value based care and value base funding and contracting

Data collection and analytics in the public system and by PHIs

140. In the public system, the move towards value based care has been accompanied by a focus on the need for access to data and data analytics. As described in the NSW Health CBV Strategy 2021 – 2024 referred to in paragraph 129(f) above, the use of evidence and data is a principle pillar underpinning the move to value based care. Data is needed to plan, implement, evaluate and continuously improve the value based services.
141. Data analytics is used both to determine pricing and improve health outcomes in the public and private health systems.
142. Examples of the use of data analytics in the public health system include:

AR

- (a) the ACSHQ actively works with patients, carers, clinicians and various organisations (including private sector) to improve outcomes for patients by providing resources and publications about safety and quality measured in the health system. For example, ACSQHC's *Australian Atlas of Healthcare Variation Series*, which identifies rates of health care events and procedures at a population rate level by geography and identifies where significant variations of care occur, the possible reasons for it and actions to reduce unwarranted variation in clinical practices. The 2021 report highlights variation across a broad range of health issues from women's health and pregnancy through to surgical procedures, medication dispensing and chronic conditions. A copy of that report is at '**Annexure DD-45**';
- (b) there are various other registries operating in Australia which are aimed at providing benchmarking information to organisations and clinicians with the aim to improve outcomes for patients. These range from registries on hip fractures to diabetes, prostate cancer, and cardio thoracic surgery. The primary purpose of many of these registries is the benchmarking of key performance indicators to allow clinicians and organisations to set targets for improvement in their quality improvement cycles. They also generally publish annual or periodical reports with participating sites in a comparative de-identified format. The National Joint Registry measures the rates of revision of prostheses used for major joint replacements and identifies prostheses with higher than anticipated revision rates. This Registry also provides surgeons with their own outcomes for revision, relative to peers to allow them to understand and address any issues in their clinical practice which may be leading to adverse outcomes for patients. A report issued by the ACSQHC in 2016 describing the role of these clinical quality registries is at '**Annexure DD-46**'.

Data collection and analytics by PHIs

143. The Department of Health manages a number of hospital related data collections from public and private hospitals as well as PHIs. This data facilitates service evaluation and helps to inform decisions on health services. It describes the characteristics of public and private hospitals, non-admitted patient care, admitted patients and the care they receive in hospital, and elective surgery and emergency department waiting times.
144. All registered PHIs are required under the PHI Act and the *Private Health Insurance (Data Provision) Rules (Data Provision Rules)* to submit Hospital Casemix Protocol

AR

(HCP) data to the Department of Health, which includes clinical, demographic and financial de-identified information for privately insured admitted and non-admitted patient services. The inpatient data (HCP1) is collected monthly and the outpatient data (HCP2) is collected quarterly. The PHIs receive this data from public and private hospitals, who are required under the *Private Health Insurance (Health Insurance Business) Rules* to provide this information to the PHIs. These de-identified data sets are a valuable tool both for service evaluation and research for industry and government. Registered PHIs are also required under the PHI Act and the Data Provision Rules to provide de-identified data on general treatment dental services to the Department of Health. The data includes information on patient demographics, type of dental service, charges and benefits, and PHIs receive this information from dental service providers.

145. Other organisations separately collect data which is relevant to their medical speciality. For example, the Australian Rehabilitation Outcomes Centre (**AROC**) collects and publishes data about rehabilitation outcomes in both inpatient and ambulatory setting. The Private Mental Health Alliance has created the Centralised Data Management Service (**CDMS**) which collects and publishes data in relation to the private mental health sector. Neither the AROC or CDMS data is publicly available to PHIs but the data used by AROC is predominantly derived from the HCP data they already have access to.
146. A major limitation of small PHIs using data to move towards value-based contracting is the depth of data that individual small funds will have (rather than the quality or breadth of the data collected). That is, the ability to derive value from the quality data collected by funds through claims, HCP and member information is limited if the data is not statistically relevant. While the small funds receive equivalent data to the Major PHIs, because they have fewer customers, they do not have sufficient volumes of admissions to be able to effectively use this data to benchmark and determine the relative quality in the system. In comparison, Major PHIs can more readily infer from their higher volume of data alone the quality and value associated with the hospital and medical providers. Increasing the volume of available data facilitates better data analytics, which in turn facilitates a value based contracting model.
147. Examples of the use of data analytics by Major PHIs include:
 - (a) Medibank's Urology Surgical Variance Report, released in 2015, which used hospital and medical specialist claims data submitted to Medicare to analyse how many patients were required to be readmitted and reoperated on. The purpose of this report was to assist surgeons in understanding clinical variance across their

profession and improve their practice in line with their peers, as well as to help Medibank understand the spectrum of out of pocket costs being charged by these same surgeons.

- (b) Medibank's and the Royal Australasian College of Surgeons' (**RACS**) review of same-day surgery for hernia repairs, released in 2017, conducted a systematic literature review using Medibank's administrative data-set as well as clinical practice guidelines and published data from a range of countries to assess the nature of hernia repair surgeries and the suitability of having them as day procedures. The study allowed a number of recommendations to be made, including that patients having certain forms of hernia surgery can be managed as day patients.

Copies of these reports are at '**Annexure DD-47**' and '**Annexure DD-48**'.

Data collection and analytics by HH

148. HH currently provides nib with a range of data analytics services. It has also performed some limited data science services to other PHIs on an ad hoc basis. Its team of data scientists work in conjunction with artificial intelligence and machine learning platforms to deliver services which include predictive health care modelling, translational health assessments, proactive patient identification and targeting, predictive risk stratification, health cost predictions and supporting data warehousing, infrastructure, reporting and smart alerts. Presently, HH has the following data science capabilities:

- (a) applying machine learning algorithms which allow it to undertake predictive modelling and timeseries forecasting with respect to treatment approaches;
- (b) undertaking health assessments, whereby a retrospective case control methodology is used to measure the value delivered by clinical programs. This allows patients that have had a medical intervention to be matched and compared with equivalent patients who did not receive the treatment, producing important data about treatment effectiveness and measuring the relative savings or costs associated with the treatment;
- (c) adopting sophisticated targeting methodologies which help identify patients who will respond best to clinical interventions;
- (d) undertaking population insight analysis to identify areas of need by reference to historical admissions by procedure, ICD10 diagnoses (an international

classification of disease), and distribution of spend between membership and the subsequent claiming behaviour of each segment. HH is able to advise customers which members are at a higher risk of disease and who could benefit from interventions which may delay or avoid members having hospital admissions;

- (e) analysing health insurance data to predict the future avoidable healthcare cost per individual;
- (f) rolling out a modern survey platform which captures patient reported outcomes and experiences which can then feed back into the above analysis tools.

149. To support these data analytics, nib collect from medical specialists and hospitals and provides to HH de-identified claims and demographic data about customers. This includes claims information relating to hospitalisations, use of general treatment providers, medical claims, diagnosis and procedure information, gender, age (in years) and general location information (suburb and postcode). HH is then able to use this information to link the progressive claims and health outcomes of member across multiple interactions with the health care system including determining quality measures such as hospital acquired complications through to avoidable readmission to hospital.

150. Data analytics have enabled HH to conduct benchmarking across medical specialists including by measuring and identifying those medical specialists who when compared to their peers have:

- (a) higher hospital acquired complication rates;
- (b) higher conversion to critical care rates;
- (c) longer length stays;
- (d) higher charges for prosthesis items;
- (e) billed significantly more MBS items;
- (f) a significantly higher overnight versus day rate;
- (g) a lower inpatient rehabilitation rate; and
- (h) a higher rate of avoidable readmission.

151. This benchmarking data allows nib and HH to determine areas of low or no-value care including to assess and investigate medical specialists and hospital providers that

appear to have systematic negative outcomes with patients. For example, using benchmarking, HH has to date identified a number of medical specialists and hospital providers operating significantly outside the scope of national clinical averages, including:

- (a) a medical specialist with a 67% conversion rate to ICU after major joint replacement when the national average is 2.4%. This was raised with the hospital group and HH is continuing to work with them to remediate this behaviour. HH now holds quarterly meetings with the group and individual hospital, and are implementing more stringent contractual obligations to remove financial incentives for this conversion when not clinically indicated;
- (b) a hospital provider with a 50% readmission rate back to hospital for mental health within 28 days where the national average is 7%. Since HH began working with this provider and providing benchmarking against peer hospitals and public hospitals, they have been able to improve their discharge planning and support to reduce this rate to 19%;
- (c) a medical specialist with a conversion rate to in-patient rehabilitation rate of 85% when the national average is 40%.

152. In my opinion, identifying, understanding and addressing those issues will benefit future patients and is plainly in the best clinical interest of patients and consumers in general who contribute to subsidising this care through their insurance premiums.

153. Specifically in relation to rehabilitation, HH and nib currently use benchmarking to determine which hospitals and medical specialists are admitting patients with very high functional scores in independence to overnight hospital care for rehabilitation when these patients are indicated, through the Guidelines for Recognition of Private Hospital-Based Rehabilitation Services (**National Rehabilitation Guidelines**), as only requiring day program or outpatient care. A copy of the National Rehabilitation Guidelines is at '**Annexure DD-49**'.

154. This data is also used to assess the efficacy of rehabilitation care through the calculation of a Functional Improvement Measure (**FIM**) efficiency score. The score indicates the relative effectiveness of the treatment to improve the patient's function. An FIM efficiency score of 1 or better is considered good in that the patient has improved by 1 point on the FIM score system each day throughout the admission (on average). Using this data, HH and nib can understand which medical specialists are admitting patients who are unlikely

to receive a significant benefit from rehabilitation and how they are applying the care. This allows HH and nib to assess services against other medical specialists and adjust funding to encourage improved outcomes for patients by either not increasing funding when conducting future contract negotiations or, making an increase in funding in future contract negotiations contingent on improving the outcomes for patients.

155. In relation to rehabilitation, HH intends to continue to utilise these data capabilities to identify medical specialists that are referring patients to care that is not improving patient outcomes, assess the relative value of those specialists against other specialists and adjust funding to those medical specialists to encourage them to provide care that improves patient outcomes.
156. Specifically in relation to the BCPP, HH has been able to, on behalf of nib and in relation to the BCPP, target negotiations and spend more in respect of providers that are providing higher quality services.
157. More generally, using data analytics, HH has worked with medical specialists to improve outcomes for patients and the health system overall in the following practical ways:
 - (a) improving selection of patients for in-patient rehabilitation by better aligning with the National Rehabilitation Guidelines and its guidance around when overnight nursing care is required. This is achieved in partnership with the specialists through the introduction of standard clinical assessment tools (such as the Risk Assessment and Prediction Tool (**RAPT**)) to assess relative need for what type of rehabilitation is required by the patient, and thereby reducing the number of patients inappropriately assigned to high cost and avoidable in-patient care;
 - (b) reducing readmission rates for patients accessing mental health services by working with identified providers to implement improved discharge practices including better reintegration of patients back into appropriate community support services. This ensured that the discharge process met the requirements under the National Standards for Mental Health Services and Guidelines for Determining Benefits for Private Health Insurance Purposes. copies of which are at '**Annexure DD-50**' and '**Annexure DD-51**'.
 - (c) reducing ICU conversion rates post major joint replacement, having regard to best practice and data collected by HH which indicated that only a small proportion of patients should require intensive care post a hip or knee joint replacement (see report at '**Annexure DD-52**'). By identifying this, HH has been able to inform and

AR

contract with providers in such a way to improve unnecessary admittance of patients to the ICU;

- (d) reducing the number of double puncture procedures in cardiac services. A double puncture refers to where a patient undergoes a diagnostic interventional angiogram to determine if they have occlusions of their coronary arteries which require stenting. Delaying the stenting to a subsequent surgical procedure can increase the risk to the patient due to delay in intervention plus the associated risk of undergoing another surgical procedure. It also substantially increases the cost to the health care system (more than doubles the health care costs). The recent MBS review by MSAC identified and changed cardiac MBS items such that medical specialists are no longer eligible to be paid for the second procedure if it was not indicated to be done at a later time. These changes are summarised at '**Annexure DD-53**'. Using this reporting, HH have proactively identified to hospital provider groups which specialists have higher than average rates of delayed stenting. This has enabled these provider groups to raise this at medical advisory meetings at the relevant hospitals to ensure appropriate clinical indication exists for why these procedures were delayed.

Data transparency

158. In my opinion, one of the largest challenges facing improvement in health care in Australia is the lack of transparency of data on the outcomes and quality of care provided by medical specialists and other providers. Although various registries collect information about the clinical practices of medical specialists, this information is not discoverable by consumers. For example, consumers cannot see how many of a particular procedure a specialist has conducted (an accurate indicator of proficiency in undertaking that procedure), nor any clinical outcomes relating to the procedure. HH intends to improve access to this information not only for consumers, but importantly, to refers through platforms such as HH's GP Utility Tool.
159. By way of example, the National Joint Registry actively collects and holds information on all orthopaedic joint replacement surgery. This registry contains information that is relevant to a consumer, and to general practitioners who act as referrers, in choosing a surgeon for a joint replacement. This includes the revision rates of the surgeon in 1, 3, 5 and 7 years as well as other information relevant to the consumer. However, the consumer, and payers of health care, are not able to access this information. Similarly, the Department of Health collects and stores HCP data for all private hospital admission

at private hospitals in Australia. This data contains information such as the hospital acquired complication rates, conversion rates to intensive care, rehabilitation and other relevant quality information. This data is not made available to consumers who may be accessing services from a specialist or hospital and to whom the rates of infection, falls or complications are highly relevant when selecting their specialist and location of care. While PHIs can make this information available through their claims data, small funds are at a distinct disadvantage as they will not have sufficient admission data to allow them to determine issues on quality with hospital providers or specialists.

160. In addition, consumers are not readily able to access accurate information on the likelihood of the costs associated with medical procedure with the associated specialists. This places consumers at a distinct disadvantage in the selection of the best specialist for their financial situation including where they may be apprehensive to change specialists after already paying for an initial consultation with a specialist and the relative complexity of doing so.

161. HH has sought to increase transparency of data about pricing by releasing:

- (a) the Find a Provider tool, which provides information to customers about which medical specialists are within nib's network and the average out-of-pockets they may expect to pay with that specialist;
- (b) the GP Utility Tool which provides this information to the general practitioner through an eligibility check. This ultimately allows the general practitioner to confirm the level of coverage held by their patient as well as select the best specialist for their clinical and financial needs.

162. The Commonwealth Government has also released its own Medical Costs Finder tool which, at present, assists patients to obtain an estimate of how much their procedure is likely to cost. It is intended that this tool will eventually be expanded to include the costs of individual specialists, although that functionality is not yet available.

Data privacy

163. Health information is sensitive in nature and must be treated carefully. PHIs and health service providers are subject to strict privacy laws under the Commonwealth *Privacy Act 1988*, and relevant state-based health privacy legislation including the *Health Records Act 2001* (Vic), *Health Records and Information Privacy Act 2002* (NSW) and *Health Records (Privacy and Access) Act 1997* (ACT). The relevant Privacy Principles and

Health Privacy Principles in these Acts pertain to the collection, use, disclosure and protection of the security of health data. Specifically, in collecting and analysing patient data, nib and HH adhere to:

- (a) HH's Privacy Policy;
- (b) Data Governance Policy and
- (c) Information Security Management Policy.

A copy of these policies is at '**Annexure DD-54**', '**Annexure DD-55**' and '**Annexure DD-56**'.

164. When members take out private health insurance, they will generally provide their consent for their personal information to be disclosed by hospitals to PHIs, for PHIs to use this information to pay their members' claims, and to be sent promotional material from their PHI. In addition, where HH provides direct services which require identification of the member, the customer will first receive a call from nib gaining explicit consent for HH to contact them in relation to the health management program. Medical specialists operating under the BCPP, actively gain consent from the patient for HH to contact them to coordinate the BCPP.

PART D: The application for authorisation and the Proposed Conduct

The application for authorisation and the authorisation process

165. On 24 December 2020, the Authorisation Applicants jointly applied for authorisation from the ACCC under section 88(1) of the CCA for HH to form a joint buying group and provide contracting and related services to PHIs and other healthcare payers. A copy of that application is at '**Annexure DD-57**'.
166. On 8 April 2021, the Authorisation Applicants submitted an amended application. A copy of the amended application is at '**Annexure DD-58**'. This amended application responded to the ACCC's concerns around the HH Buying Group representing 100% of the national private health insurance market by narrowing the scope of the Proposed Conduct (as defined in the application) in relation to Major PHIs.
167. On 6 May 2021, the Authorisation Applicants submitted a further amended application. A copy of the further amended application is at '**Annexure DD-59**'. This further amended application limited the scope of the Proposed Conduct (as defined in the application)

AR

further such that the HH Buying Group was only allowed to represent a maximum of 80% of the national private health insurance market in relation to the BCPP.

168. The Authorisation Applicants described the 'Services' in their further amended application as:

'the provision of some or all of the following services by HH to some or all of the Participants collectively through the HH Buying Group, and the acquisition of those services by the Participants from HH, in relation to arrangements between the Participants and hospitals, medical specialists, general practitioners, allied health professionals or other health providers (Providers) for the funding of health services:

- (a) *contracting negotiations and drafting;*
- (b) *contract administration and management;*
- (c) *dispute resolution;*
- (d) *data analytics;*
- (e) *administration and management of medical gap schemes and the general treatment networks;*
- (f) *performance and compliance assessment of Providers;*
- (g) *any other service notified by HH to the ACCC.*

169. On 21 September 2021, the ACCC issued its final determination, authorising:

- (a) the formation and operation of a buying group (the **HH Buying Group**) by HH, including the BCPP, involving the provision of services to Authorised Entities; and
- (b) the acquisition of contracting services by Authorised Entities from HH;

(together the **Proposed Conduct**).

170. "Authorised entities" was defined in the determination to mean:

- (a) HH and nib;
- (b) PHIs except for the Major PHIs;
- (c) international medical and travel insurance companies;

- (d) government and semi-government payers of healthcare services such as workers' compensation and transport accident scheme operators, and the Department of Veterans Affairs scheme; and
- (e) any other payer of health services or goods other than a Major PHI, as notified by HH to the ACCC,

(in this affidavit referred to as **Participants**).

171. The Authorisation was subject to a condition that Major PHIs not join the HH Buying Group. The ACCC did not seek to prohibit HH from providing services directly to Major PHIs on an individual basis.

172. The ACCC authorised the Proposed Conduct for a period of five years.

Overview of the Proposed Conduct

The HH Buying Group

173. HH intends to negotiate a bilateral participation agreement with each Participant.

174. Participants will be able to opt to purchase some or all of the contracting services offered by HH. Major PHIs will be able to opt to purchase the BCPP services.

175. Membership fees will be set based on the size of the Participant (based on insured member numbers) to ensure that the relative costs are equitable between insurers of variant size. The fee for Participants will correlate with transactional costs so that any savings that arise as Participant numbers increase, would be distributed between Participants under the Participation Agreement through reduced fees.

176. Participation will be non-exclusive and Participants will be able to purchase some or all of the contracting services offered by HH. Certain programs will fall under per episode billing arrangements (such as the BCPP) and will be billed as a service to the PHI under a chronic disease management program. Other programs will be funded through a subscription approach with the amount paid relative size of the PHI's membership.

177. I anticipate that:

- (a) PHIs that currently outsource their contracting services to AHSA or ARHG are the healthcare payers that are most likely to join the HH Buying Group.

- (b) Major PHIs may be interested in joining the BCPP to supplement their internal contracting function.

The contracting services

178. The contracting services HH proposes to offer include:

- (a) contract negotiation and drafting;
- (b) data analytics;
- (c) contract administration and management services;
- (d) dispute resolution services (in relation to contractual arrangements);
- (e) management of customer complaints; and
- (f) performance and compliance assessment (reporting and oversight of parties' adherence to terms and conditions of contractual arrangements).

179. Broadly, HH proposes to offer those contracting services to Participants in relation to HPPAs, MPPAs with medical specialists, gap cover schemes and general treatment networks.

180. Given the issues that have arisen between the parties in this review, in this affidavit I describe only two aspects of the contracting services proposed to be offered by HH:

- (a) contract negotiation and drafting for medical specialists; and
- (b) data analytics.

181. The remaining aspects of the Proposed Conduct are described in the Authorisation Applicants' applications to the ACCC (see paragraphs 165 to 167) .

Proposed contract negotiation services

182. HH proposes to offer Participants contracting services for HPPAs, MPPAs with medical specialists, existing gap cover schemes and general treatment networks. In this affidavit, I describe HH's proposal for contracting services in relation to MPPAs with medical specialists only (and, where relevant, how this interacts with gap cover schemes).

MPPAs with medical specialists

183. HH proposes to extend the BCPP MPPA model it currently provides to nib (described in paragraph 84 above) to Participants. This means that, in relation to medical specialists, HH proposes to offer Participants contracting services that will involve initially extending the BCPP to Participants and ultimately expanding the BCPP to cover a broader group of medical specialists covering more types of treatments and geographical areas. This will involve:

- (a) HH using any existing MPPA for the BCPP the medical specialist has with nib as the base agreement for the HH Buying Group (with new contracts to be negotiated upon the expiration of those agreements and with medical specialists who do not presently have an agreement with nib);
- (b) HH aggregating and analysing Participants' claims data for medical specialists to establish benchmarks for quality of service, price and application of services;
- (c) when negotiating new contracts, conducting collective commercial negotiations with medical specialists based on this aggregated data and other information obtained from Participants;
- (d) negotiating one set of terms and conditions including price schedules, business rules for payment of benefits and quality and performance targets for all Participants for each MPPA with a medical specialist;
- (e) if the Participant and medical specialist are content with the negotiated terms, coordinating the execution of the MPPA between the Participant and the medical specialist (HH will not be party to the executed agreement in its own right).

184. If a Participant or medical specialist is not satisfied with the terms proposed, they may:

- (a) agree to a different set of terms and conditions to those proposed by the HH Buying Group independently or by HH acting as an agent for the Participant; or
- (b) negotiate directly to enter into an agreement independently of the HH Buying Group; or
- (c) not enter any agreement at all.

AR

185. For medical specialists, participation in the BCPP and contracting with the HH Buying Group will be entirely voluntary. Medical specialists who do not wish to enter or continue with an MPPA with a Participant may instead:
- (a) participate in that Participant's or HH's medical gap scheme (for those Participants who opt in to the HH medical gap scheme); or
 - (b) charge patients a gap fee and receive 25 per cent of the Schedule Fee from the insurer.
186. Participants cannot bypass or boycott medical specialists who decline to contract with the HH Buying Group.
187. Medical specialists who enter an MPPA with a Participant will not be prevented from offering healthcare services to other insurers, buying groups or healthcare payers that are not participating in the HH Buying Group or restricted in the terms and conditions on which they may choose to enter such agreements.
188. As I described in paragraph 85 above, nib and HH are currently extending the BCPP to cover more procedures with orthopaedic surgeons already participating in the BCPP. In addition, nib and HH presently plan to expand the BCPP to cover additional specialty areas and see clear opportunities to do so in respect of cardiac procedures, obstetrics, ENT, gastroenterology and vascular surgeries. Any extension of the BCPP to new specialist areas will involve negotiation with those specialists, including peak bodies representing those practice areas.
189. In relation to gap cover schemes, HH proposes to offer the existing gap scheme it manages for nib to other Participants. In the event of authorisation, it is HH's intention to replace that scheme with a new HH scheme with new terms and conditions. The membership for the HH Buying Group will be adjusted for Participants who elect not to join the HH gap scheme (e.g. Major PHIs only purchasing BCPP services).
190. The Authorisation Applicants intend that nib and any other Participants will maintain medical gap cover schemes (either independently or by opting in to a medical gap scheme to be negotiated collectively by HH as described above). HH does not propose that the BCPP will replace gap cover schemes. Rather, HH intends that the BCPP will be an additional option for medical specialists who choose to participate in it (for treatments that are covered by the BCPP), in circumstances where:

- (a) the BCPP is at present confined to a small number of procedures and will not cover all of the procedures and associated work that a participating medical specialist may undertake;
- (b) even for specialist areas covered by the BCPP is likely to cover a small proportion of total medical specialists practising in that area. For instance, at present only 17% of all hip and knee joint replacements for nib customers were done through the BCPP program in 2021. In contrast, gap participation rates for the remaining procedures was at around 70%. Based on these figures, the Authorisation Applicants envision that only up to 20% of orthopaedic surgeons will participate in the BCPP in any localised area;
- (c) to date, where participating medical specialists have performed procedures not covered by the BCPP they have continued to claim for these procedures under the nib Medigap program;
- (d) there is a range of medical speciality areas and treatments that are and are not likely to be covered by the BCPP and as such there will be a need for a gap cover scheme for at least those areas and treatments;
- (e) HH will approach the expansion of the BCPP to other specialty areas and procedures on a case by case basis in consultation with relevant medical specialists in the field;
- (f) finally, it is in PHIs' best interests for medical specialists to opt in to a gap cover scheme rather than charge their customers a gap fee and this is a clear disincentive from dismantling the gap cover schemes.

191. HH does not propose to reduce coverage under the gap cover schemes. Any reductions in coverage of the current gap scheme would have a detrimental impact on members and PHIs would be required to provide advance notice to members of this change. In my experience, this could result in policy holder lapse and damage to the insurer's reputation with both their customers and with medical specialists.

Proposed Data analytics services

192. HH will offer data analytics services as part of contract negotiations (as described in paragraph 178 above) but also on an ongoing basis to assess the performance medical specialists, hospitals and general treatment providers, and benchmark their performance against the aggregated data for the HH Buying Group.

193. As HH presently does for nib, using the data capabilities described in paragraph 148 to 157 above, HH proposes that data obtained from Participants about the performance of all medical specialists, hospitals and general treatment providers will be benchmarked against aggregated data across the HH Buying Group and used to analyse:
- (a) quality of medical specialist and hospital providers (including the rate of hospital acquired complications, length of hospital stay, unplanned readmission to theatre, conversion to ICU);
 - (b) compliance of medical specialist (including accuracy of claims, compliance with the contract terms and complaints);
 - (c) benefits paid to the medical specialist (including cost per episode against national peer groups, change in cost over time and cost variability reporting across the network);
 - (d) access to the medical specialist and other provider services (including network coverage and member access issues); and
 - (e) efficiency and value of treatment provided by the medical specialist, hospital and other providers (including quality scoring and ranking of value and efficiency against quality).
194. Again, as HH presently does for nib (described in paragraph 148 to 157 above), HH intends to collect and aggregate claims data and HCP data of Participants to establish benchmarks on the outcome of services in relation to both procedures and Diagnosis Related Grouping (**DRG**). This outcomes-based data would then be normalised and risk-adjusted for the variances in patient population (e.g. age, co-morbidities and demographic factors including gender) and a relative outcome scale established for each medical specialist at a procedure level. This would include quality data and information such as Hospital Acquired Complications as well as efficiency data such as bed days or use of MBS item numbers. Once the quality scoring is established, HH will be able to use this benchmarking to assign a relative value score to each specialist at a procedure or DRG level as well as an aggregated weighted average for the specialist.
195. Members of the HH Buying Group will be required to adopt HH's policies for privacy and data protection described in paragraph 163 above as a condition of participation in the HH Buying Group. As I described in paragraph 164 above, patient information can only be shared between HH and the medical provider with the patient's express consent.

AR

PART E: Benefits of the Proposed Conduct

196. In the following section of my affidavit I describe the following overlapping benefits of the Proposed Conduct:

- (a) offering an alternative to existing buying groups;
- (b) expanding the benefits of value based contracting to more PHIs and their customers;
- (c) extending the benefits of data analytics to more PHIs and their customers;
- (d) extending out of pocket costs savings for more customers;
- (e) costs savings and efficiencies for PHIs and hospitals and medical specialists;
- (f) countervailing hospital bargaining power.

197. I also describe the benefits of allowing the Major PHIs to participate in the HH Buying Group in relation to the BCPP.

Alternative to existing buying groups

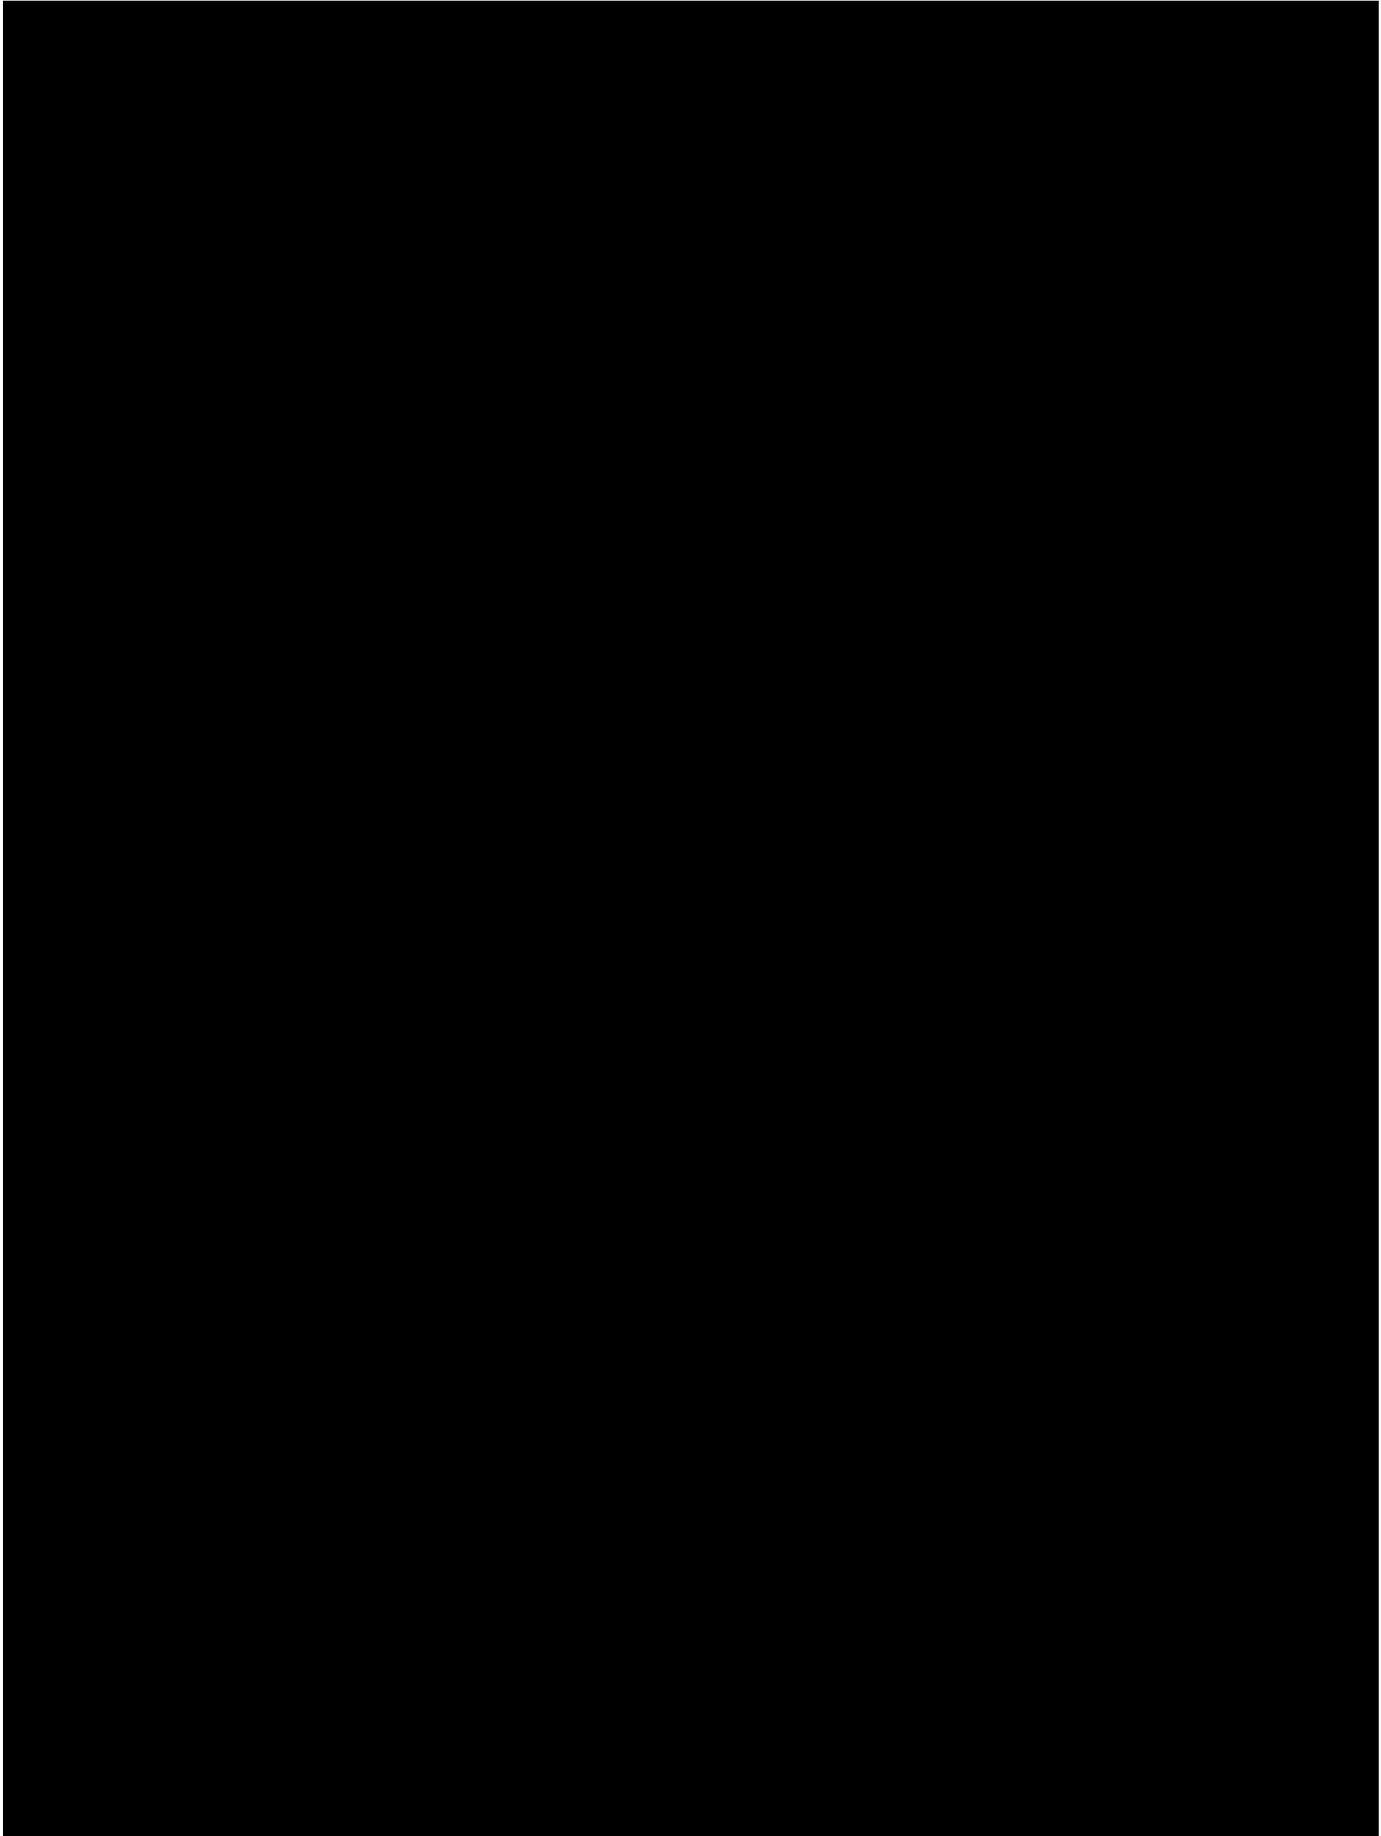

198. The HH Buying Group will offer an alternative to existing buying groups, AHSA and ARHG in four main respects:

- (a) offering an alternative contracting model that increases flexibility for Participants: see paragraphs 199 to 210 below;
- (b) offering value based contracting: see paragraph 211 below;
- (c) offering a greater range of medical specialist contracting than existing buying groups: see paragraph 212 to 214 below;
- (d) offering data analytics services not presently available in other buying groups: see paragraph 216 to 225 below.

Alternative to contracting model

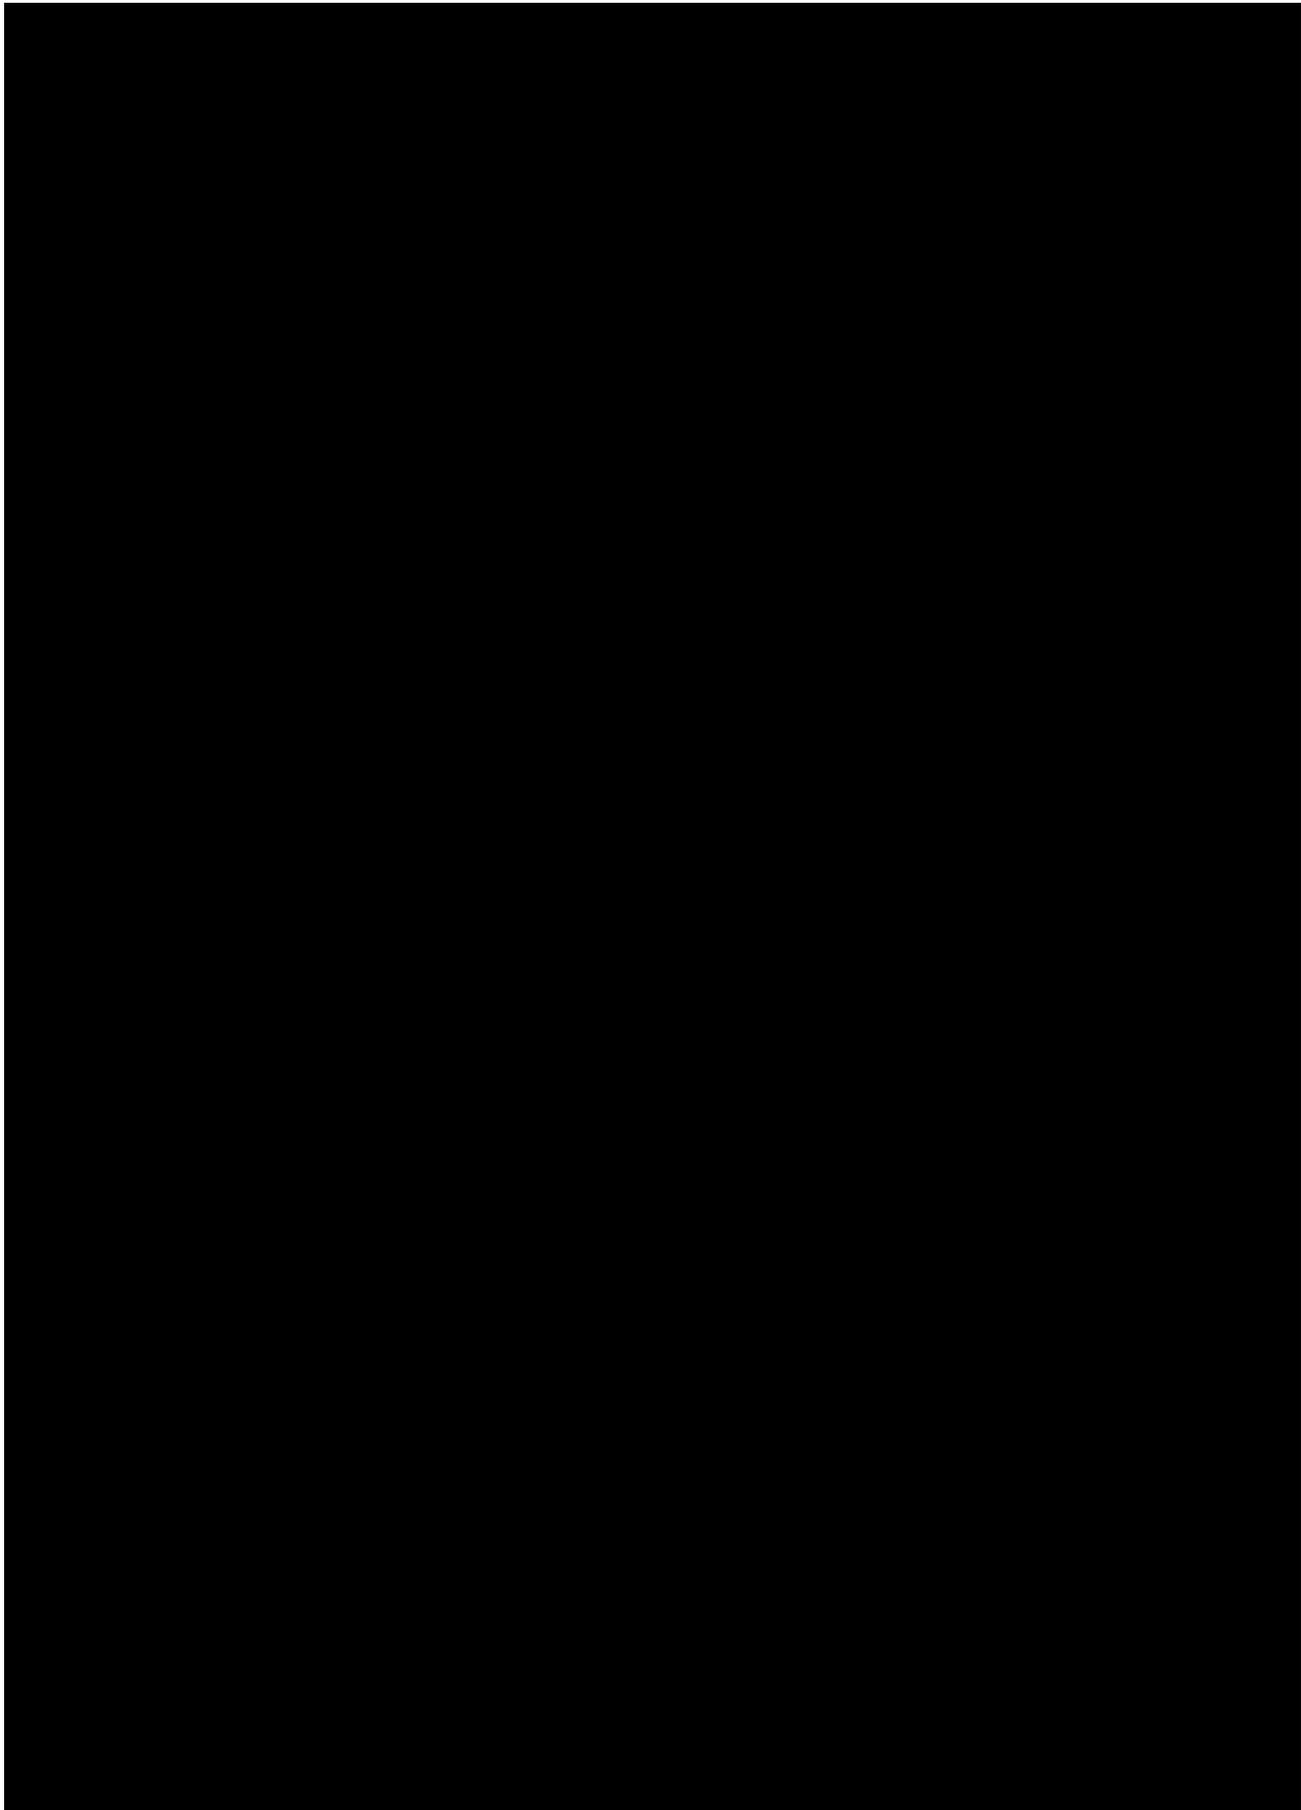

199. For smaller PHIs, including those in existing buying groups, the HH Buying Group will offer an alternative more flexible contracting model than the model offered by the AHSA.

AR

Value based contracting model

211. The establishment of the HH Buying Group will extend HH's value based contracting model to Participants. This will:

- (a) create an alternative to the offerings of existing buying groups and Major PHIs;
- (b) extend the benefits of value based contracting to Participants and in turn to their customers.

Alternative value based contract offering

212. For smaller PHIs:

- (a) smaller PHIs do not have the scale and capabilities to achieve value based contracting of their own accord; and
- (b) existing buying groups do not offer a value based contracting model and in my opinion neither of the existing buying groups are capable of developing a value based contracting model because of the associated cost and requisite expertise required to establish these services.

213. For Major PHIs that do not presently offer value based contracting (see paragraph 91 above), it would take considerable cost and resources to establish these services.

214. For other Major PHIs, value based contracting is already utilised on a limited unilateral basis, as I described in paragraphs 88 and 89 above. However, the Authorisation

Applicants' model of value-based contracting will be superior to the value based contracting currently used by Major PHIs because of HH's technical data analytics capabilities and broader access to data as described in paragraphs 148 to 157 above.

Benefits of value based contracting

215. The benefits of value based contracting for PHIs are described in Part **C** above and include:
- (a) encouraging hospitals and medical specialists to provide and refer customers to services that are proven to improve health outcomes: see paragraph 127 above;
 - (b) facilitating adoption of new technologies or products that improve outcomes but that are not funded under the MBS: see paragraph 128 above;
 - (c) reducing costs for PHIs and other healthcare payers: see paragraph 128 above;
 - (d) in turn, exerting downward pressure on insurance premiums payable or quality adjusted prices: see paragraph 131 above; and
 - (e) offering an alternative of high value care with the certainty of no out of pocket costs for customers, without increasing costs for PHIs, Participants or hospitals, medical specialists or other providers.

Extending access to data and analytics

216. The establishment of the HH Buying Group will give Participants access to aggregated data from Participants and HH's data analytics capabilities described in paragraph 148 to 157 above. This will:
- (a) create an alternative to the data analytics offerings of existing buying groups and a superior offering to the data analytics of other PHIs;
 - (b) extend the benefits of HH's superior data analytics services to Participants;
 - (c) by increasing the amount of data available for analysis, help drive improved outcomes.
217. HH's analytical capabilities, applied to the aggregated data from all Participants, will give the HH Buying Group and its members significantly more information about the market, compared with the current data and analytics to which they have access. This includes the advanced analytics HH has developed on the quality of health care services

AR

associated with acute hospitalisations as well as the data science capabilities developed to normalise for patient complexity to understand the variability.

218. The establishment of outcomes data is complex by its nature and requires the establishment of outcome measures and quality based on relevant clinical and international literature, and the normalisation and risk adjustment of the patient population to ensure like-for-like comparison in the provision of services.
219. These data analytic capabilities are not currently available to most PHIs and the relative cost investment needed for this capability limits its access to the Major PHIs.
220. Smaller PHIs are restricted in their ability to access data analytics services as they do not have the management expense available to invest in the high cost of analytics and data science which can cost millions of dollars to acquire the requisite skills and experience as well as the associated cost of the infrastructure and technologies required.
221. Further, as I described in paragraph 146 above, the establishment of outcomes data requires the collection of sufficient data for statistical relevance. This is a difficult, if not exclusionary requirement for smaller PHIs. Smaller PHIs do not hold the requisite depth of data (due to their small market share) for more advanced data science matching models or machine learning. Ultimately, data science models require substantial amounts of data to 'train' the models and small funds do not have sufficient claims data to develop machine learning models. Without a significant volume of data to be used in the development of value and outcomes-based analytics, small funds are limited in their ability to identify, influence and improve performance or materially impact outcomes through negotiation given their relative market shares with any particular hospital, medical specialist or other provide.
222. Whilst presumably these smaller PHIs could rely on existing buying groups to aggregate and use the collective data of all participants of the buying group, to date existing buying groups have had limited to no involvement in this type of work due to:
 - (a) contractual terms prohibiting the sharing and analysing of information in this way (see paragraph 205 above); and
 - (b) the relative cost;
 - (c) lack of market pressures due to a lack of competitors with this capability.

223. The HH Buying Group would reduce the information asymmetry between Major PHIs and smaller PHIs by allowing the smaller PHIs to gain these same insights from the aggregated data of all Participants of a kind that they would otherwise not have access to and that to date have only been available to Major PHIs.
224. The benefit of access to this data analysis are described in paragraphs 148 to 157 above. In particular it will enable Participants to:
- (a) compete with Major PHIs more effectively;
 - (b) develop networks of providers who offer high value care including in geographic areas where Participants would otherwise have insufficient market share to develop such networks; and
 - (c) share with their customers information about the quality and value of providers, to enable customers to make informed choices about their healthcare.
225. The level of collection and aggregation of data proposed by HH is, in my opinion, essential to driving these benefits, because of the lack of transparency of data on the outcomes and quality of care provided by medical specialists.

Extending the no gap experience to more customers

226. The establishment of the HH Buying Group will give Participants access to the BCPP and allow the BCPP to be expanded to cover more specialists and treatments. This will extend the benefits of no gap experience of the BCPP to more customers. As I described in paragraph 76 above, uncertainty about gap payments is a key concern for consumers, and, as described in paragraph 137 above, the benefits of the BCPP have been recognised by nib's customers.
227. As set out in paragraph 78 above, existing gap cover schemes do not guarantee a no gap experience to customers, because they allow specialists to charge a 'known gap fee' and/or because certain specialists involved in the treatment may choose to opt out of the scheme on a patient-by-patient basis. This scenario does not occur under the BCPP, where each of the medical specialists involved in the treatment would be required to provide a no gap experience to the customer, as I describe in paragraph 86 above.
228. By creating a complete no gap experience for customers, I estimate that for a customer undergoing a hip or knee joint replacement, the average cost saving in out of pocket costs is upwards of \$1,850, based on the average out of pocket cost charged to a nib

member for these services was prior to the implementation of the BCPP with the participating specialists.

229. In 2020 and 2021, a total of 1,380 joint replacements were conducted through the BCPP and the resultant savings to nib customers during this period was approximately \$2.5 million. The average annual total savings to nib customers to date under the BCPP is approximately \$1.4 million.
230. As I described in paragraph 226 above, by offering the BCPP to Participants, it will be made available to the customers of those Participants, enabling those customers to access the benefits of the no out of pocket experience.
231. As I described in paragraph 226 above, HH proposes to extend the BCPP to cover more specialists and treatments. The establishment of the HH Buying Group will facilitate this expansion because specialists will be increasingly incentivised to participate in the BCPP, the more PHIs that are involved. In addition to creating more opportunities for customers to have a complete no out of pocket cost experience, if the BCPP is extended to other procedures which attract significant out of pocket expenses (such as urology for radical prostatectomy), I estimate that savings for customers will be even higher than those presently available to customers under the BCPP.

Cost saving and increased efficiencies

232. The HH Buying Group will create costs savings and increase efficiencies in the following ways:
- (a) savings and efficiencies for Participants not having to negotiate individually with medical specialists;
 - (b) reducing administrative costs for medical specialists;
 - (c) efficient establishment of new models of care.
233. First, any PHI seeking to undertake medical specialist contracting services themselves would require significant investment to engage a team both large and capable enough to undertake the requisite services and to provide the requisite analytics and systems to support the development of a national network. Negotiations with medical specialists for a program like the BCPP require a significant investment of time and resources. This process is particularly complicated because of the large number of contracts required, the diversity in the range of medical specialities and treatments to be covered as well as

the required customisation of agreements to meet the specialist's specific needs around models of care and payment. Based on my experience, I would estimate that the level of capital investment required to undertake these services would be in the range of \$1 million to \$1.5 million. This estimate is given by reference to the cost of developing the BCPP, as well as the cost of employing staff and developing technology to support it. As HH is currently undertaking this function for nib, the marginal cost of HH undertaking the function for each Participant would be low.

234. These efficiencies can be realised for PHIs that are already part of the AHSA or ARHG buying groups that switch to the HH Buying Group. HH modelling suggests that the participation fee for the HH Buying Group will be competitive with the AHSA's or ARHG's membership fees and would provide a broader scope of services particularly in relation to data analytics and medical specialist contracting. In any case, the HH participation fees would be substantially lower than establishing and running an effective internal contracting function. The basis of the modelling undertaken by HH in comparing the competitiveness of the participation fee for the HH Buying Group with other buying groups is at **Annexure DD-60**.
235. Secondly, it will simplify billing processes and thereby reduce administrative costs for medical specialists, by using consistent contracts, rates and billing rules for Participants who opt into the BCPP. The ongoing setup, management and coordination of variant models of care from providers with PHIs is administratively burdensome and complex. Having fewer contracts with standard terms and conditions allows providers to provide consistent and singular models of care. Additionally, their billing teams and billing agents have consistent terms and conditions to bill against. This ensures significantly lower administrative costs to providers in managing consistent funding arrangements with several contracts rather than individual contracts with different rates and terms across different PHIs.
236. Thirdly, it will enable medical specialists to introduce and establish new clinical practices efficiently by ensuring a sufficiently high volume of customers are funded for the same models of care. In my experience, the development of new medical models of care takes on average between 1.5 to 2 years. This time is needed to adequately engage and co-design the appropriate models of care with medical specialists, develop appropriate funding models, establish support networks and to test and pilot the programs. From this point, subsequent growth of the network for the model of care can vary greatly. However, on average, from commencement of discussion to the successful execution of a MPPA

with a specialist, takes approximately 3 to 4 months. While the requirements of specialists is completed concurrently, the development of this type of network is costly and resource intensive due to the customisation of each MPPA to match the care model delivery of the individual specialist. Empowering the HH Buying Group to build these models of care and expand their networks on behalf of a number of PHIs will see a more efficient establishment of new models of care.

237. For PHIs, administrative cost savings are passed on to consumers, either because PHIs are not required to increase insurance premium increases to cover higher administrative costs, and/or are able to offer more or better services to customers for the same price.

Countervailing hospital bargaining power

238. In my experience, certain hospitals or hospital groups have strong bargaining power relative to PHIs both when negotiating the fee arrangements under HPPAs and whether they choose to enter into HPPAs at all. This is because of:
- (a) their size and national network, location and/or reputation (for example, some of the smaller private hospitals have an “iconic” status or reputation, or are the only accessible hospital for particular regional or remote communities) which means PHIs must have agreements with them to attract and keep customers;
 - (b) the relative immediate risk that sits with the PHI should there be a termination event between a PHI and a large hospital group. This is due to several factors. Most notably, due to the transitional arrangements, the hospital’s revenue is protected and guaranteed under the current HPPA for at least 3 months after the termination date and up to 9 months post the termination date for some services. This means that, while the hospital faces no immediate consequence to the termination in relation to revenue, the PHI will face (due to media coverage and actions from the hospital group to encourage patients to switch to other funds) an immediate negative impact on customer sales, increased lapse of existing customer from the fund and negative brand association in the media. This disproportionately transfer the risk to the PHI during the first 6 to 12 months of a termination notice being issued;
 - (c) an additional consideration is that for the hospital provider, the impact of not having a contract with the PHI is significantly de-risked due to the ‘second tier default benefits’ (see paragraph 94). Under this arrangement the hospital is still guaranteed 85% of the average rate paid by the PHI to that hospital type in that

state. This, in combination with the hospital providers ability to charge an out-of-pocket cost to the member when they are second tier, once again significantly reduces the relative risk to the hospital provider. These factors serve to significantly, and disproportionately, favour the hospital in negotiation and allow them to achieve rates which are substantially higher than would be seen in a normal efficient free market; and

- (d) the option of 'second tier default benefits' provides an alternative for hospitals who do not wish to agree to HPPA terms and conditions offered by PHIs. As the second tier rates are a calculated average with a 15% discount, this means that many small hospital providers can achieve rates more than sufficient to provide a profitable service while not facing the obligations on that would be otherwise imposed by the PHI through a HPPA. As the large hospital providers are able to disproportionately elevate the price in the market, as explained in (b) above, this inflation of the average price is more than sufficient for hospital providers to have no requirement to enter into a HPPA to achieve viable and profitable rates from PHIs.

239. Hospitals with strong bargaining power can and do charge higher prices under an HPPA for the same procedures provided in other hospitals, without any commensurate increase in value for the customer. Two examples of this are procedures for cataracts (MBS item 42702) and oocyte retrieval (MBS item 13212) where the median cost charged by large hospital groups is 181% and 149% of the national median cost respectively. The fees charged by Adventist HealthCare Limited, Ramsay Healthcare Ltd, St John of HealthCare Ltd and Healthscope Pty Ltd (each of which holds a substantial market share) are consistently higher than their counterparts for the same procedure. A series of graphs which detail the average fee charged by different hospital providers for the same procedure are at '**Annexure DD-61**'.

240. By increasing the level of direct value based contracting with medical specialists, the Proposed Conduct incentivises hospitals with strong bargaining power to compete on price (which they are otherwise under no obligation to do). If hospitals are not price competitive, they will risk losing medical specialists to better-value hospitals (because under a value based contracting model, HH can incentivise medical specialists with higher fees for conducting procedures at more cost-effective day hospitals or hospitals that agree to models of care which can proactively reduce the length of stay of an admission while maintaining or improving the outcomes for patients).

Benefits of including Major PHIs in the HH Buying Group for the BCPP

241. The inclusion of Major PHIs in the HH Buying Group will allow HH to extend the BCPP to a broader group of customers, treatments, and geographical areas.
242. First, the participation of one or more Major PHIs in the BCPP would increase the volume of customers able to be serviced under the BCPP and thereby encourage more medical specialists to participate in the BCPP.
243. I have been informed by surgeons currently participating in the BCPP that they would prefer if the program applied to a broader range of customers and treatments to enable a more significant volume of work across the procedures they conduct as this would simplify their practice and standardise the model of care to be the same for all patients. They also see value in having referring doctors become aware that multiple (or ideally all) funds are covered under the BCPP and hence that all patients can have certainty on access to home based recovery and complete financial certainty on a no-gap experience.
244. In my opinion, some medical specialists may be deterred from participating in the BCPP if it does not cover a broad group of customers or treatments. This is because of the time and effort for the medical specialists in establishing a model of care that may only apply to 1 in 10 of their patients. This makes it difficult for the practice and surgeon to implement the care pathways into their normal clinical practice as the service is an outlier (in that it only applies to a small number of patients). It is also a barrier to establishing new models of care, if insufficient funding will be derived from this to pay the ongoing costs of running the model of care incurred by the specialist and their practice. For example, if a specialist wishes to employ a dietician to assist in the conservative management of patients who need weight loss, then the surgeon will require sufficient funds paying for this model of care to be able to afford the ongoing investment and labour cost associated with the model of care.
245. Generally speaking, we believe at least 20 per cent of a specialists' patients are required to be covered by a funding mechanism to allow the specialist to viably manage a model of care specific to the fund. My experience is that, due to this issue, areas where nib holds less than 15 per cent market share are significantly more difficult to establish the BCPP program. Based on this, the inclusion of a Major PHI would bring sufficient volume nationally (when combined with nib) to substantiate any models of care a specialist may want to run.

246. For customers of Major PHIs that do not have a program equivalent to the BCPP (see paragraph 91 above), this would allow also them to access the benefits of the “no gap experience” for an entire episode of treatment described in paragraph 84 above.
247. Second, Major PHIs have the financial resources and systems in place to design new models of care and help facilitate the expansion of the BCPP to other speciality areas as appropriate. This can be seen in the work undertaken by Medibank with Nexus Hospital to develop and implement the ZOOP model of care. Generally speaking, large PHIs have sufficient resourcing to invest in the clinical development of new models of care (as an example they employ Chief Medical Officers which small PHIs cannot afford) as well as sufficient relevance in market share to make it compelling to medical specialists to enter into arrangements and develop models of care that involve additional work.
248. For medical specialists, the inclusion of a Major PHI in the HH Buying Group for the BCPP may lead to higher fees payable under the BCPP. This is because medical specialists generally earn more in fees under medical gap schemes with Major PHIs other than nib (see paragraph 77 above). To attract those medical specialists to participate in the BCPP rather than the gap cover schemes, HH would need to increase the fees payable to medical specialists above the fees payable under the Major PHI’s gap cover scheme.
249. Major PHIs either already operate no gap experiences (see paragraph 88 to 89 above) or have the resources to act unilaterally to develop no gap experiences similar to the BCPP.
- (a) Major PHIs that do not presently have a program equivalent to the BCPP may join the HH Buying Group to access the BCPP. Presently, in my view, at least one Major PHI would find joining the HH Buying Group for the purpose of accessing the BCPP as an attractive option. This would save the time and resources required to establish and manage a comparable program and negotiate with participating medical specialists. As noted in paragraph 111 above, I estimate that the cost of setting up and managing an equivalent program would cost in the millions of dollars to establish the relative requisite expertise, systems and process as well as develop and implement models of care with specialists. Rather than outlaying those costs, they would pay HH a fee for the coordination of the service.
- (b) I expect Major PHIs that do have a program equivalent to the BCPP are likely to continue to conduct these functions internally and compete against the HH Buying Group. However, some Major PHIs may choose not to expand their existing

programs and instead join the HH Buying Group to access an expanded BCPP. For instance, those Major PHIs may continue their programs in some regions and use the BCPP in regions where they do not hold as much market share or cannot establish their own programs.

250. As described in paragraph 49 above, any cost savings by PHIs are likely to result in reduced premium increases for consumers.

PART F: Concerns raised about medical specialist contracting and data analytics

251. In this section of my affidavit, I address some of the concerns raised by the Applicants about HH's proposed model of medical specialist contracting and data analytics, specifically in relation to:

- (a) clinical independence;
- (b) clinical targets;
- (c) clinical guidelines;
- (d) benchmarking;
- (e) patient confidentiality; and
- (f) confidentiality of the MPPA.

Clinical independence

252. As an overarching principle, the Authorisation Applicants cannot legally, and do not intend to, interfere with the clinical decision making of medical specialists.

253. I described the legal obligations protecting clinical independence in paragraph 113 above. Those obligations are expressly acknowledged in: cl 10.2 of the MPPAs which will form the basis of collective negotiation by the HH Buying Group with medical specialists in the BCPP. The MPPAs create no legal obligation to act otherwise than in accordance with medical practitioner's clinical judgment. In addition, those MPPAs contain terms expressly requiring clinical autonomy to be maintained. This includes terms requiring providers to provide services in accordance with:

- (a) professional standards: cl 7.1(b) and 5.1;
- (b) best clinical and industry practice: cl 7.1(c);

- (c) applicable Medicare guidelines: cl 7.1(d);
- (d) what is clinically appropriate: cl 7.1(e), cl 7.1(g) and Schedule 2.

A copy of the MPPA is at '**Annexure DD-62**'.

- 254. Fundamentally, the concept of value based care on which HH's contracting model is based is, as I described in Part C above, based on achieving better outcomes for the patient. It is fundamentally inconsistent with value based contracting to achieve worse health outcomes for patients.
- 255. Under the BCPP, HH does not interfere in the clinical decision-making of the medical specialist. For instance, the medical specialist is not required to seek approval from HH before providing care.
- 256. The payment of fees for the performance of the obligations under the BCPP is intended to incentivise medical specialists to provide clinically appropriate high value care. As I explained in paragraph 126 above, medical specialists already have an incentive under the fee for service model to provide more and higher funded treatments to obtain higher fees.

Clinical targets

- 257. The current BCPP MPPAs include targets for the percentage of patients receiving rehabilitation at home: clause 7.1(b) and 5.1. This is because best practice demonstrates that a small percentage of people require hospital admission for rehabilitation following the surgery. The FIM data, submitted as part of the mandatory data submission to PHI from hospitals in the HCP data submission also supports this position. The vast majority of admission to inpatient rehabilitation in this data set indicated no clinical need for overnight nursing care, a requirement of the National Rehabilitation Guidelines. Including the target ensures that PHIs and medical practitioners are aligned about what represents good value practice.
- 258. The "target" rate for inpatient rehabilitation of 30% was set at slightly below the existing average rate of 33%. As I describe in paragraph 134 above, the average rate of inpatient rehabilitation has now reduced to 13% of patients overall for BCPP surgeons.
- 259. The clinical targets do not provide a financial incentive. The MPPAs currently underpinning the BCPP do not provide for a change to the fees paid to the doctor depending on an outcome. Medical specialists are paid the same amount regardless of

whether the patient is referred to in hospital or at home rehabilitation. Medical specialists are paid the same regardless of whether targets are met and no financial or other penalties are imposed on specialists who do not achieve such targets.

260. If a medical specialist did not comply with the condition, the PHI may consider whether to continue the MPPA. This is because should the additional cost of paying the specialists more not be offset by efficiencies in other care delivery, then it would not be viable for the programs to continue.
261. The targets are expressly subject to the medical specialist's determination of what is in the best clinical interests of patients and the medical specialist would not comply with the MPPA if the specialist provided treatment that was not clinically appropriate. In my view, clinical targets are not inconsistent with clinical independence or the best interests of patients. To the contrary, clinical targets are intended to encourage the specialist to achieve higher value care, which, for the reasons I describe in Part F above, is consistent with the best interests of patients.
262. In my experience, clinical targets are commonly imposed on hospitals and medical specialists. For instance, in hospitals a range of measured targets including in relation to hospital acquired complications, and access to preventative care to avoid hospitalisation are routinely measured. For example, ACSQHC sets a minimum compliance target that 80% of hand hygiene 'moments' (i.e. washing hands before and after touching a patient) be conducted when deemed necessary in hospitals. A copy of the latest audit report is at '**Annexure DD-63**'.
263. When expanding the BCPP to new specialty areas, HH proposes to include clinical targets in MPPAs that are negotiated and agreed with relevant medical specialists practising in that area and that constitute high value care for that procedure.

Clinical Guidelines

264. The current BCPP MPPAs include requirements for medical specialists to follow clinical guidelines for the purpose of nib administering and paying claims (see clause 10.3).
265. In my experience, clinical guidelines are a standard feature of medical specialist practice (see for instance, the clinical guidelines I have referred to in paragraph XYZ above). In general, clinical guidelines are intended to promote best practice care, they are not intended to substitute clinical independence.

266. The purpose of this requirement in the existing MPPAs is to ensure that, if for the purposes of rehabilitation after joint replacement surgery, the customer is eligible for MBS-funded chronic disease management program or hospital substitution program, providers comply with any clinical guidelines of those programs.
- (a) A hospital substitution program allows patients to receive medical services in their home rather than being admitted to hospital and avoid in-patient costs associated with hospital treatment. The determination of which patients are eligible and discharged home is based on the clinicians judgment and augmented with standardised clinical assessment tools such as the Risk Assessment and Prediction Tool (**RAPT**) which predicts the type (if any) of rehabilitation required by a patient post major joint replacement.
- (b) A chronic disease management program (**CDMP**) is aimed at managing patients with chronic disease who require ongoing care from a multidisciplinary team and who are diagnosed with one or more chronic condition. The CDMP program does not stipulate any form of clinical pathway but rather requires that care plans be in place, the patient be aware of and have agreed to these and that scheduled follow up with the surgeon are held.
267. If medical specialists do not comply with the clinical guidelines of those programs, nib cannot pay benefits in respect of the services.
268. At present there are no specific clinical guidelines that surgeons participating in the BCPP are required to follow.
269. nib has required surgeons to use a RAPT form in the decision process for what post-operative care is appropriate for the patient. This form allocates a score to a patient based on a number of factors including their age group, gender, average walking distance, level of community support and carer availability. For example, a score below a 6 will warrant extended inpatient rehabilitation whereas a score above a 9 will indicate the patient may be discharged directly home. A copy of this form is at '**Annexure DD-64**'
270. The outcome of this assessment is directional, and it remains the surgeon's responsibility to refer the patient to the appropriate care they deem is required post-operatively. This may take the form of in-patient rehabilitation, rehabilitation in the home or the patient managing their standard post-operative care through assigned exercises from the surgeon independent of any support.

271. The Authorisation Applicants do not propose to apply guidelines for the treatment of patients which are formulated by any organisation other than a recognised specialist body representing that area of medical specialisation.
272. The Authorisation Applicants are willing to guarantee that no contract negotiated with, or offered to, individual medical specialists will require them to have regard to any clinical or treatment guidelines formulated by any organisation other than a recognised specialist body representing that area of medical specialisation or that otherwise in the clinician's reasonable opinion, have the likely effect of interfering with the clinician's reasonable independent assessment of the ideal treatment of each patient.

Benchmarking

273. As set out in paragraph 193 above, the Authorisation Applicants propose to use data collected from Participants with HH's data analytics to perform benchmarking.
274. In my experience, benchmarking of providers is a standard and effective approach commonly used in health care to improve outcomes. It is recognised as a core aspect of quality improvement to identify macro trends and understand areas of concern or improvement in health.
275. The collection, reporting and benchmarking of data on patient outcomes is not uncommon in the health care industry, as I described in paragraph 142 above.
276. The Authorisation Applicants do not intend to use benchmarking in the treatment of individual patients. Rather, the use of benchmarking enables PHIs to assess and investigate providers that appear to have systematic negative outcomes with patients, as I described in paragraph 151 above. Benchmarking these kinds of outcomes is, in my opinion, clearly in the best interests of patients.

Patient confidentiality

277. I describe the provisions in place to ensure informed consent and confidentiality of customer data in the HH Buying Group in paragraph 164 above. In my experience, the policies adopted by HH provide reflect a best practice approach to privacy and data governance.
278. Pursuant to the terms of the policies listed in paragraph 163:

- (a) patient information can only be shared between HH and the provider with the patient's express consent; and
 - (b) patients cannot be contacted by HH without their consent.
279. Under the MPPA, providers are obliged to obtain informed consent from the patient for the disclosure of data: see cl 19.4 of the MPPA.
280. The Authorisation Applicants presently have in place a 'Mental Health Hospital Support Program' for patients who have recently had a hospital readmission.
- (a) Using deidentified data, HH uses data algorithms to construct a list of deidentified patients who have recently had a hospital readmission for mental health.
 - (b) HH supplies the list to nib who reidentify the patient and contact them to invite them to participate in the program.
 - (c) If the patient expressly consents to participating in the program, their contact information is supplied to HH and a registered nurse with specialist training in mental health employed by HH then contacts the patient to initiate the program.

Incentivising hospital discharges and at-home rehabilitation

281. It is accepted clinical practice for surgeons post-surgery to determine, in collaboration with their patients, whether rehabilitation is required and whether it should occur in an inpatient setting. Where a decision is made for the patient to be referred to RITH, the rehabilitation continues to fall within the scope of the acute surgical admission and does not constitute a new episode of care that a separate MBS item number must be billed for. In those circumstances, the patient undertaking RITH will remain under the direct clinical supervision of the admitting surgeon and has access to the surgeon, allied health staff and nib health facilitators when and as required. The application of these services as part of the acute surgical admission is evidenced in the claims data for orthopaedic joint replacement surgeries.
282. As noted in paragraphs 266, where rehabilitation forms part of the acute surgical admission, PHIs will fund these at home rehabilitation services either as part of the chronic disease management or hospital substitution program.
283. Hospitals do not have a financial incentive to refer patients to third parties to receive at-home rehabilitation or to provide this service themselves as they are generally paid by health insurers per day that a patient is admitted at the hospital. Hospitals have a

significant financial interest to refer patients to inpatient rehabilitation as a substantial proportion of benefits paid for an episode of inpatient care can be attributed to inpatient rehabilitation.

Confidentiality of the MPPA

284. The MPPA requires that the medical specialist regard its terms as confidential and not disclose the contents of the MPPA or information acquired by a party as a result of the MPPA other than in specific circumstances. This is intended to prevent disclosure of the terms of the MPPA to nib's competitors. It is not intended prevent a specialist from disclosing the existence of the MPPA to patients.

PART G: 10 year authorisation period

285. The Authorisation Applicants applied for a 10 year authorisation period on the basis that this would enable the Authorisation Applicants to fully realise the public benefits of the Proposed Conduct.

286. Most MPPAs and HPPAs have a three year term and, in some instances, have a term of up to five years. Although benefits will be realised throughout the contracting cycle, allowing for authorisation a period encompassing at least two contract cycles would allow medical practitioners adapt their care to improve outcomes and/or efficiency.

287. Broadening the BCPP to expand geographically and include different treatments will also require a significant investment of time. HH will be required to undertake planning, analysis and negotiations with potentially hundreds of medical specialists. I estimate that this process could take up to five years to complete and achieve sufficient scale. The current program and scale for 20% of joint replacements has taken over 2 years to achieve.

288. A period of 10 years also promotes greater certainty for Participants to invest in the HH Buying Group, particularly for smaller PHIs switching from an existing buying group.

289. Ultimately, the public benefits of the Proposed Conduct will continue to build over time. In my view, in light of the above considerations, a period of 10 years would be the most desirable and would maximise public benefits in the short and longer term.

PART H: Conduct with and without authorisation

With authorisation

290. If the authorisation is granted HH would have the option of offering all of its services to smaller PHIs and other healthcare payers on a collective basis and the BCPP to Major PHIs.
291. In my view:
- (a) some members of existing buying groups would likely join the HH Buying Group and acquire some or all of the services offered by HH;
 - (b) one or more Major PHIs would likely join the HH Buying Group and acquire the BCPP services offered by HH;
292. In relation to medical specialist contracting:
- (a) medical specialists will negotiate collectively with the HH Buying Group;
 - (b) MPPAs with medical specialists will include both price and non-price terms of the kind currently included in the MPPAs for the BCPP;
 - (c) medical specialists will have the option of:
 - (i) entering into MPPAs with Participants;
 - (ii) participating in the BCPP;
 - (iii) participating in HH's or the Participants' medical gap schemes;
 - (iv) charging customers a gap fee determined at their discretion.

Without authorisation

293. If authorisation is not granted, HH intends to:
- (a) continue to provide the services it currently provides to nib;
 - (b) not engage in collective bargaining on behalf of other PHIs;
 - (c) will not provide the proposed services to individual PHIs other than in relation to the BCPP and general treatment networks;
 - (d) in relation to the BCPP, will offer to negotiate BCPP contracts for individual Major PHIs on a one on one basis, but will not be able to collectively bargain for those services, or share data and analytics across participating Major PHIs. HH is very unlikely to offer the BCPP to the smaller PHIs because the existing buying groups

already provide medical contracting services such as the medical gap scheme arrangement and are likely to be prevented under the terms of their agreement with the existing buying group from engaging other providers.

294. If authorisation is not granted, it is likely that:

- (a) Major PHIs would continue to undertake contracting services internally;
- (b) existing buying groups would continue to act on behalf of other PHIs.

295. In relation to medical specialist contracting:

- (a) medical specialists would negotiate separately with HH, Major PHIs and existing buying groups;
- (b) HH and Major PHIs will continue to engage in value based contracting, where MPPAs with medical specialists will include both price and non-price terms such as clinical targets and guidelines;
- (c) medical specialists will have the option of:
 - (i) entering into MPPAs with PHIs;
 - (ii) participating in the BCPP;
 - (iii) participating in HH's and or other PHIs medical gap schemes;
 - (iv) charging customers a gap fee determined at their discretion;

296. HH will not offer hospital contracting services to other PHIs. HH does not consider it economically viable to negotiate HPPAs on behalf of individual PHIs without leveraging nib's existing negotiated rates and HPPAs. HH would need to establish a national hospital network for each small PHI which would involve large transactional costs to negotiate with hospital groups or individual hospital to enter into the HPPAs. This would require HH to agree to, and manage, a separate suite of HPPAs for each of the small PHIs.

297. HH may offer to establish general treatment networks on behalf of individual PHIs (other than Major PHIs who administer their own general treatment networks) and an independent standard set of rates and terms to each insurer in relation to their arrangements with extras providers. These general treatment network services are not currently offered by the AHSA or ARHG. The establishment of a general treatment

network may be more viable economically than a hospital network as the rates and terms are not negotiated with the extras providers. However, there are still substantial costs involved as it would require engagement with the extras providers to register them with the general treatment network and with the ongoing management of the network. HH has not assessed whether this offering would be financially viable.

Hospital Treatment

At 31 December 2021, 11,564,808 people, or 44.9% of the population, were covered by hospital treatment cover. There was a slight increase compared to September 2021. There was an increase in coverage 58,459 insured people in the December 2021 compared to September 2021. Family policies increased by 6,917 and single policies by 16,717 during the quarter.

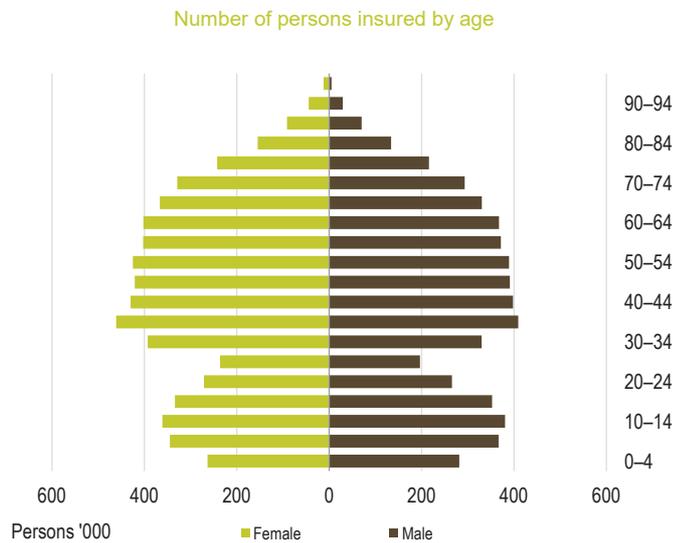

The largest increase in coverage during the quarter was 12,451 for people aged between 75 and 79. The largest net increase (taking into account movement between age groups) was for the 0-4 with an increase of 24,834 people.

Lifetime health cover

The majority of adults with hospital cover (89.2%) have a certified age of entry of 30, with no penalty loading.

At the end of the 31 December 2021 quarter, there were 904,428 people with a certified age of entry of more than 30 and subject to a Lifetime Health Cover loading; a net increasing in people paying a penalty over the preceding 12 months of 29,121. There was a net increase in people with a certified age of entry of 30 (with no penalty) over the year of 152,543. Over the year, 126,172 people had their loading removed after paying a loading for ten years.

State/Territory	Insured persons (%)	Non insured persons (%)	Total Insured (Male/Female)	Single policies (%)	Family policies (%)

General Treatment

At 31 December 2021, 14,102,981 people or 54.7% of the population had some form of general treatment cover. There was an increase of 79,088 people when compared to the September quarter. There was an increase of General Treatment policies of 44,294 for December 2021 which was mainly driven by Single Policies which increased by 26,999. For the 12 months to 30 December 2021, the number of insured persons with general treatment cover has increased by 304,076.

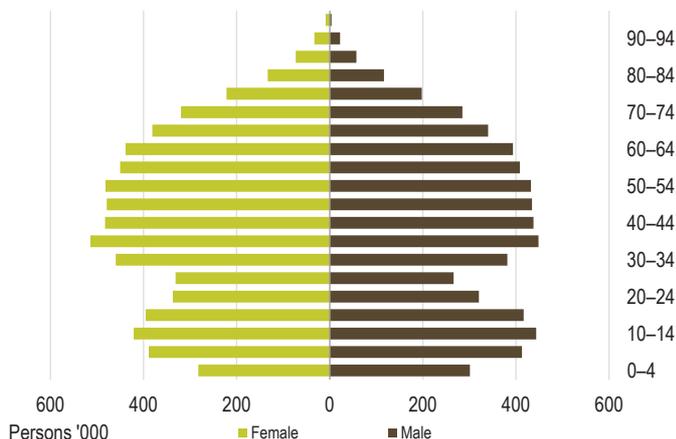

The general treatment (ancillary) by age charts and data in this report show data for those people that have general treatment policies covering ancillary services, regardless of other treatment included in the product. This excludes those general treatment policies that do not cover ancillary treatment.

There was an increase of 76,564 people with general treatment (ancillary) coverage in the December 2021. The largest net increase in coverage, after accounting for movements across age groups, was 26,647 for people in the 0 to 4 age group.

Benefits Paid

Hospital treatment

Benefits per episode/service

	December 2021	Change from September 2021
Hospital Treatment		
Acute	\$2,430	1.2%
Medical	\$65	0.1%
Prostheses	\$684	3.5%
Cardiac	\$3,779	-1.4%
Hip	\$1,708	0.7%
Knee	\$1,738	0.0%
Total benefits and growth rate		
Hospital	\$3,995,900,214	-5.2%
General	\$1,505,703,716	32.0%

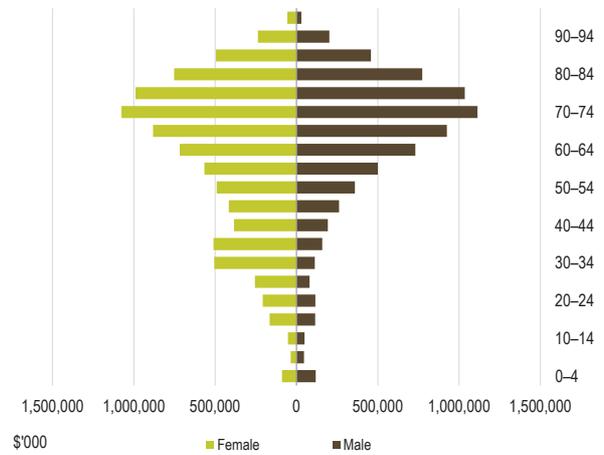

During the December 2021 quarter, insurers paid \$3,996 million in hospital treatment benefits, which was 5.2% lower compared to the September 2021 quarter. Hospital treatment benefits were comprised of:

- ◇ \$2,825 million for hospital services such as accommodation and nursing
- ◇ \$606 million for medical services
- ◇ \$564 million for prostheses items.

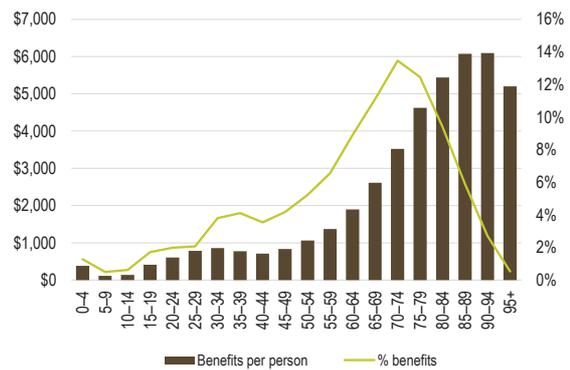

The age group for which most hospital benefits are paid is between 60 and 84 (top chart). Total benefits by age group is affected by the average benefits paid per person (displayed in the second chart) and the number of people in each age group.

Average hospital benefits per person increased from \$1,323.76 for the year ending December 2020 to \$1,406.33 for the year ending December 2021. The largest amount of benefits per person was spent on hospital accommodation and nursing, followed by medical and prostheses benefits.

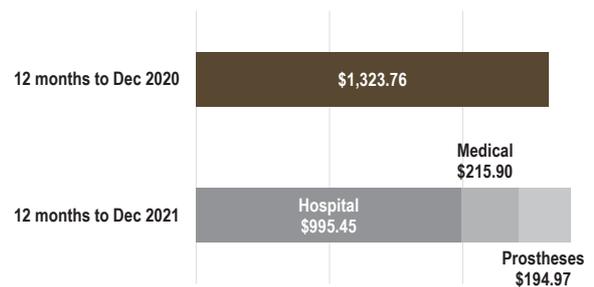

Hospital treatment benefits paid by age 12 months to 31 December 2021

Hospital treatment benefits per person covered and percentage of benefits paid by age cohort

Hospital treatment benefits per person

General treatment

Benefits per service

	December 2021	Change from September 2021
Dental	\$64	-4.7%
Chiropractic	\$32	-2.2%
Physiotherapy	\$38	-1.4%
Optical	\$77	1.9%

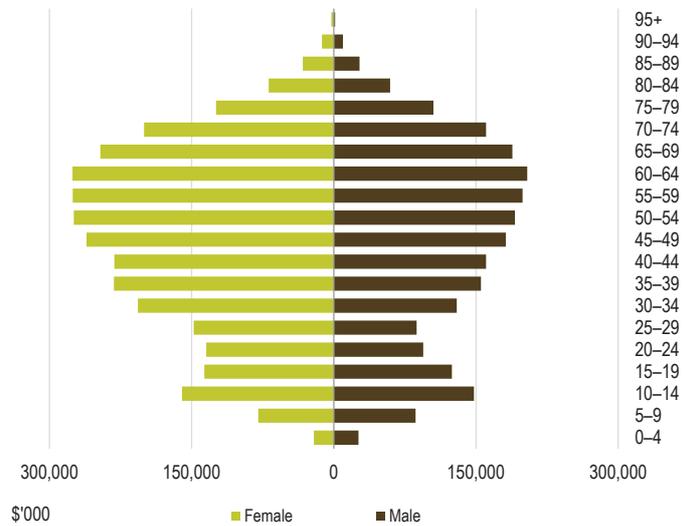

During the December 2021 quarter, insurers paid \$1,496 million in general treatment (ancillary) benefits. This was an increase of 32.3% compared to the September 2021 quarter. Ancillary benefits for the December 2021 quarter included the major categories of:

- ◇ Dental \$793.7 million
- ◇ Optical \$309.6 million
- ◇ Physiotherapy \$101.4 million
- ◇ Chiropractic \$66.7 million.

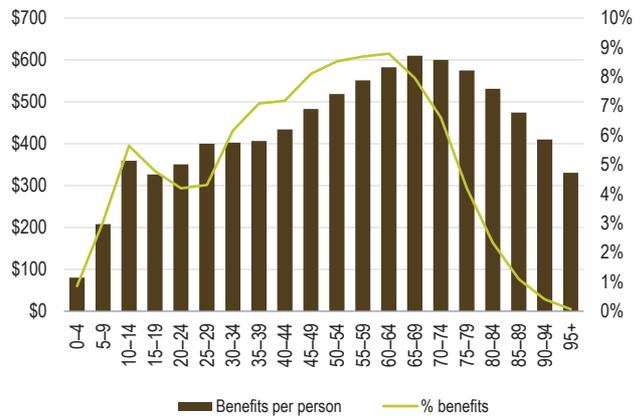

There is a marked difference between the distribution of benefits over age groups between hospital benefits and ancillary benefits. The major difference is the higher claiming rate in older age groups for hospital benefits while benefits per person for ancillary benefits are more evenly spread over the age groups.

General treatment (ancillary) benefits per person during the year to December 2020 were \$404.6 increasing to \$428.3 for the year to December 2021. The largest component of ancillary benefits is dental, for which \$229.7 was paid per insured.

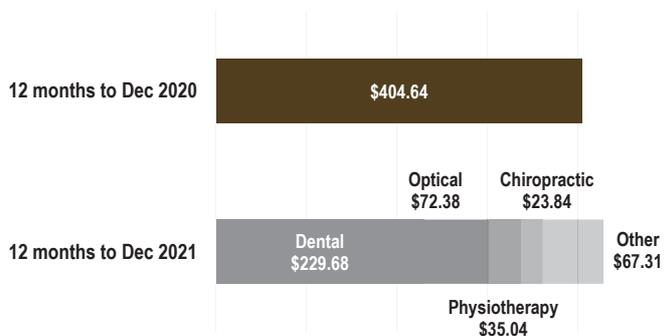

General treatment benefits paid by age 12 months to 31 December 2021 (ancillary)

General treatment benefits per person covered and percentage of benefits paid by age cohort (ancillary)

General treatment benefits per person (ancillary)

Medical benefits

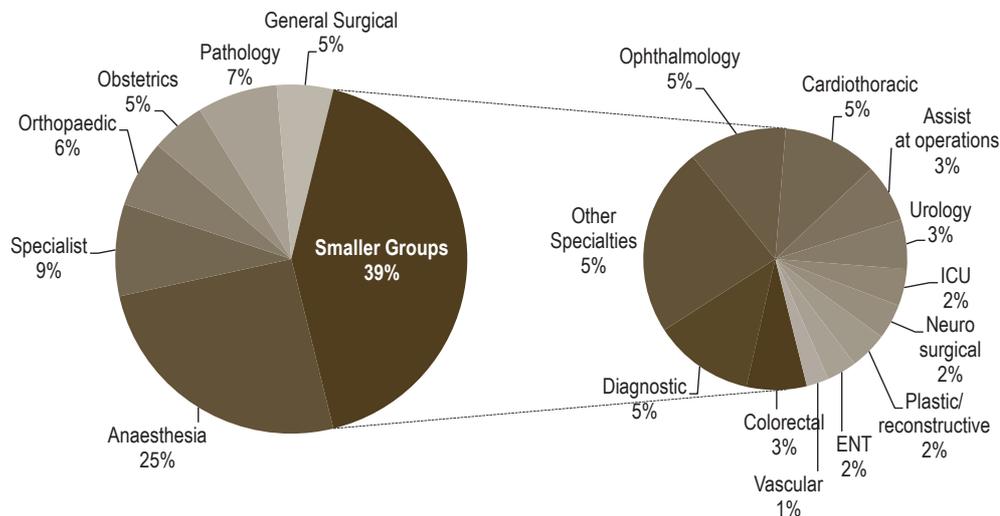

Total benefits for medical services decreased 6.9% during the December quarter 2021.

The change in medical benefits paid per service was calculated over a range of medical services and does not mean medical services overall decreased or increased in cost. The average benefits paid reflects the type of medical services utilised during the quarter as well as the volume of services. The medical service for which the greatest amount of benefits was paid was anaesthetics, comprising 25.4% of all medical benefits and totalling \$154.2 million.

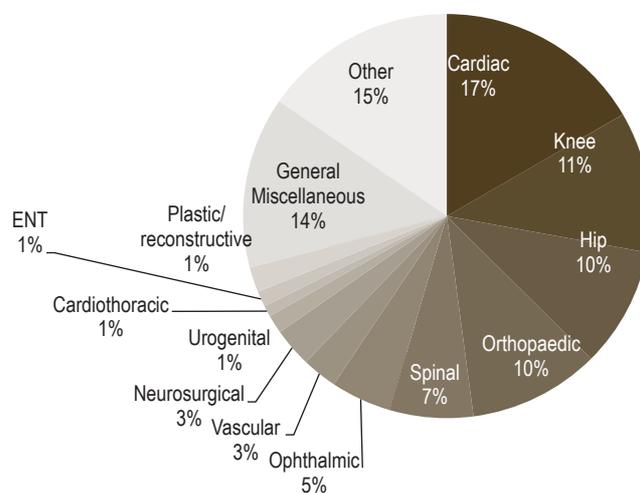

Prostheses benefits

Total benefits paid for prostheses decreased by 2.5% in December 2021 compared to September 2021. Similar to medical services, the change in benefits paid for prostheses was calculated over a range of prosthetics (see chart) and does not mean prostheses overall changed in cost. The change in benefits paid may reflect a change in the type of prosthetics utilised, or a change in the overall utilisation of prosthetics. The prosthetic group for which the greatest amount of benefits were paid was cardiac, comprising 16.6% of all prosthetic benefits and totalling \$93.7 million.

Medical benefits by Speciality group

Benefits paid for prostheses

Service utilisation

Episodes/Services by type

	December 2021	Change from September 2021
Hospital Episodes	1,162,836	-6.5%
Hospital Days	2,852,225	-8.0%
Medical Services	9,349,427	-7.1%
Prostheses Items	825,574	-5.8%
Specialist Orthopaedic	138,854	-10.5%
Ophthalmic	95,031	-9.1%
Spinal	52,734	-6.7%
General Treatment	25,448,237	30.6%
Dental	12,486,933	35.0%
Chiropractic	2,111,601	-7.4%
Physiotherapy	2,668,824	-3.9%
Optical	3,995,474	107.0%

Hospital utilisation is distributed over four categories of hospital—public, private, day only facilities and hospital-substitute. During the December 2021 quarter, hospital episodes were distributed as follows:

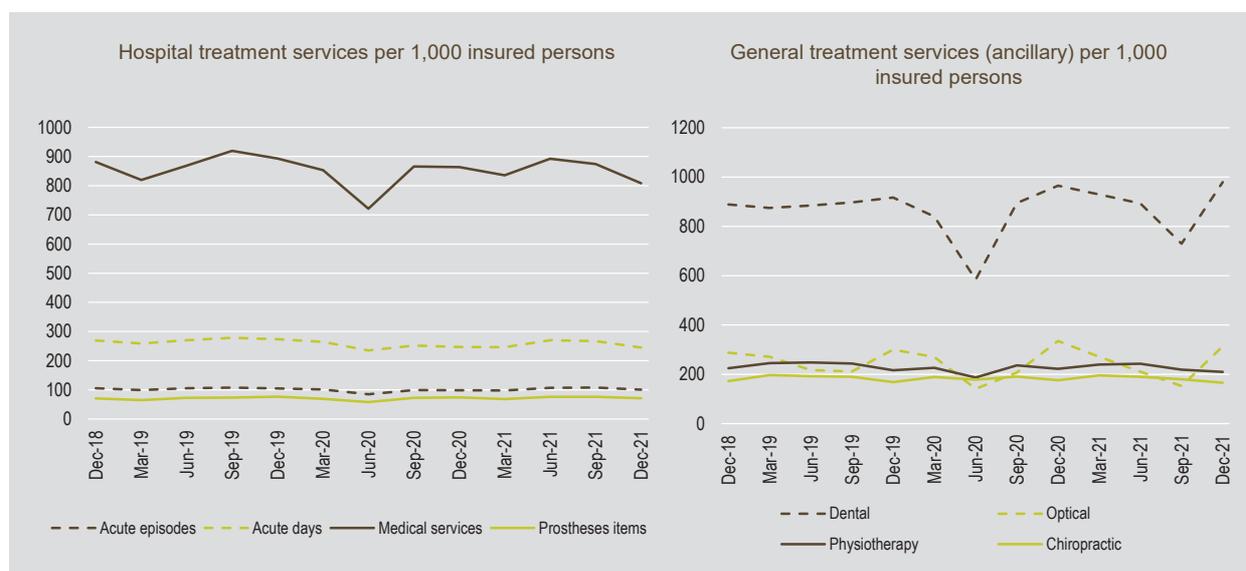

- ◇ public hospitals 163,201 episodes
- ◇ private hospitals 778,605 episodes
- ◇ day hospital facilities 167,428 episodes
- ◇ hospital substitute 53,602 episodes.

For the December 2021 quarter, hospital utilisation (measured in episodes) decreased by 6.5% which was mainly driven by private hospitals.

During the December 2021 quarter, insurers paid benefits for 2.85 million days in hospital, arising from 1.16 million hospital episodes of care.

	Quarter change	Year change
◇ public hospitals	↓ -10.4%	↓ -0.8%
◇ private hospitals	↓ -5.6%	↑ 9.9%
◇ day hospital facilities	↓ -2.0%	↑ 13.5%
◇ hospital-substitute	↓ -18.4%	↑ 25.2%

Day-only episodes in the four categories of hospital totalled 813,760, with a 5.4% change compared to September 2021.

Out-of-pocket payments

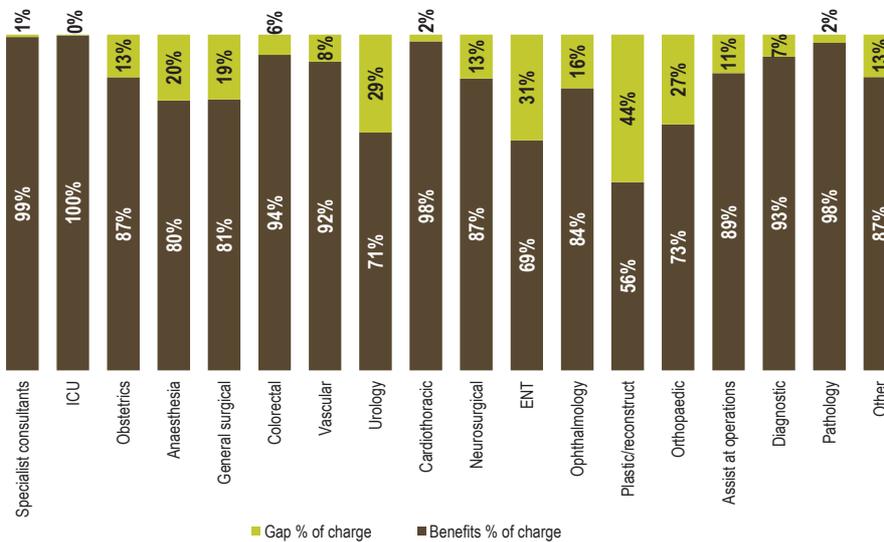

Average out-of-pocket per episode/service

	December 2021	Change from Sep 21	Change from Dec 20
Hospital treatment	\$333.35	-1.7%	-1.6%
Hospital-substitute treatment	\$5.32	9.4%	-30.9%
General treatment ancillary	\$53.39	-4.7%	3.4%
Medical gap where gap was paid	\$219.87	6.5%	18.6%

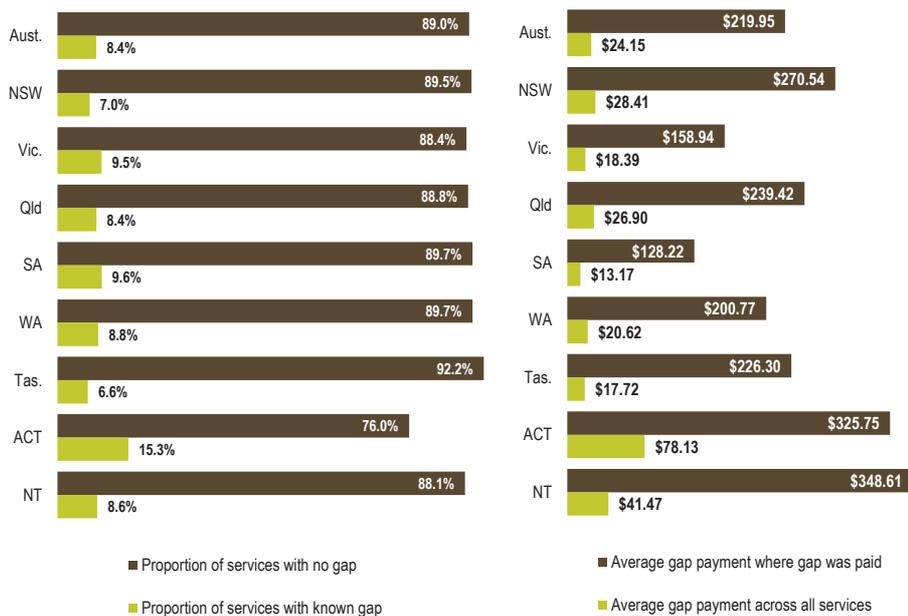

The out-of-pocket payments for hospital episodes decreased by 1.6% compared to the same quarter for the previous year. Out-of-pocket payments for medical services were \$220 where an out-of-pocket payment was payable. The amount of gap for medical services varies depending on the specialty group. The specialty group with the largest out-of-pocket payment was plastic/reconstructive with an average gap of \$538. Gap incurred for the various medical services is displayed in the first chart. Medical gap also varies by state and territory and these differences are shown in the bottom chart.

The average out-of-pocket (gap) payment for a hospital episode was \$333 in the December 2021 quarter. This included out-of-pocket payments for medical services, in addition to any excess or co-payment amounts relating to hospital accommodation.

* includes health insurance equipment and other assets

Does not include Capital Management Policy target levels (refer to glossary)

Health Benefits Fund Assets vs Liabilities as at December 2021

Notes on statistics

Source of data

On 1 July 2015, supervisory responsibilities were transferred from the Private Health Insurance Administration Council (PHIAC) to APRA under the *Private Health Insurance (Prudential Supervision) Act 2015*.

This publication is compiled primarily from regulatory returns submitted to APRA under the *Financial Sector (Collection of Data) Act 2001* by authorised Private Health Insurance companies.

Prior to 1 July 2015, PHIAC collected data from Private Health Insurers.

The population figures used to calculate coverage are derived from:

Australian Bureau of Statistics, Australian Demographic Statistics, ABS cat no. 3101.0, ABS, Canberra.

The June 2019 quarterly release of *Australian Demographic Statistics* contains the most recent estimates of the resident populations (ERP) of Australia and the states and territories based on the results of the 2019 Census of Population and Housing held on 9 August 2016. For more information refer to the publication at the ABS website.

Net change by five year age group is the actual change adjusted for the number of people moving into the cohort and out of the cohort due to ageing. The calculation makes the simplifying assumption that the number of people are evenly distributed over each year within the five year age group.

Lifetime Health Cover is a financial loading (LHC loading) that can be payable in addition to the premium for your private health insurance hospital cover (hospital cover). LHC loadings apply only to hospital cover. The loading is 2% above the base rate for each year over the age of 30 in which the policy holder did not have private health insurance hospital cover. After ten years of paying the loading the loading is removed.

Starting from 1 April 2007, general treatment policies replaced ancillary policies. General treatment policies cover treatment similar to that previously known as ancillary (eg. dental) but can also cover hospital-substitute treatment and Chronic Disease Management Programs.

Related Publications

Quarterly publications

A number of related quarterly publications are available from:

<https://www.apra.gov.au/publications>

These include:

[Quarterly Statistics](#)

The Quarterly Statistics are principal release of statistics with summaries for the key financial and membership statistics of the Private Health Insurance industry.

[Membership Statistics](#)

A publication which details by State the number of insured persons for hospital treatment and general treatment and the proportion of the population these persons represent. The tables are shown on both a quarterly and an annual basis and include hospital treatment by age cohort.

[Medical Gap Information](#)

A publication on in-hospital medical services. The proportion of services for which there was no gap or known gap and the average gap payment are shown for each state.

[Private Health Insurance Membership and Benefits \(formerly PHIAC A\)](#)

A publication detailing by State, the membership and benefits paid by private health insurers for the period. These State reports are available both in PDF format and Excel.

[Prostheses Report](#)

A report providing data on prosthetic benefits paid by private health insurers by major prosthetic category

[Medical Services Report](#)

A report providing data on services, benefits paid and gap payments by MBS Specialty Block Groupings for medical services paid by private health insurers.

[Statistical Trends - Quarterly Statistical trends in membership and benefits paid](#)

These are two separate publications detailing trends since September 1997 in the number of insured persons and benefits paid for hospital and general treatment.

Annual publications

APRA will continue to produce an Annual Report on the Operations of the Private Health Insurance Industry. This report contains an industry overview and tables of statistics by individual fund. Current and historical versions are available at:

<https://www.apra.gov.au/publications/operations-private-health-insurers-annual-report>

Orthopaedic surgery

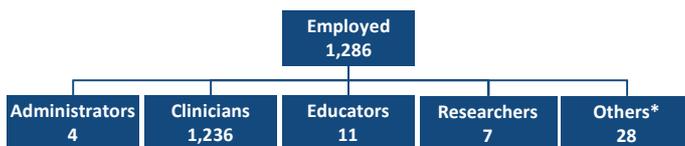

2016 Factsheet

Orthopaedic surgery involves the care of the musculoskeletal system. Orthopaedic surgeons diagnose, care and treat disorders of the bones, joints, muscles, ligaments, tendons, nerves and skin. A minimum of five years full-time advanced training through the Royal Australasian College of Surgeons is required to specialise in this area.

Workforce

In 2016, there were 1,286 orthopaedic surgeons employed in Australia, of whom 76.2% worked in the private sector. Over 96% of orthopaedic surgeons who completed the 2016 National Health Workforce Survey indicated they were clinicians.

* Includes roles reported by survey respondents that did not fit predefined survey categories.

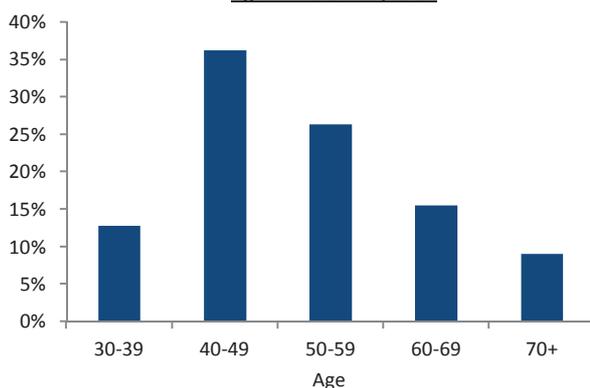

Demographics of clinicians

Males represented 96.9% of clinicians in 2016 and had an average age of 52.0 years. Females represented 3.1% of clinicians and were on average 5.9 years younger than male clinicians.

Category	% of clinicians	Average age	Average hours per week
Male	96.9%	52.0	47.2
Female	3.1%	46.1	46.8
Clinician total	100.0%	51.8	47.2

Over 36% of clinicians were aged 40-49 years and over 26% were aged 50-59 years.

Ages of clinicians, 2016

Distribution of clinicians

In 2016, the majority (83.7%) of clinicians were located in a major city or a location considered as MMM1 under the Modified Monash Model classification system.

Location of clinicians by remoteness, Modified Monash Model (MMM*)							
MMM category	1	2	3	4	5	6	7
%	83.7	8.8	6.8	-	0.4	0.2	0.1

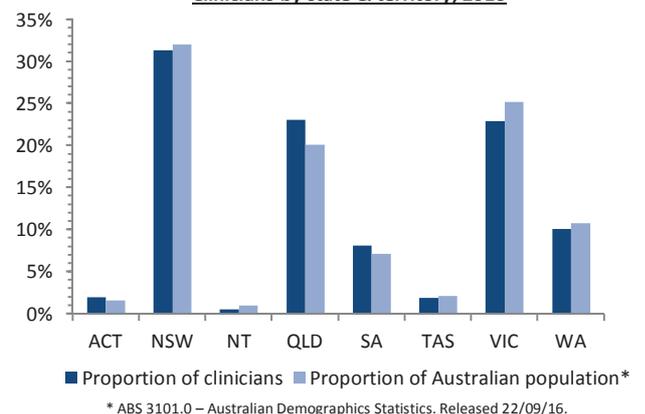

* Further information on the Modified Monash Model is available at doctorconnect.gov.au

Quick facts of clinician workforce

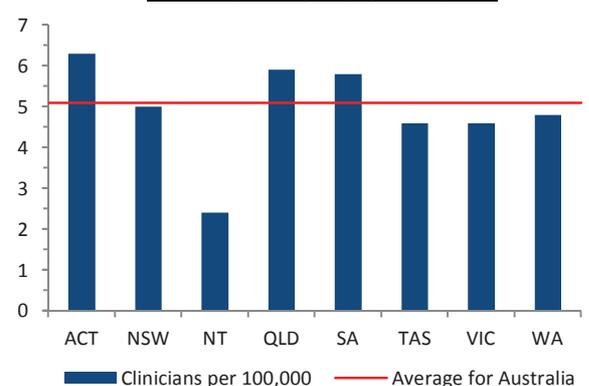

The largest number of clinicians was in New South Wales with 31.3% clinicians indicating their principle place of practice was in this state.

Clinicians by state & territory, 2016

There was an average of 5.1 clinicians per 100,000 population across Australia in 2016. The Australian Capital Territory had the highest ratio of clinicians with 6.3 per 100,000 population, followed by Queensland and South Australia with 5.9 and 5.8 per 100,000 population respectively.

Clinicians per 100,000 population, 2016

New fellows

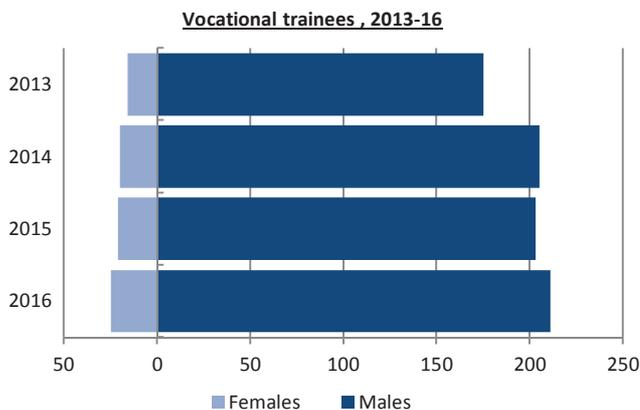

The number of orthopaedic surgery new fellows fluctuated between 2013 and 2015. During this period the number of female new fellows remained static.

Number of new fellows, 2013-15			
	2013	2014	2015
Males	47	28	44
Females	3	3	3
Total	50	31	47

Vocational training

Between 2013 and 2016, the number of female trainees increased by 56.3% and males increased by 20.6%.

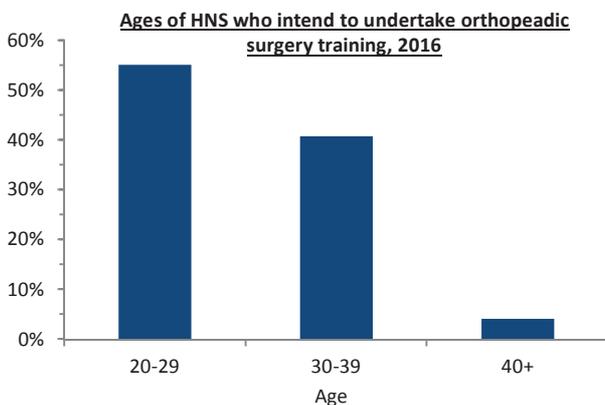

Trainee numbers, 2013-16			
Year	Females	Males	Total
2013	16	175	191
2014	20	205	225
2015	21	203	224
2016	25	211	236
Change 2013-16 (%)	56.3%	20.6%	23.6%

Vocational intentions

In 2016, there were 363 Hospital Non-Specialists (HNS*) who indicated their intention to undertake vocational training in orthopaedic surgery.

* A HNS is a medical practitioner employed in a salaried position mainly in a hospital. They do not hold a specialist qualification and are not training to obtain one. They include career medical officers, hospital medical officers, interns, principal house officers, resident medical officers and registrars.

Workforce dynamics indicator*

The workforce dynamics indicator highlights areas of concern in the future. The indicators measured and their current status is highlighted in the table below.

Note: The workforce dynamics indicators are for workforce assessment purposes only and are not intended to guide future training numbers.

* Further information on the workforce dynamics Indicator is available at health.gov.au

Indicator	Description	Status
Ageing of workforce	Workforces with higher average ages are more susceptible to higher exit rates due to retirements.	Yellow circle

Psychiatry

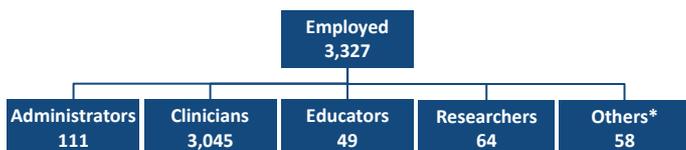

2016 Factsheet

Psychiatrists specialise in the diagnosis, treatment and prevention of mental illness and emotional problems. They are trained to recognise and treat the effects of emotional disturbances on the body, as well as the effects of physical conditions on the mind. A minimum of five years full-time advanced training through the Royal Australian and New Zealand College of Psychiatrists is required to specialise in this area.

Workforce

In 2016, there were 3,327 psychiatrists employed in Australia, of whom 49.7% worked in the private sector. The majority (91.5%) of psychiatrists who completed the 2016 National Health Workforce Survey indicated they were clinicians.

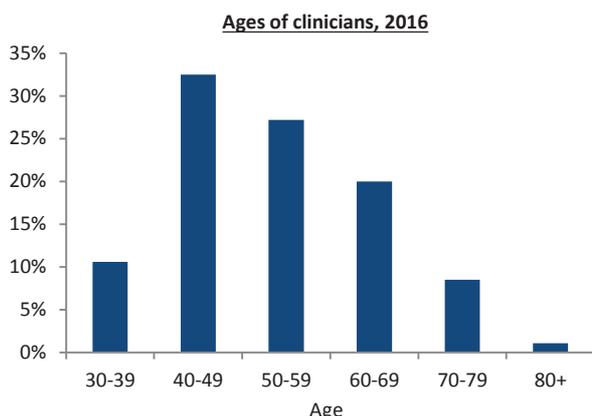

* Includes roles reported by survey respondents that did not fit predefined survey categories.

Demographics of clinicians

Males represented 61.3% of clinicians in 2016 and had an average age of 54.5 years. Females represented 38.7% of clinicians and were on average 3.4 years younger than male clinicians.

Category	% of clinicians	Average age	Average hours per week
Male	61.3%	54.5	40.6
Female	38.7%	51.1	34.2
Clinician total	100.0%	53.1	38.1

Over 32% of clinicians were aged 40-49 years and over 27% were aged 50-59 years.

Distribution of clinicians

Most clinicians (87.5%) were located in a major city or a location considered as MMM1 under the Modified Monash Model classification system in 2016.

Location of clinicians by remoteness, Modified Monash Model (MMM*)							
MMM category	1	2	3	4	5	6	7
%	87.5	6.6	4.1	0.6	0.4	0.5	0.3

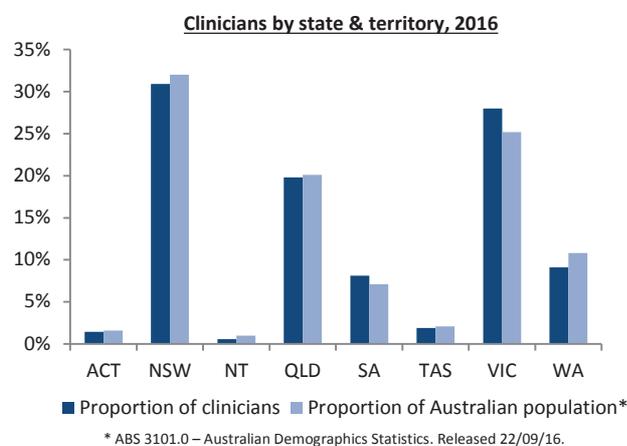

* Further information on the Modified Monash Model is available at doctorconnect.gov.au

The proportion of clinicians for South Australia and Victoria were higher than the population proportions for these states.

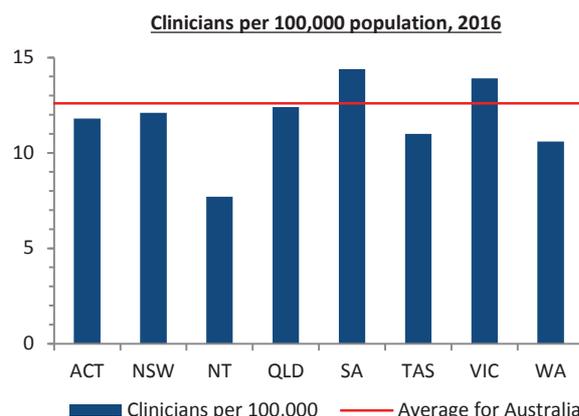

Quick facts of clinician workforce

Over 30% of clinicians reported their principal place of practice was in New South Wales.

New South Wales had the highest number of clinicians for 2016, however South Australia and Victoria were the only states with more clinicians than the national average of 12.6 clinicians per 100,000 population.

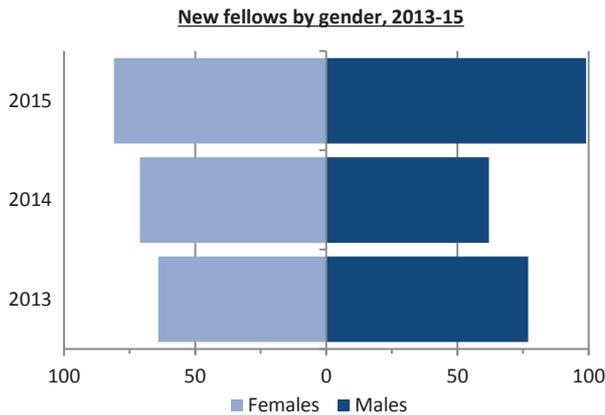

New fellows

The number of new fellows from the Royal Australian and New Zealand College of Psychiatrists increased 27.7% from 2013 to 2015. In 2015, 41.1% of new fellows obtained their specialist qualification outside of Australia.

Number of new fellows, 2013-15			
	2013	2014	2015
Trained in Australia	85	92	106
Overseas trained	56	41	74
Total	141	133	180

In 2015, 45% of new fellows were female.

Vocational training

The number of trainees increased every year between 2013 and 2016. During this period the number of male trainees increased by 44.4% and female trainees increased by 2.8%.

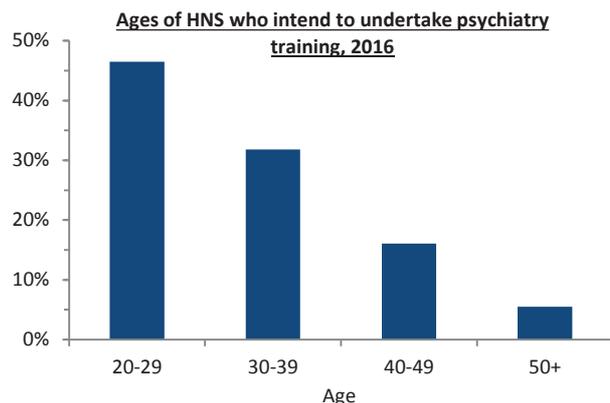

Trainee numbers, 2013-16			
Year	Females	Males	Total
2013	684	567	1,251
2014	699	587	1,286
2015	716	686	1,402
2016	703	819	1,522
Change 2013-16 (%)	2.8%	44.4%	21.7%

Vocational intentions

In 2016, there were 217 Hospital Non-Specialists (HNS*) who indicated their intention to undertake vocational training in psychiatry. Over 46% were aged 20-29 years.

* A HNS is a medical practitioner employed in a salaried position mainly in a hospital. They do not hold a specialist qualification and are not training to obtain one. They include career medical officers, hospital medical officers, interns, principal house officers, resident medical officers and registrars.

Workforce projections

The demand for psychiatrists will exceed supply. There is a projected shortage of 74 full-time equivalent (FTE) psychiatrists in 2025 and a shortfall of 124 FTE in 2030.

Supply and demand forecasts were calculated based on figures from the Australia's Future Health Workforce dataset.

Workforce dynamics indicator*

The workforce dynamics indicator highlights areas of concern in the future. The indicators measured and their current status is highlighted in the table below.

Note: The workforce dynamics indicators are for workforce assessment purposes only and are not intended to guide future training numbers.

* Further information on the workforce dynamics Indicator is available at health.gov.au

Indicator	Description	Status
Ageing of workforce	Workforces with higher average ages are more susceptible to higher exit rates due to retirements.	
Replacement rate	This measure indicates whether trainee numbers are sufficient to replace the numbers leaving the workforce.	
Reliance on Overseas Trained Specialists (OTS)	Workforces with high proportions of OTS are of concern because they depend on a supply stream affected by immigration policies that change.	
Duration of training program	This measure indicates how long it takes to train a replacement workforce. Indicator considers basic and advanced training components.

Rehabilitation medicine

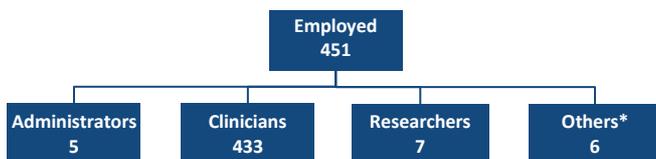

2016 Factsheet

Rehabilitation medicine involves the diagnosis, assessment and management of a disability due to illness or injury. Rehabilitation physicians work with people with a disability to help them achieve and maintain an optimal quality of life. A minimum of four years full-time advanced training through the Royal Australasian College of Physicians, Australasian Faculty of Rehabilitation Medicine, is required to specialise in this area.

Workforce

There were 451 rehabilitation medicine specialists employed in Australia in 2016, of which 37.7% worked in the private sector. The majority (96.0%) of specialists in this field who completed the 2016 National Health Workforce Survey indicated they were clinicians.

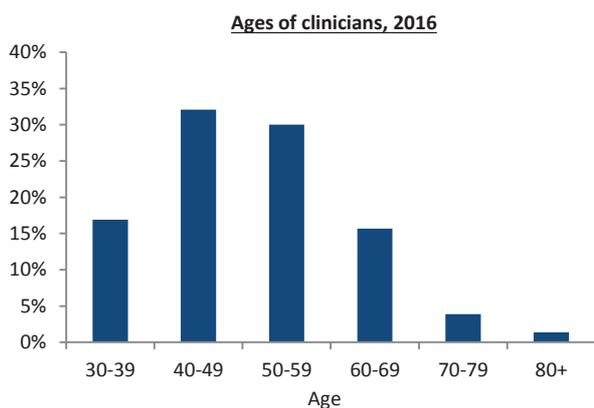

* Includes roles reported by survey respondents that did not fit predefined survey categories.

Demographics of clinicians

Males represented 53.6% of clinicians in 2016 and had an average age of 53.3 years. Females represented 46.4% of clinicians and were on average 6.0 years younger than male clinicians.

Category	% of clinicians	Average age	Average hours per week
Male	53.6%	53.3	37.0
Female	46.4%	47.3	33.1
Clinician total	100.0%	50.5	35.2

Over 32% of clinicians were aged 40-49 years and 30% were aged 50-59 years.

Distribution of clinicians

In 2016, the majority (86.1%) of clinicians were located in a major city or a location considered as MMM1 under the Modified Monash Model classification system.

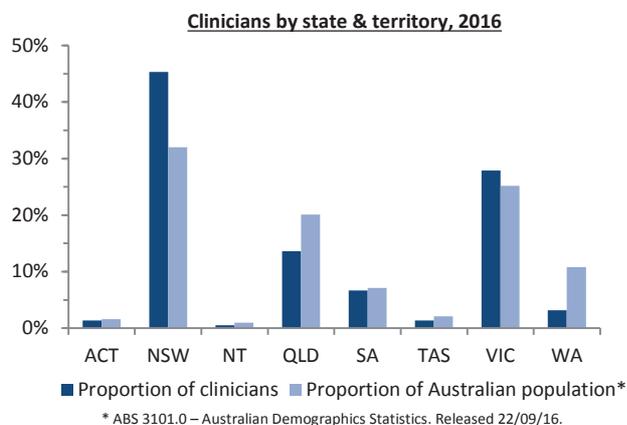

Location of clinicians by remoteness, Modified Monash Model (MMM*)							
MMM category	1	2	3	4	5	6	7
%	86.1	6.3	7.2	0.2	0.2	-	-

* Further information on the Modified Monash Model is available at doctorconnect.gov.au

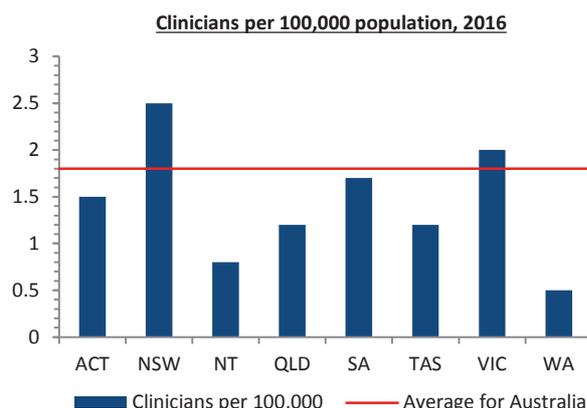

Quick facts of clinician workforce

The largest number of clinicians was in New South Wales with 45.3% of clinicians indicating their principle place of practice was in this state.

New South Wales had the highest ratio of clinicians in 2016 with 2.5 per 100,000 population. Victoria was the only other jurisdiction with more clinicians than the national average of 1.8 per 100,000 population.

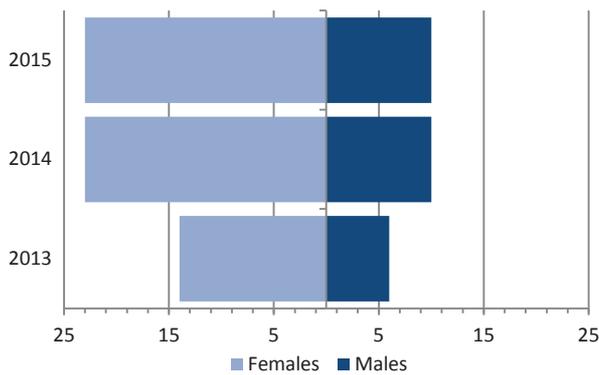

New fellows

The number of rehabilitation medicine new fellows in 2015(33) was 65.0% higher than the number in 2013(20). Over the same period, the number of overseas trained new fellows who obtained their specialist qualification outside of Australia decreased by 50.0%.

	Number of new fellows, 2013-15		
	2013	2014	2015
Trained in Australia	18	30	32
Overseas trained	2	3	1
Total	20	33	33

In 2015, 69.7% of new fellows were female.

New fellows by gender, 2013-15

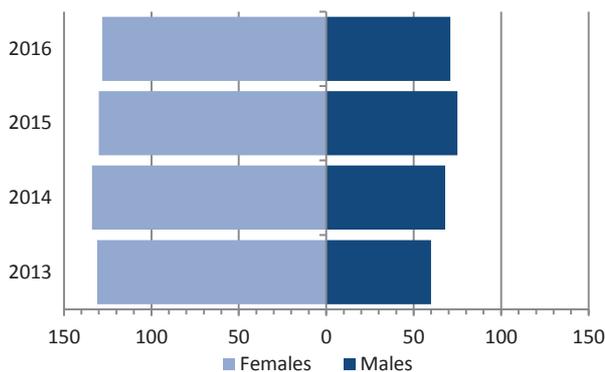

Vocational training

Female trainees outnumbered male trainees in every year between 2013 and 2016. During this period, the total number of trainees increased by 4.2%.

Trainee numbers, 2013-16

Year	Females	Males	Total
2013	131	60	191
2014	134	68	202
2015	130	75	205
2016	128	71	199
Change 2013-16 (%)	-2.3%	18.3%	4.2%

Vocational trainees, 2013-16

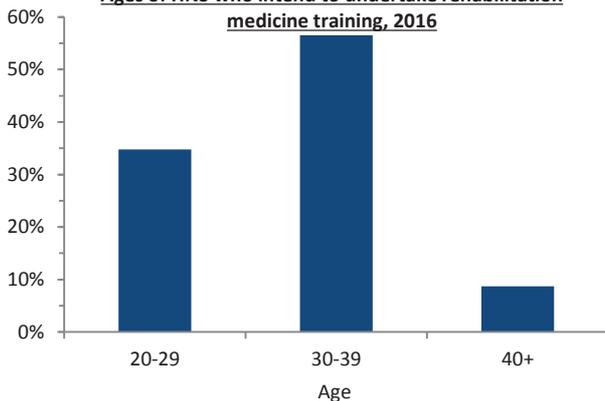

Vocational intentions

In 2016, there were 23 Hospital Non-Specialists (HNS*) who indicated their intention to undertake vocational training in rehabilitation medicine.

* A HNS is a medical practitioner employed in a salaried position mainly in a hospital. They do not hold a specialist qualification and are not training to obtain one. They include career medical officers, hospital medical officers, interns, principal house officers, resident medical officers and registrars.

Ages of HNS who intend to undertake rehabilitation medicine training, 2016

Workforce dynamics indicator*

The workforce dynamics indicator highlights areas of concern in the future. The indicators measured and their current status is highlighted in the table below.

Note: The workforce dynamics indicators are for workforce assessment purposes only and are not intended to guide future training numbers.

* Further information on the workforce dynamics Indicator is available at health.gov.au

Switching private health insurance funds? Here's what you need to know

We answer the biggest questions you have about switching

20 February 2020

4 minute read

When it comes to your health insurance, things with your current fund might not be working out the way you thought they would.

At nib, we're focused on giving our members the best value for money, so if you're not getting the service you were hoping for, it may be time to consider switching. But, before you call your current health fund to say 'it's not you, it's me', read up on some of the biggest questions you might have when it comes to transferring your health insurance.

Related: [A guide to saving money on your health insurance cover](#)

I want to transfer to nib, how do I do it?

Private health insurance should be easy, right? So we've made choosing the right cover and getting a quote as simple as possible. You can [get a quote online](#) in minutes and, once you're ready to sign up, you can sit back knowing that we'll contact your previous fund on your behalf.

What is a transfer certificate?

Under the Private Health Insurance Act, when you switch to nib your previous fund is required to send us a transfer certificate within 14 days. The transfer certificate outlines details of your previous cover, including any waiting periods you've served, the type of cover you had and your claims history. You can start claiming on services that you're eligible for as soon as we receive this certificate.

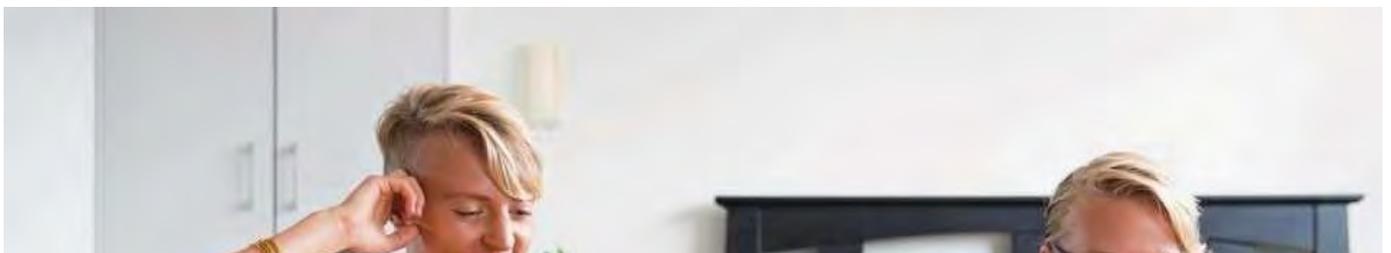

If I transfer to nib from another fund, do I have to re-serve waiting periods?

If you're transferring to a policy that has an equivalent or lower level of benefits, you won't have to re-serve any waiting periods on the services covered with your previous fund. We'll also recognise partially served waiting periods - so even if you've only served three months of a 12 month waiting period, we'll make sure that the three months still count when you transfer to us.

For more information, check out our article [What's a waiting period and why do we have them?](#)

What happens to my annual limits if I transfer?

The benefits you have claimed with your previous fund this year will be deducted from your new nib policy. We work by calendar year at nib, so if you've got an annual limit of \$1,000 for major dental treatment and you've already claimed \$400 this calendar year, you'll still have \$600 remaining.

How does my excess work?

Already made a hospital claim this calendar year with your previous fund? Don't worry; if you've switched to a policy that has the same level of excess (or a lower excess) and you're readmitted to hospital this year, you won't have to pay your excess again with nib.

If you've transferred to a policy with a lower level of excess, your new excess amount will kick in two months following your transfer to nib.

The exception to this is if you're admitted to hospital for a **pre-existing condition** within your first 12 months with nib after switching, then your previous higher excess will be applicable.

At nib, we offer our members a range of options when it comes to their excess. As an nib member, you can choose between a \$500 and \$750 excess for singles, and \$1,000 and \$1,500 for couples or families. This means you have the ability to opt for a higher level of excess in return for a lower premium.

To find out more about nib's excess options, head to our article **Excess changes: How to reduce the cost of your premium**.

If I transfer, will it affect my Lifetime Health Cover (LHC)?

If you're transferring your Hospital Cover to nib you can rest assured that your **Lifetime Health Cover loading** won't be affected so long as you haven't taken a break that will exceed your **'absent days'** between transferring health covers.

If you've got LHC loading, we will recognise the years you've had private Hospital cover for. This means we will know when you have hit the magic 10 year mark to remove your loading and reduce your premiums.

I've paid my cover in advance with my old fund, will I lose this?

If you've paid your private health premiums in advance and decide to transfer your policy to nib, your old health fund should refund you the excess money you've paid.

What should I do about my direct debit payments with my other fund?

The best thing to do is to cancel any direct debit arrangements you have previously made with your financial institution and then leave the rest to us! nib will contact your previous health fund to advise them that you have decided to switch and to request your transfer certificate.

If you set up automatic direct debit payments from your bank, building society or credit union cheque or savings account, you might be eligible for a discount of up to 4% on your nib premium.*

Keen to learn about more ways you can save? Check out our article: [**A guide to saving money on your health insurance.**](#)

How can I claim with nib?

We believe that claiming your benefits with nib should be simple. When you need to make a claim, you can submit it using the [**nib app**](#) or via [**Online Services**](#).

Related: [**How to claim on the nib app**](#)

Are you serious about your health? At nib, we can tailor your cover to include the things that are important to you and it only takes a few minutes to [**get a quote**](#).

*Discount not available on Ambulance Only cover.

Y	Indicates the clinical category is a minimum requirement of the product tier.			
(R)	Restricted cover permitted: insurers are allowed to offer cover for this clinical category on a restricted basis. A restricted benefit means you are partially covered for hospital costs as a private patient in a public hospital. You may incur significant expenses in a private room or private hospital so you should check with your insurer and hospital for details.			

O Optional for the insurer to include: insurers may choose to offer these as additional clinical categories.

ANNEXURE CERTIFICATE

DD-14

This is the Annexure marked "DD-14" referred to in the affidavit of David Du Plessis affirmed at Newcastle in New South Wales on June 2022.

Before me:

AR

.....
Signature of witness

ADELAIDE NANCY ROSENTHAL, 447 COLLINS STREET, MELBOURNE VIC 3000
An Australian Legal Practitioner within the meaning of the Legal Profession Uniform Law (Victoria).
A person authorised under section 19(1) of the Oaths and Affirmations Act 2018 to take an affidavit.

2020 Private Health Insurance Premium Application Form

Guidance

Section 66-10 of the *Private Health Insurance Act 2007* provides that

*(1) A private health insurer that proposes to change the premiums charged under a *complying health insurance product must apply to the Minister for approval of the change:*

- a) in the approved form; and*
- b) at least 60 days before the day on which the insurer proposes the change to take effect.*

A **written report** and three templates (**Template A, Template B and Template C**) is the approved form (referred to as the premium application form) - if completed in accordance with the direction in this document. Covering letters to the premium application form will also be considered part of the premium application form.

The premium application form will be assessed by the Department of Health (Health) and the Australian Prudential Regulation Authority (APRA).

Health's intention is to provide the Minister a package of information that comprises:

- For each private health insurer:
 - **Template C**; and
 - Additional supplementary comments prepared by Health/APRA.
- For the industry:
 - An aggregated **Template C**; and
 - Additional pages with supplementary comments from Health/APRA.

In submitting the premium application form, please note:

- all information should be provided as instructed in this document
- data should be cross checked with information provided to APRA, notably HRF601 and HRF602
- pages should be numbered in the written report
- the premium application form should not be submitted in PDF format
- only information that is relevant to the health insurance business is required
- **Template A** (Product Information) should be completed for all products currently available and all new products expected to commence on 1 April 2020.

Health/APRA will contact insurers to discuss applications that do not comply with the guidelines and requirements set out in this document.

Applications submitted via SecureDoc

Applications should be submitted via SecureDoc, a cloud-based APRA owned file transfer system by **3pm Tuesday, 12 November 2019**.

Please direct queries regarding the premium application form to phi@health.gov.au.

Confidentiality and publication

The completed form will be treated as “protected information” as defined by the *Private Health Insurance Act 2007*.

The Department’s intention is to publish on its website:

- **For each private health insurer:**
 - Each insurer’s average premium price change.

- **For the industry:**
 - The industry average premium price change.
 - Only highly aggregated or non-identifiable information will be made public, such as average premium changes in jurisdictions or by insured groups.

Written Report Guidance

Applications for premium changes **should** include the below information.

As a guide – an application which is consistent with the insurer’s pricing philosophy and capital management plan is expected to be no more than:

- 20 pages addressing the questions below; and an additional
- 10 pages for an Actuarial Opinion.

Reference	Question	Guidance
1	Insurer name	Provide the name of the insurer as registered with APRA as at the premium application date.
2	Date(s) of premium change effect	Provide the date(s) on which the premium change(s) are to take effect. It is preferable for insurers to implement a date of effect of 1 April.
3	Consistency with Pricing Philosophy	<p>Outline the extent to which this year’s premium application is consistent with the insurer’s pricing philosophy over the forecast period. This should include commentary on the expected level of performance in 2020, 2021 and 2022 and forecast premium changes in 2021 and 2022.</p> <p>The commentary should discuss the extent to which the application is consistent with all of the pricing philosophy including:</p> <ul style="list-style-type: none">- Overall target gross or net margin- Targets for individual products or product groups- Hospital and general treatment products- Product hierarchies. <p>Commentary should specifically discuss products currently operating, or forecast to operate, outside of the pricing philosophy and the insurer’s strategy for each of these products.</p>
4	Consistency with Capital Management Plan	Outline the extent to which this year’s premium application is consistent with the insurer’s capital management plan. This should include reference to the insurer’s forecast capital and the forecast target capital range as stated in template B.
5	Key financial risks over the forecast period	<p>Outline the key risks to the financial performance position of the fund over the forecast period. This should be a brief high level description of the main financial risks to the fund over the next two and a half years. The risk areas covered are not intended to duplicate the risk register or risk management framework. Rather it should provide a concise description of the key areas of uncertainty in the projections.</p> <p>Some examples may include:</p> <ul style="list-style-type: none">- A change in the profile of policyholders, either through material new joiners or lapses- New products- Product changes- Volatile experience or large changes in benefit payments, making assumption setting difficult- Changes in strategy- Changes in the health or competitive environment. <p>It is suggested that insurers be specific and comment on the risks that are applicable to the insurer’s risk profile in this year’s premium application.</p>

6	Management of key risks identified	<p>Outline how the insurer is managing the risks and uncertainties outlined above. Insurers should <u>briefly</u> discuss the insurer's approach to these risks. The discussion should be sufficient to get a high-level understanding of the approach, actions taken and where further detail can be found.</p> <p>This section is not designed to replicate the insurer's existing documents such as the insurer's risk register and risk management framework.</p>
7	Reasons identified for the changes in benefit payments or drawing rates	<p>Outline changes in benefit payments or drawing rates that have resulted in the requested premium change. The commentary should reference recent experience, risk factors and insurer action, to demonstrate how the forecast benefit change was determined.</p> <p>Insurers should also comment on experience that is materially different to industry, the reasons for the differences and justify the premium change.</p> <p>Insurers are asked to be mindful that the reasons for premium changes are not always well understood by the public. This is especially the case for the relationship between premium changes, CPI and AWE. Clarity in this section could assist in communicating these messages and ensure that the reasons for premium changes are clear to the Minister for Health and the Department so adequate public messaging can be provided.</p>
8	Initiatives to address affordability concerns	<p>Outline the initiatives the insurer is taking to support the affordability of premiums, including by reducing benefit inflation or improving the value proposition of private health insurance.</p>
9	Other matters considered relevant	<p>This section provides an opportunity for the insurer to comment on any other matter considered relevant. This may include matters that influenced the premium change or matters which the insurer considers the Minister may find useful in considering his assessment.</p> <p>Examples of such matters could include:</p> <ul style="list-style-type: none">- The insurer's competitive position- Premiums being materially different than competitors- The insurer's strategy- Broader health programs and initiatives to enhance affordability- Extent of downgrades or lapses- Health related business (such as Overseas Student Health Cover)- Recent performance.
10	Consistency with Act and Rules	<p>Provide a declaration that the premium changes are consistent with the <i>Private Health Insurance Act 2007</i> and <i>Private Health Insurance (Prudential Supervision) Act 2015</i>, and the associated Rules, as at 12 November 2019.</p>

11	Actuarial experience analysis	<p>Provide an experience analysis comparing actual performance to the forecasts submitted during last year's premium round.</p> <p>The commentary should include:</p> <ul style="list-style-type: none">- The extent of the differences- The reasons for the differences, if known- The impact these differences had on this year's forecasts. <p>This can include experience up to June or September. Specifically, it can include the experience analysis completed in the recent Financial Condition Report (FCR), provided the forecasts assessed in the FCR were those submitted in last year's premium application.</p> <p>If experience up to June is used, this section should include a statement whether any material deviations from expected experience have arisen in the September quarter.</p> <p>The Appointed Actuary should also comment on how the assumptions compare to recent actual experience and the reasons for material difference.</p> <p>The experience analysis should be signed by the Appointed Actuary.</p>
12	Actuarial risks	<p>Provide an opinion from the Appointed Actuary on whether there are any other material risks impacting the insurer in addition to those provided under item 5 of this premium application.</p>
13	Actuarial opinion	<p>Provide commentary from the Appointed Actuary on the extent to which duration effects have been incorporated into the forecasts.</p> <p>Provide commentary from the Appointed Actuary on the extent to which changes in the demographic profile have been incorporated into the forecasts.</p> <p>Provide an opinion from the Appointed Actuary regarding whether the financial forecasts and assumptions are reasonable central estimates.</p> <p>Provide a comment on the suitability of the conversion factor values provided by the insurer in Template C, for the intended use.</p>
14	Contact person	<p>Provide the contact details of a primary contact person, and an alternative contact person. This should include:</p> <ul style="list-style-type: none">- name- position title- landline telephone number- mobile phone number- e-mail address.

Template A (Product Information)

Please note the following guidance in completing **Template A**.

- All current products and proposed new products commencing prior to 2 April 2020, regardless of whether a change in premium is being sought, should be reported.
- All products should reflect the name, excesses, and premiums as they will appear in the PHIS and Fund Rules from 1 April 2020.
- Ambulance Only policies should be included where they are complying health insurance products, and included in HRF601.
- Information should be provided for all products, even if some products have the same price (i.e. information should be provided for couple policies even if they are priced the same as family policies).
- Do not include Overseas Visitors Health Cover products or Overseas Student Health Cover products.
- Do not create new categories as a substitute for drop down list options – select only options in the drop-down menu.
- Template A “number of policies” and “insured people” should be consistent with HRF601 for the September 2019 quarter.
- The age-based discount conversion factor at Column **P** of Template A is only relevant to products where the aged-based discount will be applied.
 - If the discount does not apply to the product, the factor will be 100 per cent.
 - If 100 people are on a product, and 10 people are eligible for a 2 per cent aged-based discount, the difference in monthly income when the discount is applied is 0.2 per cent, therefore, the aged-based discount conversion factor is 99.8 per cent.
- Products listed in all templates should be identified with a unique ‘Product Code’ identifier. This should be the PHIS ID.
- If an insurer plans to terminate products from 1 April 2020, the 2020 new product price should be left blank.
- For further assistance in completing template A, direct all queries to phi@health.gov.au, using “2020 Premium Round” in the subject line.

Template A guidance

Field	Data Entry Guidelines	Example
STATE	Select from the drop down list the State or Territory in which the product is available. This should be consistent with the risk equalisation jurisdiction for APRA reporting. Each State/Territory should be recorded separately (i.e. if the same product is available in multiple states do not record in the same row as NSW/ACT/VIC but in individual rows).	Drop down list: NSW ACT NT QLD SA TAS VIC WA
PRODUCT CODE PHIS ID	Enter in full the unique product identification code for the product, exactly as generated in the PHIS by privatehealth.gov.au (i.e. do not truncate by omitting insurer identifier component of code). This includes products that are closed, or have zero policies/people.	
PRODUCT NAME as at 1 April 2020	Enter the product name. If the name is duplicated across products, do not leave any rows blank, but instead enter the identical name for each product. This should be consistent with the information recorded in the PHIS for the product.	Gold Hospital Cover
PRODUCT STATUS as at 1 April 2020	Select from the drop down list whether the product is: <ul style="list-style-type: none"> • <u>Open</u> and is a <u>New Product</u> to the market. • <u>Open</u> already <u>Existing</u> product. • <u>Closed</u> – <u>Closing</u>, if the insurer plans to close the product anytime between 1 April 2019 to 31 Mar 2020. • <u>Closed</u> prior to 1 April 2019 – <u>Existing</u>. • <u>Terminating</u>, if planning to terminate the product prior to 1 April 2020 with customers being migrated to alternative products. 	Drop down list: Open – New Product Open – Existing Closed – Closing Closed – Existing Terminating
PRODUCT TYPE	Select from the drop down list the product type. Do not use values that are not in the drop down list.	Drop down list: Hospital = Hospital treatment only General = General treatment only Combined = Combined Hospital and General Treatment General Ambulance = AmbulanceOnly
HOSPITAL CATEGORY as at 1 April 2020	Select from the drop down list the hospital category. This should be consistent with the information recorded in the PHIS for the product with that particular unique product identification code. Leave blank for general products. <i>Note: All products categorised from Basic to Silver Plus are considered exclusionary.</i>	Drop down list: Gold Silver Plus Silver Bronze Plus Bronze Basic Plus Basic

Field	Data Entry Guidelines	Example
INSURED GROUP	<p>Select from the drop down list the insured group for the product. Do not use values that are not in the drop down list</p> <p>Enter information for each product subgroup separately even if different insured groups have the same price (e.g. include couples information in a separate row from families information even if they have the same prices).</p>	<p>Drop down list: ChildrenOnly Couple ExtendedFamily ExtendedSingleParentFamily Family Single SingleParentFamily 3+Adults</p>
ANNUAL EXCESS as at 1 April 2020	<p>Enter the amount of the excess for the product as at 1 April 2020. This is the maximum annual excess for the policy (i.e. \$500 should be entered if the excess is \$250 per admission per person but limited to a maximum of \$500 per year). This should be consistent with the information recorded in the PHIS for the product with that particular unique product identification code.</p>	\$500
ANNUAL CO-PAYMENT as at 1 April 2020 (Yes/No)	<p>Select from the drop down list whether the product has co-payments or not, as at 1 April 2020. This should be consistent with the information recorded in the PHIS for the product with that particular unique product identification code.</p>	<p>Drop down list: Yes No</p>
RESTRICTIONS as at 1 April 2019 (Yes/No)	<p>Select from the drop down list whether the product has restrictions or not, as at 1 April 2020. This should be consistent with the information recorded in the PHIS for the product with that particular unique product identification code.</p>	<p>Drop down list: Yes No</p>
2019 MONTHLY PREMIUM (\$) for products existing on 30 September 2019 (Leave blank for new products commencing on 1 April 2020)	<p>Enter the current price per month for the product. This price should reflect the full price and <u>exclude</u> the rebate, LHC loadings, and discounts.</p> <p>For new products commencing on 1 April 2020, please leave blank.</p>	\$100.07
2020 MONTHLY PREMIUM (\$) as at 1 April 2020 - for all products (new and existing)	<p>Enter the proposed new price per month for the product as at 1 April 2020, including for new products. This price should reflect the full price and <u>exclude</u> the rebate, LHC loadings, and discounts.</p> <p>For products terminating by 1 April 2020, please leave blank.</p>	\$101.67
TOTAL NUMBER OF PEOPLE COVERED BY THIS PRODUCT as at 30 September 2019	<p>Enter the total number of <u>people</u> covered by the policies comprising the insured group for the particular product as at 30 September 2019 (e.g. number of people covered by couples policies for the product). <u>Do not record SEUs.</u></p> <p>Please leave blank for new products commencing on 1 April 2020.</p>	2,000

Field	Data Entry Guidelines	Example
TOTAL NUMBER OF POLICIES COVERED BY THIS PRODUCT as at 30 September 2019	Enter the total number of <u>policies</u> comprising the insured group for the particular product as at 30 September 2019 (e.g. number of couples policies for the product). <u>Do not record SEUs.</u> Please leave blank for new products commencing on 1 April 2020.	1,000
AVERAGE AGE-BASED DISCOUNT CONVERSION FACTOR	The average aged-based discount conversion factor applied to all policies on this product. 100% should be applied to products that do not have age-based discounts or for all new products.	99.8 per cent
2019 MONTHLY INCOME FROM PRODUCT	This is an automated field that calculates the 2019 monthly income from all policies on the product based on 2019 monthly premium in column L multiplied by the total number of policies covered by this product as at 30 September 2019 in column O. Because there will be zero policies in column O for a proposed new product, this field will be zero for all new products.	
2020 PREMIUM INCREASE (\$)	This is an automated field that calculates the dollar value of the premium change between the 2020 monthly premium price in column M and the 2019 premium price in column L. For new products this field will be automatically flagged as a 'new' product. For terminating products this field will be automatically flagged a "terminating".	
2020 PREMIUM INCREASE (%)	This is an automated field that calculates the percentage change of the premium change between the 2020 monthly premium price in column M and the 2019 premium price in column L. For new products this field will be automatically flagged as a 'new' product. For terminating products this field will be automatically flagged a "terminating".	
2020 MONTHLY INCOME FROM PRODUCT	This is an automated field that calculates the 2020 monthly income for all policies on the product based on the 2020 monthly premium in column M multiplied by the total number of policies covered by this product as at 30 September 2019 in column O. Because there will be zero policies in column O for a proposed new product, this field will be zero for all new products.	

Template B (Financial Forecasts)

Please note the following guidance in completing **Template B**.

- Information requested in dollars should be entered as thousands of dollars (\$'000).
- Forecasts are required for the period October 2019 to March 2022.
- Figures under the Balance sheet and Capital Adequacy Standard for September 2019 should align with the September 2019 HRF602 returns.
- Hospital SEUs at September 2019 should reconcile with the HRF601 and HRF602.
- Expected dividend payments should be entered as a positive value and capital injections expected to be received as a negative value under 'dividend payments'.
- Capital Target Range should be expressed as total assets. This is the amount of assets required to be consistent with the targets outlined in the Capital Management Plan. Capital target range upper and lower bounds should both be entered. Where only a single target exists, this is to be repeated.

Template C (Snapshot)

Please note the following guidance in completing Template C:

- Insurers are only required to complete the white cells. Grey cells will auto-populate.
- Rate Protection Conversion Factor (%) will convert Excluding Rate Protection (%) into Including Rate Protection (%).
- Proposed changes to benefits, should include an estimated cost or saving as a percentage of total contribution income.
 - Savings should be stated as a negative amount as a percentage of Total Contribution Income.

Avoiding data issues and resubmissions

Each year a number of insurers are asked to resubmit applications due to incorrectly completing the approved form or for data issues. To avoid these in the coming round, insurers are asked to be particularly vigilant of data issues that have historically resulted in insurers being asked to resubmit.

To ensure each application does not contain data issues it is requested insurers check the following before submitting:

- No additional columns or rows are inserted into **Template B**.
- The excel spreadsheet does not contain links to other files.
- The capital target range is expressed as total assets, not net assets (capital).
- Cells surrounding the template are blank. Cells outside of the requested fields do not have checking or verification calculations.
- Changes to benefits in **Template C** that result in savings are expressed as a negative.
- Cells requesting a number have a number inserted and not text. Similarly that cells with a number have not been formatted to 'text'.
- Cells in **Template B** without a value have a '0' inserted and are not left blank.
- If an insurer has a single capital target rather than a range, this figure is entered into both the lower and upper bound.
- The formula cells have not been edited by the insurer.
- Data entered by the insurer should be values and not include calculations.
- Expected dividend payments should be entered as a positive value and capital injections expected to be received as a negative value under 'dividend payments'.

Health funds hit back after minister rejects 3.5 per cent premium hike

By **Dana McCauley**

November 25, 2019 – 12.00am

Insurers are appealing to federal Health Minister Greg Hunt to fast-track reforms aimed at lowering costs, as he comes under pressure to force funds to cap premium rises.

Private Healthcare Australia chief executive Rachel David said the industry was battling rising costs that were squeezing profit margins - with some funds in "negative territory" - making the minister's request for a 3 per cent rise "incredibly challenging".

Health Minister Greg Hunt is determined to keep a lid on health insurance premium rises. AAP

The medical devices industry, which is at war with insurers over their push for a crackdown on sales tactics that drive up overall costs, heaped political pressure on Mr Hunt by commissioning polling to back its demand that he use his powers to force a lower premium rise.

Results of a YouGov poll of 1000 people suggested three-quarters of Australians want the minister to "force private health insurers to use some of their \$1 billion in profits to keep premium increases under 3 per cent next year".

Mr Hunt has written to insurers demanding they resubmit applications for 2020, after being hit with requests for increases understood to be an average 3.5 per cent - more than double the rate of inflation and higher than this year's 3.25 per cent hike.

Dr David said for-profit health funds were battling rising costs, with ageing members putting in more claims, hospital costs increasing and suppliers of medical devices using sales tactics to drive up expenditure.

She said the trend was "not sustainable" and government intervention was needed.

Health funds made an average net profit margin of 4.2 per cent in the three months to September - 19 per cent lower than the same period a year earlier, when the average net margin was 5.2 per cent - the latest data from the Australian Prudential Regulation Authority shows.

Mr Hunt said the government was "on the side of the consumer" and was working hard to deliver the lowest private health insurance premium changes in 19 years.

"Private health insurance is an essential and valuable part of the health system, and our government is committed to improving value and affordability," he said.

Health regulations require the minister to approve insurers' proposed premium increases unless satisfied they are "contrary to the public interest".

Dr David said funds were not making "big profits", with lower margins than other categories of insurance due to the fact they paid out 80 per cent of premium revenue in claims.

Mr Hunt said the government had implemented "the most comprehensive reforms to private health insurance in over a decade" with changes including new gold, silver and bronze policies, and discounts for young people, introduced this year, making it "simpler and more affordable".

He is consulting on further changes to help lower insurer costs, including a review of how medical device manufacturers market and sell products [such as surgical glues, sponges and prostheses in private hospitals](#), after insurers blamed their sales tactics for a failure to deliver \$250 million in promised savings despite a 2017 agreement to lower prices.

Medical Technology Association of Australia chief executive Ian Burgess disputed this, saying Medibank, Bupa and NIB "have not paid once extra cent for medical devices in the past two premium years".

The minister is also considering including allowing health funds to pay for medical services to be delivered outside of hospitals at a lower cost.

Dr David said these changes were not expected to be delivered in time to affect health funds' costs for 2020, saying insurers had to base their premium increases on projections based on costs.

"We need that decision to be made now. The only thing we can factor in are the current levels of expenditure."

Code Compliance.....	11
Definitions	13

Introduction

What is the Private Health Insurance Code of Conduct?

Any reference to “we” or “our” is a reference to the signatory health funds to the Code.

The Private Health Insurance Code of Conduct (**the Code**) has been developed by [Private Healthcare Australia \(PHA\)](#) and the [Members Health Fund Alliance \(MHFA\)](#) as the bodies which represent private health funds, in consultation with private health funds themselves.

Private health insurance is an important and cost-effective way to protect you and your family against unexpected health issues, giving you more control over your health care, choice of services, choice of doctor and where you receive elective surgery. Private hospitals usually have shorter wait times for planned elective surgery than public hospitals.

As an industry, private health insurance funds are committed to helping you choose the best private health insurance for your needs.

The Code explains how this will be achieved and is a commitment by individual health funds to provide you with a standard of customer service, accountability and transparency. It only applies to health funds that are signatories to the Code and does not apply to the industry generally or its peak bodies, Private Healthcare Australia and the Members Health Fund Alliance.

At the end of this document, you will find a list of key terms and their definitions, which will assist you in reading and understanding the Code.

The Code sets out the information that your health fund will provide to you regarding its policies; the complaints handling process and what happens if your health fund needs to change your policy.

Under the Code health funds commit to:

- Helping you better understand the role of private health insurance in Australia’s healthcare system;
- Helping you understand the coverage provided in your policy;
- Assisting you to navigate the healthcare system and to use your private health insurance to claim for healthcare;

- Only offering you insurance based on your own personal needs;
- Providing you with clear, concise and relevant information about policies and benefits;
- Ensuring health fund employees are trained to clearly explain your health insurance options and to provide you with the information you need to make an informed choice about your private health insurance policy;
- Recording the advice given to you and maintaining those records;
- Resolving any complaints you might have with your health fund in a timely, efficient and transparent manner;
- Maintaining a fully-documented dispute resolution process for resolving any dispute between you and your health fund; and
- Working with the [Federal Government’s Private Health Insurance Ombudsman](#) to understand the sorts of complaints that are made against private health insurers and to use this information to improve our policies and procedures.

Commitment to compliance with key legislative and regulatory requirements

Private health insurance funds are required to comply with relevant legislation, including:

- *Private Health Insurance Act 2007*;
- *Private Health Insurance (Transitional Provisions and Consequential Amendments) Act 2007*;
- *Competition and Consumer Act 2010*;
- *Private Health Insurance (Prudential Supervision) Act 2015*;
- *Private Health Insurance (Prudential Supervision) (Consequential Amendments and Transitional Provisions) Act 2015*;
- *The Privacy Act 1988*;

- *Corporations Act 2001;*
- *Private Health Insurance (Complaints Levy) Act 1995;*
- *Private Health Insurance (Risk Equalisation Levy) Act 2003;*
- *Private Health Insurance Supervisory Levy Imposition Act 2015;*
- *Private Health Insurance (Collapsed Insurer Levy) Act 2003;*
- *Private Health Insurance (National Joint Replacement; Register Levy) Act 2009;*
- *Private Health Insurance (Prostheses Application and Listing Fees) Act 2007;*
- *Private Health Insurance (Health Insurance Business) Rules 2018;*
- *Financial Planning Association of Australia Code of Professional Practice;*
- *Unclaimed Money Act 1995;*
- *The Spam Act 2003 (Cth);*
- *Do Not Call Register Act 2006 (Cth);*
- *Private Health Insurance (Benefit Requirements) Rules 2011;*
- *Private Health Insurance (Complying Product) Rules 2015.*

Consumer Information

Health funds aim to make all their communication with you clear and easy to read, to help you understand what your health insurance policy covers and how to make the best use of it.

Health funds will also provide information to you in plain language.

Helping you choose the right private health insurance policy

Health funds are committed to ensuring you have access to comprehensive, up-to-date information so you can navigate the health system and make informed choices when purchasing or switching between private health insurance policies.

This includes ensuring that you have access to the following information:

- How the Australian health system works, including the healthcare options available through the public system (Medicare);
- How private health insurance works and the benefits it offers compared to the public system;
- Factors you should consider when choosing a private health insurance policy based on circumstances such as age, family situation and health needs; and
- The different health funds and policy options available to choose from.

Health funds will either provide you with the information listed above or provide internet links so you can access the relevant information.

On the health fund's website, you will have access to the comprehensive, independent information set out on the Department of Health and Commonwealth Ombudsman websites, as well as any relevant internet links. These sites contain detailed explanations of how the Australian healthcare system and private health insurance operate. A health fund's website will also outline how you can find and compare different private health insurance policies.

When you are choosing a private health insurance policy, health funds will make sure all of its sales material accurately reflects the cover offered.

When you join a health fund

Health funds will ensure that, prior to joining, you will be provided with information about your entitlement to benefits, including any waiting periods and pre-existing conditions, exclusions, restrictions, co-payments and/or excesses.

Upon confirmation of your acceptance into the health fund's policy, you will be provided with further information regarding the specific entitlements and exclusions relevant to your policy.

If you are an existing customer, you will be provided with advance notice of any changes that are made to your policy benefits.

Some funds may undertake a periodic review of your cover and suggest alternative policy options that might better suit you as your circumstances change over time. You should contact your health fund if you think your circumstances will change to discuss the options available to you.

If you want to transfer to another private health fund, your new private health fund will be provided with a Transfer Certificate that will help you change funds.

Your previous health fund will provide this within 14 days after you have told your fund that you want to transfer and your new fund has made the request.

Policy documentation

Policy documentation is the information regarding what is covered by your policy and what is excluded, as well as any restrictions on what you can claim for and limits on how much you can claim.

Health funds will:

(a) express all consumer information as clearly and simply as possible, using plain language and readily accessible formats

(b) ensure that our Policy documentation and product sales material accurately reflects the cover offered, and—as appropriate to a particular document's intended purpose—contains accurate information about:

(1) waiting periods and pre-existing conditions;

(2) what sorts of procedures and treatments are excluded from your policy and what that could mean for you;

(3) the restriction on benefits in your policy and what this could mean for you;

(4) co-payments and/or excesses;

(5) annual limits;

(6) an explanation of pre-existing conditions;

(7) how to find details of hospitals which the health fund have treatment agreements with;

(8) 'no gap' or 'known' gap doctors;

(9) how to find out if an extras or general treatment provider is either a preferred provider or is recognised by the health fund;

(10) how to find out about the health fund's privacy policy;

(11) how to access the health fund's complaints handling procedures;

(12) information about the existence of this Code, including the Code logo;

(13) advice that the documentation should be read carefully and retained; and

(14) where to find any additional rules or product disclosure statements.

Cooling off period

You can cancel your policy and receive a full refund of any premiums you have paid within 30 days of your policy starting, as long as you haven't yet made a claim.

Additional information from your health fund

At your request, your health fund will provide you with details of your entitlement to benefits.

You will also be provided with specific information on any changes to your policy. This information should be provided in a timely manner and will be in a clear and consumer friendly format.

Changes to Policies

From time to time, changes might need to be made to your policy.

These changes may be general membership updates to your policy or may extend to either hospital or general treatment (extras) cover benefits.

General principle in relation to detrimental changes to policies and benefits

Health funds adopt the approach that any detrimental change (that is not significant) requires a minimum of 30 days' notice.

General changes to hospital or general treatment (extras) policies

General changes to a hospital or general treatment policy include:

- A change of policy name; or
- A change to payment frequency or method.

These changes require a minimum of 30 days' notice to members.

A detrimental general change to hospital or general treatment (extras) policy include:

- Where a change to a payment frequency or method results in a payment frequency or method no longer being available, the health fund will provide a minimum of 60 days' written notice.
- Where closing a product has a significant detrimental effect to a policy holder, or group of policy holders (For example, when policy holders are required to move to an alternative product) the health fund will provide a minimum of 60 days' written notice.

Changes to hospital policy benefits

A detrimental change to hospital policy benefits includes:

- The removal of a clinical category;
- An increase to a policy holder's excess or co-payment; or

- A change in which an excess or co-payment may apply.

These changes require a minimum 60 days' notice to members.

Where the above changes to hospital benefits occur, health funds will:

- Not apply the changes to pre-booked hospital admissions prior to the notification date; and
- Put in place transitional measures for patients already in a course of treatment for a reasonable time period, for example, up to 6 months.

Changes to general treatment (extras) policy benefits

A detrimental change to general treatment (extras) benefits includes:

- The reduction of a limit;
- A change to entitlement under such limit;
- Removal of a service or modality covered under a general treatment (extras) policy.

These changes require a minimum 60 days' written notice to members.

Where the above changes to general treatment (extras) benefits occur, health funds will:

- Provide a transitional period for policy holders undertaking a course of treatment, for example, orthodontic or endodontic services, for up to 6 months.

Where a health fund provides benefits such as an accumulative roll over, a transitional period for unused benefits in the previous year may be provided for up to 6 months.

Dispute Resolution

Your health fund believes it is important to comply with a rigorous and credible standard of complaints handling.

It is also important the standard is independent of the private health insurance sector and adheres to global best practice in dispute resolution.

To that end, your health fund will:

- Comply with the global benchmark in complaints handling, as set out in the *International Standard, ISO10002:2018 Quality Management – Customer Satisfaction – Guidelines for Complaints Handling in Organizations* and/or the *Australian Standard AS/NZS 10002:2014 Guidelines for Complaint Management in Organizations*.
- Make information on the complaints-handling process available, including:
 - How complaints can be made;
 - Information that should be provided when making a complaint;
 - The process for handling complaints;
 - Time periods associated with various stages in the process;

- How your privacy and personal information is handled in accordance with the health fund's Privacy Policy;
- Advice on how to engage with the Commonwealth Ombudsman's complaint handling service if you are not satisfied with the outcome of the health fund's dispute resolution process; and
- How you can obtain information on the status of your complaint.

While health funds do everything possible to resolve a dispute, in some cases it is not always possible to reach a resolution.

If you and your health fund are unable to resolve the dispute you have the option of taking your complaint to the [Commonwealth Ombudsman](#).

To improve the effectiveness of the complaints handling process and to see what improvements can be made, health funds will periodically review their complaints handling process.

Intermediaries

As an industry, health funds are committed to helping you choose the best private health insurance for your needs.

Organisations other than your health fund may advise you about private health insurance or sell you private health insurance on a health fund's behalf. These organisations are known as intermediaries and can include insurance brokers, consultants and comparison websites.

There are many different types of arrangements health funds may enter into with intermediaries to provide services or act on their behalf in dealing with consumers. On occasions, health funds might also pay the intermediaries a fee or a commission when they sell insurance policies. Disclosure obligations require intermediaries to disclose if they have commission or referral arrangements. This means that intermediaries must take reasonable steps to make consumers aware of any commission or referral arrangements where the business receives a financial incentive from another supplier. Intermediaries do not need to disclose the nature or value of the financial incentive.

Some intermediaries have obligations under their own industry self-regulatory code of conduct titled the [Private Health Insurance Intermediaries Code of Conduct](#). Health funds will abide by the obligations under this Code in relation to intermediaries if the intermediary is a signatory to the Code.

If the intermediary is not a signatory of the Private Health Insurance Intermediaries Code of Conduct, it is the health fund's responsibility to demonstrate that the intermediary is meeting the compliance requirements equivalent to the Private Health Insurance Intermediaries Code of Conduct.

What is required of health funds who work with intermediaries

Health funds will ensure that all arrangements with any intermediary clearly and unambiguously set out the obligations of each party and are able to be verified, if required, by an audit.

Health funds require the intermediary and its employees to do the following:

- Discharge their responsibilities and duties competently, with integrity and honesty, in compliance with the law and to exercise reasonable care and skill;
- Make clear disclosures to all consumers who deal with

the intermediary advising if the intermediary is paid any fees, commissions or other benefits for health insurance services;

- Make clear disclosures to all consumers who deal with the intermediary in relation to health insurance business, as well as the nature of their relationship with the health insurance business;
- Not provide advice, make representations or otherwise act outside the areas of activity or private health insurance products authorised under any agreement, arrangement or understanding;
- Have the necessary skills to represent a health fund and its products; and
- Have an effective alternative dispute resolution procedure for resolving a dispute between a consumer and the intermediary.

If an intermediary is required or authorised under an agreement to provide information about private health insurance products to consumers, health funds will ensure that the agreement requires the intermediary to:

- Only provide to the consumer copies of product sales material and policy documentation that comply with the requirements of this Code;
- Explain the consumer's options clearly, using plain language and provide the information a consumer requires to make an informed choice regarding their private health insurance purchase; and
- Keep appropriate records of advice given to consumers.

Intermediaries are also required to:

- Maintain confidentiality regarding any confidential information in relation to consumers or health fund's business and comply with relevant privacy laws;
- Maintain records required by law and comply with legal requirements for production of, access to, or copying of such records, and provide such information as may be legally required by any regulatory or other authority;
- Comply with the provisions of the *Private Health Insurance Act 2007*, the *Competition and Consumer Act 2010*, and any other relevant laws; and
- Comply with any applicable industry code where relevant.

Training

Health funds will require intermediaries (including call centre workers) to possess the necessary skills appropriate to the private health insurance products they are promoting or selling and the activities they are undertaking. This will ensure that call centre employees can provide appropriate advice taking into account a consumer's individual circumstances.

To achieve this, health funds must provide appropriate ongoing and documented training to intermediaries.

Code Compliance

To ensure the Code is adhered to by participating health funds and is as effective as possible, Private Healthcare Australia has established a Code of Conduct Compliance Committee (**the Committee**), comprising independent consumer and industry representatives.

The Committee has the responsibility to ensure the Code is fully complied with by health funds and does this by:

- Admitting health funds to participate in the audit process;
- Monitoring and enforcing compliance by participants by conducting audits, as well as requiring the health funds to conduct full self-audits and triennial audits;
- Receiving complaints about any alleged breach of the Code;
- Imposing sanctions for breaches of the Code; and
- Publicising an annual report on compliance and operation of the Code.

Monitoring compliance

Health funds are required to submit an annual self-audit of their compliance to the Code, to the Code's independent auditors using the form prescribed by the Committee.

At other times, the Committee can also verify a health fund's ongoing compliance with the Code through full-compliance audits and spot audits of the health fund either in full or in part. These audits are undertaken by independent auditors.

Annual report

The Committee will publish an annual report on the operation of the Code, including a summary of compliance. This report will be published on the websites of PHA and the MHFA.

Complaints handling

The Committee will accept complaints about alleged breaches of the Code from other health funds or relevant bodies. It will respond to complainants within 21 business days, provided all necessary information is available to the Committee and any required investigation has been completed. It will keep complainants informed of the progress of the response to the complaint, any decision and

information on how a response can be reviewed.

As part of its annual reporting process, the Committee will from time to time receive and analyse data on consumer complaints from the Office of the Commonwealth Ombudsman to identify any systematic issues and areas where the Code can be improved.

Non-compliance with the Code

The Committee may investigate suspected or alleged breaches of the Code and make findings in relation to the suspected or alleged non-compliance. Such investigations will involve consultation with the health fund, which is required to cooperate with the Committee and provide information about the subject of the investigation.

Any findings will be provided in writing to the health fund, which must take all reasonable steps to ensure that procedures are established to prevent any breach identified by the Committee from reoccurring.

If the Committee has determined that a health fund has not cooperated with the Committee, has not materially complied with the Code or has not put in place procedures to prevent the reoccurrence of the breach, it may apply sanctions.

Sanctions imposed by the Committee

The Committee imposes and reviews sanctions in accordance with a defined/documented procedure.

The Committee may give notice to the health fund in accordance with a documented procedure, stating that it proposes to impose sanctions on the health fund for non-compliance with the Code according to documented policy.

Sanctions can be applied if the health fund:

- Refuses or fails to cooperate with a request of the Committee in response to an alleged or suspected breach of the Code.
- Fails or refuses to comply with any recommendation by the Committee.
- Fails to adopt or comply with amendments to the Code within the timeframe required, and without an extension of time being granted by the Committee.

- Fails to implement procedures to prevent a reoccurrence of breaches identified by the Committee.

Failure to comply

If a health fund fails to comply with a sanction, the Committee may do one or more of the following:

- Take action to enforce compliance with the Code or sanction.
- Disqualify and immediately ban the health fund from using the Code of Conduct tick logo.
- Name the health fund in the annual Code of Conduct report as having not complied with the Code and/or having not complied with a sanction.
- Report the breach on the PHA and Members Health Fund Alliance websites.
- Request that the health fund report the breach on their own website.
- Request that any issued sanctions be published on the non-compliant health fund's website.
- In cases where the Committee considers the breach of the Code may constitute a breach of any regulatory or legislative obligation, report the health fund to the appropriate government agency.
- Request the health fund publish corrective advertising within one month of the request.

Definitions

Agreement Private Hospitals – These are hospitals, including day hospitals, where a health fund has negotiated agreed charges for treatment within those hospitals. In most cases, where the treatment is included under the customer’s cover, the only out-of-pocket expenses will be those applied to a level of cover, for example, excesses and co-payments. All agreement hospitals are obliged to provide an estimated out-of-pocket cost, if any, prior to admission.

- *Public Hospitals* – Public hospitals do not negotiate agreed charges with private health funds, rather, they have their charges set by State Governments. In most cases, a health fund will pay the set public hospital charges, less any excess or co-payment applied to a level of cover.

Annual Limit – A maximum benefit payable for a particular service, or group of services with a 12-month period. Annual limits can be calculated based on a calendar year, or financial year, or for every 12-month period from the anniversary of the membership commencement date.

Benefit

- *General Treatment benefit (also known as extras or ancillary)* – A benefit refund where the service is provided by a registered provider with the health fund, not covered by Medicare, or in some circumstances is not covered within a hospital agreement. Some examples of services commonly covered under general treatment are dental, physiotherapy, optical and ambulance (depending on the level of cover).
- *Default benefit* – The minimum amount of money that a health fund is permitted to pay to a hospital for inpatient treatment under your policy.
- *Hospital Cover benefit* – This is the benefit that a health fund pays to a hospital for a policy holder under the membership. It is paid according to the level of cover and includes hospital services like bed accommodation, theatre charges, medical treatment and in most cases extends to ambulance cover.

Clinical Categories (also known as product tiers) – What is, and is not, covered in the Gold, Silver, Bronze and Basic Hospital Tiers is based on clinical categories. Each standard clinical category—for example, ‘bone, joint and muscle’ category or ‘heart and vascular system’ category—sets out the hospital treatments that must be covered by your private health insurer. If a policy covers a certain clinical category, then it must cover everything listed in it—not only some things. Further information on clinical categories

is available at: https://www.privatehealth.gov.au/health_insurance/howitworks/clinical_categories.htm

Commonwealth Ombudsman – The Commonwealth Ombudsman protects the interests of private health insurance consumers.

More information can be found here:

<https://www.ombudsman.gov.au/How-we-can-help/private-health-insurance>

Community Rating – Private health insurance is community rated. Community rating means that every person is entitled to buy the same health insurance products or renew the same products for the same price as any other person (except where State-based pricing, Lifetime Health Cover loading or aged based discount applies). A health fund cannot charge one person more – or refuse to cover them – based on what health conditions they have or how often they have claimed on their health insurance in the past.

There are some exemptions to this, for example, where a person has a Lifetime Health Cover penalty, or a person has an aged-based discount applied to their premium.

Consumer – A person who has purchased or is considering the purchase of a private health insurance policy.

Course of Treatment – A plan made up of several cycles of treatment. This can include visits rather than medication. I.e. an agreed documented plan between a consumer and a provider for more than one treatment.

Co-payment (also known as a daily excess or overnight excess, referred to as excess in this document)

- *Hospital co-payment* – Is an agreed, upfront contribution amount under the level of cover that a policy holder agrees to, in exchange for a lower premium. This may be an agreed reduced daily contribution or an agreed upfront larger monetary amount, or both. For example, \$50 per night for 5 nights, or the first \$250 co-payment on an overnight stay, or both excess and co-payment combined. Usually, the higher the excess and/or additional co-payment, the lower the premium.
- *General Treatment co-payment (also known as extras or ancillary)* – Some general treatment products require a policy holder to pay a contribution amount before benefits are claimable. This is commonly known as a co-payment and is more likely when purchasing items such as CPAP machines (breathing apparatus) or weight loss memberships, for example, a benefit of \$300 after a co-

payment of the first \$50 by the policy holder. A general treatment co-payment is less likely on services such as dental, physiotherapy and optical. Policy holders are advised to always check with their health fund prior to any claim for services.

Detrimental Changes – These are changes made to a level of cover by the health fund or may be imposed across all health funds on an industry basis outside of a health fund’s reasonable control.

Health funds adopt the approach that any detrimental change, that is not significant, requires a minimum of 30 days’ notice. Where the rule is imposed outside of the health fund’s control, there is flexibility to deal with special or unusual circumstances on a case-by-case basis.

Where a health fund removes or reduces benefits that are deemed a significant detrimental change, the fund must provide the policy holders on that cover with a minimum of 60 days’ notice and in some cases provide additional flexibility to those directly affected. For example, a reduction or removal in benefit for a clinical category where a patient is undertaking a course of treatment.

Dispute – This is where a policy holder and health fund disagree with the outcome of services such as payment of benefits, premiums, a change in benefits or information provided and/or any other matter. Policy holders should obtain a copy of the health fund’s dispute resolution policy and submit a complaint to the health fund following that process.

Where a policy holder believes the outcome is unsatisfactory following all actions taken with the health fund, they can escalate the complaint to the Commonwealth Ombudsman, who acts as an independent adjudicator through their own dispute resolution service.

Excess (also known as **co-payment** in this document) – An agreed upfront contribution amount, under the level of cover that a policy holder agrees to, in exchange for a lower premium. An excess may apply to a day hospital procedure or overnight stay in hospital, usually with a maximum per person, or overall policy limit.

Gap Payment (also known as out-of-pocket expenses or gap cover) – In most cases, referred to as the amount a policy holder has to pay above the Medicare and health fund benefit for medical treatment while in hospital.

This may also extend to additional hospital services like; prostheses items or pharmacy services where the charge is above the agreed fund benefit. In all gap cover charges, the doctor, hospital or service provider is obliged to provide the policy holder with informed financial consent, prior to treatment.

Hospital Cover – A product that provides services and benefits for inpatient medical treatment in a hospital setting. There are four tiers of hospital cover: Gold, Silver, Bronze and Basic.

Informed Financial Consent – An agreement between health funds and their contracted service providers that all patients will be provided with informed financial consent and a quote for out-of-pocket costs, prior to the agreement for services.

Further information on informed financial consent and consumer rights as a patient is available at: <https://www.ombudsman.gov.au/publications/brochures-and-fact-sheets/factsheets/all-fact-sheets/phio/informed-financial-consent>

Intermediary (also known as insurance brokers, consultants or comparator websites) – A third- party organisation or business that offers advice or compares health insurance products on behalf of a health fund. In most cases these organisations may be paid a fee or commission.

Lifetime Health Cover (also known as LHC) – A government initiative for private hospital insurance introduced on 1 July 2000, to encourage participants to take out and maintain private health insurance before their 31st birthday.

A person who delays taking out a hospital policy will pay a 2% loading on top of their premium for each year they are aged over 30, to a maximum loading of 70%. This loading is removed after 10 years’ continuous hospital cover.

The Lifetime Health Cover loading does not apply to general treatment cover.

Policy Documentation (also known as health fund brochure, product disclosure statement or Private Health Information Statements (PHIS)) – This documentation provides a full description of all the terms and conditions, benefits, restrictions and/or exclusions under the cover. This documentation is part of the legal requirement that forms part of your insurance contract.

A health fund is also required to provide its policy holders with an annual PHIS. To provide consumers with a simple comparison tool, all private health insurers are required to provide details of their products online at: <https://www.privatehealth.gov.au/>.

Pre-Existing Condition – A pre-existing condition is an ailment, illness or condition, the signs or symptoms of which, in the opinion of a medical practitioner appointed by the health insurer, existed at any time during the six months prior to taking out hospital cover or upgrading to a higher level of cover.

Health insurers are able to impose a maximum 12 month waiting period for hospital treatment for ailments, illnesses or conditions that are considered to be pre-existing.

For hospital psychiatric services, rehabilitation and palliative care, the maximum waiting period is two months, even if the condition is pre-existing. If you are going to hospital during your waiting period, it is important to check with your health insurer prior to the admission as to whether you will be covered or if the condition will be deemed pre-existing.

Private Health Insurance – There are generally three categories of private health insurance policies: hospital, general treatment and combined policies.

Hospital cover provides benefits for hospital and medical services when you are admitted to hospital.

General treatment/extras cover primarily provides benefits for services such as dental, physiotherapy, optical and some therapies.

Combined policies are combined hospital and general treatment covers that allow consumers to “mix and match” their insurance. However, some health funds only provide set packaged products. Most health funds provide some coverage for ambulance services, while

others offer an additional ambulance policy.

Private Healthcare Australia Limited (PHA) – A body that represents Australia’s private health insurance industry for the benefit of its members.

Transfer Certificate (also known as a clearance certificate) – This document is generated when a person ceases cover with a health fund. It provides level of cover information and Lifetime Health Cover entitlements and ensures that this information is considered when transferring or rejoining private health insurance and where applicable, waiting periods are exempt.

Waiting Periods – How long you will need to be a member before you are eligible for benefits.

The Government has set maximum waiting periods for benefits for hospital services, but insurers can set their own waiting periods for general treatment benefits. The PHIS lists waiting periods in months for standard services.

AR

.....
Signature of witness

ADELAIDE NANCY ROSENTHAL, 447 COLLINS STREET, MELBOURNE VIC 3000
An Australian Legal Practitioner within the meaning of the Legal Profession Uniform Law (Victoria).
A person authorised under section 19(1) of the Oaths and Affirmations Act 2018 to take an affidavit.

Termination and Transition Guidelines for Hospitals and Insurers

Introduction

The Termination and Transition Guidelines for Hospitals and Insurers (the guidelines) have been developed in consultation with the private health industry to support consumer protection and minimise undue disruption and risk to the industry when contractual agreements between health insurers and hospitals are terminated.

The guidelines were developed by the Office of the Commonwealth Ombudsman (the Office), in its capacity as the Private Health Insurance Ombudsman. Public consultation on the guidelines was conducted in December 2019, with submissions provided by a range of parties in the private health insurance industry.

They are intended to support the resolution of disputes. They are not legally enforceable but act as a guide for best practice. They operate externally to any existing agreement or arrangement in place between the parties.

Background

Contract cessation and contractual disputes between insurers and hospitals have the potential to adversely affect consumers' benefits under their health insurance. The Office has a role in ensuring the interests of consumers are protected in these circumstances. The guidelines are intended to provide guidance on appropriate transitional arrangements and communication with members and patients in the event of a contract cessation or dispute. The Office's expectation is that insurers and hospitals will abide by the guidelines and work in good faith to minimise impact of these disputes on consumers.

The decision to terminate a contractual agreement is a significant decision for any hospital or health insurer. The financial impact of such a change on the hospital can be considerable, depending on the extent to which those insurer's members contribute to hospital utilisation and income. Equally, the impact on an insurer can also be significant, depending on the location of and services provided by the hospital, and the potential financial impact of members transferring to other insurers.

Regardless of the financial impact, such changes can be disruptive and confusing to patients, doctors, and the staff of health insurers and hospitals. As with any significant change, disruption and adverse effects can be minimised by effective transition planning and change management.

In addition to considering the financial and management implications for the hospital and health insurer, transition planning and change management should focus on avoiding undue disruption and disadvantage to patients, doctors and staff of health insurers and hospitals. This is important in maintaining a positive, professional working relationship with all healthcare providers and insurers, and not diminishing the public perception of the value of private health arrangements.

Insurers and hospitals should also ensure that any public statements made by them, or on their behalf, are factual and neutral in tone, and not likely to cause confusion and concern to members and patients. Communications that are intended to put the case for one party and denigrate the other can have a negative impact on consumer perceptions of the industry and make it more difficult for the parties to resolve the dispute. Both parties need to bear in mind that in the longer term, they are likely to be in contract again and it is in their interests to take a longer-term view of the dispute.

Notice of termination

The terms of the agreement should specify the required minimum notice period for advising of a decision to terminate the agreement. Most agreements will require 30 days as the minimum notice period.

However, a longer period of notice is preferable in some cases, to ensure that affected members receive adequate notice of the change. A minimum notice period of at least 50 days is likely to be necessary where members of the particular insurer make up a significant proportion of the hospital's admissions or where the hospital provides a significant proportion of services to the insurer's membership.

The Ombudsman recommends a 50 day notice period as the minimum period of notice consistent with adequate transition planning and change management.

When a hospital is giving notice of termination: the notice of termination should be in writing to the insurer's provider relations contact (or as specified in the Agreement) and copied to the insurer's Chief Executive Officer (CEO). The notice should clearly indicate the proposed date of cessation of the agreement arrangements.

When an insurer is giving notice of termination: the notice should be in writing to the hospital CEO/and or group CEO (or as specified in the Agreement) and copied to the hospital's payer relations contact and should clearly indicate the proposed date of cessation of the agreement arrangements.

The notice of termination should also include the name and contact details of the staff member responsible for settling and dealing with transition and out-of-contract arrangements, and request a contact name and details from the other party for these purposes and indicate a willingness to commence discussions on these issues immediately.

Transitional arrangements

On cessation of an agreement, at the end of the period of notice or disengagement, health insurers and hospitals may agree to appropriate transitional arrangements to apply to patients in a range of circumstances. The following transitional arrangements should apply as a minimum when there is no existing arrangement in place:

- **Treatment commenced:** For patients admitted prior to the effective date of the agreement termination but discharged on or after termination, the terms and conditions of the terminated agreement should apply. The hospital should accept these rates as payment in full (subject to any applicable excess/deductibles).
- **Pre-bookings (non-pregnancy and birth):** For patients with a booking received by the hospital prior to the date of agreement termination, including bookings notified by the doctor or where the patient has completed the necessary forms, but where

admission occurs within six months (or any longer period agreed between the insurer and the hospital) of the date of termination of the agreement, the terms and conditions of the terminated agreement should apply. The hospital should accept these rates as payment in full (subject to any applicable excess/deductibles).

- **Pregnancy and birth pre-bookings:** For pre-booked pregnancy and birth patients with a booking received by the hospital prior to the date of agreement termination, including bookings notified by the doctor, the terms and conditions of the terminated contract should apply. The hospital should accept these rates as payment in full (subject to any applicable excess/deductibles).
- **Course of treatment:** For all patients undertaking a course of treatment (e.g. chemotherapy, dialysis, psychiatric, rehabilitation¹), the terms and conditions of the terminated agreement should apply. The hospital should accept these rates as payment in full (subject to any applicable excess/deductibles). The terms and conditions of the terminated agreement should continue for the duration of the course of treatment or a continuous period of up to 6 months (or any longer period agreed between the insurer and hospital) from the termination of the agreement, whichever occurs first. Insurers and hospitals should be flexible with this timeframe if the patient's particular circumstances make it difficult for them to access alternative services within this timeframe.
- **Emergency admissions:** For emergency admissions, the terms and conditions of the terminated agreement should apply for a continuous period of at least 3 months, or any longer period agreed between the insurer and the hospital (subject to any applicable excess/deductibles).

The definition of emergency admission should be agreed between the fund and the hospital and such agreement or, in the absence of agreement, will include any of the following:

- At risk of serious morbidity or mortality and requiring urgent assessment and resuscitation.
- Suffering from suspected acute organ or system failure.
- Suffering from an illness or injury where the viability of function of a body part or organ is acutely threatened.
- Suffering from a drug overdose, toxic substance or toxin effect.
- Experiencing severe psychiatric disturbance whereby the health of the patient or other people is at immediate risk.
- Suffering from severe pain where the viability or function of a body part or organ is suspected to be acutely threatened.
- Suffering acute significant haemorrhaging and requiring urgent assessment and treatment.
- Patient requires immediate admission to avoid imminent morbidity or mortality and where a transfer to another facility is impractical.

¹ 'Course of treatment' is not limited to the examples listed above.

Communications with members/patients

Where there is dispute over a contractual matter, insurers and hospitals should ensure that any public statements made by them or on their behalf are fair and reasonable and do not include any information or comment that could create adverse publicity or negative perceptions of the other party to the dispute.

Information and comment which should be avoided includes:

- comparison of benefits or prices offered with those applying under agreements with other parties
- imputing motives to the other party
- commenting on the financial position or ownership structure of the other party
- denigrating the quality of services or facilities provided by the other party
- suggesting that consumers do not use the services of the other party.

It is preferable that both parties use the same wording in their communications to avoid any confusion. The Office can give guidance and advice on any proposed wording of communications to members and patients or public statements, if requested to do so, by either party to an agreement termination.

The timing of communications to members and patients should be a matter for discussion between the parties, to minimise confusion to members and patients and ensure they have full information about the issue.

Where there is no existing arrangement regarding the timing of communication of termination to members and patients, the Ombudsman recommends 50 days' notice for significant changes to hospital benefits and 30 days' notice for other changes to hospital benefits.

Health insurer communications

The primary obligation for communication with members rests with the health insurer.

The Ombudsman recommends that the communication should include advice on transitional arrangements.

This communication may include advice on:

- which hospitals have agreements with the health insurer
- which hospitals will no longer have agreements with the insurer
- the potential for out-of-pocket expenses for treatment at a non-contracted hospital, and
- how to help avoid out-of-pocket expenses.

The communications should not advocate that the member seek treatment in a particular hospital or class of hospitals (e.g. contracted hospitals only).

The insurer should provide individual written advice to the following categories of members:

- where possible to do so, patients currently in-hospital or booked for treatment, including those booked for pregnancy and birth and those with on-going arrangements (e.g. chemotherapy)

- regular patients of the hospital (those patients whose records show they have used the hospital in the past two years), and
- members whose records show they live in the catchment area for the hospital.

The insurer should also communicate more broadly with members who may be affected by press announcement or regular newsletter. The method and extent of communication will depend on the size and location of the hospital and utilisation patterns.

Insurers may choose to communicate with members who are covered by the transitional arrangements, once they receive this information from the hospital, in order to re-assure them that they will be covered for their admission.

Hospital communications

Hospitals may also choose to communicate with current, former or potential patients and referring doctors.

The Ombudsman recommends that the communication should include advice on transitional arrangements.

These communications may include advice on:

- which insurers have agreements with the hospital
- which insurers no longer have agreements with the hospital
- the potential for out-of-pocket expenses for treatment of members of a non-contracted insurer, and
- how to avoid out of pocket expenses.

The communications should not advocate that the member transfer to a particular health insurer or class of insurers (e.g. those with which the hospital has a current agreement).

Hospitals should provide insurers with a list of patients that fall within the scope of the transitional arrangements as soon as practicable but no later than 14 days after the date of termination.

The insurer will confirm that the list matches their own records and both parties will address any discrepancies within 10 business days from the receipt of the list by the insurer.

Discussions between insurers and hospitals about out-of-contract arrangements for patients not covered by transitional arrangements

Insurers and hospitals will communicate directly with each other to confirm arrangements to apply from the date the agreement is terminated, as soon as practicable after the notice of termination is provided.

The Ombudsman expects these matters to be discussed, to some extent, prior to the notice of termination but also expects there to be additional discussion after the notice of termination in order to finalise and confirm:

- the rates of benefit that will be paid by the insurer in the out-of-contract situation²
- the billing arrangements to apply, both in respect of patients covered by the transitional arrangements and bookings made post-termination
- arrangements and contacts for dealing with any cases of special circumstance that may arise but are not covered by the general transition arrangements, and
- approaches to communicating with patients, members and doctors.

Billing Arrangements

Payment or billing arrangements should not be used as a mechanism for pressuring the insurer or hospital.

Arrangements that require full upfront payment, in all cases, should be avoided because they unduly disadvantage or inconvenience many patients.

A hospital may, however, choose to request upfront payment for any portion of the hospital's charge that is not covered by health insurer benefits, provided that informed financial consent for any out-of-pocket costs is obtained from the patient.

Health insurers should pay valid claims paid via ECLIPSE within 60 days or as per the relevant contractual agreement.

Regardless of the billing arrangements adopted in the out-of-contract situation, the Ombudsman's view is hospitals retain an obligation to provide for patient-informed financial consent, prior to admission, where practicable.

At a minimum this should include advice of the likely hospital charges and advice that the (prospective) patient should confirm benefits with their insurer, prior to admission, if possible. The hospital should provide as much assistance as possible to enable members to understand what their out of pocket expenses will be.

² These will vary depending on the approach of the insurer and factors such as whether or not the hospital is eligible for second tier benefits. In some cases the insurer may be prepared to maintain old contract rates or higher for some treatments)

Section 12: Privacy notice	8
Section 13: Contact, Feedback and Complaints	9
Section 14: Glossary of important terms	10

Section 1: About MediGap and the MediGap Schedule of Benefits

MediGap is a network comprised of registered medical specialists who may elect to charge the MediGap fees when treating nib Members. MediGap and the MediGap Schedule of Benefits are designed to remove the Gap for your patients. MediGap is a No-Gap Scheme.

Honeysuckle Health acts as nib's agent in managing nib's MediGap network on nib's behalf.

Once registered for MediGap, participation is voluntary and on a case-by-case basis. For each service you provide to a nib Member, you may elect whether to charge for your services through MediGap. For more detail on how to submit claims when choosing to do so through MediGap, or if you elect not to, please refer to Section 5: Claiming Requirements.

MediGap is a no-gap scheme. When billing through the Scheme you cannot charge the Member a Gap. If your charge equals the relevant fee on the MediGap Schedule of Benefits, we will pay the invoice in full and the Member will have no Gap.

If you decide to charge above the MediGap Schedule of Benefit, nib's MediGap Benefits will not be payable and the maximum nib will pay in this circumstance is 25 per cent of the MBS Fee.

If you elect to charge for a service through MediGap, you acknowledge and agree that the Member will not be charged any additional booking, administration, technology or facility fees, Known Gaps or any other such fees related to that Treatment. The MediGap Benefits are identified and described by the corresponding Commonwealth Medicare Benefits Schedule (MBS) item number in the MediGap Schedule of Benefits available at nib.com.au/providers/medigap

The MediGap Network Schedule of Benefits shows the maximum amount nib will pay you under MediGap. The MediGap Benefit for a service is the total amount payable to you for that service (which includes 100% of the MBS payable for the service) and the MediGap Benefit will be the full and final payment for your Claim.

We acknowledge the right of medical practitioners to exercise clinical independence at all times in relation to the provision of medical services. We will not interfere in the clinical relationship between medical practitioners and their patients.

Section 2: How these Terms and Conditions apply

These Terms and Conditions apply to nib MediGap. By applying for registration with MediGap and each time you submit a MediGap claim, you acknowledge that you have read and agree to comply with these Terms and Conditions. It may be necessary from time to time for us to:

- change these Terms and Conditions; or
- change the MediGap Benefits or, add or remove any MBS item in the MediGap Schedule of Benefits,

by providing notice on nib.com.au/providers/medigap and if applicable, writing to nib members who have claimed under their insurance policies for any of the affected procedures in the previous 2 years where that procedure was part of an ongoing course of treatment.

Your use of MediGap after any amendments to the Terms and Conditions constitutes your agreement to comply with the amended Terms and Conditions. Accordingly, you should regularly review the MediGap website to inform yourself of any changes to the Terms and Conditions. Further details of such changes will be made for available for nib members at nib.com.au/health-information/going-to-hospital/nib-medigap

Any changes made to these Terms and Conditions or the MediGap Schedule of Benefits will not affect any Claims already submitted by you on, or prior to, the date of the change.

Exclusivity of the GapSure network (Anaesthetics)

Please note that you are not permitted to be registered with both MediGap and the GapSure Anaesthetics network simultaneously. It is a condition of your participation in GapSure that you will be deregistered from MediGap, and Honeysuckle Health will coordinate this on your behalf at time of registration. You may reregister with MediGap if you choose to resign from GapSure.

Cover for nib members

In addition to nib branded products; nib underwrites branded Products including, but not limited to APIA Health Insurance, Qantas Insurance, Suncorp, AAMI, ING Health, Priceline Health Insurance and United Healthcare Global for Medicare eligible residence in Australia.

These Terms and Conditions apply to nib Members, including Members that hold these branded Products and partners we may work with in the future. A full list of nib's partnerships and more information is available at nib.com.au/providers/medigap

The MediGap Schedule of Benefits for nib patients also applies for these Members.

Section 3: Practitioner eligibility for MediGap

To apply for registration in MediGap, please complete the registration form which can be found at <https://register.honeysucklehealth.com.au/for-providers/medical-network-registration/>

Your registration will be backdated for three months from the date the application is received by Honeysuckle Health, meaning services provided to eligible Members during that three-month period can be charged under MediGap. Any requests to backdate registrations beyond three months will need to be submitted in writing, and may be accepted at nib's discretion.

At the time of your registration and at all times during your participation in MediGap, you must meet the following requirements:

- be registered with Medicare Australia for the specialty being claimed;
- hold medical indemnity insurance with a recognised indemnity provider with a minimum sum insured of \$20 million;
- not allow another person to perform services using your provider number;
- bill nib directly when charging a service through MediGap; and
- otherwise comply with these Terms and Conditions.

You are not eligible to participate in MediGap if:

- you are treating a Public Patient at a Public Hospital; or
- you are a salaried practitioner at a Public Hospital and are treating Private Patients covered by the registered participating health fund at a Public Hospital; or
- you are a pathologist; or
- you are, or become, unregistered or have your registration suspended under the laws of the relevant state or territory within Australia, in which case you must immediately notify nib; or
- we suspended or cancelled your registration with MediGap under Section 10: Suspension and Cancellation.

Section 4: Patient eligibility for MediGap

A Member may be eligible for MediGap Benefits if at the time of receiving a service from you, the Member:

- receives treatment from you that has an MBS item number specified in the MediGap Schedule of Benefits. MediGap does not apply to consultations before or after treatment or In-Patient pathology;
- is eligible for Benefits for the Treatment under a Hospital Product to which MediGap applies;
- is not in arrears with their Premiums;
- is not subject to a Waiting Period in respect of the service;
- is eligible to receive Medicare Benefits; and
- is not entitled to Compensation.

We recommend practitioners confirm a Member's eligibility prior to the service by contacting nib on 1300 853 530 or any other nominated contact channels.

If a Member is ineligible for MediGap Benefits, it will be necessary for you to issue an invoice so they can claim their benefit entitlements from Medicare and nib (if applicable). The maximum that nib may be able to pay in this circumstance is 25 per cent of the MBS Fee.

Section 5: Claiming requirements

Claims can be submitted electronically using the Medicare Eclipse system, even when you choose not to participate in MediGap, or manually to nib via post or email. Please include your official invoice and an accompanying batch header when submitting manually. It will be necessary to include the following details as part of your MediGap claim:

- Member's policy/Membership number;
- Member's name, address and date of birth;
- Member's current Medicare card number, including the patient reference number; and
- the MBS item numbers, associated charges and the date of service for inpatient treatment provided.

When participating in MediGap, or not, on a case-by-case basis it is important to note electronic claims do need to be submitted to reflect the choice you have made.

When participating, and therefore **not** charging the Member a Gap, selecting **Agreements (AG) or Scheme Claims (SC)** is required.

For the cases you have decided to charge above the MediGap rate, passing on an out-of-pocket expense to the member, one of three selections can be made: **Patient Claims (PC), Billing Agent (MB) or Two Way (TW)**.

More detail on Simplified Billing and Eclipse can be found on the **Services Australia website**. Additionally, it may be necessary for your practice to contact your system administrator as there could be variations in your practice management software.

From time to time, it may be necessary for us to request information in addition to the above to assist in establishing details of an admission or treatment provided, or to reconcile our records. More information about how to claim is available at **nib.com.au/providers/medigap**

Claim rejections

There may be times where nib will be unable to pay claims for MediGap Benefits. MediGap Benefit claims may be rejected, at the time of claims submission or after review, for reasons including, but not limited to:

- if you or the Member do not meet the requirements in Sections 3 and 4; or
- if insufficient or incorrect details are provided on the official invoice or batch header; or
- if the fee charged by you exceeds the MediGap Benefit payable for that service (in which case the Member will need to be advised by you – see Section 9); or
- where your fees are equal to or below the MBS fee; or
- where the Claim is sent directly to Medicare or to the Member instead of to nib; or
- Where the MBS claimed does not meet the MBS description or explanatory notes; or
- where a Claim is lodged with nib more than two years after the date of service; or
- for any service where the Member is an Outpatient; or
- any service where the Member is classified as a Public Patient; or
- Where the claim is detected to be the result of non-compliance with these Terms and Conditions or where nib determines the billing practice to be inappropriate or incorrect.

Nib will return rejected claims to you and may ask for the invoice to be:

- amended where appropriate and re-submitted;
- sent to the Member to be claimed through Medicare and nib (if applicable); or
- sent to the Member noting that the item shown on the account is not claimable through Medicare or nib.

Section 6: Payments of MediGap Benefits

If you provide a service specified in the MediGap Schedule of Benefits to a Member and:

- you meet the eligibility requirements in Section 3;
- the Member meets the eligibility requirements in Section 4;
- your claim meets the requirements of Section 5; and
- we have received Medicare Benefits for that service,

nib will pay you the MediGap Benefit for the treatment into your bank account within 10 business days of receipt of the Medicare Benefit from Medicare.

You can nominate or change your bank account with nib by completing the nib MediGap Network registration form available at <https://register.honeysucklehealth.com.au/for-providers/medical-network-registration/>. Please ensure that your bank account details are kept up to date with nib.

Incorrect payments

Should you, Honeysuckle Health, Medicare or nib become aware that a Claim has been incorrectly paid or overpaid, Honeysuckle Health and nib reserve the right to obtain a refund of any money paid to you in error. If this should occur, you agree to:

- refund any amount paid incorrectly to you within 14 business days from the date you are given notice that a refund is required; and
- reissue an amended invoice as soon as practical after becoming aware of, or receiving notice of, the error.

If at any time you fail to refund any amount due as a result of the overpayment of a MediGap Benefit made in error, the amount owing is a debt owed by you to nib. nib may consider recovering the amount by offsetting future MediGap Benefit payments.

Section 7: Auditing

We may require your assistance to enable the verification of amounts paid by nib as MediGap Benefits in accordance with these Terms and Conditions.

Should nib or Honeysuckle Health reasonably suspect a breach of these Terms and Conditions or inappropriate billing practices nib or Honeysuckle Health may contact you to understand our information in greater detail. Often, this first point of contact and investigation is enough to resolve our enquiries. However, if we require further clarification, it may be necessary for you to provide us with access to, or copies of, additional Records, as required, during the course of a more detailed audit.

Section 8: Collection and Publication of Provider Information

We acknowledge that you have a right to choose whether or not to Claim through MediGap on a discretionary, case-by-case basis. Nib will make that clear to Members on its websites and via other standard communication channels

Collection of your information

When you register for MediGap, you consent to Honeysuckle Health and nib collecting your information for the benefit of Members, consumers, referring doctors and the promotion of MediGap, including but not limited to the following information (**Practitioner Information**):

- your name;
- your provider number;
- your practice name and address;
- your practice phone number;
- the email address for your practice;
- if you do not have consulting rooms, any contact details you have supplied to nib as being suitable for nib Members (eg Principal Place of Practice, contact phone number or email);
- your specialty;
- information about how often you make a Claim through MediGap or charge the Medicare Benefits Schedule Fee for Members including your Participation Rate;
- average Gap charges (if any) for procedures performed by you during a certain period;
- number of services provided to Members over a certain period;
- your surgical partners (for example, anaesthetist) over a certain period; and
- the name of the Hospitals in which you have provided services to Members over a certain period.

Contact information will be obtained from you (or from an authorised representative).

nib collects Practitioner Information from a variety of sources including from Honeysuckle Health, directly from you, and indirectly from our claims data.

You consent to Honeysuckle Health and nib sharing Practitioner Information with one another for the purpose of administering and managing the MediGap network.

How we use Practitioner Information

At nib we think it's important to help our Members make informed choices about their healthcare. nib may disclose or publish, by any means, Practitioner Information (as described above) to third parties, such as Members, consumers or referring doctors, including general practitioners or other specialists for the purpose of administering MediGap and to help Members and consumers find a practitioner who suits their needs, including who is more likely to participate in MediGap.

Practitioner Information may be published in any nib approved media or materials, including on websites controlled by nib or third parties, and via other nib communication channels. This includes publication via online healthcare provider directories. It is a requirement of your participation in MediGap that you consent to the publication of your Practitioner Information as described in this clause 8. By registering and continuing to participate in MediGap, you provide your consent.

Section 9: Informed Financial Consent

If you elect not to Claim through MediGap for a service, then, we request that, wherever practicable, you provide the Member with Informed Financial Consent outlining the Gap they will pay and obtain their acknowledgement of that Gap. This information is to be provided before the Treatment or services are provided where possible or otherwise as soon as practicable after.

As set out in Section 1, you may not charge any booking, technology or facility fees, or any other such fees related to that treatment.

Disclosure of Financial Interests

You agree to disclose to your patients any financial interest that you have in the products or services recommended by you to the patient

Government Approved Prosthetic Devices

You must obtain Informed Financial Consent from Members when using surgically implanted prosthetic devices which will result in the Member having an out-of-pocket expense. Members should also be advised if there are suitable alternate devices which could be fully covered.

More information about prostheses arrangements is available at [health.gov.au](https://www.health.gov.au)

Section 10: Modern Slavery

nib providers are expected to respect universally recognised principles on human rights and labour rights. To this end, we expect you to

- comply with the nib Supplier Code of Conduct (available at [nib.com.au](https://www.nib.com.au)), which sets out the commitments, and principles we expect of all our supply chain partners to ensure they comply with internationally recognised principles on human rights, labour rights, the environment and anti-corruption;
- not engage in any conduct which may contravene modern slavery laws in Australia; and
- undertake to implement due diligence procedures to ensure that **there is no, or there is no risk of the following types of modern slavery in your supply chains:** exploitation of a worker, human trafficking, slavery, servitude, forced labour, debt bondage or deceptive recruiting for labour or services, or similar types of conduct.

We ask that you promptly provide nib with any information or documentation upon request that nib reasonably requests to:

- enable nib to comply with its obligations under Australian modern slavery laws; and
- evidence your compliance with the nib Supplier Code of Conduct and your obligations with respect to modern slavery as set out in this clause.

Section 11: Suspension and Cancellation

We may suspend or cancel your registration with MediGap in the following circumstances:

- where we have reasonable grounds for suspecting fraud or non-compliance with these Terms and Conditions during the conduct of an audit; or
- you have committed a material breach of these Terms and Conditions, or after repeated instances of non-compliance with these Terms and Conditions, where we have notified you in writing of your non-compliance; or
- we determine, acting reasonably, that suspension is required to protect our interests or reputation; or
- you owe nib money under these Terms and Conditions and despite being notified of the debt, you have refused to pay within 14 business days; or
- you are, or become, unregistered or have your registration suspended under the laws of the relevant state or territory within Australia, in which case you must immediately notify nib; or
- you no longer carry medical indemnity insurance with a recognised indemnity provider in which case you must immediately notify nib.
- you have conditions placed on your registration that, while not preventing you from practising, we view as not being in line with members' expectations; or
- Honeysuckle Health identifies you have not submitted a Network claim with the Participating Funds for a period greater than 2 years.

Honeysuckle Health will notify you of any suspension with a minimum of 14 business days' prior written notice setting out the reasons for suspension or cancellation, except where nib reasonably determines that suspension or cancellation is urgently required to protect Members or nib's interests, in which case nib may suspend you with immediate effect.

nib may, at its discretion, allow a practitioner whose registration has been cancelled to reregister for and participate in MediGap. You may also reregister at any time if you previously voluntarily resigned from MediGap, we deregistered as a result of joining the GapSure Anaesthetic network or were deregistered as a result of inactivity.

If you do deregister, or we suspend or cancel your registration with MediGap, nib will pay its 25 per cent portion of the MBS Fee for services unless Medicare has suspended or cancelled your registration with Medicare. In this instance, nib will not pay the 25 per cent portion of the MBS Fee.

To reregister visit [Honeysuckle Health website](#) or contact Honeysuckle Health's Provider Support Team by phone: 1800 411 633 (Mon – Fri: 9am – 5pm AEST/AEDT) or email providers@honeysucklehealth.com.au.

Section 12: Privacy notice

Both Honeysuckle Health and nib are committed to complying with their obligations under Privacy law, which regulates how personal information should be collected, used and disclosed and stored

The Australian Privacy Principles require Honeysuckle Health and nib to use nib Members' personal information only for the purpose for which it is collected, or for a permitted purpose, which includes a secondary purpose that is related (or directly related in the case of health information) to the primary purpose. Nib assessing and paying benefits under a Member's Policy is a permitted purpose.

When you, as a medical practitioner, apply for registration with MediGap and when you request to update your contact details, Honeysuckle Health will collect from you or from your authorised representative your name, address and contact details (including your phone number and email address) and your Medicare provider number.

Honeysuckle Health and nib will use your personal information for the purpose of registering you in MediGap, for assessing and processing Claims and making payments, and for the purpose of helping Members and consumers find a practitioner who suits their needs, including who is more likely to participate in MediGap.

We will disclose or publish your Practitioner Information, as outlined in Section 8.

Please refer to nib's Privacy Policy at nib.com.au and Honeysuckle Health's Privacy Policy at honeysucklehealth.com.au for information on:

- how you may access and seek correction of your personal information held by nib and Honeysuckle Health;
- how you may report a breach of the Australian Privacy Principles; and
- how nib and Honeysuckle Health will deal with such a complaint.

Section 13: Contact, Feedback and Complaints

For enquires related to your agreement and registration please contact Honeysuckle Health's Provider Support Team

Phone: **1800 411 633** (Mon – Fri: 9am – 5pm AEST/AEDT)

Email: providers@honeysucklehealth.com.au

For enquiries related to claims (including remittance advice), please contact nib's Provider Relations Team

Phone: **1300 853 530** (Mon – Fri: 9am – 5pm AEST/AEDT)

Email: providers@nib.com.au

nib and Honeysuckle Health understand the importance of providing excellent service and we appreciate that feedback can help us improve.

Honeysuckle Health and nib will make every possible effort to resolve claims and complaints to your satisfaction.

In the event that you are not satisfied with the outcome you can contact the Commonwealth Ombudsman:

Phone: **1300 362 072**

Mail: GPO Box 442
Canberra ACT 2601

Or submit a form online at ombudsman.gov.au

For more information about the Commonwealth Ombudsman visit privatehealth.gov.au

Section 14: Glossary of important terms

“Admission” means being admitted by a medical practitioner to a Hospital to receive Hospital Treatment as a Private Patient. Treatment in the emergency room of a Hospital is not an admission.

“Admitted Patient” means a person who is formally admitted to a Hospital for the purposes of Hospital Treatment.

“Benefit” means an amount of money payable from the Fund to or on behalf of a Member under their Policy.

“Claim” means a claim for the payment of MediGap Benefits which complies with these Terms and Conditions.

“Code of Conduct” means the nib Supplier Code of Conduct, a copy of which is available at the following link: <https://www.nib.com.au/docs/supplier-code-of-conduct-nov19>

“Compensation” means an entitlement or a potential entitlement to receive compensation or damages or any other indemnification in respect of any Condition (e.g. including an entitlement to workers compensation, compulsory third party insurance, travel insurance, sports insurance, common law damages, government and agencies programs).

“Condition” includes any illness, injury, ailment, disease or disorder for which Treatment is sought.

“Eligible Practitioner” means a practitioner who meets the eligibility requirements set out in these Terms and Conditions.

“Fund” means the health benefits fund established by us under the Private Health Insurance Act.

“Fund Rules” mean the fund rules established by us that relate to the day-to-day operation of the Fund.

“Gap” means the difference between the amount the Provider charges the Member for a specific MBS item and the amount they are able to claim through Medicare and/or nib for that item.

“GapSure” means the “Honeysuckle Health Anaesthetics Network” .

“Government approved prosthetic device” means a surgically implanted item like an artificial knee or hip joint listed on the Government’s prostheses schedule.

“Honeysuckle Health” means Honeysuckle Health Pty Limited (ABN 55 637 339 694).

“Hospital” has the meaning given under the Private Health Insurance Act.

“Hospital Product” means a Product which includes Benefits for fees and charges for:

- a) some or all Hospital Treatment; and
- b) some or all associated professional services rendered to a patient receiving Hospital Treatment, and includes combined hospital and extras products.

“Hospital Treatment” means the provision of goods and services that:

- a) is intended to manage a Condition; and
- b) is provided to a Patient:
 - i) by a person who is authorised by a hospital to provide the treatment; or
 - ii) under the management or control of such a person; and
- c) either:
 - i) is provided at a Hospital; or
 - ii) is provided, or arranged with the direct involvement of a Hospital.

“Informed Financial Consent” is where a Patient is told in writing about, and consents to, the cost of Hospital Treatment before being provided with that treatment. The Patient should be informed of the cost of Hospital Treatment before they are admitted to Hospital to enable Informed Financial Consent to be given.

“Inpatient” has the same meaning to ‘Admitted Patient’.

“MBS” – see Medicare Benefits Schedule.

“Medicare Benefit” means the benefit payable by Medicare for a particular service as set out in the Medicare Benefits Schedule.

“Medicare Benefits Schedule” means the schedule set by the Commonwealth Government for the purpose of paying Medicare Benefits.

“Medicare Benefits Schedule Fee” or **“MBS Fee”** means the amount set under the Medicare Benefits Schedule.

“MediGap” is our scheme set out in these Terms and Conditions where a practitioner accepts the MediGap Benefit as full payment for services provided to the Member and is not permitted to charge Members any additional charges or out-of-pocket expenses.

“MediGap Benefit” means the fee set out in the MediGap Schedule of Benefits for each MBS item.

“MediGap Schedule of Benefits” means the Benefits that nib will pay under these Terms and Conditions. The MediGap Schedule of Benefits is available at nib.com.au/providers/medigap

“Member” means any Policyholder and any insured person covered under a Policy (including adults and dependent children).

“Modern Slavery” means the exploitation of a worker, human trafficking, slavery, servitude, forced labour, debt bondage or deceptive recruiting for labour or services, or similar types of conduct.

“Modern Slavery Laws” means any law which prohibits Modern Slavery and which is applicable or otherwise in force in the jurisdiction in which nib or the Supplier is registered or conducts business or in which activities relevant to the Agreement are to be performed, or which imposes Modern Slavery reporting obligations on one or both of the parties to this Agreement.

“nib” means nib health funds limited (ACN 000 124 381).

“Official Provider Receipt” meaning accounts and/or receipts on your letterhead or showing your official stamp, and showing the following information:

- a) your name, provider number and address;
- b) the Member’s full name and address;
- c) the date of service;
- d) the description of the service;
- e) the amount(s) charged; and
- f) any other information that we may reasonably request.

“Out-Of-Pocket Expenses” means those charges and fees not covered by us under a Policy. For example, we will not pay for medical fees above the MBS Fee (where doctors don’t participate in MediGap), any Hospital excess, or some personal and take home items like toiletries, newspapers and long distance and mobile phone calls provided in Hospital. These are billed to Members by practitioners and Hospitals. Members are advised to ask the Hospital and their Provider what their potential out-of-pocket expenses might be (see also Informed Financial Consent).

“Outpatient” means Patients that don’t require admission or an overnight stay in a Hospital.

“Participation Rate” means the percentage of times, over 12 months, you participated in MediGap or charged only the Medicare Benefits Schedule Fee for a service to a Member.

“Policy” means a policy for a Complying Health Insurance Product issued by nib.

“Policyholder” means the person who was named in an application for a Policy where that application was accepted by us and the Policy was issued.

“Premium” means an amount of money a Policyholder is required to pay to us in respect of a specified period of cover for a Policy issued under a Product.

“Principal Place of Practice” means the principal place of practice as defined by AHPRA being the location declared by the practitioner as the address at which they mostly practise their profession.

If the location of the principal place of practice is in Australia, the following information is displayed on the **registers of practitioners**: Suburb, State and Postcode.

“Privacy law” means the Privacy Act 1988 (Cth), the Australian Privacy Principles, and state and territory privacy and health records laws, as applicable.

“Private Health Insurance Act” means the Private Health Insurance Act 2007 (Cth), Private Health Insurance (Prudential Supervision) Act 2015 (Cth) and includes any regulations and rules made pursuant to those Acts.

“Private Hospital” means a privately run Hospital.

“Private Patient” means a Member electing to claim under their Policy for Treatment in a Public Hospital or a Private Hospital.

“Product” means a defined group of Benefits which are payable to a Member under their chosen level of health cover in accordance with the Fund Rules, for approved expenses incurred by a Member and in respect of which Premiums are payable.

“Professional Attention” means:

- a) medical or surgical treatment by or under the supervision of a medical practitioner; or
- b) obstetric treatment by or under the supervision of a medical practitioner or a registered nurse with obstetric qualifications; or
- c) dental treatment by or under the supervision of a dental practitioner.

“Psychiatric treatment” means treatment of a mental illness or addictions at a psychiatric facility. This may include treatment for mood disorders, eating disorders, drug and alcohol detoxification and addiction therapy.

“Public Hospital” means a Hospital owned and operated by the State or Federal Governments.

“Public Patient” means a Patient who has elected to be admitted as a ‘public’ patient in a Public Hospital which means that all benefits are claimable through Medicare only and are not claimed under the Member’s Policy.

“Records” includes financial records, books of account, medical records and other documents and information which may be stored electronically or manually.

“Self-Insured Patient” or **“Uninsured”** means a Member has opted to take full financial responsibility for a Claim and all associated costs.

“Treatment” means:

- a) in respect of Hospital Products: Hospital Treatment, Professional Attention and any other item in respect of which Benefits are payable to a Member under their Policy; and
- b) in respect of General Products: services and items for General Treatment for which Benefits are payable to a Member under their Policy.

“You” and **“Your”** means the person named in the application to participate in MediGap.

“Waiting Period” means a period of time during which a Policyholder must continuously hold a Policy for a particular Product before a Member under that Policy has an entitlement to receive a Benefit under that Product for particular goods or services.

“We, us and our” means nib and/or Honeysuckle Health as the case may be.

COMMONWEALTH OF AUSTRALIA

Competition and Consumer Act 2010 (Cth)

IN THE AUSTRALIAN COMPETITION TRIBUNAL

File No: ACT 4 of 2021 and ACT 5 of 2021

Re: Application for review of authorisation AA1000542 lodged by nib Health Funds Ltd and Honeysuckle Health Pty Ltd and the determination made by ACCC on 21 September 2021.

Applicants: National Association of Practising Psychiatrists and Rehabilitation Medicine Society of Australia and New Zealand

ANNEXURE CERTIFICATE

DD-19

This is the Annexure marked "DD-19" referred to in the affidavit of David Du Plessis affirmed at Newcastle in New South Wales on June 2022.

CHAPTER 3 - CONTRACTS: MEDICAL AND HOSPITAL PURCHASER-PROVIDER AGREEMENTS

THE REVIEW OF THE HEALTH LEGISLATION (PRIVATE HEALTH INSURANCE REFORM) AMENDMENT ACT 1995

Navigation: [Previous Page](#) | [Index](#) | [Next Page](#)

CHAPTER 3 – CONTRACTS: MEDICAL AND HOSPITAL PURCHASER–PROVIDER AGREEMENTS

3.1 This chapter addresses issues relating to the implementation and operation of the contractual arrangements provided for in the Reform Act between doctors, private hospitals and health funds. Contracts are fundamental to achieving the stated objectives of the Reform Act which, as noted in Chapter 2, have generally not been achieved. The chapter discusses areas of concern raised in relation to the contracting arrangements and suggests areas where the legislation can be improved so that its aims with respect to contracts can be achieved. The chapter also discusses the issue of 'gap' insurance and the impact of the Reform Act on the public hospital system.

Medical provider agreements

3.2 The Reform Act establishes two types of medical agreements. One form of agreement is with funds and is termed a Medical Purchaser–Provider Agreement (MPPA). The second form of agreement is with hospitals and is termed a Practitioner Agreement (PA).

3.3 MPPAs are contracts entered into between health funds and medical practitioners which allow the fund to pay medical benefits in excess of the Medicare Benefits Schedule (MBS) fees for that practitioner's services. The agreement must include the fees that will be charged. Such agreements may eliminate out-of-pocket costs for patients or allow the patient to meet a predetermined amount (or co-payment). The amendment is the key element enabling funds to offer 100 per cent insurance for in-hospital medical expenses and hence improved value for money. Where no MPPA exists, the fund is restricted to paying medical benefits up to a maximum of the amount between the Medicare rebate and the MBS fee.

3.4 MPPAs entered into between funds and doctors are subject to a number of requirements. The principal requirements are that:

- funds agree to accept an assignment of the 75 per cent Medicare benefit from the Health Insurance Commission;
- any predetermined co-payment to be met by eligible contributors must be identified in the MPPA;
- apart from any such co-payment, doctors must accept the fund's payment in full satisfaction for medical services rendered in accordance with the MPPA during the episode of patient hospital care; and
- wherever possible, doctors are required to inform patients of any amount that they may reasonably expect to pay before any professional services are rendered. [\[1\]](#)

3.5 The Reform Act also provides for hospitals and doctors to enter into Practitioner Agreements (PAs), and for hospitals to receive payment under Hospital Purchaser-Provider Agreements (HPPAs) for medical services provided by those doctors. Both PAs and MPPAs involve identical consumer protection measures, such as requiring the doctor to inform patients in advance of likely medical charges. They both permit simplification of the medical benefits process by allowing the fund (for the MPPA) or the hospital (for the PA) to collate the separate medical bills and collect the Medicare benefits. [\[2\]](#)

3.6 Few medical agreements have been signed to date. The Australian Medical Association (AMA) claimed that there were between 'zero and 100', with the Australian Doctors' Fund (ADF) stating that 'to our knowledge no doctors have signed contracts'. [\[3\]](#) The Department of Health and Family Services (DHFS) stated that it was 'unaware of any MPPAs' and knew of only one Practitioner Agreement. [\[4\]](#) Medibank Private, however, informed the Committee that the fund has a small number of medical agreements 'less than 100'. These contracts cover a num

specialties and were not restricted to any particular geographical areas `we have at least some agreements in all States. We also have one instance where all of the doctors in a particular hospital have signed agreements'. [5]

Views on contracts

3.7 Groups representing the medical profession were opposed to contracts between doctors and health funds. [6] The AMA in its submission argued that MPPAs `invite the introduction of US-style managed care concepts into the Australian health system and should be removed [from the Act]'. [7] The Council of Procedural Specialists (COPS) argued that contracting provided for in the Reform Act `was and is and will always be unacceptable to doctors and in conflict with their fundamental ethical principles. Clinicians must be contracted to their patients and not to third parties'. [8]

3.8 The health insurance industry generally indicated its support of the current contractual arrangements. [9] One fund Medical Benefits Fund of Australia (MBF) indicated, however, that the current system of contracts with doctors is flawed as it `discourages the voluntary cooperation of the medical profession, because it is a system of forced co-operation of gaining de-facto control of the private health sector'. [10]

3.9 Some medical groups, such as the ADF and the Australian Association of Surgeons (AAS) indicated a fundamental objection to contracting as set out in the Reform Act. The ADF stated that no amendments to the contracting aspects of the legislation would be acceptable to the ADF `it is a moral issue. It is immoral for any third party to come between a doctor and patient'. [11] The AAS also argued that `the requirement for there to be a contract between the doctor and the health fund...should be removed'. [12]

3.10 The AMA indicated, however, that some compromise on the issue of contracts may be possible. The Committee questioned the AMA as to their position regarding allowing doctors to negotiate contracts as a group. Dr Woollard, Federal President of the AMA noted that:

I think that is a possibility If there is a range of options available, even if sections for medical provider agreements in the Act were repealed, it does not stop doctors entering into arrangements with funds. If there were some support from the government for doctors to negotiate in groups, I think it is much more like

those things would move ahead because the doctors would feel that they were equal partners, in a sense, in that negotiating field where there were groups of doctors on the one hand and funds on the other. [13]

3.11 The Council of Procedural Specialists (COPS) also indicated that while the Council is opposed to 'specific contracting and always will be', loose agreements and arrangements could be considered. [14]

3.12 Several peak medical groups have campaigned against the introduction of contracts with the aim of dissuading doctors from entering into these agreements. The AMA and AAS have advised their members not to sign contracts. [15] The ADF stated that while it does not give advice to its members not to enter into contracts, it has pointed out 'some areas of considerable concern and difficulty' with the proposed contractual arrangements. [16] One group, the Association for the Advancement of Private Health (AAPH), was formed in 1995 in response to the proposed changes to private health insurance and has argued for the repeal of the legislation. [17]

3.13 As noted above, the aim of MPPAs was to eliminate patients' out-of-pocket expenses or allow the patient to meet a predetermined amount. To the extent that few MPPAs have been negotiated and the funds have therefore been unable to offer 100 per cent insurance for in-hospital medical expenses, many witnesses suggested that the aim of the legislation in respect of MPPAs has not been met. [18] The Reform Act has, however, been given little chance to achieve its aims given the reluctance of members of the medical profession to sign contracts. The Australian Health Insurance Association (AHIA) also argued that while products offering 'no gaps' insurance are not available, the absence of such products does not mean that the legislation has failed 'particularly as we are dealing with voluntary agreements in a market environment'. The Association also noted that a number of AHIA-affiliated funds are actively pursuing agreements with specialists, with varying degrees of success. [19]

Conclusion

3.14 The Committee acknowledges the concerns expressed by the medical profession in relation to negotiating contracts with third parties that obligations imposed by such contractual relationships could seriously compromise the professional independence of doctors or could adversely affect judgements at patient care. The Committee has difficulty in properly assessing these concerns in the absence of any significant number of contracts or conclusive evidence that

concerns are warranted. The Committee recognises that the Reform Act provides an opportunity to address a major consumer concern relating to out-of-pocket in-hospital medical expenses, but has not provided practical mechanisms for meeting this goal.

3.15 The Committee believes that the medical profession should co-operate in negotiating contracts, but with the introduction of measures that address the concerns of the profession in relation to their freedom to contract; their freedom to treat patients according to their clinical needs; the right of the profession to collectively negotiate contracts with funds and private hospitals, subject to the authorisation provisions of the Trade Practices Act; and the need to guarantee the public scrutiny of contracts. The Committee accordingly addresses these issues in the following sections of the chapter.

Recommendation 2:

The Committee recommends that the provisions relating to the implementation of medical purchaser-provider agreements under the *Health Legislation (Private Health Insurance Reform) Amendment Act 1995* proceed, subject to the recognition of the right of the medical profession to treat patients according to their clinical needs, the right of the profession to collectively negotiate contracts, subject to authorisation by the ACCC, and the right to public scrutiny of contracts as provided for in later recommendations.

Contracts areas of concern

3.16 A number of objections to the contractual arrangements proposed in the Reform Act have been raised by groups representing the medical profession and others. These include issues related to managed care, the abrogation of accepted clinical freedoms and the doctor-patient relationship. Other issues related to the need to collectively negotiate with funds and the need for public scrutiny of contracts were also raised.

Managed Care

3.17 A major objection by the medical profession to the introduction of contracts has been the prospect that such a system of contracts would lead to what is referred to as a 'US-style managed care' system in this country. [20] Managed care has been described as an arrangement whereby an organisation assumes responsibility for all necessary health care for an individual in exchange for a fixed payment. Initially, managed care programs in the USA involved development of clear protocols for what symptoms should be present before a patient within a program was admitted to hospital. Protocols have now been developed for out-of-hospital treatment, including what drugs should be used to treat certain conditions and when allied staff or specialist counsellors should be involved in care. [21]

3.18 Managed care is a generic term covering a wide range of financing systems. One form of managed care in the USA involves companies which tender to medical insurance companies to provide medical care for those enrolled. These companies may also tender directly to large employers or directly to governments (for Medicare and Medicaid). The company then negotiates with hospitals, doctors and other services to create a network of individual providers. At the other extreme, a managed care company may be a Health Maintenance Organisation (HMO) with its own hospitals and staff that provide medical care for enrollees. [22]

3.19 The literature on managed care points to some advantages of these type of arrangements. One study noted that the protocols developed by many US managed care organisations are evidence-based and ensure that patients receive state-of-the-art, scientifically validated treatment and, conversely, that out-of-date, ineffective treatments are not imposed on patients. Adherence to protocols and rigorous screening of the need for hospital care can lead to significant cost savings managed care plans in the USA are generally cheaper than fee-for-service plans. [23] Managed care also has the advantage of offering 'one-stop shopping' with a team of doctors from diverse fields working together on a patient's medical condition. [24]

3.20 Studies have also pointed to deficiencies of the system including 'underservicing' of patients if doctors have a financial incentive through their contracts in not providing all the necessary care for patients, for example, if contracts encourage limitations on hospitalisation or referral of patients. A further weakness occurs if the managed care protocols are not state-of-the-art, that is, are designed to minimise costs rather than achieve the best health care outcomes. [25]

3.21 Studies in the USA that have compared the quality of health care under managed care vis-a-vis the traditional fee-for-service systems have found that the quality of care is similar under both systems. A 1994 review of 16 studies generally found better or equal results for HMOs one form of managed care in the USA

patients suffering from a wide range of diseases, including congestive heart failure, colorectal cancer and diabetes. [26] Consumer-satisfaction surveys showed that HMO patients, when compared with patients treated under fee-for-service arrangements, are less likely to be satisfied with the care they receive but are satisfied with the costs of that care. The surveys indicated that consumers are willing to trade some quality in service for lower costs. Critics of managed care argue, however, that the published studies tend to be based on the best forms of managed care (principally HMOs) composed of salaried, dedicated staff whereas the fastest growing type of managed care in the USA today is represented by looser networks of doctors under contract for fixed or discounted fees. Critics argue that these networks are more likely to be influenced by financial incentives to compromise the quality of care. [27]

3.22 The AMA argued that their main objection to US-style managed care was that 'the doctor treating the patient loses control over the clinical decision-making process...They [the doctors] have to seek prior approval on some occasions for treatments they wish to offer to the patients from the funds; the funds then decide whether that is appropriate care. They are observed in terms of the expense of the care and they are delisted from the funds if their care is more expensive than the average or the mean that is acceptable to the funds'. [28] COPS expressed similar concerns noting that 'we do not wish to place ourselves in the same position as surgeons in America where the way they treat patients is now largely dictated by the funds that their patients belong to'. [29]

3.23 AHIA argued, in contrast, that the legislation did not represent an attempt by the funds to introduce US-style managed care in Australia. AHIA stated that the funds 'do not, and do not want, to manage health care. Doctors manage care, and should continue to do so'. [30] AHIA argued that the term 'managed care' covers a wide range of financing systems and has been designed to meet the peculiarities of the US health system which do not pertain in Australia. [31] For example, the undersupply in the USA of general practitioners has led to a system of self referral by citizens to specialists, whereas in Australia, general practitioners have traditionally performed this role. [32]

Conclusion

3.24 The Committee acknowledges the concerns expressed by the medical profession on the possible implications, as it perceives them, that US-style managed care arrangements may have in the Australian context. The Committee believes, however, that because there are major differences between the health systems of the United States and Australia, these differences would make the introduction of

style managed care arrangements in this country unlikely. The Committee further considers that as few contracts have been concluded to date, it is difficult to assess the potential effects that a system of contracts or protocols would have in Australia. The Committee believes that the medical profession has largely based its opposition to contracts on inferences drawn from the managed care arrangements operating in the United States which may not be applicable to Australian circumstances.

3.25 The Committee would wish to avoid the worst features of the US situation and is strongly of the view that this should be avoided. The Committee is opposed to any system of health care that compromises the quality of patient care. However, it accepts that there is a common interest, shared by practitioners, hospitals and health funds, to ensure that patient care is both of the highest clinical quality while remaining as cost effective as possible. Providers especially doctors have to acknowledge that whoever pays the medical bills (Medicare or the funds) is entitled to seek accountability, efficiency and value for money.

Abrogation of clinical freedoms

3.26 A concern flowing from the misgivings raised in relation to 'managed care' was that contracts would result in the abrogation of accepted clinical freedoms to treat patients according to their clinical needs. [33] The Australian Association of Surgeons (AAS) stated that the legislation 'would undermine safe, orderly and ethical private, in-hospital, care'. [34] The Council of Procedural Specialists (COPS) argued that there are 'plenty of examples from the United States where a whole range of restrictions are placed on doctors as to what services they can provide for their patients and how long the patients can be kept in hospital'. [35] However, when the Committee questioned COPS whether they had evidence that funds in Australia have sought to exercise control over clinical and hospital care decisions, Dr Sheldon, Chairman of COPS, replied that 'I do not think we have any specific example where this has happened'. [36]

3.27 The Committee also questioned witnesses as to whether the actual conditions in proposed contracts sought to direct doctors in the clinical management of their patients. Dr Sheldon responded that 'I do not think it has ever been stated in that blatant fashion. Those are the concerns we have and that is what many of us would regard as inferences in the proposals'. [37] The Australian Doctors' Fund (ADF) stated that the power to direct doctors derives from 'the individual contract, in conjunction with the power of the most powerful bureaucracy in this country the ACCC which says that you must accept or deny these particular terms and conditions as an individual, because you are not allowed to discuss it with your colleagues or to negotiate as a group'. [38]

3.28 The health insurance industry argued that the operation of the legislation would not result in the abrogation of accepted clinical freedoms. AHIA stated that 'the clinical needs of a patient must be determined by their medical practitioner, in consultation with the patient AHIA would oppose any system which interfered with patients being treated according to their clinical needs'. [39] AHIA further stated that the Association was 'not aware of any contract which imposes interference or in any way imposes upon clinician's judgements'. [40] Another submission noted that the doctor agreements prepared by Medibank Private and the National Mutual Health Insurance (NMHI) give undertakings to refrain from interfering in the treatment of patients. [41] The Health Insurance Restricted Membership Association of Australia (HIRMAA) indicated that its agreements contained a similar undertaking. [42]

3.29 The proposed contracts sighted by the Committee did not contain any provisions that interfered or attempted to interfere in a doctor's right to treat patients according to their clinical needs. For example, the proposed NMHI medical agreements contain a clause which states that:

NMHI acknowledges that it is for the Medical Provider to exercise his own clinical judgement at all times in relation to the provision of Services to Eligible NMHI Members. NMHI further acknowledges that it will not interfere in the autonomous relationship between the Medical Provider and patients who are Eligible NMHI Members. [43]

3.30 AHIA proposed that, to allay the concerns of the medical profession regarding clinical freedoms, a provision be included in the National Health Act which rendered a contract null and void if a fund used it to 'direct a medical practitioner in the treatment of a patient'. [44]

Conclusion

3.31 The Committee believes that the concerns of the medical profession in relation to any possible impact of the Reform Act in respect of a doctor's freedom to treat patients need to be addressed appropriately. The Committee, therefore, considers that any contracts offered by funds should contain an unambiguous undertaking to refrain from interfering in the clinical treatment of patients so that the profession may be assured that the doctor-patient relationship is respected at all times and the funds will refrain from interfering or attempting to influence a doctor's treatment of a patient.

Recommendation 3:

The Committee recommends that contracts entered into between medical practitioners and health funds or hospitals at all times clearly uphold the professional duty of practitioners to treat patients according to their clinical needs.

Doctor–patient relationship

3.32 Some groups argued that the notion of contracts between doctors and health funds interferes in the traditional doctor–patient relationship. [45] ADF stated that a system of direct contractual relations between doctors and funds ‘obliterates or limits the independence of the doctor and creates a conflict of interest, which ultimately, will not serve the best interests of patients. It destroys or substantially interferes with the traditional doctor/patient relationship’. [46] ADF argues that a doctors' professional independence and the direct relationship between the doctor and the patient would be compromised by a system of contracts. [47]

3.33 Medibank Private told the Committee that the fund had received no complaints from doctors with whom they had contracted MPPAs regarding the doctor–patient relationship. [48]

3.34 The Committee believes that an effective doctor–patient relationship is one in which the doctor's primary obligation is to the welfare of the patient. It is therefore essential that the professional independence of doctors should be preserved. The Committee believes that this independence will not necessarily be threatened by contracts entered into between doctors and funds, provided that the agreements respect the primacy of the doctor–patient relationship, and refrain from interfering in, or attempting to influence, a doctor's treatment or care of a patient. The Committee considers that as few contracts have been concluded to date, a proper assessment of whether contracts pose a threat to the right of doctors to treat consumers according to their clinical needs cannot be made at this stage of the inquiry.

Negotiations with health funds

3.35 Some evidence to the Committee suggested doctors should be permitted to negotiate in groups when negotiating contracts with funds. The AMA argued that was necessary because the provision of medical care, particularly in hospitals,

involves teams of doctors and requires by its very nature coordination and discussion among doctors about a whole range of factors. [49] AHIA also acknowledged that the current requirement to establish separate contracts with individual doctors is cumbersome for all parties. AHIA suggested that the funds should be allowed to contract with an 'aggregate billing authority' which would be an individual, group of individuals or organisation involved in the direct provision of medical services which accepts responsibility for the aggregation of medical bills in the services provided by the individual, group or organisation, but not so as to limit competition. [50]

3.36 Several groups representing the medical profession including the AMA and ADF highlighted the disparity in the bargaining position of the medical profession in their negotiating position vis-a-vis the funds over contracts. [51] Under the Trade Practices Act 1974 neither the AMA or other associations are permitted to negotiate on behalf of their members with the various health funds or private hospitals unless the joint negotiation position is authorised by the Australian Competition and Consumer Commission (ACCC). Without authorisation, health professionals who jointly negotiate with health funds or hospitals are likely to be in breach of section 45A of the Trade Practices Act which prohibits agreements that have the purpose or effect of fixing, controlling or maintaining prices. [52]

3.37 The ACCC noted in its submission 'that individual negotiation with hospitals or health funds over fee arrangements is the only way that will guarantee no breach of the [Trade Practices] Act'. [53] The ACCC stated that agreements with other doctors to collectively negotiate with hospitals or health funds are likely to fix fees and breach the Trade Practices Act. The appointment of a negotiator to act on behalf of doctors does not remove that risk. If doctors are bound by the fee scales negotiated by the negotiator this is, in effect, the same as a collective negotiation. Even if doctors use a collectively appointed negotiator but decide individually whether to supply services at the negotiated price there remains a risk of breaching the Trade Practices Act. In the latter case, it may be argued that the negotiator has set a benchmark level around which the individual's fee scales will be established. [54]

3.38 The AMA noted that the Trade Practices Act places 'severe restrictions' on the behaviour of medical practitioners with the only arrangement the ACCC endorses as not breaching the Trade Practices Act is one where individual doctors negotiate with health funds. [55] The AMA noted that 'no regard is paid to the severe imbalance in this arrangement. There is an enormous concentration of financial power vested in the handful of funds that dominate the industry'. [56]

3.39 In most States, two or three health funds dominate the market leading to charges of oligopolistic domination of the market. In 1994–95, there were 49 funds operating in Australia of which four funds controlled 91 per cent of the NSW market (with MBF controlling 30 per cent); three funds controlled 85 per cent of the Victorian market (Medibank Private with 37 per cent); two funds controlled 91 per cent of the Queensland market (MBF with 62 per cent); two funds controlled 74 per cent of the combined South Australian and Northern territory markets (Mutual Community with 60 per cent); two funds controlled 94 per cent of the Western Australian market (Hospital Benefits Fund (HBF) with 79 per cent); and two funds controlled 79 per cent of the Tasmanian market (MBF with 57 per cent). [\[57\]](#)

Authorisation

3.40 As noted above, joint negotiation between funds and groups representing the medical profession must be authorised by the ACCC. The authorisation provisions in the Trade Practices Act give the ACCC the power to grant immunity from legal proceedings for conduct that might otherwise breach the restrictive trade provisions of the Trade Practices Act. For authorisation to be granted, the applicant must satisfy the ACCC that the conduct in question will result in a benefit to the public that outweighs any anticompetitive effect. The benefits must be public, not private benefits. [\[58\]](#)

3.41 The AMA raised some concerns with the authorisation powers of the ACCC. The Association claimed that the authorisation powers are 'untested' in the health area, are characterised by long delays and are 'expensive and uncertain'. [\[59\]](#)

3.42 The Committee questioned the ACCC concerning aspects of the authorisation process. Mr O'Brien of the ACCC stated that 'you cannot assume that doctors, if they did apply for joint negotiation, would get an authorisation. There is that unsureness of it But any authorisation, if you are asking on a time scale, would take three months or so to look at and do correctly'. [\[60\]](#) A lodgement fee of \$7 500 is payable for authorisation applications. The ACCC stated that it had received no applications to date for joint authorisations. [\[61\]](#)

3.43 The ACCC noted that the authorisation power had 'not been tested enough to know whether or not it works. There is a presumption perhaps that it is just too difficult'. [\[62\]](#) The ACCC further noted that the process has been in place for many years and has worked effectively across other sectors:

It is flexible enough to deal with the issues. If there are genuine reasons supporting joint negotiations, and the public benefit arguments can be mounted and sustained, then the Commission, in all the circumstances, will grant authorisation. [63]

3.44 The Committee believes that criticism of the approach of the ACCC especially in relation to anti-competitive agreements (s.45 of the Trade Practices Act) by some organisations representing the medical profession is unfounded as the Commission is merely interpreting the Trade Practices Act as it stands at present. [64]

Conclusion

3.45 The Committee considers that those doctors who choose to enter into contracts and who wish to conduct joint negotiations with health funds or private hospitals seek authorisation under the Trade Practices Act. The Committee believes that the authorisation provisions under the Act provide an appropriate mechanism for conducting joint negotiations. The Committee believes that the AMA or other associations should be able to negotiate jointly with the funds and private hospitals to counter the oligopolistic market position of the funds and, consequently, the unequal bargaining position they have vis-a-vis individual doctors when negotiating contracts. The Committee believes that it is essential, and in the interests of all parties, to ensure that a level playing field be established in this negotiating environment. These principles conversely apply where some funds find themselves confronted with a dominance of some specialties, where limited numbers of specialists may create a reverse oligopoly.

Recommendation 4:

The Committee recommends that groups of doctors or organisations representing the medical profession negotiate medical agreements with health funds or private hospitals by seeking authorisation for joint negotiations as provided for under the *Trade Practices Act 1974*.

Public scrutiny of contracts

3.46 Concerns were raised by the AAS and the Complaints Commissioner over lack of provision for public scrutiny of contracts between doctors and the funds. AAS argued that consumers should have public access to contracts, including

applicable fee schedules. [65] The Association argued that access to contracts was essential to ensure that contracts did not contain provisions that compromised the provision of appropriate care. The AAS suggested that the contracts be available for inspection at agreed locations throughout the country. [66] The Complaints Commissioner argued that consumers should have access to both MPPAs and HPPAs, with the costings deleted, particularly as these agreements are negotiated on behalf of fund members. [67]

3.47 AHIA conceded that consumers are entitled to information in relation to any restrictions in contracts which might be alleged to impact on the quality of their health care delivery. [68] AHIA, however, argued that contracts should be entitled to commercial confidentiality insofar as price is concerned, as it would be inappropriate, for example, for competitors to discover the price arrangements entered into between consenting parties. The Association suggested that the legislation be amended to provide that a patient be permitted to view a contract between their doctor and their health fund should the patient so request. [69]

Purchaser–Provider Panel

3.48 The Complaints Commissioner suggested that the Purchaser–Provider Panel should have a monitoring and oversight role in relation to contracts. [70] While the Reform Act provides for the establishment of the Panel to monitor the legislative provisions relating to purchaser–provider agreements, no action has been taken to date to establish the Panel. The Panel is to operate to 30 June 1997 by which date it will be disbanded. Members of the Panel are appointed by the Minister and are to comprise the Complaints Commissioner as Chair and representatives of the medical profession, public and private hospitals and consumers. [71]

3.49 The Complaints Commissioner suggested that the Panel be established and that the sunset clause be deleted. This would allow the Panel to monitor agreements, including the renegotiation of agreements when they expire; and gauge the effects of agreements on consumers. [72] The Complaints Commissioner also argued that the National Health Act be amended so that the Chair of the Purchaser Provider Panel be provided with copies of any purchaser–provider agreements. It was also suggested that copies of agreements could be provided to the other Panel members if the parties to the contracts agreed.

Conclusion

3.50 The Committee believes that the Purchaser–Provider Panel should be established as provided for in the Reform Act and that it should have access to purchaser–provider agreements to enhance its role in monitoring the legislative provisions relating to contracts and provide a consumer focus to the oversight of contracts.

Recommendation 5:

The Committee recommends that the *National Health Act 1953* be amended to provide for the public scrutiny of purchaser–provider agreements by consumers, except for those parts of contracts dealing with the price arrangements entered into between the parties.

Recommendation 6:

The Committee recommends that the Purchaser–Provider Panel be convened and that the sunset clause which limits the life of the Panel to 30 June 1997 be deleted.

Recommendation 7:

The Committee recommends that the Purchaser–Provider Panel be provided with access to purchaser–provider agreements as part of its monitoring role relating to contractual arrangements entered into between the relevant parties.

Hospital provider agreements

3.51 The Reform Act amends the National Health Act to provide for a specific form of contract between private hospitals and health insurance funds called a Hospital Purchaser–Provider Agreement (HPPA). [\[73\]](#) It allows funds to enter contracts with hospitals which specify the level of accommodation provided and the amounts to be charged. Hospitals must render a single account for each episode of hospital

treatment and must inform patients covered under the agreement of the amount of their out-of-pocket expenses. Under the HPPAs hospitals must also provide the funds with the information specified in the Hospital Casemix Protocol (HCP). [74]

3.52 The main elements of HPPAs are:

- the hospital or day hospital must accept the HPPA price in full payment covering the episode of care for eligible contributors, apart from any co-payment which must be specified in an HPPA;
- the HPPA price must specify the level of accommodation and provide for the hospital or day hospital facility to render a single bill covering all hospital and related services; and
- the hospital or day hospital must inform eligible contributors of any amount they will be required to pay from their own pocket in relation to hospital treatment. [75]

3.53 DHFS advised that as at 26 June 1996 there were 7 459 HPPAs between funds and hospitals (of which 912 were for day hospital facilities), an average of 20 HPPAs per private hospital and 7 HPPAs per day hospital facility. [76] The Australian Private Hospitals Association (APHA), the peak organisation representing two-thirds of all private hospitals, indicated that all APHA members have contracted with health funds, with larger hospitals having 40 to 50 contracts in place at any one time. [77]

Views on contracts

3.54 Organisations representing private hospitals were not generally opposed to the concept of contracting with health funds (contracting arrangements already existed in some States), although many argued that the negotiation processes needed to be improved and the perceived market imbalance vis-a-vis the funds needed to be addressed. [78]

3.55 APHA noted in its submission that 'our members generally support the concept of negotiating prices, quality standards and other relevant aspects of hospital care with health funds. In fact, contracts between private hospitals and health funds have operated in Victoria and South Australia for many years. Our major concern, however, is that the current practice does not involve genuine negotiation on the part of many insurance funds'. [79] The Australian Catholic Health Care Association (ACHCA) stated that the notion of contracting 'has some benefits' if out-of-pocket expenses can be reduced and the overall price of premiums can be lessened. Health Care of Australia (HCoA), the largest private hospital operator in Austr

stated that 'we do not have any objection to contracting. It suits us to contract because we can have certainty for our hospitals as well; we know the rules to work to'. [81] Ramsay Health Care, the second largest private hospital group in the country, noted that the private hospital industry is generally supportive of the 'concept of contracting'. [82]

3.56 The stated aims in the legislation with respect to requiring contracts between funds and hospitals were to generate competition between health funds and hospitals, resulting in improved efficiency leading to better value-for-money, quality and access for patients; to link hospital funding to appropriate quality assurance and accreditation procedures; and to reduce restrictions on products offered, thereby allowing funds to operate according to market demand for different products. [83]

3.57 Views expressed to the Committee differed as to whether these aims have been achieved. Groups representing the private hospital industry generally argued the aims have not been met. For example, APHA and ACHCA argued that the goal of improving the value of health insurance has not been achieved. [84] ACHCA pointed to the continued out-of-pocket expenses borne by patients and the cost to consumers of obtaining private health insurance. [85]

3.58 The health insurance industry generally considered that the legislation has achieved its aims, or at least has the potential to achieve them. AHIA argued that the legislation:

Represents a micro-reform of the health care sector by offering consumers the opportunity for wider choices in health care packages. It also provides a framework through which the privately insured patient can obtain the benefits of private sector health care while avoiding unpleasant financial surprises. It provides a framework for a more competitive market in the provision of health services. [86]

3.59 Medibank Private, commenting on the aims of the legislation in relation to HPPAs, argued that the legislation encourages funds and hospitals to enter into agreements with the aim of generating increasing competition 'industry competition should improve efficiency, leading to better value-for-money, quality and access for patients'. [87] MBF, however, argued that the aim of generating competition between health funds and hospitals was based on 'flawed logic'. MBF stated that there has always been competition between health funds, limited only by the regulations imposed by the Commonwealth 'competition in pricing and packages is subject to conditions of registration which preclude true marketplace competition if the regulations are enforced'. [88] MBF noted that the conditions of registration require that any package offered to one group of people must be available to all other people at the same price for people in the same area. Regarding the issue of value-for-

money, MBF argued that some health insurance packages do provide better value for money, but these have largely been restricted to the corporate sector and not the wider community. [89]

Contracts issues

3.60 A number of issues relating to the contractual arrangements were raised by organisations representing private hospitals. These included the effect of the market imbalance on the negotiation process, the effect of default benefits and aspects of the negotiation process.

Market imbalance

3.61 Concerns about the market dominance by a few large funds, referred to earlier in this Chapter by the medical profession, were also raised by representatives of the private hospitals similarly concerned about the market dominance of funds vis-à-vis private hospitals. ACHCA noted that:

Clearly the larger the health fund the more potent its commercial negotiating capacity. However, when a health fund has a majority of the local market, hospitals are placed in an increasingly difficult situation. [90]

3.62 APHA also noted that funds are in a strong negotiating position with one fund controlling at least 40 per cent of the market in each State except in the case of NSW. In contrast, private hospital groups control a much smaller market share with no one group controlling more than 20 per cent of the market, except in NSW and WA. APHA noted that three-quarters of private hospitals have less than 100 beds and therefore are unable individually to benefit from any market-share based negotiating influence. [91]

3.63 The Private Hospitals Association of Victoria (PHAV) noted in its submission that the Victorian experience of contract negotiations over an 8-year period demonstrated the effect of the unequal market power between health funds and private hospitals:

Private hospitals in Victoria found that they could not compete in this 'negotiation' framework. The market power of individual hospitals was not enough to enable true negotiations to occur. Funds had a greater modelling capacity and access to information across state boundaries. Funds tended to ignore hospital cost increases when negotiating benefit reviews. [92]

3.64 The health insurance industry rejected the view that private hospitals are disadvantaged by virtue of market 'dominance' by funds in particular States. [93] AHIA pointed to the considerable market power of hospitals that operate in certain geographic locations and in certain market niches. [94] MBF also argued that it should be recognised that while some health funds have a degree of market power, some private hospitals also have a degree of market power. [95]

3.65 The Committee asked witnesses regarding any possible 'collusion' between the funds as regards the terms and conditions offered in contracts as a consequence of their market power. Dr Adler, a member of APHA, responded that 'while on some aspects [of contracts] there has been great diversity, on other aspects there have been some interesting coincidences. Of the four major parties in New South Wales MBF, HCF, Medibank Private and the Alliance in my contracts, with regard to day only accommodation, which exists in four different bands, all four have identical rates in every band'. [96] HIRMAA sought to clarify the situation regarding funds offering the same rates 'there is a price which is available and has been suggested for public hospitals, and we all offer the same price. We would be stupid to offer anything higher. We would also be stupid to offer anything lower because we know the hospitals are not going to accept it'. [97]

3.66 Some concerns were raised during the inquiry with regard to the possibility of funds 'refusing' contracts with particular hospitals because of their market dominance. ACHCA claimed that a fund's refusal to contract can lead to the active 'defunding' of hospitals and the forced closure of some services. [98] However, in questioning by the Committee, the Association could not provide an instance where a health fund had refused to contract with a hospital. [99] AHIA also indicated that member funds had not engaged in the practice. [100] Mr Murray, General Manager of Medibank Private, indicated that the fund does not discriminate against certain hospitals:

As a matter of policy, we seek to sign agreements with all hospitals so that we can give the widest possible access to our members. There are occasions where the price that we think is appropriate is not accepted by the hospital and we have not been able to reach agreement. But we do not go out with a list of hospitals with whom we will sign agreements and a list of hospitals with whom we will not sign agreements. [101]

Effect of default benefits

3.67 APHA raised the issue of the effect that the level of default benefits have in 'pressuring' hospitals to contract with funds. A default benefit is payable by the fund if a patient receives care in a hospital with which a patient's fund does not have a contract.

3.68 APHA argued that as the average default benefit is only approximately 45 per cent of the actual care costs 'there is a very powerful incentive for hospitals to successfully negotiate a contract. It is virtually impossible under the current environment to continue operating unless you have contracted with funds that have a wide-ranging coverage of the health insured population in the geographic catchment area of a hospital'. [102] AHIA argued, however, that if the default is set too low for some hospitals to survive on it is of no benefit to the hospitals in question. If, on the other hand, the default is set high enough for uncontracted hospitals to survive, there is no incentive for a hospital to enter into an agreement with a health fund. [103]

3.69 The Committee was advised that DHFS has prepared a discussion paper examining issues related to the use of case payments for default benefits which will shortly be released for industry and public discussion. [104]

Recommendation 8:

The Committee recommends that in the interests of continuing certainty in the contracting process, and recognising that contributors should not be totally disadvantaged, if in an emergency they are treated in a non-contracted hospital, an appropriate default benefit should continue in place after 1 July 1997.

Negotiation process

3.70 The Committee received a range of views on aspects of the negotiation process. APHA reported several problems with the process. The Association stated that as a result of the power imbalance between the funds and private hospitals many funds do not 'genuinely negotiate HPPAs', with 'negotiations' often involving the fund setting a price prior to discussions and refusing to consider a contract at any other price. [105]

3.71 ACHCA noted that member hospitals reported 'varied satisfaction with the progress of negotiated agreements. Some hospitals report that funds have merely formalised existing arrangements. Others, albeit few, maintain that negotiations have been relatively smooth'. [106] HCoA indicated, however, that the group had no major difficulties in negotiating contracts 'to date the negotiations have been undertaken quite professionally and with mutual agreement'. [107]

Country/smaller hospitals

3.72 Some evidence suggested that smaller and/or country hospitals had problems negotiating with the funds. APHA claimed that in the case of smaller hospitals (up to 50 beds) many funds do not negotiate in person at all, rather they routinely make 'offers' in writing, without visiting the private hospitals to assess the scope or quality of services provided. [108] However, MBF argued that their fund 'would certainly not simply offer terms to a hospital and say 'There it is' We have had, in a number of cases, quite protracted negotiations until we reach agreement. That would apply to country hospitals as much as to urban hospitals.' [109]

3.73 ACHCA noted that the difficulty for country private hospitals is that many operate in a quasi fashion between the public and private sectors because doctors use them for different purposes 'so there are peculiar issues that need to be addressed in the negotiations and a lot of the times it does come down to the capacity of individuals around that table'. [110] Evidence from HCoA noted that due to the complexity of the negotiating environment 'smaller operators without the information resources and computer systems would find it very difficult'. [111]

3.74 APHA suggested that data on hospital closures suggests that smaller hospitals are 'having greater difficulties negotiating appropriate contracts with health insurance funds than the larger hospitals'. [112] AHIA, while not addressing the issue of smaller hospital closures specifically, suggested, however, that there are many reasons for hospital closures including poor management, sale of a facility to another organisation etc. AHIA pointed out that while 13 private hospitals have closed nationally since 1 July 1995 over the same period 12 new private hospitals have opened, resulting in an increase of 80 beds in the private hospital sector. [113]

3.75 The Committee inquired as to whether there is any differentiation in the benefits offered by funds to smaller hospitals as opposed to larger ones. Medibank Private stated that differential benefits were based 'more on our assessment of their patient mix rather than their size' therefore an acute surgical hospital would have a higher offer than a hospital with predominantly medical patients. [114] HCoA

told the Committee that the differentiation in the benefits offered 'is mainly done on the basis of issues such as clinical infrastructure and the types of services that are provided within those facilities'. [\[115\]](#)

Conclusion

3.76 The Committee notes the concerns expressed in evidence concerning the difficulties that many country and/or smaller hospitals may have in negotiating contracts with funds. The Committee considers that the contracting arrangements could be improved if smaller hospital groupings were able to collectively negotiate contracts with the funds (see Recommendation 9).

Administrative costs

3.77 Evidence from organisations representing private hospitals indicated that there are increased administrative costs for private hospitals since the introduction of HPPAs. [\[116\]](#) These relate to the direct costs of undertaking negotiations, information systems costs in administering the agreed contracts and staff costs associated with explaining the implications of HPPAs to patients.

3.78 APHA stated that, typically, negotiation of contracts involves 60 per cent of a senior executive's time (or equivalent spread amongst multiple senior executives) in each private hospital. The Association argued that while this involves a reasonably small absolute cost for larger hospitals, for smaller hospitals the actual cost may be a 'significant burden'. [\[117\]](#) APHA also claimed that training of staff to use new information systems and to understand the variety of payment systems has added approximately \$1000 per annum per employee to each hospital's training costs. In addition, due to the number and complexity of health fund products and the time required to explain these arrangements to consumers, additional administrative staff have been required in some hospitals. [\[118\]](#)

3.79 The Committee considers that the administrative costs involved in the negotiation process, especially for smaller hospitals, could be rationalised by permitting hospital groupings to collectively negotiate contracts with health funds (see Recommendation 9).

Renegotiation of hospital contracts

3.80 APHA and PHAV argued that hospital experience in the renegotiation of existing contracts has also been unsatisfactory. [\[119\]](#) APHA claimed that some funds have unreasonably delayed concluding contract negotiations. These funds have the

extended the existing contract until the delayed negotiations are complete, often months later. [\[120\]](#)

3.81 In addition, APHA argued that many funds enter renegotiation discussions with a predetermined view on the size of any increased benefits. For example, funds tend to be unwilling to consider the impact of significant cost increases, such as wage rises, that have taken place since the previous contract was negotiated. Other funds have a predetermined idea of the total benefits to be paid based on the previous year's case profile `this approach is likely to be inappropriate where a hospital's service profile is changing due to specialisation or broadening the range of services offered'. [\[121\]](#) APHA argued that some private hospitals, especially smaller and independent hospitals, have been offered renegotiated contracts which pay substantially lower benefits compared to those previously paid by the fund. [\[122\]](#)

Collective negotiations with health funds

3.82 APHA argued that to achieve a more equitable basis for negotiations between hospitals and health funds, independent hospitals and small hospital groups should be permitted to collectively negotiate contracts with the health funds. [\[123\]](#) AHIA, however, was opposed to this proposal arguing that it would lead to the creation of `cartels'. [\[124\]](#) The Association argued that the existing trade practices legislation provides sufficient flexibility for hospitals to negotiate without the need for special exemptions. [\[125\]](#)

3.83 The ACCC in its submission to the Committee stated that under the Trade Practices Act, private hospital negotiations with health funds for the provision of hospital services need to be completed on an individual basis to ensure no breach of the Trade Practices Act. Hospitals that compete with each other, or are in a position to compete with each other, cannot collectively negotiate on price with health funds (nor can they appoint a negotiator) without risking breaching s. 45A of the Trade Practices Act the price fixing provisions of the Trade Practices Act. [\[126\]](#)

3.84 The ACCC advised the Committee, however, that not all joint negotiations on prices and rates would breach s.45 of the Trade Practices Act. Private hospitals that do not compete with each other, either in a geographic sense or in a product market sense, are able to negotiate jointly, provided that such conduct does not substantially lessen competition. Secondly, it is not a breach of s.45 for all hospitals owned by one legal entity, for example an order of the Catholic Church, to negotiate jointly with the health funds. [\[127\]](#)

3.85 Currently, the ACCC may authorise collective negotiation by hospitals, in circumstances where the applicants are able to demonstrate public benefit which outweighs any reduction in competition. The Commission advised the Committee that it has examined one joint negotiation proposal involving major private hospitals in a particular metropolitan area. The ACCC noted that:

The Commission formed the tentative view that in this particular instance the effect on competition would be significant. The public benefits to outweigh this detriment to competition focused nearly entirely on the countervailing power argument. That is, the other side to the bargaining equation had a lot of power and the hospitals did not. While this can be claimed as a public benefit the Commission's preliminary view was that it did not feel that this countervailing power argument was likely to produce sufficient benefits to outweigh the impact on competition. However, this would not necessarily be the position in all cases involving a joint negotiation proposal. [128]

3.86 APHA has argued that the public benefit argument necessary for authorisation for joint negotiation 'is difficult to demonstrate to the satisfaction of the ACCC'. [129] APHA further stated that the authorisation process inadequately addresses the hospital/insurer power imbalance and is an expensive (costing some \$7 500 per application) and lengthy process (taking a minimum of four months). [130]

3.87 APHA suggested, that to overcome the difficulties associated with the authorisation process, legislation should permit the establishment of hospital alliances for the purposes of negotiating HPPAs. The Association proposed that the National Health Act be amended to allow private hospitals to form negotiation alliances which comprise no more than 30 per cent of the privately owned private beds in a State or 30 per cent of day procedure centres working in any one speciality. APHA argued that the proposed upper limit (of 30 per cent of beds in a State) would not create a 'new power imbalance' as both new hospital alliances and existing hospital groups would have less market power than the funds. [131]

3.88 In additional information provided to the Committee APHA stated that hospital alliances would result in each alliance representing a significant proportion of fund members. An alliance which represented 30 per cent of the private beds in a State would provide services for about 20 per cent of each fund's members (the remaining 10 per cent attend public hospitals as private patients). Thus the fund would be required to enter 'meaningful negotiations with the alliance to avoid disenfranchising 20 per cent of its members'. [132]

3.89 AHIA raised some concerns with the APHA proposal. AHIA argued that some small independent operators may be disadvantaged as some 90 per cent of privately owned beds in a State could be tied up in three negotiating groups 'if I had a group that had 30 per cent of the market I would be in a stronger competitive position than my competitor who has 10 per cent or less of the market'. [133] AHIA also argued that the increased market power of private hospital alliances may lead to situations where groups containing both high quality and 'poorer quality' hospitals may demand contract conditions on a 'take it or leave it' basis. [134]

Conclusion

3.90 The Committee is satisfied that on the evidence there is a market dominance of the funds vis-à-vis private hospitals. This dominance creates a potentially unfair negotiating advantage for the funds. The Committee is of the view that a level playing field needs to be established to achieve a more equitable basis for contract negotiations. The Committee therefore considers that private hospitals should be encouraged to collectively negotiate contracts with health funds but that this should be pursued under the authorisation provisions of the Trade Practices Act.

Recommendation 9:

The Committee recommends that private hospitals negotiate hospital agreements with health funds by seeking authorisation for joint negotiations as provided for under the *Trade Practices Act 1974*.

Gap insurance

3.91 The gap between health insurance coverage and what a doctor actually charges (out-of-pocket expenses) has been identified as a major reason why many people perceive a 'lack of value for money' in health insurance cover. [135] The Commonwealth Government sets the amount which can be covered by insurance for a particular procedure through the MBS. For procedures conducted in hospital on persons with private health insurance, Medicare will rebate 75 per cent of the schedule fee and the health insurance fund will make up the remaining 25 per cent. If a doctor opts to charge above the schedule fee, the patient bears this cost it is these 'out-of-pocket' costs that have caused concern to those with private h

insurance. This problem is addressed in the legislation which provides, through MPPAs, for funds to offer 100 per cent insurance cover for in-hospital medical expenses. [\[136\]](#)

3.92 The level of out-of-pocket costs for patients can be substantial. AHIA stated that the 'average' co-payment for a patient treated by a specialist and anaesthetist is approximately \$130. In 1995, one AHIA-affiliated fund reported more than 850 co-payments to surgeons exceeding \$1000. On the basis of this data, AHIA estimated that one claimant in 90 would face an uninsurable co-payment of more than \$1000. [\[137\]](#)

3.93 The problem of medical 'gaps' is complicated by the fact that the real value of MBS fees has been eroded over time and, as the gap between that fee and the charges made by the doctors widens, the out-of-pocket costs have increased. The AMA argued that the problem with the MBS list is that it does not reflect 'current relativities or legitimate variations in the medical market across Australia'. [\[138\]](#) The AMA argued that a factor in any solution must be the earliest possible production of an up-to-date fees schedule with a reasonable and agreed basis for indexation. The Association argued for the Relative Value Study (RVS) to be concluded on an accelerated timetable and for discussions to be held with the Government on future indexation. The AMA suggested that if this were to be achieved such a schedule would equalise gaps across the schedule. [\[139\]](#)

3.94 A number of submissions addressed the question of alternative approaches that could be made to achieve the aim of nil or known out-of-pocket costs for patients and reasonable stability in the cost of private health insurance.

3.95 AHIA, while favouring the current arrangements, outlined an approach that involved allowing funds to pay medical benefits above the MBS, up to an amount determined by the fund. Payment of benefits above the schedule would be conditional on the fee not exceeding the published fund benefit or the practitioner entering into an agreement with the fund in relation to a higher fee which, if it involved a co-payment, would be known to the contributor prior to consent to treatment. [\[140\]](#)

3.96 Sinclair Wornell and Associates (SWA) argued that unless there was some form of agreement between health funds and doctors, average doctors' fees would increase in line with an increase in the MBS fee, leaving most patients with similar out-of-pocket expenses. Premiums would also rise without a benefit to patients. [\[141\]](#) Medibank Private also noted that open-ended gap insurance, while giving funds the opportunity to offer products that covered all charges, would be a expensive product'. [\[142\]](#)

3.97 The Committee believes that any form of gap insurance needs to be limited in the sense that funds should not be expected to provide coverage for whatever sum a doctor may care to charge. AHIA argued that 'open-ended gap insurance where we simply tie benefits to whatever the doctor charges is a recipe for galloping inflation! I would be amazed if the profession was able to exercise any form of price restraint if benefits simply chased the charge'. [143] The Committee believes that doctors should exercise some restraint in the fees they charge, in return for the guaranteed freedom of clinical action.

3.98 AHIA commented further that for health insurance to meet reasonable charges above the MBS, there is a need to ensure that funds can establish predictable premiums; the premiums are affordable for consumers; and consumers can be guaranteed that, in return for a higher premium, they can access providers 'on the basis of a predictable risk exposure rather than a potentially open ended financial liability'. [144]

Conclusion

3.99 The Committee believes that the Reform Act, through the implementation of MPPAs, provides one approach to address the issue of eliminating out-of-pocket costs. The Committee also considers that the Commonwealth Government should consider other approaches to address the issue of medical gaps.

Recommendation 10:

The Committee recommends that the Commonwealth Government take available options to conclude the Relative Value Study of the MBS on an accelerated timetable.

Impact on public hospitals

3.100 Several submissions from State Governments raised issues relating to the likely impact of the Reform Act on public hospitals. [145] The Reform Act provides that public hospitals may enter into HPPAs with health funds from 1 July 1996. In order to encourage the development of HPPAs, the basic table benefits were abolished from that date and replaced by a default benefit. This benefit is to be paid by funds to hospitals with whom they have not negotiated HPPAs, and as such operate similar to that of the basic table benefit. [146]

Negotiating contracts

3.101 Several submissions from State governments argued that the health insurance reforms provide little incentive for health funds to enter into MPPAs with public hospitals. [147] The Victorian Minister for Health stated that some Victorian health insurance funds have indicated to public hospitals in that State that they 'do not want to enter purchaser provider agreements that would lead to serious competition between public and private hospitals'. [148]

3.102 The reasons for the lack of negotiation of agreements are due to a number of factors, but principally relate to the lack of incentives that the public sector can offer to privately insured patients. In particular, the Medicare arrangements do not allow for preferential access to be given to private patients in public hospitals. Furthermore, in those areas where services are not available in the private sector, for example, country areas and some specialities, insurers are under no pressure to enter into contracts with public hospitals since the legislation limits their costs to the minimum default benefit. [149]

3.103 Commenting on the lack of incentives for funds to negotiate with public hospitals, the Western Australian Minister for Health, stated that:

It is questionable whether the funds have much incentive to negotiate reasonable fees. It is in the funds interest to keep the benefits which apply to private patients in public hospitals as low as possible and let the respective State Government incur the odium of charging fees which are not fully recoverable from the patient's health fund. Also, the funds are aware that where public hospitals charge fees in excess of the fund benefit, there is incentive for the patient to elect to be treated as a public patient and hence make no claim on their private health insurance.

[150]

3.104 Several submissions also noted that some health funds indicated that a precondition for negotiating HPPAs with public hospitals would be preferred access for fund contributors to public hospitals. As noted above, the Medicare Agreement, however, requires that admission to public hospitals is based solely on clinical need, and that the health status of a patient is irrelevant. [151] The Tasmanian Minister for Community and Health Services suggested that in order to make HPPAs more attractive the Medicare Principles would need to be relaxed so as to allow preferred access to be provided. [152] AHIA also indicated that the funds see little, if any, benefit in negotiating contracts with public hospitals 'unless they can provide guarantees of access and/or accommodation'. [153]

Equivalence

3.105 Several submissions to the inquiry suggested that the policy of 'equivalence' under the new health insurance arrangements needs to be clarified by the Commonwealth Government. Under the new contracting arrangements, public hospitals are able to negotiate with funds on the same basis as private hospitals. This allows for 'equivalence' between private hospital charges and benefit payments for the treatment of private patients. To offset the potential problem of increasing health insurance premiums as public hospitals move to full cost recovery pricing for private patients, it is proposed that the Commonwealth Government 'clawback' any extra revenue from the States and return the revenue to the funds. [\[154\]](#)

3.106 State Governments indicated a number of difficulties with these arrangements. The Tasmanian Minister for Community and Health Services argued that the circumstances where clawback may apply are 'unclear' and need to be clarified. [\[155\]](#) The Victorian Minister for Health argued that there should be no clawback unless there is 'clear evidence' that increased public hospital fees have caused a substantial increase in health insurance premiums. [\[156\]](#) Evidence from State governments also indicated that any increase in State revenue from the treatment of private patients in public hospitals could also effect the distribution of financial grants from the Commonwealth to the States. [\[157\]](#)

Other issues

3.107 A number of other issues were raised by the States in submissions to the inquiry. One issue canvassed was the perceived discrimination by funds against co-located hospitals with funds currently unwilling to pay benefits, such as theatre fees when co-located private hospitals lease operating theatre time in public hospitals. [\[158\]](#)

3.108 Another issue raised was the effect of the current Medicare and health insurance arrangements which, it was argued, encourage funds to direct their members to public hospitals for high cost treatments and where the patients' stay in hospital is likely to be longer. The Western Australian Minister for Health argued that this results in public hospitals 'having to carry a higher proportion of high cost care than do the private hospitals'. [\[159\]](#)

3.109 The Victorian Minister for Health also noted a problem concerning the lack of recognition in the Reform Act for 'service innovation' in the health area. The Minister noted that the Victorian Government's Hospital in the Home (HITH) pilot program has had to be restricted to public patients because the focus of the NHA on defining a hospital as a premises at a particular address has prevented funds paying benefits for private patients under this program. [\[160\]](#) The Minister stated that the definit

`hospital' and a `hospital service' in the NHA need to be reviewed `to ensure that hospitals and health insurance organisations can keep up with services innovations that will lead to lower costs of services and better outcomes for patients'. [\[161\]](#)

Conclusion

3.110 The evidence from State Governments raised a number of important issues in relation to the impact of the Reform Act on the public hospital sector, and highlighted a number of problems associated with the new contracting arrangements between public hospitals and the funds. The Committee believes that, while the full impact of the new arrangements may not be known for some time, as the major changes relating to public hospitals only commenced on 1 July 1996, the possible effects of these changes and any unintended consequences need to be addressed by the Commonwealth Government, in consultation with State and Territory Governments.

[26] The studies based their conclusions on clinical results such as how many patients died or how far a patient's cancer had advanced before it was discovered. HMOs are organisations that provide health care in return for set monthly payments. Most HMOs provide care through a network of doctors and hospitals that their members must use in order to be covered. There are several different forms of managed care plans. Another example is Preferred Provider Organisations under these plans, networks of doctors and hospitals provide care at a lower cost than through traditional insurance. The choice is usually wider than under HMOs. See CQ Researcher, *op.cit.*, pp.317–20. See also Rosenman, *op.cit.*, p.33.

A person authorised under section 19(1) of the Oaths and Affirmations Act 2018 to take an affidavit.

Percentage of services with no gap or where known gap payment made - this table includes both the percentage of no gap services and what is called 'known gap' services. Known gap schemes are an arrangement where the insurer pays an additional benefit on the understanding that the provider advises the patient of costs upfront.

These tables consider all the insurer's policies. The information in the tables is not indicative of any individual policy offered by the insurer but is an average across the insurer's total membership.

Table 4A: Medical services with no gap

Fund Name (Abbreviated)	% of Services with no gap								
	ACT	NSW	VIC	QLD	SA	WA	TAS	NT	Australia

How Medibank's No Gap Joint Replacement Program works

The No Gap Joint Replacement Program allows eligible members to pay no out-of-pocket costs* on a wide range of services as part of hospital admission for elective surgery for a joint replacement¹. That means they will only pay their excess if they participate in the program.

The program has been designed to provide members with more affordable care options and transparency about out-of-pocket costs* when undergoing a joint replacement with participating surgeons and hospitals.

Ready for joint replacement surgery? There are some steps to consider including your eligibility and medical advice from a GP

Check your eligibility

Doctor-led and designed

The doctor-designed model of care has been developed to help patients spend less time in hospital and get back to doing what they love faster. The typical joint replacement experience may have people in hospital for 5 days.² The No Gap Joint Replacement Program typically has people in hospital between 1-3 days.³ This means we can pass on no out-of-pockets to our members.

Through this model of care people may return to mobility faster, aiding an improved range of movement and outcome.⁴

Patient education and support

With the No Gap Joint Replacement Program, members may spend less time in hospital but that doesn't mean they get less support. The program is designed to provide eligible members access to personalised support before and after their surgery.

This may include: pre-admission joint school, rehabilitation with a physiotherapist, other allied health support if their treating doctors consider it to be clinically appropriate.

rehabilitation is right.

What costs are covered in the No Gap Joint Replacement Program?

Usually, there are several out-of-pocket costs* associated with an elective joint replacement surgery: surgeon fees, bills for scans and blood tests, the anaesthetist's bill and more – it adds up. That's why we've partnered with a range of surgeons and participating hospitals to deliver no gap knee or hip joint replacement surgeries.

Pre-admission joint school

Joint replacement surgery with a participating surgeon, including your prosthesis (artificial joint)

What about rehabilitation?

There isn't a one-size-fits-all approach to rehabilitation because everyone is different. A surgeon will decide whether rehabilitation is required as part of a joint surgery recovery plan. If rehabilitation is required there are two ways: in hospital or at home.

If clinically appropriate, and there is a rehabilitation at home provider in the area, eligible Medibank members can receive rehabilitation in the comfort of their own home at no additional cost.

Please note: excess and any per-day payments under the policy are still payable.

Things you should know

* There may be out-of-pocket expenses associated with outpatient appointments, such as your initial visit with a participating surgeon in their consulting rooms. If a member has chosen an excess or per-day payment on their cover to lower their monthly premium, this will still be payable (for example, if you're claiming for the first time that calendar year, you may need to pay an excess).

¹ Excludes joint replacements resulting from an emergency admission.

³ Medibank No Gap Joint Replacement Program member clinical Indicators average length of stay data taken from July 2020 to November 2021.

⁴ Soffin E, YaDeau J. 'Enhanced recovery after surgery for primary hip and knee arthroplasty: A review of the evidence', Br J Anaesth 2016; 117(3):iii62-iii72.

⁵ Health Concierge is available to all eligible Medibank members who hold hospital cover. Excludes Overseas Visitor Health Cover, Working Visa Health Cover and Overseas Student Health Cover (OSHC). Some referred services may involve out of pocket costs.

⁶ OSHC members should call the Student Health and Support Line on [1800 887 283](tel:1800887283).

Offered only by participating orthopaedic surgeons and only at participating hospitals. The surgeon and hospital will work with you to decide if the pilot is right for you and your health needs. However, if the surgeon refers you to a non-participating hospital and/or the pilot is not otherwise right for your health needs, any such procedure will not be part of the no gap joint replacement program and you may incur out-of-pocket costs.

The listing of a provider does not comprise any sort of representation or recommendation by Medibank regarding the provider. To the fullest extent allowed by law, such reference should not

REST EASY WITH OUR NO-GAP JOINTS PROGRAM

NO-GAP JOINTS PROGRAM THAT PUTS YOU IN CONTROL

We believe Uncommon Care is taking a holistic approach to your health and wellbeing. So, when it comes to having primary hip or knee replacement surgery, we want to give eligible members* greater flexibility to make their experience simple and supported.

Our No-Gap Joints program for primary hip and knee replacements, gives eligible members peace of mind with no out-of-pocket costs from hospital admission through to discharge and post-surgery rehab, with participating private hospitals and clinicians*.

The No-Gap Joints program is scheduled to end between March 2023 and April 2024, depending on the participating hospital.

[Get cover now](#)

Eligible HCF members will have access to:

primary hip and knee replacements with no out-of-pocket costs through participating private hospitals and clinicians in NSW and Vic⁺

peace of mind – we'll cover the costs during and after surgery, so you can focus on recovery

continuity of care with the same health professionals and hospital coordinating your care from admission through to post-surgery rehab

treatment with a participating surgeon in a complete package including rehab.

Eligible members need to be accepted into the program in line with clinical criteria by the participating clinician and hospital*.

ALREADY AN HCF MEMBER?

Eligible members who have held HCF hospital cover that includes primary hip and knee replacements for at least 12 months are covered for No-Gap Joints. You'll then need to be accepted into the program by a participating surgeon and hospital before the relevant end date (excludes Overseas Visitors Health Cover members)*.

Find out if you're eligible by logging in to [My Membership app \(/members/manage-your-health/hcf-apps\)](/members/manage-your-health/hcf-apps) and [online member services \(/memberservices/mycover/cover-details\)](/memberservices/mycover/cover-details), by calling us on [13 13 34](tel:131334) or visiting your local [branch \(/locations/find-a-branch\)](/locations/find-a-branch).

[Login now](#)

NOT A MEMBER YET?

To be eligible to access the No-Gap Joint program you must have held a policy with HCF for 12 months with appropriate level of HCF cover, which includes primary hip and knee replacements. The program* is scheduled to end between March 2023 and April 2024, depending on the participating hospital.

[Get a quote](#)

CARE AND SUPPORT WHEN IT COUNTS

We help eligible members find ways to be fit and strong before a procedure with access to a range of chronic disease management programs:

[Healthy Weight for Life](/members/manage-your-health/weight-management/healthy-weight-for-life) (</members/manage-your-health/weight-management/healthy-weight-for-life>) assists eligible members[#] with losing weight who are over 18, with a BMI over 28 and have hip or knee osteoarthritis.

[The COACH Program](/members/manage-your-health/coach-program) (</members/manage-your-health/coach-program>) is a telephone support program provided at no extra cost for eligible members[^] with heart conditions or diabetes. You'll be teamed with one of our qualified coaches who's a dietitian, pharmacist or nurse, for up to 6 coaching sessions to help you improve your heart health.

WHERE CAN YOU ACCESS OUR NO-GAP JOINTS PROGRAM?

We know that giving you the choice of specialists, hospitals and services is important. That's why we've partnered with these hospitals to make your primary hip or knee replacement experience as simple, affordable and supportive as possible.

[East Sydney Private Hospital, NSW \(https://www.shortstayjointreplacement.com.au/\)](https://www.shortstayjointreplacement.com.au/)

FAQS

DO YOU HAVE MORE QUESTIONS ABOUT NO-GAP JOINTS?

How do I know if I'm eligible for the No-Gap Joints program?

Eligible members that have held HCF hospital cover including primary hip and knee replacements for at least 12 months are covered for No-Gap Joints, once they are accepted into the program by a participating surgeon and hospital (excludes Overseas Visitors Health Cover members)*. Please visit the [participating hospitals' page](#) to see the list of surgeons involved in the program.

Will I have any out-of-pocket costs?

Our No-Gap Joints program covers eligible members on their primary hip or knee replacement journey from hospital admission through to discharge and post-surgery rehab, with participating private hospitals and clinicians*.

HCF members who are eligible to participate in the program won't have any out-of-pocket costs except for any hospital policy excess (an excess may apply depending on your level of cover and if you're claiming for the first time in a calendar year), or any additional services. Additional services may be required if you have other medical conditions such as diabetes or cardiac conditions. These additional services are not covered by the No-Gap Joints program and additional costs may apply.

If there are complications during your hospital admission that require additional care or services beyond what's included in the No-Gap Joints program, there may also be additional costs. Please speak with your participating surgeon about any risks that may be associated with your chosen surgery.

The No-Gap Joints program includes:

- participating surgeon costs for primary hip or knee replacement surgery. This doesn't include pre-surgical consultations but includes post-surgical consults
- diagnostics (pathology and radiology) for any inpatient diagnostics performed while admitted for the primary hip or knee replacement surgery
- hospital services including accommodation and theatre. Excludes any hospital excess you need to pay
- any costs related to anaesthetists and theatre support to assist with the surgery
- rehabilitation, organised by the participating hospital if clinically required.

Please speak to your participating surgeon to make sure you're aware of and have given Informed Financial Consent for any additional costs.

If you have been charged any out-of-pocket costs and would like to check with HCF, please get in touch with us by calling [13 13 34](tel:131334) or email service@myhcf.com.au (<mailto:service@myhcf.com.au>).

How do I access the No-Gap Joints program?

To access the program, eligible HCF members need to be accepted into the program in line with clinical criteria by a participating clinician and hospital on a patient by patient basis and undergo their joint replacement surgery before the relevant proposed trial program end date*. Please visit the [participating hospital's page](#) to see the list of surgeons involved in the program.

Can I choose my surgeon?

You can choose any of the participating No-Gap Joints program surgeons - please visit the [participating hospitals](#) to see the list of surgeons in the program. You'll need to confirm whether the hospital and surgeon is available and they must accept you into the program.

If I change cover or move health funds, is there a waiting period?

Yes, the program is only available once you've held hospital cover that includes primary hip and knee replacements with HCF for 12 months (excluding Overseas Visitors Health Cover)*.

What if I can't access or don't live near one of the participating hospitals?

If you can't participate in the No-Gap Joints program, you can still access No-Gap surgeons who participate in our No Gap or Known Gap arrangement. Call us on [13 13 34](tel:131334) to find out more on hospitals and surgeons that are part of our participating network near you. Please note participating surgeons have the discretion to choose in line with clinical criteria if members are accepted into the program on a patient-by-patient basis.

When does the No-Gap Joints program end?

The No-Gap Joints program is proposed to end at:

Hurstville Private Hospital, NSW on 31 March 2023

Macquarie University Hospital, NSW on 31 September 2023

East Sydney Private Hospital, NSW on 31 March 2024

Vermont Private Hospital, Vic on 30 April 2024

You must undergo your joint replacement surgery before the relevant proposed trial program end date.

I have more questions about the No-Gap Joints program - who can I speak to?

For any questions, get in touch with us on [13 13 34](tel:131334) or email service@myhcf.com.au (<mailto:service@myhcf.com.au>). We aim to get back to you within 2 business days.

Will HCF contact me regarding No-Gap Joints?

As part of our No-Gap Joints program we may email you a short survey about your experiences with HCF and the program. Hearing your feedback will help us improve the services we offer you and other members.

IMPORTANT INFORMATION

*Eligible members will need to have HCF hospital cover including primary hip and knee replacements for 12 months (excluding Overseas Visitors Health Cover). Members will be accepted into the program in line with clinical criteria by the participating clinician and hospital on a patient-by-patient basis. Must be admitted at Macquarie University Hospital, East Sydney Private Hospital, Hurstville Private Hospital or Vermont Private Hospital. You must undergo your joint replacement surgery before the proposed trial program end date. The No-Gap Joints program is proposed to end 31 March 2023 at Hurstville Private Hospital, 30 September 2023 at Macquarie University Hospital, 31 March 2024 at East Sydney Private Hospital and 30 April 2024 at Vermont Private Hospital.

#To be eligible, members must meet the clinical requirements of the program and have held an eligible hospital cover for 12 months that covers the relevant condition. Excludes Accident Only Basic cover. For the eligibility criteria see [hcf.com.au/hwfl \(/members/manage-your-health/weight-management/healthy-weight-for-life\)](https://hcf.com.au/hwfl (/members/manage-your-health/weight-management/healthy-weight-for-life)) or call [1800 226 180](tel:1800226180).

+Excludes any hospital excess payable.

^To be eligible, members must have had a heart-related condition or diabetes and have had hospital cover that includes heart conditions and vascular system for at least 12 months. Excludes members who only have risk factors for heart disease and members with these

The Australian Health Service Alliance

Operating for more than 20 years

Represents 27 of the 37 private Health Insurance funds in Australia

Health funds are small to medium in size and are located nationally

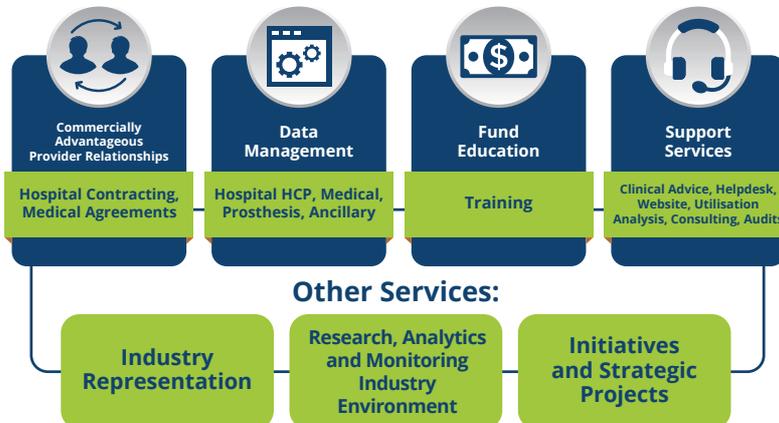

AHSA's market share is 19.06% which covers 2.17 million Australians

Funds pay more than \$2billion in benefits to healthcare providers annually

AHSA is a not-for profit organisation whose primary purpose is to provide services for its participating health funds

AHSA Services for Participating Funds

BENEFITS

AHSA exists for its members. Our mission is to provide our participating funds with services that enable them to successfully compete in their marketplace.

Around 90c in every \$1 earned by health funds is paid in benefits. The bulk of this is paid to hospitals. This means that the hospital agreements AHSA negotiates on behalf of participating funds are vitally important to their viability.

The strength of AHSA is the combined market share of the participating funds which enables AHSA to negotiate commercially advantageous relationships on their behalf.

The success of AHSA is tied to the success of our participating funds and vice versa

The key strength of AHSA's success is the combined expertise of the AHSA staff including hospital negotiators, clinical staff (doctors and nurses), health information managers, trainers for fund education, analysts, IT staff, and compliance staff.

PARLIAMENTARY DEBATES

HOUSE OF REPRESENTATIVES

PRIVATE HEALTH INSURANCE BILL 2006

Second Reading

SPEECH

Thursday, 7 December 2006

BY AUTHORITY OF THE HOUSE OF REPRESENTATIVES

SPEECH

<p>Date Thursday, 7 December 2006 Page 6 Questioner Speaker Abbott, Tony, MP</p>	<p>Source House Proof No Responder Question No.</p>
---	--

Mr ABBOTT (Warringah—Minister for Health and Ageing) (9.23 am)—I move:

That this bill be now read a second time.

This government is committed to choice in health care. Initiatives such as the 30 per cent rebate, the increased rebate for older Australians, no gap and known gap arrangements, the Medicare levy surcharge and Lifetime Health Cover are important measures which the government has implemented to enhance choice, certainty and the value of private health care.

The government's strong commitment to choice in health care ensures a viable and sustainable private health sector and, in turn, improves the capacity of the public hospital system. It also gives millions of Australians, often on low and fixed incomes, peace of mind. They know that when something serious happens to them they can face the trauma of hospital and medical care with the freedom to choose their doctors and places of treatment.

It is a matter of pride for the government that these measures have halted the slide in private health insurance membership. From just over 30 per cent seven years ago, private health insurance membership has stabilised at about 43 per cent of the Australian population. Private hospital admissions, mostly funded by private health insurance, now account for almost three-fifths of all surgical procedures. Medical practitioners who work in the private sector, again largely funded by private health insurance, earn a return on their efforts that makes them willing to do the sessional work in the public sector on which our public hospitals depend.

Still, there is the ongoing task of revitalising the private health sector. The next step is to help it adapt to the realities of early 21st century health care: a way of care that does not always centre on admission to hospital. Day procedures, outpatient services, hospital in the home, wellness and prevention are all part of the healthcare equation in a way that simply was not envisaged when the current regulatory regime was devised over half a century ago.

This package of bills, to come into effect from 1 April next year, will enact the reforms to private health insurance announced on 26 April 2006. These changes should translate into greater competition and improved services for consumers. The changes should also mean much clearer and simpler regulation for health insurers and service providers.

Private Health Insurance Bill 2006

The main bill, the Private Health Insurance Bill 2006, is a significant piece of legislation. It sets out a comprehensive regulatory framework for the private health insurance sector to replace the current regime, mainly set out in the National Health Act 1953, the Health Insurance Act 1973, and the Private Health Insurance Incentives Act 1998.

This bill contains important measures for consumers, including broader health cover, standard product information, a comparative website for consumers, and changes to Lifetime Health Cover for those with 10 years continuous cover.

By far the most significant new measure is the introduction of broader health cover. Hospital cover will expand to cover out-of-hospital services that substitute for or prevent hospital care. This is a groundbreaking change. Health insurers will now have the choice to offer it to the almost nine million Australians with hospital cover.

Broader health cover will apply to services that can safely be delivered outside a hospital and which substitute for or prevent hospital care. This will potentially include a wide range of services, such as dialysis and chemotherapy, allied health services and domestic nursing assistance.

Broader health cover will also allow health insurers to work with a wide range of service providers to develop more flexible and innovative products that reflect modern clinical practice and consumer expectations. Health

insurers will be able to better assist consumers to manage and prevent acute and chronic conditions. Many people can benefit from tailored programs that support and sustain healthy lifestyles, services such as personalised health checks, dietary guidance, exercise supervision, and support to quit smoking.

Some things will not be covered under broader health cover, including:

- general practice services;
- specialist and physician consultations that attract a Medicare rebate; and
- the costs of normal residential accommodation in aged-care facilities.

Consumers can expect products that offer greater convenience and relevance to their needs all of the time, not just when they go to hospital. Broader health cover policies will be fully covered by the government's private health insurance rebates.

The bill also ensures that the contracts that doctors have with insurers may not limit the clinical freedom of doctors to choose the most appropriate treatment for their patients.

Effective choice depends on information. Consumers will benefit from new requirements on insurers to produce standard information statements for their products. These information requirements will help consumers to compare health insurance policies and to understand their entitlements under them. This will assist consumers when they are shopping around for cover and, importantly, when they need to use their cover. With funding announced in this year's budget, the Private Health Insurance Ombudsman is developing a website to present this information to further assist consumers with their private health choices.

As the government announced earlier this year, the ministerial role in reviewing private health insurers' premium applications is being retained. This is an important consumer protection, as well as safeguarding the Australian people's investment in the private health insurance rebate. As part of the annual premium application process, the government may give informal advice on the factors the minister will take into account in considering proposed premium increases.

The government previously announced that it would legislate to provide annualised health insurance contracts, so that a member would not face more than one rate adjustment in any one premium year. However, after extensive consultation with industry and employers handling salary deductions for private health insurance, the government has decided not to proceed with this measure on the grounds of expense and efficiency.

Indeed, the government is pleased that the industry has been behaving responsibly in regard to helping its members through rate changes. We are happy that funds have honoured prepaid contributions applying after a rate change, and in lieu of legislation we expect this responsible self-regulation to continue.

This bill also includes changes to Lifetime Health Cover. People who have retained their private hospital insurance continuously for more than 10 years will no longer be subject to Lifetime Health Cover penalties. This recognises and rewards people who have made the effort to maintain their cover over time, having first joined after the age of 30. They have made the effort and they deserve credit for their commitment and loyalty.

Efficiently run health funds mean lower overheads and lower pressure on premiums. This bill includes significant regulatory reforms which aim to make private health clearer and simpler.

The first such measure changes the focus of regulation from insurers to products. Under the existing arrangements, product regulation is achieved through an arcane set of conditions of registration imposed on insurers. Currently insurers are subject under the National Health Act to no fewer than 48 conditions of registration, and could be deregistered for breaching any of them. This is as clumsy as it is onerous.

By regulating products not providers the government wants to open the door more widely to new entrants into the private health insurance industry and the possibility of existing health insurers adapting their businesses to current market conditions and consumer demands.

The bill also includes offence provisions for breaching the new product standards. The penalties are the maximum allowable. It will be open to a court to impose a lesser penalty depending on the magnitude of the offence.

Chief executive officers and directors can be held personally liable only if they do not exercise due diligence in putting in place systems to ensure that insurers comply with the product standards. The government's intent is to align health insurer director and chief executive obligations with general corporate governance expectations. The directors of insurers, except as mentioned, will not be personally liable for any breach of the new act by insurers. The corporation, not the individual board members and chief executives, will be held accountable instead.

Accountability for poor governance and decision making is more properly a matter for the Corporations Law, for members where the fund is a mutual corporation and, in the case of any future for-profit insurers, shareholders. It should also be noted that the majority of the offence provisions in the bill currently exist in health insurance legislation. The few new offence provisions, while industry specific, have been framed to maximise consistency with existing Commonwealth law.

The second significant regulatory measure is the clarification of the operating rules relating to health benefits funds. While insurers are required to have health benefits funds under the existing arrangements, there are no clear requirements on the conduct of such funds.

The bill sets out a framework for the establishment, operation, merger and termination of these funds. This will require that the assets of the health benefits fund only be used to meet the liabilities arising from the health insurance business or any health related business. Insurers registered to operate on a for-profit basis may withdraw money for other purposes if the capital adequacy and solvency standards are not breached.

The new health benefits funds provisions will improve prudential oversight and protection of the public interest. They will also make it easier to restructure or amalgamate insurance businesses. And by drawing a clear line between the wider business of the insurer and the business of the fund, the bill will also make it easier for new entrants to access the market.

The bill also clarifies aspects of the role of the Private Health Insurance Administration Council, PHIAC, in supervising insurers and their health benefits funds. The current ability for PHIAC to set capital adequacy and solvency standards will be maintained, together with the ability to direct insurers to take action to meet the standards. The bill will also allow PHIAC to set prudential standards for insurers.

The bill allows for subordinate legislation known as the Private Health Insurance Rules to be made by legislative instruments. The rules will:

- continue current default benefit arrangements;
- maintain front end deductible limits for hospital products; and
- restrict eligibility for the private health insurance rebates to people who are eligible for Medicare.

The bill also includes a number of smaller but significant measures that simplify and reduce regulation, including the simplification of the Lifetime Health Cover rules and the rewriting of the rules around waiting periods and portability requirements.

The government has made an undertaking to the industry to review the operation of the legislation as industry develops to meet its requirements over the next few years.

The government has worked cooperatively and constructively with the private health sector in developing this legislation. I have also given an undertaking that I will consider further input over the summer recess and am prepared to introduce government amendments to give effect to refinements that are consistent with the government's policy objectives.

Finally, I should also place on the record the government's thanks to the team of officers in my department who have worked long and hard to develop this highly complex legislation in a matter of months.

I commend the bill to the House.

Debate (on motion by **Mr Edwards**) adjourned.

SUMMARY

Patients, consumers and the community trust clinicians and health service organisations to provide safe, high-quality health care, and most Australians have access to such care. Australians experience comparatively better health outcomes and live longer than people from most other highly developed countries. The Australian health system is more efficient than many other similar health systems¹, and Australia's clinicians are highly regarded as skilled professionals who are committed to meeting the healthcare needs of their patients.

Although most health care in Australia leads to good outcomes, patients do not always receive the care that is most appropriate for them, and preventable adverse events occur across the Australian health system.² Lapses in safety and quality, and unwarranted variation in health care provided to different populations within Australia have substantial costs, in terms of both the effect on people's lives and finances.^{2,3}

The personal and financial impact of patient safety lapses is considerable. In 2013, approximately 12% to 16.5% of total hospital activity and expenditure was the direct result of adverse events.⁴ In the financial year 2017–18, admissions associated with hospital-acquired complications (HACs)* were estimated by the Australian Commission on Safety and Quality in Health Care (the Commission) to cost the public sector \$4.1 billion or 8.9%*** of total hospital expenditure. The most burdensome adverse event types include healthcare-associated infections (HAIs), medication complications, delirium and cardiac complications.**

* HACs list complications only

** Public hospitals only, and all care types

*** Projected based on 2016–17 National Hospital Cost Data Collection

Australia has adopted a nationally consistent approach to improving the safety and quality of health care. In 2006, the Council of Australian Governments (COAG) established the Commission to lead and coordinate national improvements in the safety and quality of health care.

In 2011, the Federal Parliament passed the *National Health Reform Act 2011* which established the Commission as a corporate Commonwealth entity under the *Public Governance, Performance and Accountability Act 2013*. The Commission's governance structure is determined by these Acts.

The Commission works in partnership with patients, carers, clinicians, the Australian, state and territory health systems, the private sector, managers and healthcare organisations to achieve a safe, high-quality and sustainable health system. Key functions of the Commission include: developing national safety and quality standards, developing clinical care standards to improve the implementation of evidence-based health care, coordinating work in specific areas to improve outcomes for patients, and providing information, publications and resources about safety and quality.

The Australian approach to safety and quality has been to identify systemic risks to patients, to mitigate those risks and to improve patient outcomes through clinically appropriate risk management responses.

Measurement is foundational to this, as meaningful metrics are required to understand what the major safety issues are across the care continuum, proactively mitigate patient safety risks and engender improvement.

As global understanding of the nature of safety and quality issues improves, and as new issues emerge, the Commission and partners have continued to evolve Australia's approach to supporting improvement across the health system. Internationally, and within the Australian health system, there has been an increasing focus on delivering value-based health care for consumers and funders - achieving the best care possible for each patient while maintaining an efficient use of resources.⁵ In supporting this move towards value-based health care, the Commission has been fostering system change in five key areas to:

- Focus on people
- Measure and report on safety and quality
- Use evidence-based guidance and policy
- Strengthen clinical governance
- Embed safety and quality into national systems.

Moving forward, over the coming year the Commission will be building on existing work in these areas, and specifically focusing on: supporting implementation of the NSQHS Standards and improving the reliability of accreditation processes; setting national goals to reduce HACs; promoting rapid knowledge exchange on safety and quality

practices; and supporting quality improvement through a health learning system for measurement and monitoring of safety and quality. Sustained and nationally coordinated action in these areas provides health service organisations with the guidance and tools required to make multi-faceted and meaningful improvement to the safety and quality of care delivered within the Australian health system. **Box 1** provides a description and definition of the term 'safety and quality'.

Box 1: What is safety and quality?

Patient safety and quality is often summarised as the right care, in the right place, at the right time and cost. The Commission defines patient safety as prevention of error and adverse effects associated with health care; and quality as 'the degree to which health services for individuals and populations increase the likelihood of desired health outcomes and are consistent with current professional knowledge'.⁶

PATIENT SAFETY AND QUALITY IN AUSTRALIA

The performance of the Australian health system

Australia has better health outcomes at a population level than most other highly developed economies.¹ Australians have the third longest life expectancy among Organisation for Economic Co-operation and Development (OECD) countries, at 82.8 years, and a high number of years spent in good health.⁷ The cost effectiveness of Australia's health system is also high compared with other OECD countries, as we spend less on health than many countries for similar or better outcomes.^{1,8}

Health care in Australia is provided by teams of clinicians working in partnership with patients, families and carers. It is delivered in a wide variety of public and private health service organisations, ranging from sole proprietorships to large statutory corporations and public companies.⁹

Patients, consumers and the community trust clinicians and health service organisations to provide safe, high-quality health care, and most Australians have access to such care. Australia's clinicians are highly regarded as skilled professionals who are committed to meeting the healthcare needs of their patients.⁹

Although most health care in Australia leads to good outcomes, patients do not always receive the care that is most appropriate for them, and preventable adverse events occur across the

Australian health system.³ Lapses in safety and quality, and unwarranted variation in health care provided to different populations within Australia have substantial costs, in terms of both the effect on people's lives and finances.^{2,3}

The personal and financial impact of patient safety lapses is considerable. In 2013, approximately 12% to 16.5% of total hospital activity and expenditure was the direct result of adverse events.⁴ In the financial year 2017–18, admissions associated with HACs* were estimated by the Commission to cost the public sector \$4.1 billion or 8.9%*** of total hospital expenditure. The most burdensome adverse event types include HAIs, medication complications, delirium and cardiac complications.**

* HACs list complications only

** Public hospitals only, and all care types

*** Projected based on 2016–17 National Hospital Cost Data Collection.

The delivery of health care is a complex endeavour. Contemporary models of care are sophisticated and rapidly changing, as are the expectations of patients and consumers. Health service organisations such as hospitals sit within intricate networks of different types of services across tertiary, secondary and primary sectors. Patients and consumers move between these services and sectors, and safety and quality risks exist at all points on this journey.^{9,10}

Key safety and quality risks have been identified nationally, and strategies are being implemented to improve the safety and quality of health care in Australia at local, regional, state and territory and national levels.

Australian leadership in patient safety and quality

Clinical teams provide relief to sick and injured people through the provision of safe, high-quality health care. Good health outcomes are dependent on the skills and ability of individual clinicians, clinical teams, and support staff and the clinical governance, teaching and research capability of the health service organisation.

Adverse clinical outcomes were traditionally viewed as the result of unavoidable complications caused by the patient's condition, and harm was thought to be isolated to rare cases.⁷

In 1995 Australia took the lead internationally by exploring safety and quality improvement across the health system and publishing the first large-scale Australian study of adverse events. The ground-breaking *Quality in Australian Health Care Study*, published in *The Medical Journal of Australia*, reported that 16% of patients in hospitals experienced some form of adverse event during their admission and approximately 50% of these were preventable.¹¹ This proved to be a turning point for the Australian health system, dramatically raising the profile of patient safety and stimulating major review of safety of patient care.

Landmark reports followed this Australian study, including *To Err is Human*¹² in 2000, which revealed that in the United States as many as one in 10 hospital patients were harmed unnecessarily, and that a substantial proportion of patients died as a direct result of medical care.⁷ Increasingly, patient harm was understood to be not just a result of human fallibility, but the result of system failures in the way care was organised and coordinated, and potentially preventable through improvement efforts targeted at clinical practice, health service organisations and systems.

Clinical risk, once regarded primarily as a professional indemnity issue for clinicians, became a priority for healthcare policymakers and providers, and a focus for consumers. Knowledge gaps were identified, the healthcare sector began to draw on

safety lessons from other high-risk industries and the role of clinical governance and organisational culture to support patient safety was accepted.

See **Figure 1** for a summary of key developments in safety and quality in health care nationally and internationally.

Figure 1: Summary of key developments in safety and quality in health care nationally and internationally

INTERNATIONAL AND NATIONAL SAFETY AND QUALITY MILESTONES

1990

2000

EVENT

1991

Harvard Medical Practice Study (US)^(a)
 Formal patient complaint mechanisms established in states and territories

1995

Quality in Australian Healthcare Study (Australia)^(b)

1996

Professional Indemnity Review (Australia)^(c)

TARGET

Recognition of scope of patient harm
 Highlighted need for focus on patient safety
 Recognition of need for formal patient complaint processes

National approach to safety and quality monitoring and improvement

Broader understanding of contributing factors to harm
 Importance of governance, culture and reporting recognised

Increased transparency and understanding of scope of harm and focus areas

2000

To Err is Human (US)^(d)
 An Organisation with a Memory (UK)^(e)
 The Australian Council for Safety and Quality in Health Care established

2001

Crossing the Quality Chasm (US)^(f)
 Bristol Royal Infirmary Inquiry Report (UK)^(g)
 First Australian Hospital Inquiry Report (King Edward Memorial)^(h)

2002-04

Hospitals required to report sentinel events nationally according to the Australian Sentinel Events List⁽ⁱ⁾
 First national Open Disclosure Standard (Australia)^(j)

2010

2006

The Australian Commission on Safety and Quality in Health Care established Requirement for hospitals to introduce incident management systems

2008-11

Australian Charter of Healthcare Rights endorsed ^(k)
The Australian Safety and Quality Framework for Health Care endorsed by Health Ministers ^(l)
Australian Health Service Safety and Quality Accreditation Scheme ^(m)

2013-18

Health service accreditation assessment against the first edition of the NSQHS Standards for hospitals and day procedure services commenced ⁽ⁿ⁾

More than 1,330 hospitals and day procedure services assessed against the NSQHS Standards by 2017
Consultation on and development of the second edition of the NSQHS Standards, released in November 2017 ^(o)

Development of the hospital-acquired complications (HACs) list ^(p)
National Model Clinical Governance framework released ^(q)
Australian Atlas of Healthcare Variation Series: 1, 2 and 3 released ^(r)

2019

Health service accreditation assessment against the second edition of the NSQHS Standards commenced ^(o)
New accreditation scheme commenced
Integration of HACs into funding model from July 2018

2020

Common set of safety and quality metrics and public reporting of safety and quality data, using the Australian Health Performance Framework^(s)

Enhancement of consumer role

Greater understanding of causes of sentinel events and preventative strategies

No-blame culture

Consistent approach to consumer rights and recognition of importance of consumer participation in care

Three core principles specified for safe and high-quality care: consumer-centred, driven by information, and organised for safety

Nationally consistent approach to accreditation

Accreditation focus on systems for clinical risk, consumer-focused care and governance.

Commission and jurisdictions develop resources to support health service improvement

Increased understanding of safety and quality strengths and weaknesses

Improvements in key areas of care and governance

No-blame culture moves to learning culture

Defined focus areas for reducing complications, cost and practice variation; and for establishing robust clinical governance in health service organisations

Strengthened focus on cognitive impairment, mental health, health literacy, end-of-life care, Aboriginal and Torres Strait Islander health

Health system-wide learning systems to support safe, quality care

AUSTRALIA ADOPTS A NATIONALLY CONSISTENT APPROACH TO MAKE HEALTH CARE SAFER

Primum non nocere:
‘First, do no harm’.

In 2006, the Council of Australian Governments (COAG) established the Australian Commission on Safety and Quality in Health Care (the Commission) to lead and coordinate national improvements in the safety and quality of health care. The Commission's permanent status was confirmed with the passage of the *National Health and Hospitals Network Act 2011*¹³, while its role was codified in the *National Health Reform Act 2011*.¹⁴ The Commission commenced as an independent statutory authority on 1 July 2011, funded jointly by the Australian Government and state and territory governments.

Box 2: The role of the Australian Commission on Safety and Quality in Health Care

The Commission leads and coordinates national improvements in healthcare safety and quality. It works in partnership with patients, carers, clinicians, the Australian, state and territory health systems, the private sector, managers and healthcare organisations to achieve a safe, high-quality and sustainable health system.

Key functions of the Commission include: developing national safety and quality standards, developing clinical care standards to improve the implementation of evidence-based health care, coordinating work in specific areas to improve outcomes for patients, and providing information, publications and resources about safety and quality. The Commission works in four priority areas:

- Patient safety
- Partnering with patients, consumers and communities
- Quality, cost and value
- Supporting health professionals to provide care that is informed, supported and organised to deliver safe and high-quality care.

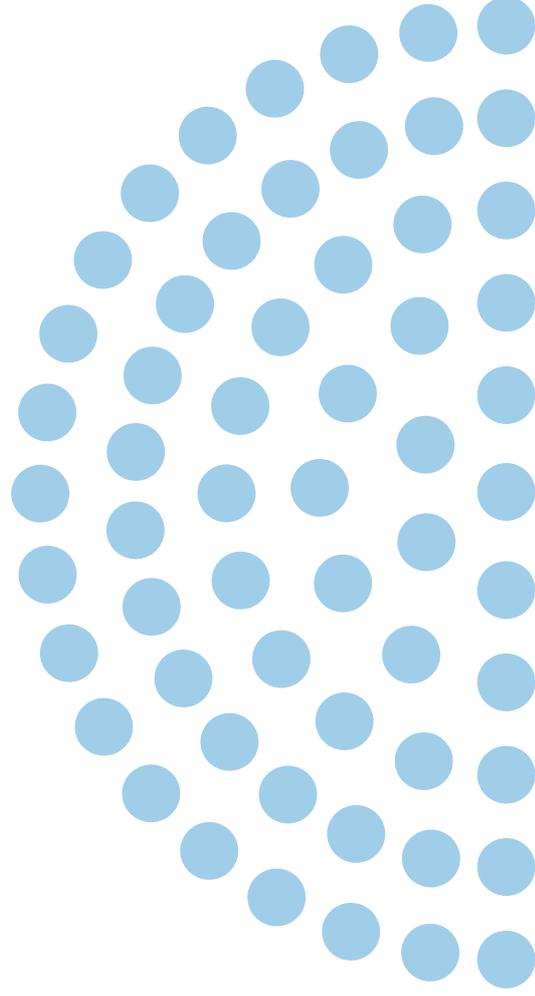

Australia adopts a nationally consistent approach to make health care safer

The Australian approach to safety and quality is to identify systemic risks to patients, to mitigate those risks and to improve patient outcomes through clinically appropriate risk management responses. In taking this approach, the health sector has adopted industrial principles from aviation, mining and used human factors analysis to develop patient safety standards.

Robust clinical governance, setting of standards, meaningful consumer partnerships, and measurement and reporting are central to Australia's approach to safety and quality. These issues have been highlighted in a range of activities to address safety and quality in Australia including the development and implementation of:

- Australian Charter of Health Care Rights²²
 - Australian Atlas of Healthcare Variation series.²³
- In June 2017, all Australian Governments committed to develop and implement reforms to improve health outcomes for patients and decrease potentially avoidable demand for public hospital services through the National Health Reform Agreement (NHRA) Addendum.²⁴ This Addendum sets out governments' intent to develop and implement reforms to:
- Improve patient outcomes
 - Incentivise the system to provide the right care, in the right place, at the right time
 - Decrease avoidable demand for public hospital services
- Signal to the health system the need to reduce instances of preventable poor-quality patient care, while supporting improvements in data quality and information available to inform clinicians' practice.²⁵

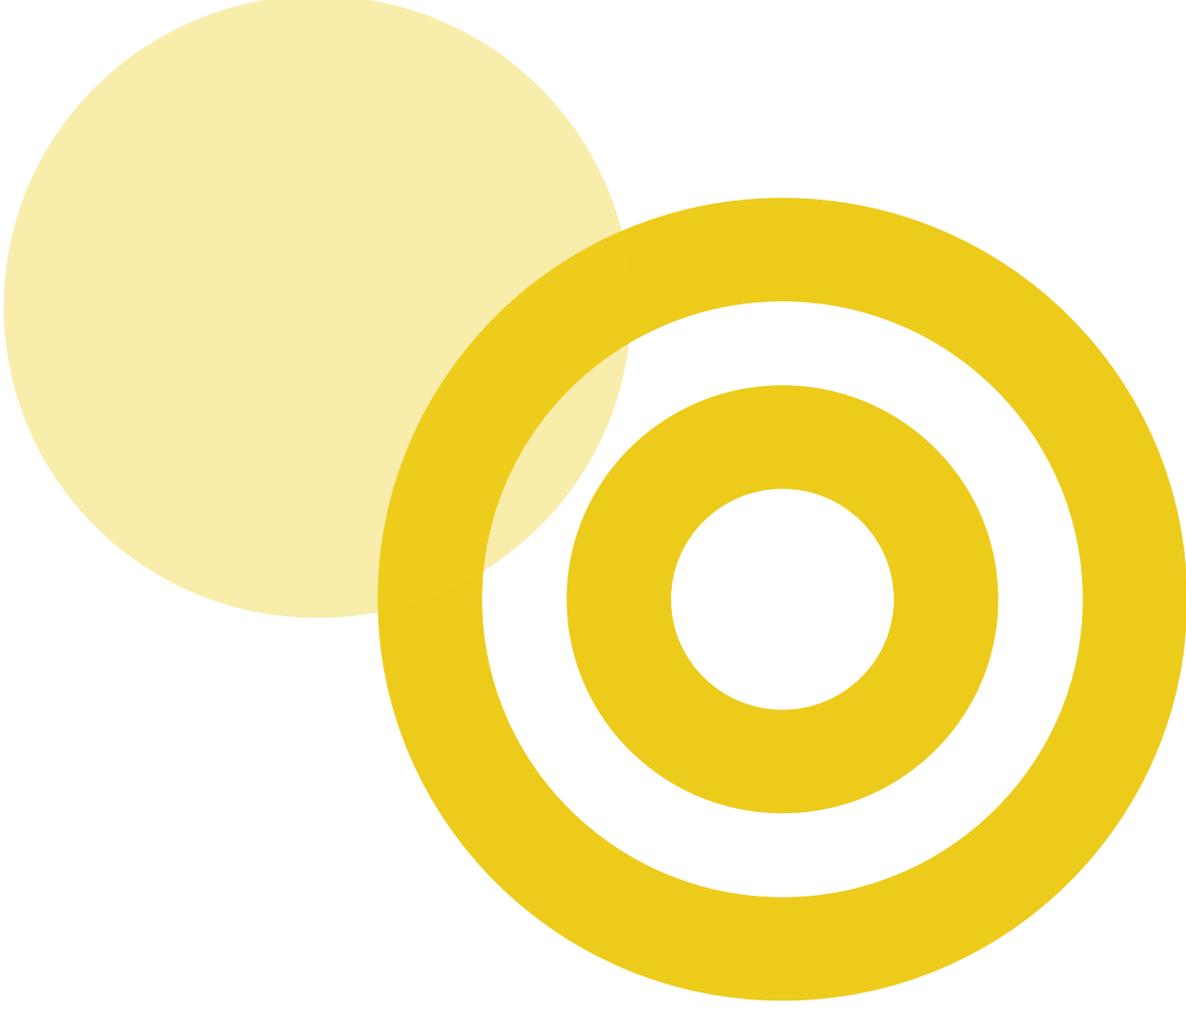

- National Safety and Quality Health Service (NSQHS) Standards (first and second edition)^{15, 16}
- Australian Health Service Safety and Quality Accreditation Scheme¹⁷
- Review of the Australian Health Service Safety and Quality Accreditation Scheme¹⁸
- Health service organisations' clinical risk management systems
- Measurement and reporting of sentinel events
- Hospital-acquired complications (HACs) specification for measurement and reporting¹⁹
- Adverse event reporting systems and open disclosure²⁰
- Measurement and reporting of patient experience
- Feedback and complaints management systems
- National Model Clinical Governance Framework⁹
- Australian Safety and Quality Framework for Health Care²¹

For the first time from 2017, funding and pricing arrangements for sentinel events and HACs have been incorporated into the national funding processes for public hospitals, and work is progressing on other potential markers.²⁵ Sentinel events, HACs and avoidable readmissions are discussed in detail in the Patient Safety Surveillance section of this report.

The Commission also provides evidence-based information, education and guidance for policy, strategy and action to improve safety and quality in high-risk areas. These include information, education and guidance on infection prevention and control; antimicrobial stewardship and medication safety; management and prevention of deterioration in physical and mental state; management of cognitive impairment; prevention of falls and pressure injuries; open disclosure and clinical communication.

The Commission has also developed a range of clinical care standards for conditions or treatments where the *Australian Atlas of Healthcare Variation* has indicated there may be unwarranted variation in care across Australia. **Box 3** provides information on clinical care standards.

Box 3: Clinical care standards

A clinical care standard is a nationally agreed statement on the care patients should be offered by health professionals and health services for a specific clinical condition, such as hip fracture, acute stroke or delirium. Clinical care standards play an important role in guiding the delivery of appropriate care and reducing unwarranted variation, as they identify and define the care people can expect to be offered or receive, regardless of where they are treated in Australia. Patients and consumers can use the clinical care standards, where relevant to their condition, to guide discussions with their healthcare professional about suitable treatment options.²⁶

Each clinical care standard contains a set of up to 10 quality statements that describe the key aspects of evidence-based care that a patient should be offered for a specific clinical condition or defined part of a clinical pathway. Accompanying each clinical care standard is a set of suggested indicators to assist local health services to monitor how well they implement the care described in the clinical care standard, and for use in quality improvement.²⁶

Each clinical care standard, in conjunction with clinical guidelines on which it is based, should contribute to improvements in care outlined in the NSQHS Standards. Used together, the clinical care standards and the NSQHS Standards aim to ensure people will receive safe and appropriate care.

THE AUSTRALIAN HEALTH SERVICE SAFETY AND QUALITY ACCREDITATION SCHEME

The very first requirement in a hospital...it should do the sick no harm.

Florence Nightingale, 1863²⁷

The Commission is responsible, with Australia and state and territory partners, under the *National Health Reform Act 2011* for the formulation of standards relating to healthcare safety and quality and for formulating and coordinating national models of accreditation for health service organisations.

Local implementation of the National Safety and Quality Health Service Standards

The primary aim of the NSQHS Standards is to protect the public from harm and to improve the quality of health service provision. They outline safety and quality outcomes that a health service organisation must achieve, while allowing health service organisations the flexibility to decide how to achieve these outcomes in a way that is appropriate for their context.

All hospitals and day procedure services are required to implement the NSQHS Standards. They must implement organisation-wide safety and quality processes and a comprehensive clinical governance framework.

There are eight NSQHS Standards, which cover high-prevalence adverse events, healthcare-associated infections, medication safety, comprehensive care, clinical communication, the prevention and management of pressure injuries, the prevention of falls, and responding to clinical deterioration. Importantly, these NSQHS Standards have provided a nationally consistent statement about the standard of care consumers can expect from their health service organisations.¹⁶

The eight NSQHS Standards are:

Clinical Governance, which describes the clinical governance, and safety and quality systems that are required to maintain and improve the reliability, safety and quality of health care, and improve health outcomes for patients.

Communicating for Safety, which describes the systems and strategies for effective communication between patients, carers and families, multidisciplinary teams and clinicians, and across the health service organisation.

Partnering with Consumers, which describes the systems and strategies to create a person-centred health system by including patients in shared decision making, to ensure that patients are partners in their own care, and that consumers are involved in the development and design of quality healthcare.

Blood Management, which describes the systems and strategies for the safe, appropriate, efficient and effective care of patients' own blood, as well as other supplies of blood and blood products.

Preventing and Controlling Healthcare-Associated Infection, which describes the systems and strategies to prevent infection, to manage infections effectively when they occur, and to limit the development of antimicrobial resistance through prudent use of antimicrobials, as part of effective antimicrobial stewardship.

Recognising and Responding to Acute Deterioration, which describes the systems and processes to respond effectively to patients when their physical, mental or cognitive condition deteriorates.¹⁶

With the NSQHS Standards and a clinical governance framework in place, health service organisations reduce the risk of harm to patients from hospital-acquired infections, the wrong medicines, falls, pressure injuries, or failures to communicate or identify and manage acute deterioration. They can also ensure better care for Aboriginal and Torres Strait Islander people and patients with cognitive impairment, mental illness or at the end of life.

Medication Safety, which describes the systems and strategies to ensure that clinicians safely prescribe, dispense and administer appropriate medicines to informed patients, and monitor use of the medicines.

Comprehensive Care, which describes the integrated screening, assessment and risk identification processes for developing an individualised care plan, to prevent and minimise the risks of harm in identified areas.

Assurance to the community — the accreditation (assessment) process

In Australia, all public and private hospitals, day procedure services and most public dental practices must be accredited against the NSQHS Standards, under the Australian Health Service Safety and Quality Accreditation (AHSSQA) Scheme.¹⁷ Accreditation is a program in which trained external reviewers assess a health service organisation's implementation of the NSQHS Standards.

Assessment involves an on-site visit during which surveyors seek evidence of implementation against the actions in the NSQHS Standards. Surveyors assess a hospital's performance during an accreditation visit of up to five days, during which they interview clinical staff, patients, consumer representatives, review hospital performance data such as HACs, observe clinical practice, inspect resources and test high-risk scenarios.

Assessment against the NSQHS Standards and the awarding of accreditation status provides assurance to the community that a health service organisation has the safety and quality systems and processes in place to meet expected patient safety and quality standards of care. The AHSSQA Scheme provides for the national coordination of accreditation processes, and consists of five inter-related elements to support the application of the NSQHS Standards:

- Health Ministers endorse the NSQHS Standards and receive information about health service organisations' performance against the NSQHS Standards

- Australian, state and territory governments determine the health service organisations required to be assessed against the NSQHS Standards. They receive data on the outcomes of assessment of health service organisations and respond to emerging issues
- Health service organisations implement the actions required to meet the NSQHS Standards and select an approved accrediting agency to assess their compliance in meeting the NSQHS Standards
- Approved accrediting agencies assess health service organisations against the NSQHS Standards
- The Commission, through coordination of a national program, develops and maintains the NSQHS Standards, approves accrediting agencies to assess health service organisations against the NSQHS Standards, undertakes ongoing liaison with state and territory health departments on opportunities to improve the NSQHS Standards and the accreditation system, and reports to Health Ministers annually on safety and quality.¹⁷

Following feedback from state and territory regulators, chief executives and others from health service organisations on the reliability of accreditation to the first edition of the NSQHS Standards, the Commission has implemented changes to improve accreditation processes.

Box 4 summarises the implementation of the NSQHS Standards.

Box 4: Implementation of the NSQHS Standards

Since January 2013, all hospitals and day procedure services in Australia have been accredited at least once to the first edition of the NSQHS Standards, and 906 health service organisations have completed two assessment cycles. Of these organisations, 67% (609 organisations) met all core actions at initial assessment for their first accreditation cycle, compared to 74% (672 organisations) for the second accreditation cycle, demonstrating an improvement in accreditation results over time.

Both the NSQHS Standards and the AHSSQA Scheme have been reviewed since their introduction, with the second edition of the NSQHS Standards released in November 2017. Health service organisations have been assessed to the second edition since 1 January 2019 under the revised AHSSQA Scheme.

What has been achieved?

Despite the limitations of data availability, significant improvements in the safety and quality of care over the past decade are evident. There has been a reduction in HAIs, reductions in preventable in-hospital cardiac arrests, improved experience and outcomes for patients, better governance of clinical care and more meaningful involvement of patients and consumers in health care.

A review of the impact of implementing the first edition of the NSQHS Standards shows a range of benefits, including prevention of harm, improvements in patient care, empowerment of patients and consumers, development of better governance systems, wiser investment and reduction of waste.²⁸

Box 5 summarises the key changes observed.

Box 5: Improvements in patient outcomes arising from implementation of the first edition of the NSQHS Standards 2013–2018

Key changes observed following implementation of the first edition of the NSQHS Standards included:²⁸

- A drop in the yearly number of methicillin-resistant *Staphylococcus aureus* bacteraemia cases between 2010–11 and 2016–17 from 505 to 290^{53,54}
- A decline in the *Staphylococcus aureus* bacteraemia rate per 10,000 patient days under surveillance between 2010–11 and 2016–17 from 1.1 to 0.76 cases^{53,54}
- A decline of almost one-half in the national rate of central line-associated bloodstream infections between 2012–13 and 2013–14 from 1.02 to 0.64 per 1,000 line days
- The number of hospitals with antimicrobial stewardship increased from 36% in 2010 to 98% in 2015
- Formularies restricting use of broad-spectrum antimicrobials increased from 41% in 2010 to 86% in 2015
- Better documentation of adverse drug reactions and medication history
- Reduction in yearly red blood cell issues by the National Blood Authority between mid-2010 and mid-2015 from about 800,000 units to 667,000 units
- Declining rates of in-hospital cardiac arrest and intensive care unit admissions following cardiac arrests:
 - NSW Between the Flags program report 51.5% decrease in cardiac arrest rates between 2010 and 2016
 - Victorian hospitals report a 20% relative reduction in monthly cardiac arrest rates between 2010 and 2014
- Early warning or track and trigger tools in 96% of recognition and response systems in 2015, compared with 35% in 2010
- The majority of hospital boards or their governance equivalent (84%) reported that as a result of the NSQHS Standards the board understood and enacted their roles and responsibilities concerning patient safety and quality.

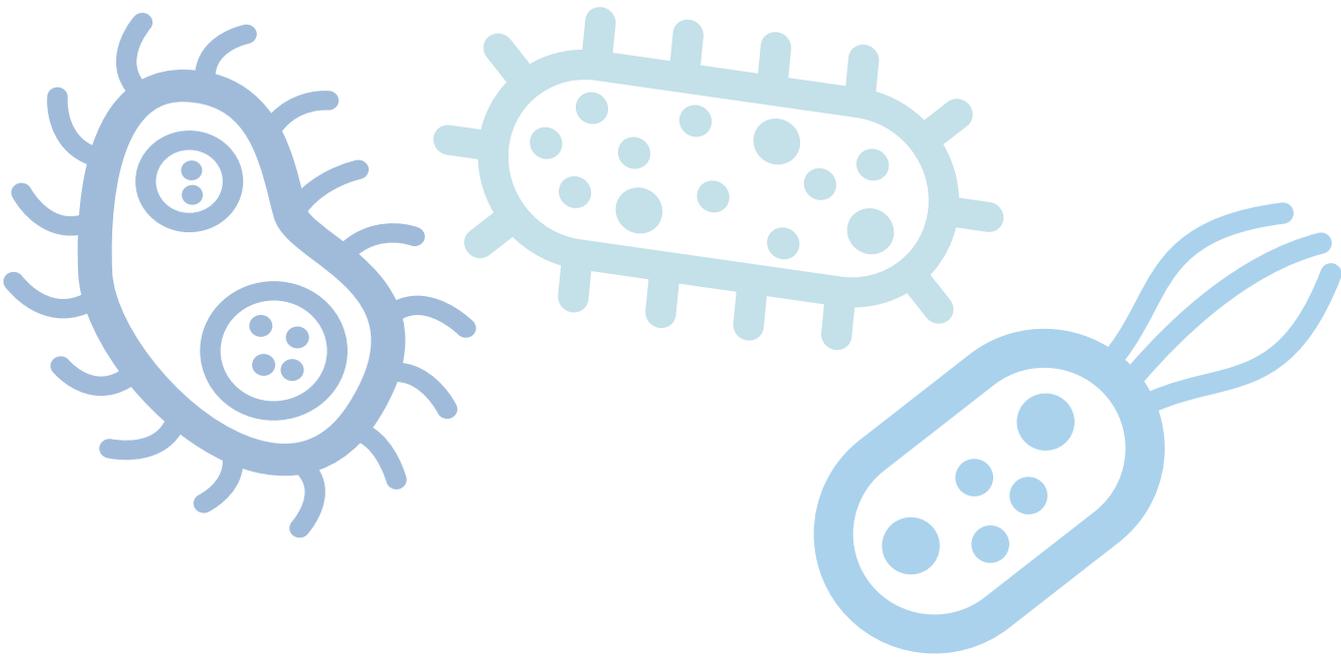

In addition to the clinical safety improvements achieved, the NSQHS Standards have driven more effective clinical governance systems by helping to expand and define the roles of governments, executives, boards, clinicians and consumers in care safety and quality. As a result, responsibility for improving the safety and quality of health care is no longer seen to rest solely with frontline clinicians. Hospital boards say the NSQHS Standards have led to better integration of governance and quality improvement systems, and have clarified the roles and responsibilities of boards, with health service leaders and clinicians working together to improve safety and quality.²⁸

Significant changes in healthcare cultures and practices have been achieved through the NSQHS Standards' focus on consumer engagement in their own care and in improving services. Health service organisations are increasingly involving consumers and patients in decision-making around the governance, planning, communications, design and delivery of services. In many organisations, consumer participation has become part of everyday practice through consumer advisory committees and representatives, dedicated consumer engagement staff and executive leadership.²⁸

The review of the impact of implementation of the first edition of the NSQHS Standards, as well as a range of reviews of patient safety events undertaken by the Commission have identified areas that require further action to support safety and quality improvement. **Box 6** presents a summary of these areas.

Box 6: Areas requiring further action to support safety and quality improvement

- Implementation of an open disclosure response consistent with national and local standards
- Ensuring that incident management and investigation systems provide adequate surveillance to recognise major safety lapses and risks
- Implementation of corrective action in response to identified patient safety risks and lapses
- Establishment of complaint management systems that include a partnership with patients and carers
- Implementation of informed patient consent
- Ensuring a robust and positive safety culture
- Clearly understanding the roles and responsibilities of governing bodies, the executive, clinical teams and clinicians in clinical governance.⁹

PATIENT SAFETY SURVEILLANCE

Reporting systems can be designed differently but their principal purpose should be learning and improvement.

OECD, 2019²⁹

Measurement is fundamental to improving safety

Measurement is fundamental to advancing safety and quality improvement – meaningful metrics are required to understand what the major safety issues are across the care continuum, to proactively mitigate patient safety risks and to stimulate improvement.^{29, 30}

Evidence demonstrates that the provision of relevant and timely clinical information to clinicians and managers is an effective driver of safety and quality improvement.^{31, 32}

The Commission has worked to support a consistent national approach to measurement by specifying, validating and gaining agreement on key safety and quality indicators. This work allows clinicians, health service organisations and states and territories the opportunity to compare outcomes and identify areas for quality improvement. It also provides a basis for reporting to patients, carers and consumers generally.

Australian patient safety measures

The Commission in collaboration with its partner organisations has developed and specified patient safety measures and indicators for sentinel events, adverse events, core hospital-based outcome indicators and HACs. In addition, the Commission has developed and tested national indicators for patient experience – the Australian Hospital Patient Experience Question Set (AHPEQS)³³ – and work is commencing on exploring national patient reported outcome measures and safety culture. The Commission also develops indicators to monitor implementation of national standards including the Commission’s clinical care standards and the NSQHS Standards.

This section details current data for some of these indicator sets, and discusses work being undertaken by the Commission and partners to provide further guidance in measuring patient safety.

Mandatory reporting

Since 2007, Australian hospitals have in place a mandatory system to manage and report clinical incidents including the provision of appropriate feedback to patients, families, carers and clinicians, and the sharing of lessons learned to prevent patient harm.

Sentinel events

Sentinel events are rare, and are occurring less frequently

A sentinel event is a particular type of serious incident that is preventable and has caused serious harm to, or death of, a patient.

In Australia, reporting of sentinel events, against a nationally endorsed and agreed sentinel event list (endorsed by all Australian Health Ministers in 2002), has been mandatory since 2007. Since 2017, public hospitals receive no Australian Government funding for an episode of care in which a patient experiences or suffers from a sentinel event.

The Commission has recently reviewed the Australian sentinel event list, clarifying its purpose, definitions and criteria.³⁴ Broad consultation across Australia resulted in the removal of two sentinel events, and the addition of two others. **Box 7** shows the latest version of the list – the Australian sentinel event list (version 2)³⁵, which was endorsed for national use in December 2018. The Australian sentinel event list (version 2) will be incorporated into the national public hospital funding arrangements from 1 July 2019.

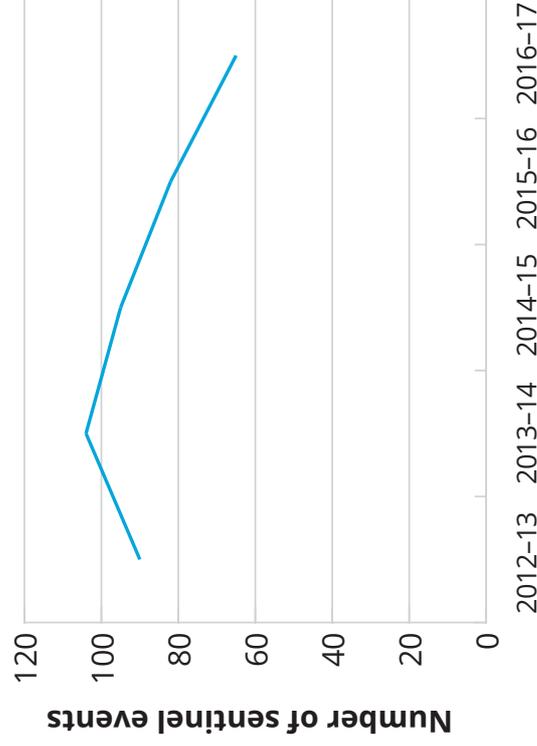

Box 7: Australian sentinel event list (version 2)

Sentinel events are a subset of clinical incidents that are wholly preventable and result in serious harm to, or death of, a patient and include:

1. Surgery or other invasive procedure performed on the wrong site resulting in serious harm or death
2. Surgery or other invasive procedure performed on the wrong patient resulting in serious harm or death
3. Wrong surgical or other invasive procedure performed on a patient resulting in serious harm or death
4. Unintended retention of a foreign object in a patient after surgery or other invasive procedure resulting in serious harm or death
5. Haemolytic blood transfusion reaction resulting from ABO blood type incompatibility resulting in serious harm or death
6. Suspected suicide of a patient in an acute psychiatric unit or acute psychiatric ward
7. Medication error resulting in serious harm or death
8. Use of physical or mechanical restraint resulting in serious harm or death
9. Discharge or release of an infant or child to an unauthorised person
10. Use of an incorrectly positioned oro- or nasogastric tube resulting in serious harm or death.³⁵

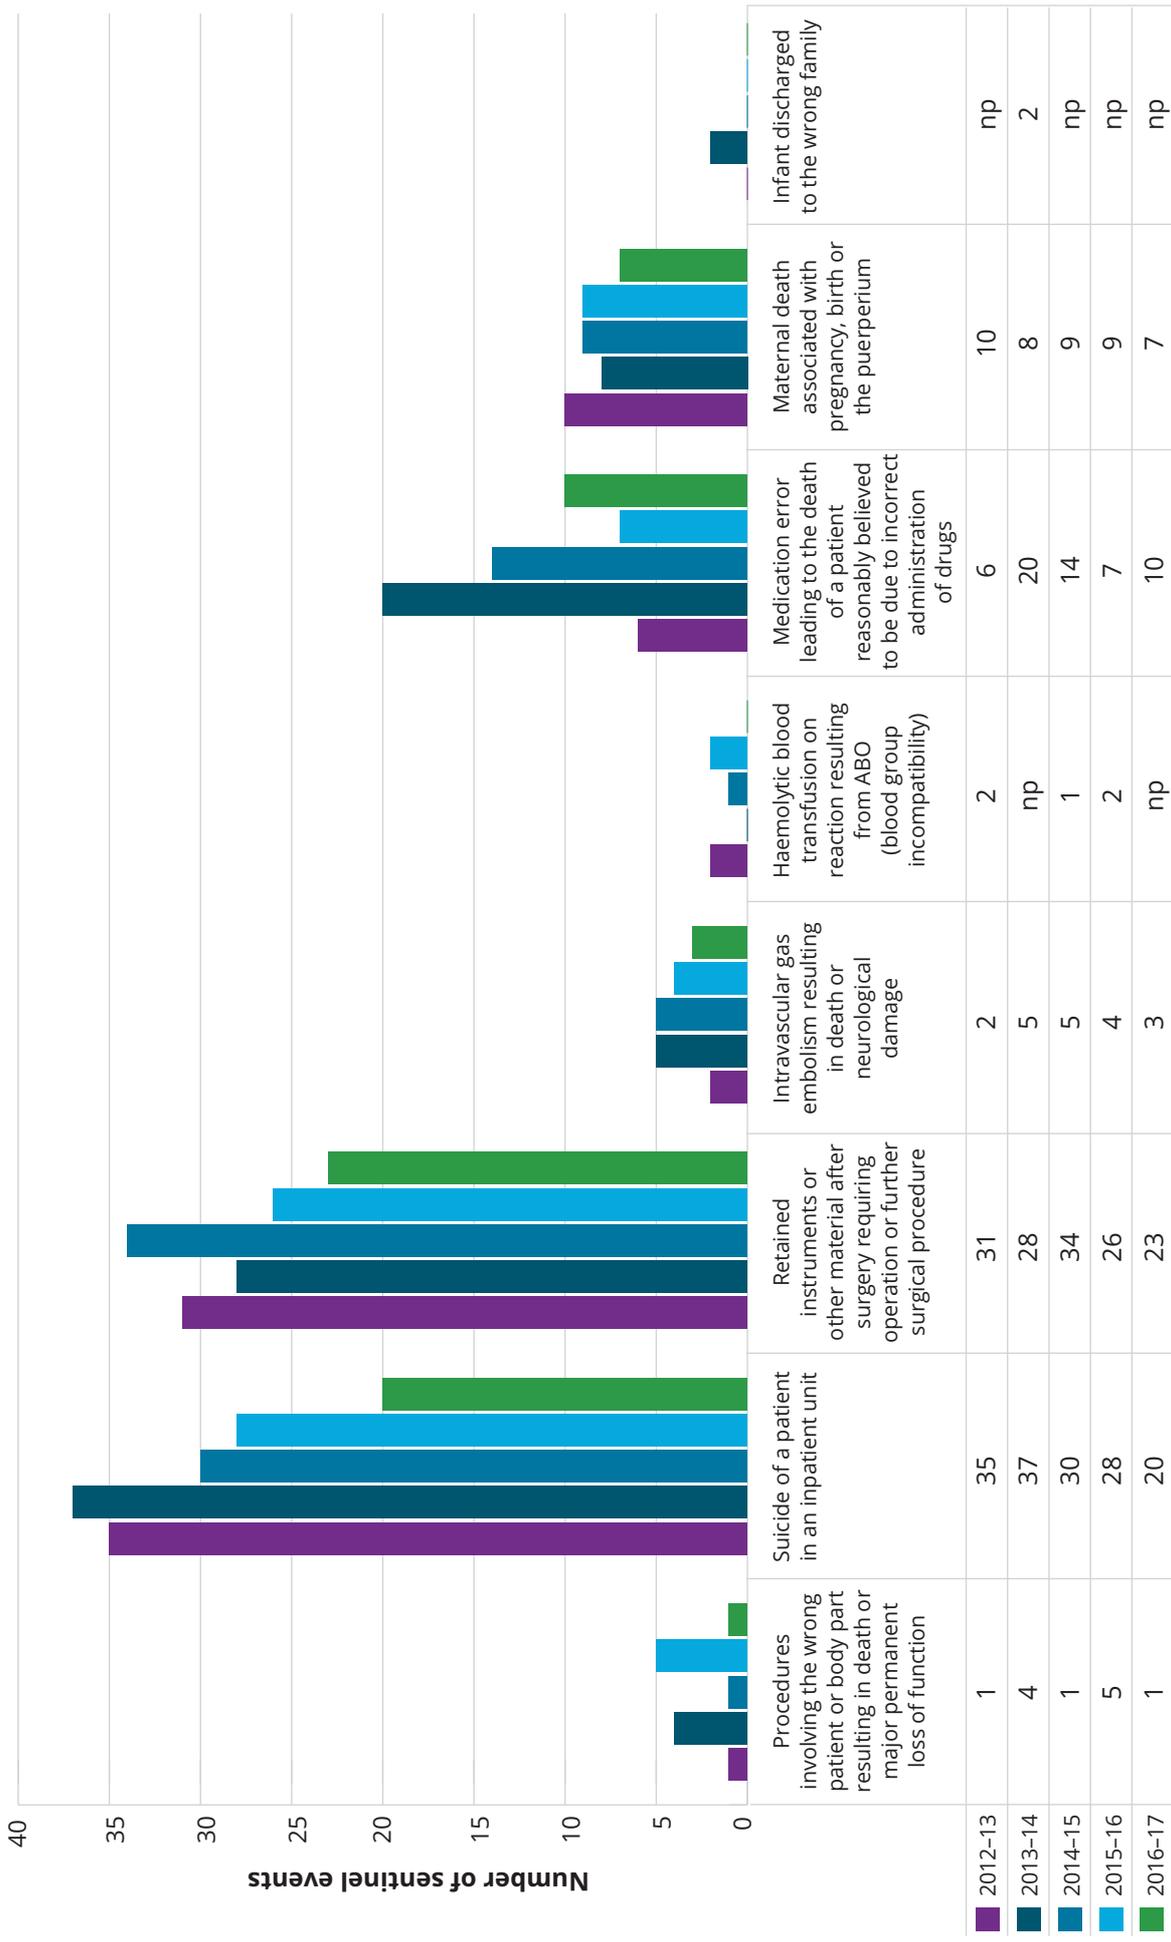

Very serious, fully preventable patient safety events are rare in Australia. However, they have the potential to seriously undermine public confidence in the health system.⁸ Time-series analysis for the period 2012-2017, against the previous sentinel event list (version 1), shows that these most serious clinical incidents are now occurring less frequently (**Figures 2-4**).³⁶

NSW Ministry of Health – aims of clinical incident reporting systems and management

Case study 1 provides the aims of the NSW Ministry of Health’s clinical incident management system:

- a. “Ensure a consistent and coordinated approach to incident management including the identification, notification, investigation and analysis of incidents resulting in appropriate action
- b. Allow the lessons learned to be shared across the whole health system
- c. Ensure health services establish processes that comply with the legal aspects of both clinical and corporate incident management
- d. Establish standard approaches to both clinical and corporate incident management, including the establishment of performance indicators to monitor compliance.”³⁷

Clinical incidents

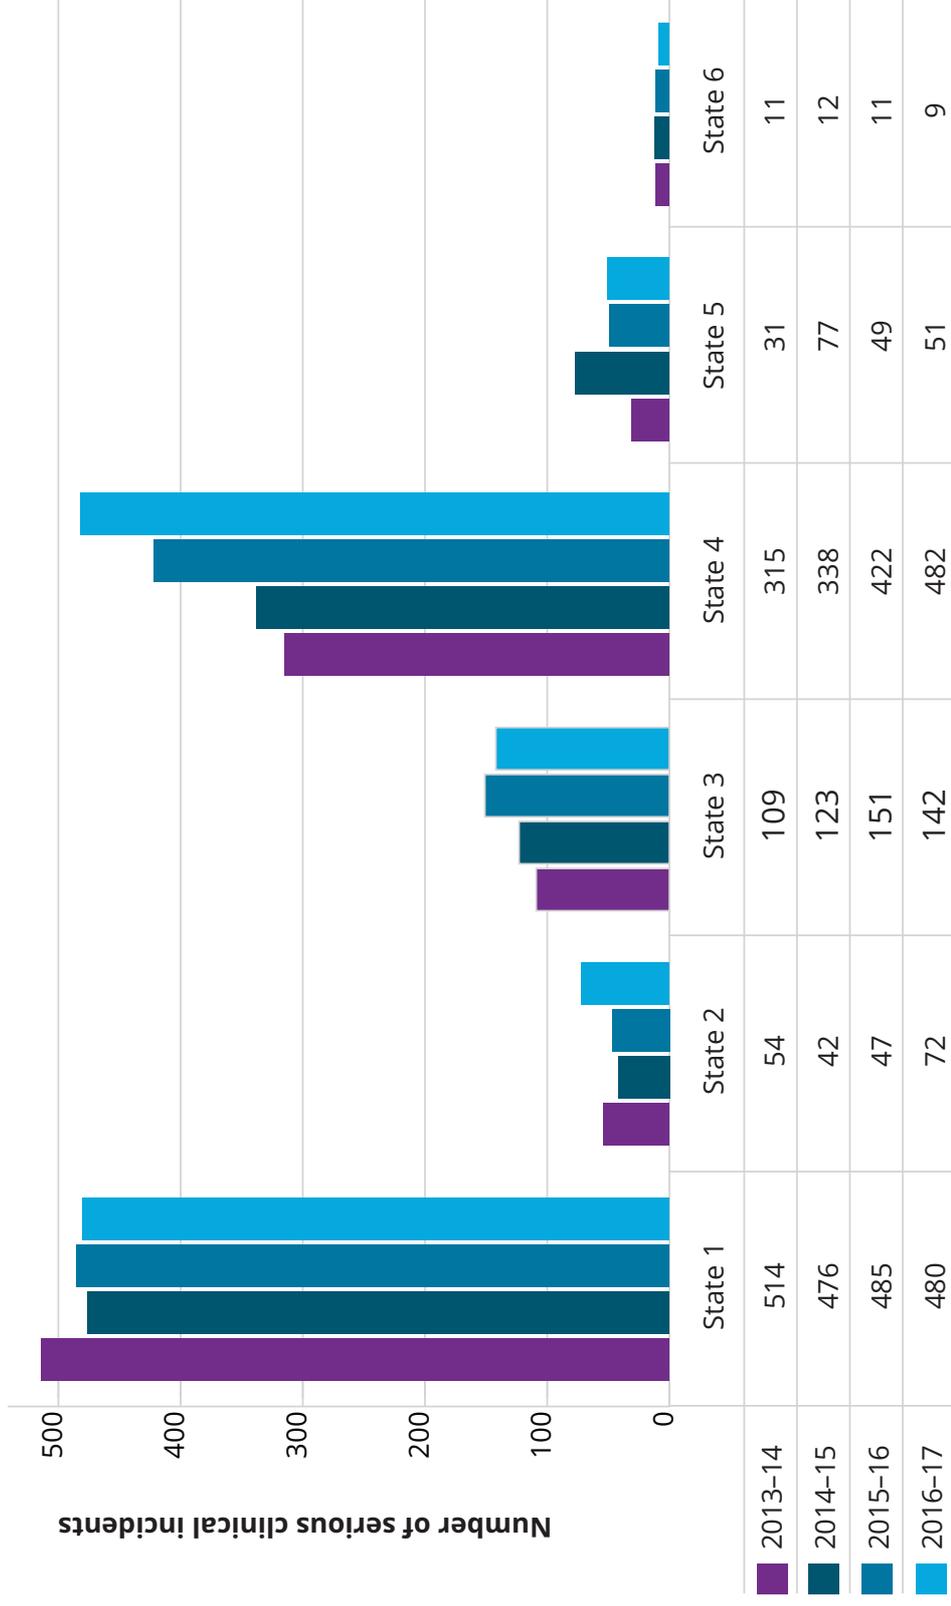

Australia has implemented a mandated reporting system where clinical incidents, their causes and any relevant contextual information are systematically recorded in a central repository. The information is then analysed and deployed to improve deficient processes where relevant, share lessons across related settings, improve safety for patients and prevent similar incidents from happening again.²⁹

The rate of clinical incidents appears to be steady. However, action is being taken to support improved clinical incident reporting which can be used to inform local quality improvement.

Clinical incidents have varying degrees of severity, ranging from near misses where minimal or no harm is experienced to incidents that can result in serious harm or death. Severity Assessment Codes (SACs), or similar risk rating scales, are used by state and territory health departments to rate the severity of incidents in public hospitals and to guide the level of investigation and action needed. For example, in New South Wales (NSW) and South Australia (SA), the most serious types of clinical incidents are rated as SAC1.^{38,39}

Available data show the rate of serious clinical incidents (SAC1s) has not changed significantly between 2013–14 and 2016–17 (**Figures 5 and 6**). However, assessing the rate of the most serious clinical incidents (for example SAC1s) across Australia is complicated as there are different incident reporting processes and severity classification systems used by the states and territories. Work is underway within the Commission to better understand and to support improvements to clinical incident reporting.

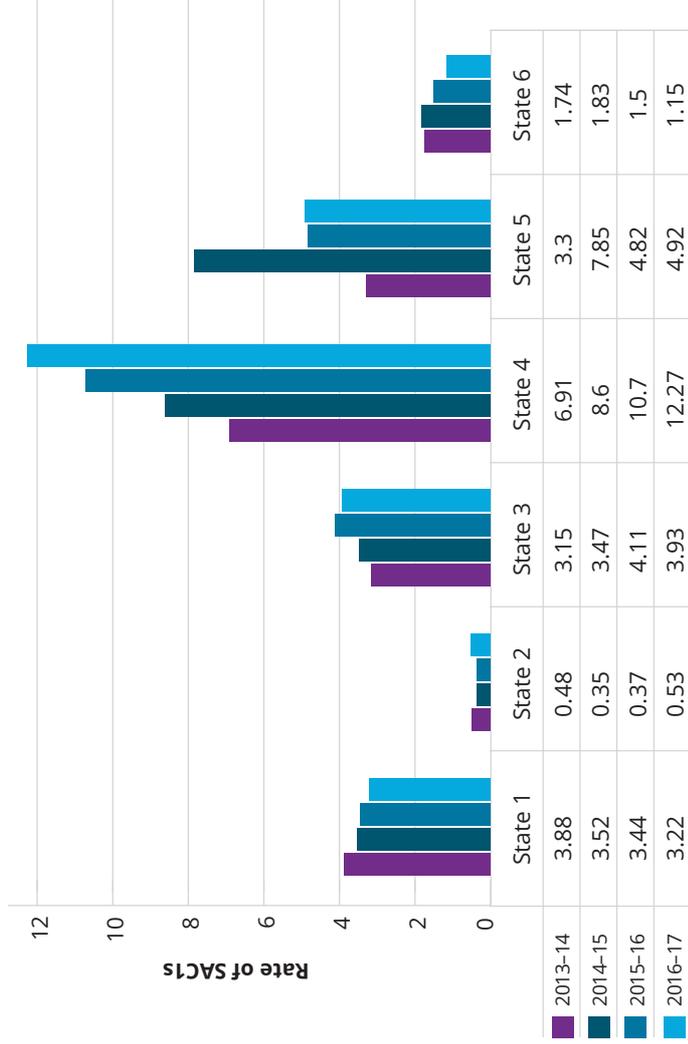

Figure 5: Number of serious clinical incidents (SAC1) by state and territory, as reported through the different state and territory incident management systems, 2013–2017

Source: Australian Commission on Safety and Quality in Health Care, unpublished correspondence, 2019.

Note: Rating systems, classifications and definitions for clinical incidents vary between states and territories. Due to these inconsistencies clinical incident data may not be comparable across states and territories. The most serious clinical incidents are included in these figures (Severity Assessment Code 1 [SAC1]).

Figure 6: Rate of serious clinical incidents (SAC1) per 10,000 separations by state and territory, as reported through the different state and territory incident management systems, 2013–2017

Source: Australian Commission on Safety and Quality in Health Care, unpublished correspondence, 2019.

Note: Rating systems, classifications and definitions for clinical incidents vary between states and territories. Due to these inconsistencies clinical incident data may not be comparable across states and territories. The most serious clinical incidents are included in these figures (Severity Assessment Code 1 [SAC1]). Rates are per 10,000 separations.

Box 8: Clinical incident management and open disclosure

Open disclosure of harm with patients is an important part of clinical incident management, and requires a just and learning culture to be built within organisations. In Australia, clinical incident management systems and incident reporting is open to all healthcare staff. The opportunity to report the details of the specific incident from the perspective of the reporter, and the ability to analyse contributing factors and how the event could have been prevented all form part of incident management systems to improve safety and quality of care.²⁹

Open disclosure and discussion of clinical incidents resulting in harm with patients, their families and carers is important. It entails an apology, explaining what occurred; discussing the experience and consequences; and describing what steps are being taken to manage the incident and prevent recurrence. Australia has instituted open disclosure policies as a regulatory requirement, guided by the Australian Open Disclosure Framework.²⁰

Open disclosure has been shown to convey a range of benefits. For patients, their families and carers it can allay feelings of anxiety and abandonment after harm and has also been shown to have a cooling effect on desires to litigate - most commonly motivated by patients simply wishing to find out exactly what happened when faced with evasion and lack of communication.⁴⁰ For providers, who can be seen as the 'second victims' of harm, open disclosure can be a healing process.⁴¹ Open disclosure – endorsed and supported by organisational leaders – also contributes to the 'just culture'.⁴⁰

Hospital-acquired complications

Hospital-acquired complications (HACs) are a sub-set of adverse healthcare events that have been identified as originating during the patient's hospital stay and are not present when the patient is admitted. A HAC refers to a complication for which clinical risk mitigation strategies may reduce (but not necessarily eliminate) the risk of that complication occurring.⁴² The Commission has developed a list of 16 high-priority HACs. Many of the identified HACs represent those adverse events whose occurrence – while perhaps difficult to prevent in each single case – in aggregate, can be reduced through consistent mitigation strategies.²⁹

The Commission, together with clinicians and other experts, developed the HACs based on four criteria: preventability, patient impact (severity), health service impact and clinical priority. The national list of 16 HACs was developed through a comprehensive process that included reviews of the literature, clinical engagement and testing of the concept with public and private hospitals.¹⁹

In April 2016, all Australian, state and territory governments signed a Heads of Agreement that committed to improve Australians' health outcomes and decrease avoidable demand for public hospital services through a series of reforms, including the development and implementation of funding and pricing approaches for safety and quality.⁴³

These reforms are detailed in Schedule 1 of the Addendum to the National Health Reform Agreement: Revised Public Hospital Arrangements 2017, which provides agreement to develop and implement reforms to integrate safety and quality into the pricing and funding of public hospitals services.²⁴

In February 2017, the Australian Government Minister for Health directed the Independent Hospital Pricing Authority (IHPA) to implement three recommendations of the COAG Health Council relating to sentinel events, HACs and avoidable readmissions. IHPA's recommendations in relation to this were set out in *The Pricing Framework for Australian Public Hospital Services 2017–18*.²⁵

For HACs, this included, consistent with the Ministerial Direction, that IHPA reduce the funding level for all HACs across every hospital to reflect the extra cost of a hospital admission with a HAC from 1 July 2018, subject to a shadow year from 1 July 2017.²⁵

In the financial year 2017–18, admissions associated with HACs* were estimated by the Commission to cost the public sector \$4.1 billion or 8.9%*** of total hospital expenditure. The most burdensome adverse event types include HAIs, medication complications, delirium and cardiac complications.**

- * HACs list complications only
- ** Public hospitals only, and all care types
- *** Projected based on 2016–17 National Hospital Cost Data Collection

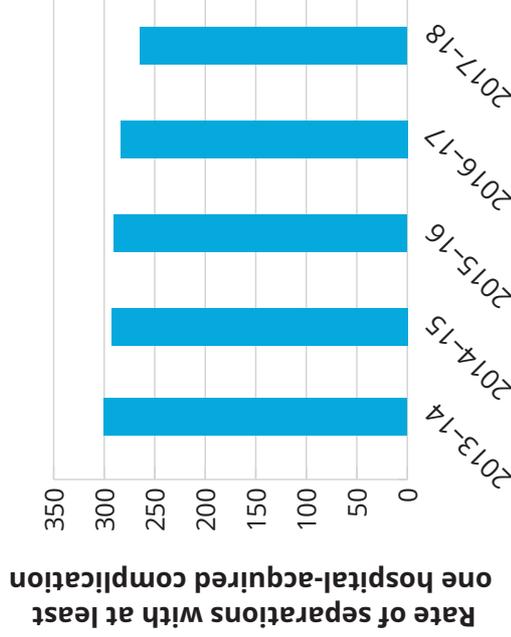

Reducing hospital-acquired complications at the local hospital level

The Commission has developed a range of resources to encourage and support the local monitoring of the HACs list and improve patient safety and healthcare quality. This includes an information kit to provide frontline clinicians and others with tools to minimise the occurrence of HACs in their health service organisation. The release of this information kit draws upon consultation with clinicians from across Australia, as well as the latest evidence and clinical guidelines. The information kit provides strategies related to 15 HACs. The fact sheets outline steps clinicians, managers, governing bodies and others can put in place to reduce the occurrence of HACs. The kit also highlights the importance of ongoing monitoring of these HACs, which can provide an indication of the success of a service, or signify safety and quality issues that require improvement.⁴²

The overall rate of hospital-acquired complications is decreasing, and data collection is improving

Overall HAC rates in Australia appear to be gently decreasing over time (**Figure 7**). Actual numbers of incidents or episodes are generally increasing. For some HACs, such as medication, respiratory and cardiac complications, this increase is large (**Table 1**). There is a strong drive to increase the focus on more accurate measurement and monitoring of HACs as part of a national approach to reducing HACs. It is anticipated that as data becomes more reliable and coding more consistent, clearer trends for HACs rates will become apparent.

Figure 7: Rates of identified hospital-acquired complications per 10,000 separations, 2013–14 to 2017–18

13	Malnutrition	4,043	4,755	5,145	5,487
14	Cardiac complications	17,746	29,105	31,173	31,096
15	Third and fourth degree perineal laceration during delivery	5,008	5,154	5,764	5,642
16	Neonatal birth trauma	745	809	990	1,108

Source: Admitted Patient Care National Minimum Data Set, 2014-15 to 2017-18.
Note: Public hospitals only, which meet the robust condition onset flag coding criteria, all care types. Sum of individual HACs will not equal total HAC episodes, due to single episodes having multiple HACs. Unplanned return to theatre is not currently reported in the national data. Surgical complication numbers are based on the HAC diagnosis codes.

Patient safety surveillance

The HACs with the highest incidence are healthcare-associated infection, cardiac complications, delirium and medication complications (Figure 8). The Commission, states and territories and local health service organisations are working to implement strategies to address these identified HACs. **Case study 2** illustrates work undertaken to reduce healthcare-associated infection.

Figure 8: Distribution of HACs, 2017–18

Source: Admitted Patient Care National Minimum Data Set, 2017–18.

Note: Public hospitals only, which meet the robust condition onset flag coding criteria, all care types. Total (n) is sum of all HACs across the 15 complication groups, which can currently be measured at the national level.

CASE STUDY 2

Reducing healthcare-associated infections

Healthcare-associated infections (HAIs) are HACs that have the potential to cause significant harm to patients in hospital, including pain and suffering, and increased healthcare costs through prolonged hospital stay and associated treatment. HAIs are one of the most common complications affecting hospital patients; they increase the risk of morbidity, mortality and readmission within 12 months.⁴⁴⁻⁴⁶

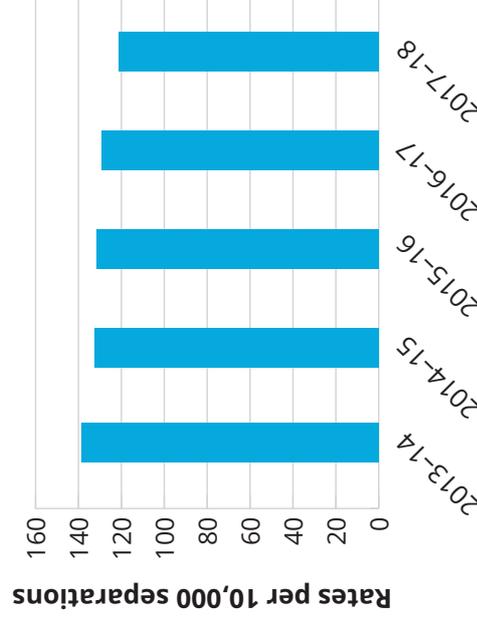

The Commission has led national work and collaboration on HAIs since 2006, bringing a breadth of stakeholders together to develop and implement strategies to reduce HAIs. A range of strategies to promote effective infection prevention and control undertaken by the Commission have been incorporated into the NSQHS Standards and have become essential components of NSQHS Standard 3: Preventing and Controlling Healthcare-Associated Infection. These include:

- The National Hand Hygiene Initiative⁴⁷
- The development of standard definitions for the surveillance of *Staphylococcus aureus* bacteremia (SAB), central line-associated blood stream infections and *Clostridium difficile* infection
- The national surveillance initiative for the prevention of HAIs, contributing to a national definition of SAB and the reporting and monitoring of SAB rates nationally
- Antimicrobial Stewardship programs
- The Antimicrobial Stewardship Clinical Care Standard⁴⁸
- Clinician capacity building
- *The Australian Guidelines for the Prevention and Control of Infection in Healthcare* in conjunction with the National Health and Medical Research Council⁴⁹

- Strategies to reduce multi-resistant organisms and for surveillance of surgical site infection
- The Antimicrobial Use and Resistance in Australia Surveillance System⁵⁰
- Activities undertaken by the states and territories.⁴⁶

Marked reductions in the rate of HAIs have been observed over time and are linked to coordinated effort across the health system to improve infection control and the appropriate use of antimicrobials (Figure 9).^{28, 46}

Figure 9: Rates of healthcare-associated infections in Australian hospitals per 10,000 separations, 2013-14 to 2017-18

Source: Admitted Patient Care National Minimum Data Set, 2013-14 to 2017-18.

Note: Public hospitals only, which meet the robust condition onset flag coding criteria, all care types. Rates are per 10,000 separations.

Continued...
The Commission's activities in this area, as well as those led by state and territory health departments and clinical groups, have led to a reduction in HAI rates, including those associated with serious morbidity.²⁸ Key outcomes include:

- An increase in the overall hand hygiene compliance rate in public and private hospitals from 63% in 2009 to 84% in 2017^{51, 52}
- A decline in the *Staphylococcus aureus* bacteraemia (SAB) rate per 10,000 patient days under surveillance from 1.1 to 0.76 between 2010–11⁵³ and 2016–17⁵⁴
- A reduction in the yearly number of methicillin-resistant *Staphylococcus aureus* (MRSA) bacteraemia cases in Australian public hospitals from 505 to 290 between 2010–11⁵³ and 2016–17⁵⁴
- A decline in the national rate of central line-associated blood stream infections (CLABSI) from 1.02 to 0.64 per 1,000 line days between 2012–13 and 2013–14.^{28, 46, 55}

National goals for optimal outcomes and reducing hospital-acquired complications

HACs are highly burdensome both to individual patients and the broader healthcare system, and extended admissions as a result of a HAC can incur significant cost implications. When examining the rate of each HAC across peer hospitals with similar patient cohorts, it is clear that there is significant variation. The Commission encourages all hospitals to work towards the rates achieved in the top quartile of peer facilities. If all hospitals with higher rates of a HAC can learn from better performing peer hospitals, and similarly reduce the incidence of that HAC, a significant overall reduction in HACs could be achieved. This would provide significant value to patients and the health system in terms of reduced morbidity, mortality, bed days and costs.

In identifying the rate for the top quartile of hospitals for each HAC by peer group, the Commission is providing a reasonable goal for health service organisations to work towards in achieving optimal outcomes for patients. Each hospital is expected to examine their individual HAC rates, identifying which HAC rates are higher than the rate for the top quartile, and apply quality improvement methodologies in order to reduce the incidence of these HACs.

Table 2 details the rates for the top quartile for three peer groups that health service organisations should strive for in reducing HACs and providing optimal outcomes for patients. The impact of health service organisations achieving that goal is illustrated for eight HACs in **Figures 10-17**.

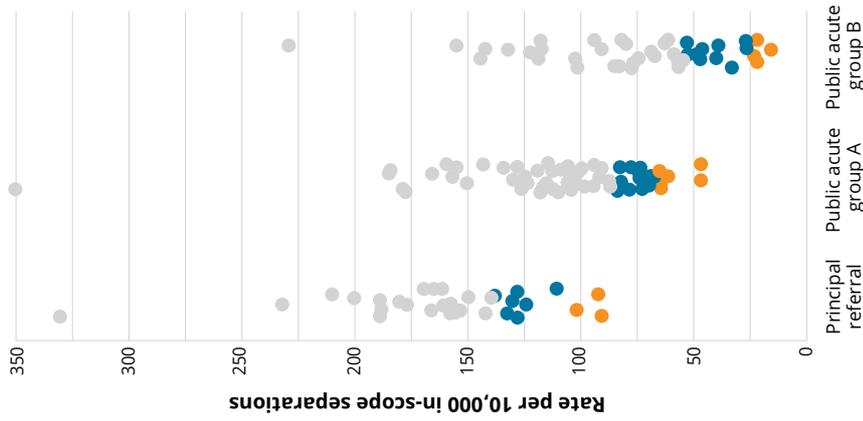

Table 2: Setting national goals for achieving optimal outcomes and reducing hospital-acquired complications

Hospital-acquired complication	National goal (rates per 10,000)		
	Principal referral hospital	Public acute group A	Public acute group B
Pressure injury	3.7	3.3	2.1
Medication complications	29.1	16.5	9.4
Delirium	57.9	38.7	17.3
Persistent incontinence	4.3	2.0	1.9
Malnutrition	6.4	2.3	1.7
Cardiac complications	67.4	43.6	25.3
Third and fourth degree perineal laceration during delivery	349.3	273.7	219.8
Birth trauma	54.2	37.8	29.5
Falls resulting in fracture or other intracranial injury	3.2	3.4	2.4
Healthcare-associated infection	138.4	84.9	52.0
Surgical complications requiring unplanned return to theatre	20.2	9.7	2.3
Respiratory complications	32.5	17.0	7.4
Venous thromboembolism	9.8	5.3	1.9
Renal failure	2.7	np	np
Gastrointestinal bleeding	13.1	9.1	4.8

Figure 17: Potential impact of reducing respiratory complications

Respiratory complications

Avoidable hospital readmissions

Avoidable hospital readmissions are costly, and rates remain relatively steady. However, action is being taken to improve data collection which can be used to inform local quality improvement.

Rates of avoidable hospital readmissions provide another insight into the safety and quality performance of the health system. An avoidable hospital readmission occurs when a patient who has been discharged from hospital is admitted again within a certain time interval, and the readmission:

- Is clinically related to the original admission, and
- Has the potential to be avoided through improved clinical management and/or appropriate discharge planning in the original admission.⁵⁶

The Commission has developed a list of avoidable hospital readmission conditions and their associated condition-specific timeframes (**Table 3**). This list was developed in consultation with clinical and consumer experts.⁵⁶

Table 3: List of hospital readmission conditions considered to be avoidable

Readmission condition	Readmission diagnosis	Readmission interval
Pressure injury	Stage III ulcer	14 days
	Stage IV ulcer	7 days
	Unspecified decubitis and pressure area	14 days
Infections	Urinary tract infection	7 days
	Surgical site infection	30 days
	Pneumonia	7 days
	Blood stream infection	2 days
	Central line and peripheral line associated blood stream infection	2 days
	Multi-resistant organism	2 days
	Infection associated with devices, implants and grafts	90 days
	Infection associated with prosthetic devices, implants and grafts in genital tract or urinary system	30 days
	Infection associated with peritoneal dialysis catheter	2 days
	Gastrointestinal infections	28 days
Surgical complications	Postoperative haemorrhage / haematoma	28 days
	Surgical wound dehiscence	28 days
	Anastomotic leak	28 days
	Pain following surgery	14 days
	Other surgical complications	28 days

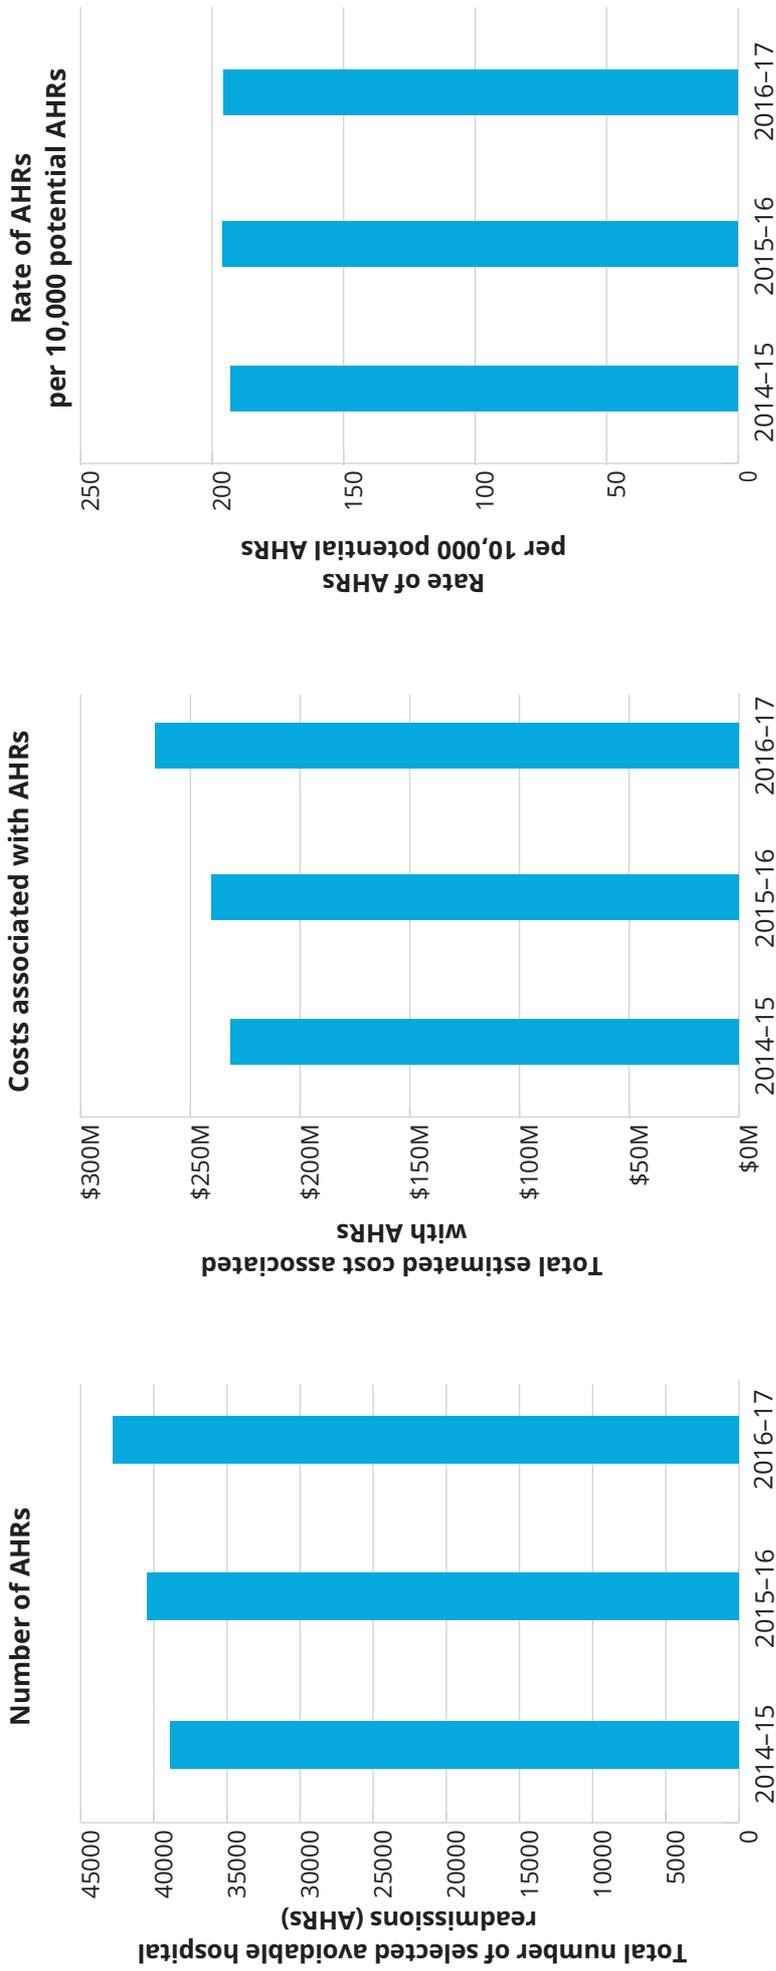

Table 3 continued

Readmission condition	Readmission diagnosis	Readmission interval
Respiratory complications	Respiratory failure including acute respiratory distress syndromes	21 days
Venous thromboembolism	Aspiration pneumonia	14 days
	Venous thromboembolism	90 days
Renal failure	Renal failure	21 days
Gastrointestinal bleeding	Gastrointestinal bleeding	2 days
Medication complications	Drug related respiratory complications / respiratory depression	2 days
Delirium	Hypoglycaemia	4 days
	Delirium	10 days
Cardiac complications	Heart failure and pulmonary oedema	30 days
	Ventricular arrhythmias and cardiac arrest	30 days
Other	Atrial tachycardia	14 days
	Acute coronary syndrome including unstable angina, STEMI and NSTEMI	30 days
Other	Constipation	14 days
	Nausea and vomiting	7 days

Source: Australian Commission on Safety and Quality in Health Care, 2019.⁵⁶

Rates of avoidable hospital readmissions on the Commission's list have remained steady over time and are associated with a financial cost to the Australian health system in excess of \$200 million dollars annually (**Figure 18**). Reducing avoidable hospital readmissions is an important aspect of value-based care as it supports better health outcomes, improves patient safety and leads to greater efficiency in the health system.⁵⁶

Figure 18: Selected avoidable hospital readmissions and cost to the Australian health system, 2014–15 to 2016–17

Source: Admitted Patient Care National Minimum Data Set, 2014–15 to 2016–17.

Note: Public hospitals only, excluding WA, due to data quality issues. Only accounts for readmissions back to the same hospital as the index admission. Costs are calculated for each year based on the National Weighted Activity Unit of the readmission.

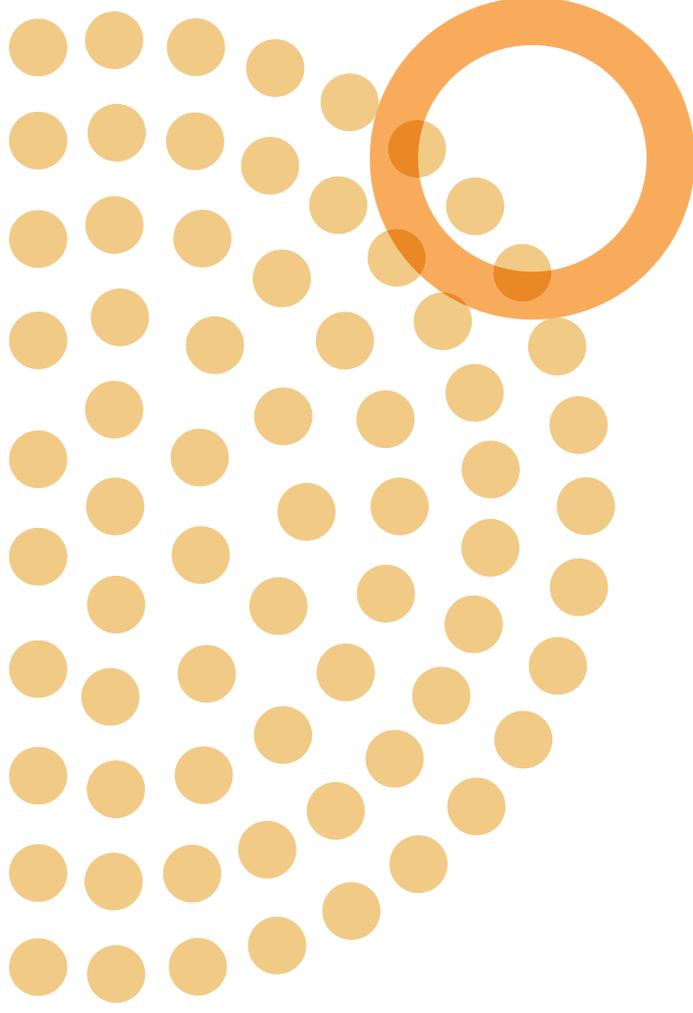

CASE STUDY 3

Reducing readmissions locally

In 2015, staff at the Hunter New England Local Health District undertook a project aimed at reducing recurrent re-presentations and

readmissions. The project involved developing a process to identify patients at high risk of re-presenting to hospital and implementing methods to address their medical and psycho-social needs. This new model of care has reduced the need for care by using partners in the primary care sector to provide support for these patients in the community. Key results from this project include:

- “A combined decrease of 44% in readmissions for these patients to hospital (Calvary Mater Newcastle achieving a 47% decrease and Maitland and Kurri Kurri achieving a 56% decrease)
- A combined decrease of 17% in presentations by these patients to the ED (Calvary Mater achieving a 17% decrease, Maitland achieving a 16% decrease and Kurri Kurri achieving a 19% decrease)
- There is now more accurate identification and assessment of vulnerable, high-needs patients through the use of the SCALE-UP tool
- Introduction of personalised care plans (VIP Action Plan) which now address psycho-social vulnerabilities and focus on improving quality of life”.⁵⁷

QUALITY - APPROPRIATE CARE

Australia has one of the best health systems in the world, but there are large variations in the way health care is currently delivered across the country. Healthcare variation is not necessarily bad, and if it reflects differences in patients' needs or preferences it is a good thing. But when a difference in use does not reflect these factors, it is unwarranted variation and represents an opportunity for the health system to improve.

This improvement may involve increasing access to treatment options that produce better outcomes for patients, or reducing treatment with little or uncertain benefit. Addressing unwarranted healthcare variation can therefore benefit patients and improve the value gained from the health budget.

The Australian Atlas of Healthcare Variation

The Commission has produced a series of Australian Atlases of Healthcare Variation (the Atlas series) to map differences in healthcare use according to where people live. The first *Australian Atlas of Healthcare Variation* was produced in partnership with the NHPA and published in 2015; the second and third Atlases were produced in partnership with the Australian Institute of Health and Welfare (AIHW) and published in 2017 and 2018. They revealed substantial variation in the use of many treatments and diagnostic procedures, and have raised

important questions about why this variation might be occurring.³⁸⁻⁶⁰

The Commission has worked closely with clinicians and government health departments to understand the reasons for variation seen in each intervention mapped in the Atlas series and – most importantly – what can be done where unwarranted variation is suspected.

What are the reasons for variation?

Rates of an intervention that are substantially higher or lower in some areas can highlight:

- Clinical practice that is not supported by evidence-based guidelines
- Inequity of access to evidence-based care, and the need to deliver services more fairly
- Higher rates of private health insurance in areas of greater socioeconomic advantage
- Inadequate system supports for appropriate care, and the need for changes in training or financial incentives
- Uncertainty about the intervention's place in therapy, and the need for better data on its benefits and harms.

Differences in the ages of different populations are accounted for in the data analysis to allow comparisons between populations with different age structures. All rates are based on a person's place of residence, not the location of the hospital or health service where they were treated.

What is being done to reduce unwarranted variation?

The Atlases were published relatively recently (2015, 2017 and 2018), and implementing changes in complex systems takes time. **Table 5** gives examples of how different groups within the health sector have addressed issues highlighted in the first and second Atlases, in the context of the many other organisations working to improve health care in Australia. More in-depth case studies are shown in **Case studies 4 and 5**.

Highlights from the third Atlas

Concerning rates of early, planned caesarean section with no medical reason

There is a growing body of evidence that planned birth before 39 weeks' gestation can increase short-term risks to the baby and long-term developmental problems in children.⁶¹⁻⁷⁰ Waiting until 39 weeks' gestation is recommended by several international organisations and some Australian states if there are no medical or obstetric reasons for an earlier birth.⁷¹⁻⁷⁴ A position statement from the Royal Australian and New Zealand College of Obstetricians and Gynaecologists (RANZCOG) states that 'On balance, weighing up the risk of respiratory morbidity following elective caesarean section and the risk of labouring prior to caesarean section, it is recommended that elective caesarean section in

women without additional risks should be carried out at approximately 39 weeks gestation'.⁷⁵

Data about planned caesarean section before 39 weeks have only recently begun to be collected routinely in Australia. Only four states and territories had sufficient data for reporting in the Atlas. Despite the data limitations, the third Atlas showed some concerning patterns:

- In 2015, between 42% and 60% of planned caesarean sections performed before 39 weeks'

gestation did not have a medical or obstetric indication

- In 2015, between 10% and 22% of caesarean sections performed before 37 weeks did not have a medical or obstetric indication
- Percentages of planned caesarean sections without an obstetric or medical indication were higher for privately funded compared with publicly funded patients (less than 39 weeks: 60% versus 52%).

Given the emerging research on long-term effects of early-term births, practices need to be re-considered. Strategies to reduce rates of early planned birth should include: providing parents with information about short- and long-term adverse effects of early-term births, clinician education, improving data collection and monitoring and hospital-level public reporting of this indicator.

Source: Australian Commission on Safety and Quality in Health Care, Third Australian Atlas of Healthcare Variation, 2018.

High rates of antibiotic dispensing for children

The third Atlas found high rates of antibiotic dispensing for children aged 0 to 9 years – equivalent to one antibiotic prescription annually for every child. Rates were highest for children aged 0 to 4 years.

Australia has one of the highest rates of antibiotic medicine use in children compared with other similar countries. The use of antibiotics in children of this age group in Australia was three times the rates of Norway and the Netherlands in 2015. The very high

rates of antibiotic dispensing in Australian children suggest that antibiotics are frequently prescribed inappropriately – such as to treat viral infections where they have no benefit.⁷⁶

Overuse of antibiotics is potentially putting many children at risk of serious long-term adverse effects. Antibiotic use may change a child's normal gut bacteria and increase the risk of a number of conditions in later years including asthma and Crohn's disease.⁷⁷⁻⁷⁹

Source: Australian Commission on Safety and Quality in Health Care, Third Australian Atlas of Healthcare Variation, 2018.

Changes between the first and the third Atlases

The Commission will publish a report with further detail about these trends in Atlas topics in the near future, and will continue to monitor and publish data reflecting areas examined by the Atlases as a way of providing feedback to the health system.

Trends in data can signal where interventions are successful - and where greater efforts are needed. The third Atlas examined changes in rates of dispensing for commonly prescribed medicines between 2013–14 and 2016–17, as shown in **Table 4**.

Table 4: Changes in Australian national rates of medicines dispensing per 100,000 people, between 2013–14 and 2016–17

Type	Change	Comment
Antimicrobial medicines	9% decrease	This reduction is encouraging, given that rates of use of Australia are substantially higher than in some other countries, raising concerns about growing antibiotic resistance. Continued effort to improve use of antibiotics is needed.
Antipsychotic medicines for people aged 65 years and over	Little change	The current use of antipsychotic medicines outside current guideline recommendations as a form of restrictive practice to manage behavioural and psychological symptoms of dementia in aged care homes is a matter of grave concern. Efforts to reduce inappropriate use of antipsychotic medicines in Australia have included guidelines, safety warnings, education and policy. The Commission proposes a series of regulatory responses.
ADHD medicines for people aged 17 years and under	30% increase	Further investigation is required to determine whether this is due to increased incidence and diagnosis of attention deficit hyperactivity disorder (ADHD), or increased prescribing outside guideline recommendations. Ongoing vigilance is required to promote appropriate prescribing of these medicines.
Opioid medicines	5% increase	It is unclear whether these changes are due to more people requiring opioids for appropriate uses or an increase in inappropriate prescribing. Despite the number of regulatory efforts already in place to minimise harm from these medicines, continued focus on improving medicine use in this area is needed.

Source: Australian Commission on Safety and Quality in Health Care, Third Australian Atlas of Healthcare Variation, 2018.

Response to the Atlas series

The aim of the Atlas series is to provide clinically meaningful information that can be used to investigate and improve the appropriateness,

effectiveness and efficiency of health care. Examples of work by a number of groups to improve care in clinical areas analysed in the Atlas series are outlined in **Table 5**.

Table 5: Examples of initiatives to address unwarranted variation in Atlas topics

Atlas findings	Responses
<p>Anxiolytic medicines</p> <p>The rate of anxiolytic prescriptions dispensed for people aged 18-64 years was 4.8 times higher in some areas compared to others, 2013-14; and the rate of antidepressant prescriptions dispensed for people age 18-64 years was 2.8 times higher in some areas compared to others.</p>	<p>Tasmanian health services led improvements in prescribing through new mental health pathways, as well as education and audits (see Case study 4: A state response to high psychotropic medicines use).</p> <p>ACT Health implemented mental health pathways with general practitioners (GPs) to reduce unnecessary prescribing of antidepressants.</p> <p>The Royal Australian and New Zealand College of Psychiatrists has produced updated clinical practice guidelines on the management of mood disorders (depressive and bipolar disorders), schizophrenia and anxiety disorders, to provide greater clarity about treatment options and when medication is appropriate.</p>
<p>Antipsychotic medicines</p> <p>The rate of antipsychotic prescriptions dispensed for people 65 years and over was 7.1 times higher in some areas compared to others, in 2013-14.</p>	<p>Efforts to reduce inappropriate use of antipsychotic medicines in Australia have included guidelines, safety warnings, education and policy. The Commission proposes a series of regulatory responses.</p>
<p>ADHD medicines</p> <p>The rate of prescriptions dispensed for ADHD for people aged 17 years and under, in 2013-14.</p>	<p>Paediatricians are researching reasons for variation in prescribing medicines for ADHD, and antidepressants and antipsychotic medicines for children.</p>
<p>Knee arthroscopy</p> <p>Rate of admissions for knee arthroscopy in people 55 years and over was 7.1 times higher in some areas compared to others, in 2012-13.</p>	<p>The Medicare Benefits Schedule (MBS) Review Taskforce used Atlas data on knee arthroscopy to guide its review.</p> <p>The Commission released the Osteoarthritis of the Knee Clinical Care Standard⁶⁰ (see Case study 5: Falling rates of knee arthroscopy).</p>

Atlas findings

Responses

Chronic diseases

Potentially preventable hospitalisations due to several conditions showed substantial variation; for example, a 16-fold difference between the highest and lowest areas for chronic obstructive pulmonary disease (COPD); and a 12-fold difference for diabetes complications, in 2014–15.

The Queensland Clinical Senate met to discuss the Atlas findings and strategies to reduce potentially preventable hospitalisations.⁸¹

The Northern Territory Clinical Senate discussed Atlas findings at its inaugural meeting.

Colonoscopy

The rate of MBS-funded colonoscopies was 30 times higher in some areas than in others, and was lower in areas of low socioeconomic status (despite higher rates of bowel cancer in this group), in 2013–14.

The MBS Review Taskforce used Atlas data on colonoscopy to guide its review.

Hysterectomy

The rate of hysterectomy was 6.6 times higher in some areas than in others, and was markedly higher in regional areas than in major cities, in 2014–15.

The Commission released the Heavy Menstrual Bleeding Clinical Care Standard.⁸²

Caesarean section

The rate of Caesarean section in selected women aged 20–34 years was 3.0 times higher in some areas than in others, in 2012–2014.

AIHW adopted the Robson classification for reporting data on all births including caesarean section, as recommended in the first Atlas. Data reported using this system allows comparison of rates of caesarean section between groups with the same obstetric and neonatal risk factors. This makes it easier to see where variation in rates is likely to be due to differences in clinical practice rather than patient characteristics.

Source: Australian Commission on Safety and Quality in Health Care, 2019.

CASE STUDY 4

State response to high psychotropic medicines use

Several areas of Tasmania were among the highest users in Australia of anxiety and depression medicines in the first Atlas, and Hobart – North West had more than double the national average rate of use of anxiety medicines.⁵⁸ Differences in rates of anxiety and depression in the population did not account for these high rates. A lack of awareness of, and access to, non-medicine treatment for mental illnesses was thought to be a potential problem.

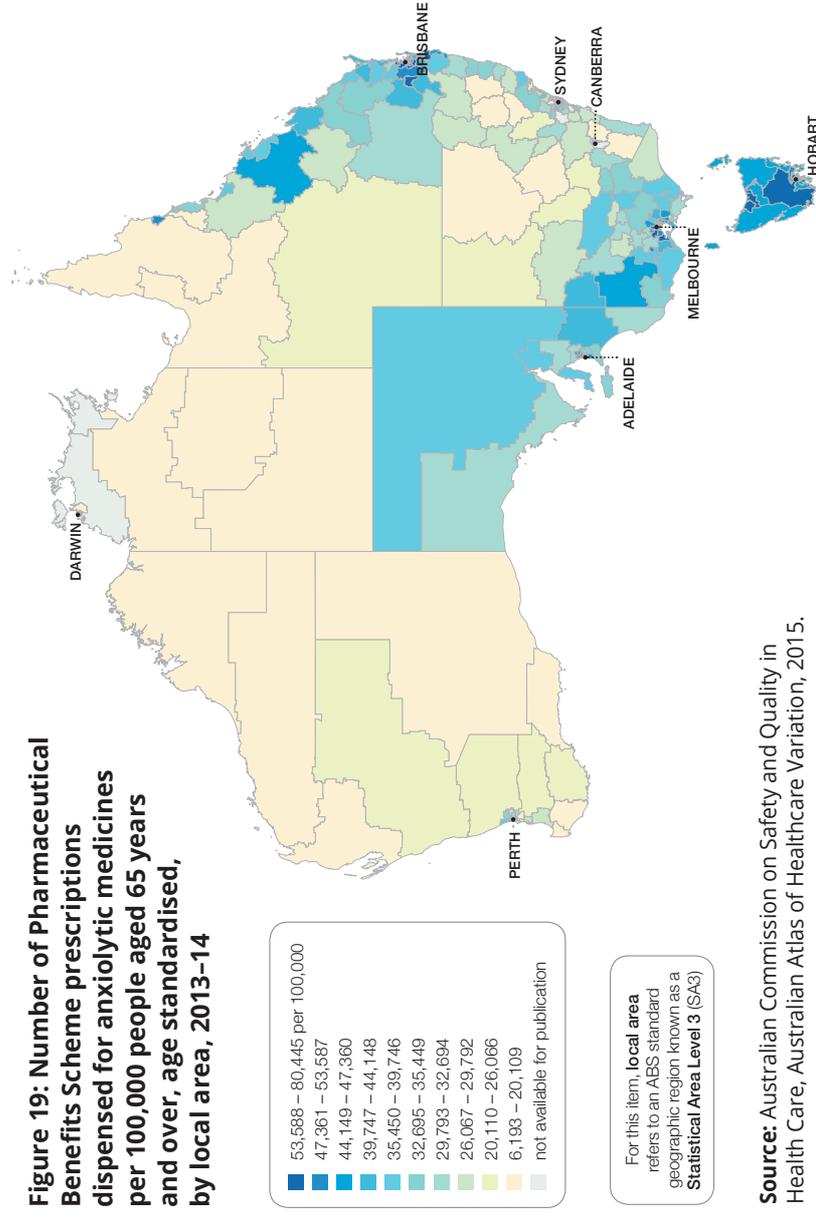

Primary Health Tasmania undertook a comprehensive needs assessment to gain a deeper understanding of the Atlas findings, and to see how resources to support optimal treatment of anxiety and depression could best be used. Staff from Primary Health Tasmania collaborated with other clinicians, including the Chief Psychiatrist, and consulted with the Chief Pharmacist, to look more closely at treatment of mental illnesses in different parts of Tasmania.

Primary Health Tasmania, together with the Tasmanian Health Service and the Department of Health and Human Services, took a multifaceted approach to improving the quality of clinical care. Quality improvement initiatives included:

- Auditing practice data
- Having conversations with clinicians in target areas and providing peer support to improve practice
- Developing de-prescribing resources and training clinicians in their use
- Developing and promoting Tasmanian Health Pathways for mental health.

The team assessed the availability of mental health services in different areas of Tasmania, and increased access where gaps were found. The team increased access to face-to-face social work and psychology supports, promoted patient self-management tools for depression and anxiety, and increased the use of GP Mental Health Treatment Plans.

Figure 19: Number of Pharmaceutical Benefits Scheme prescriptions dispensed for anxiolytic medicines per 100,000 people aged 65 years and over, age standardised, by local area, 2013–14

Source: Australian Commission on Safety and Quality in Health Care, Australian Atlas of Healthcare Variation, 2015.

CASE STUDY 5

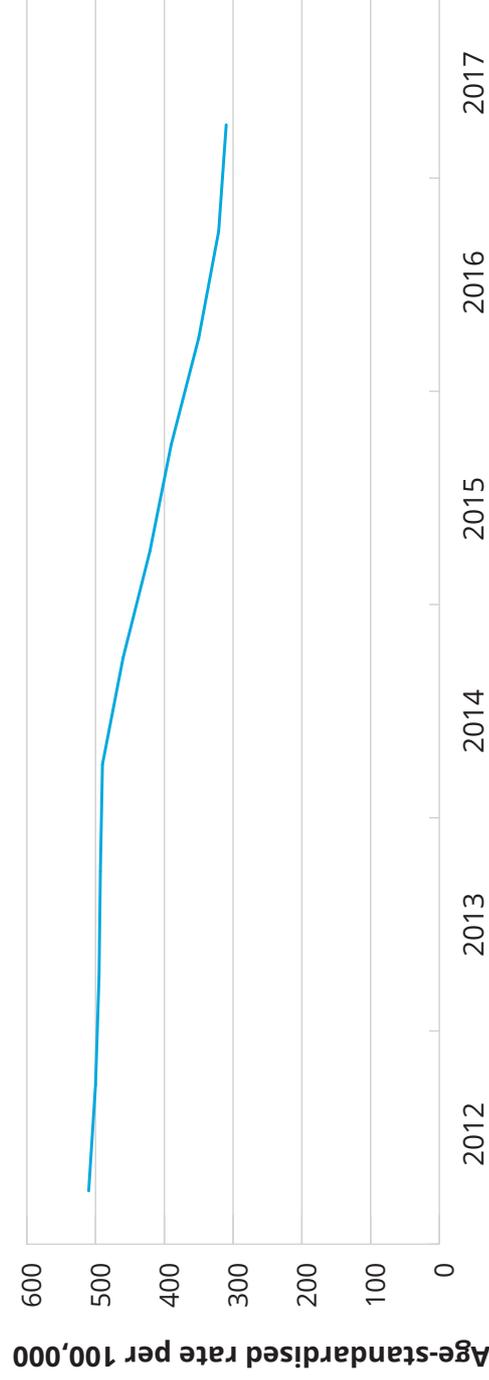

Falling rates of knee arthroscopy

Knee arthroscopy is a surgical procedure for examining the inside of the knee joint and, if necessary, repairing it. Arthroscopic procedures are not effective for treating knee osteoarthritis.^{83, 84} In older patients with knee pain caused by osteoarthritis or degenerative meniscal changes, arthroscopic procedures provide only minor pain relief, which is offset by an increased risk of harm, when compared with conservative management.⁸⁵ Exercise therapy

is more effective than knee arthroscopy for reducing osteoarthritic knee pain.⁸⁶ In 2015, the first Atlas reported that there were more than 33,000 admissions for knee arthroscopy in people aged 55 years and over in Australia in 2012–13.⁵⁸ The rate of admissions was seven times higher in the area with the highest rate compared with the area with the lowest rate. In light of the Atlas findings, the Commission released a clinical care standard for osteoarthritis of the knee (OAK)⁸⁰ and commissioned a documentary about appropriate care for knee pain. The Commission

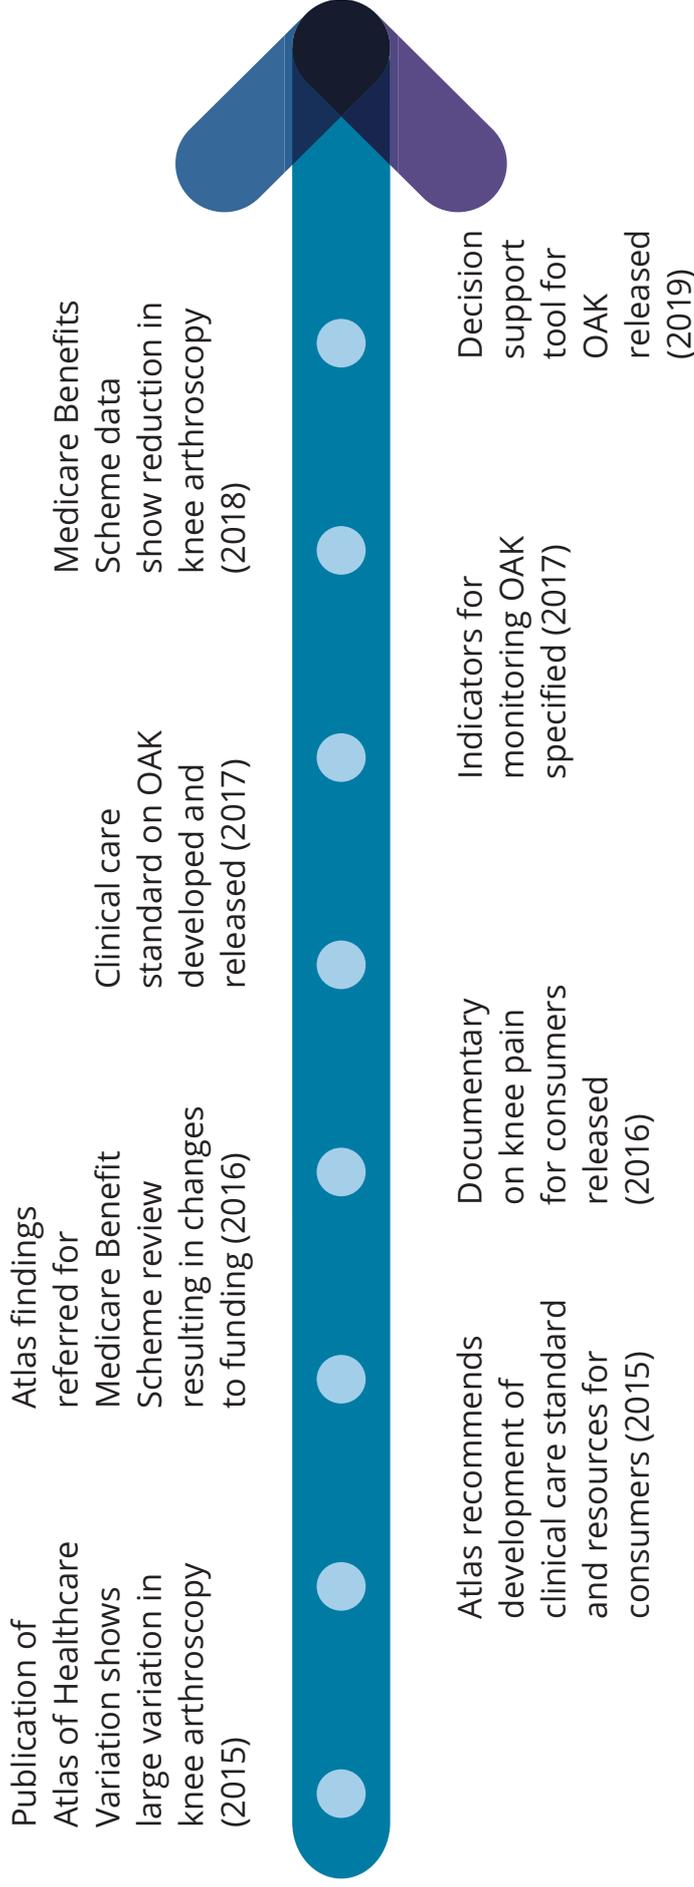

also referred the findings to the MBS Review Taskforce, which subsequently recommended removal of funding for knee arthroscopy for degenerative changes. The rate of knee arthroscopy in people aged 55 years and over in Australia fell from 412 per 100,000 in 2015 to 312 per 100,000 in 2017 – a 24% decline (Figure 20).⁸⁷ Figure 21 illustrates how the Commission used different types of resources, levers and approaches to influence and enact change within the health system on osteoarthritis of the knee.

MOVING TOWARDS VALUE-BASED HEALTH CARE

Internationally, and within the Australian health system, there has been an increasing focus on delivering value-based health care for consumers and funders. Value-based health care is about achieving the best care possible for each patient while maintaining an efficient use of resources.⁵ Importantly, the strategy provides a common goal for patients, clinicians, provider organisations, administrators, governments and policy makers, because it places patient outcomes as the focus for health system performance.

Creating high-performing health systems involves delivering services that improve health outcomes that matter to patients; understanding and improving the experience of both staff and consumers; and ensuring the efficiency and effectiveness of healthcare delivery.⁸⁸

There is significant work happening across Australia towards refocusing health systems, and value-based health care has been the subject of discussions and seminars auspiced by national and state governments. The NSW Government in particular, has implemented a number of initiatives to deliver better outcomes for patients and better value for the NSW health system. The NSW Ministry of Health's Leading Better Value Care program is the state's core approach to value-based health care.⁸⁹

The literature and global discussion on value-based health care identifies a number of basic building blocks. The most common are: measuring patient outcomes (particularly patient reported outcomes) and related costs; a system of guidelines and standards for best

practice; identifying payment methods focusing on the outcome of care for a pathway or cycle of care; and an enabling information technology platform.⁹⁰⁻⁹³

The Commission has been supporting the achievement of value-based health care by fostering system change in five key areas to:

- Focus on people: understanding and responding to what matters to consumers and staff
- Measure and report on safety and quality: using data to identify, monitor and report on patient experience and outcomes, staff experience, costs and variation in practice. This means focusing on a new generation of outcome indicators that show how well health systems are serving people's needs, including patient reported experience and outcome measures
- Use evidence-based guidance and policy: using evidence to inform clinical practice and improvement
- Strengthen clinical governance: embedding accountability and strategies for safety and quality within organisational governance
- Embed safety and quality into national systems: using information and knowledge about safety and quality to inform national systems.

Figure 22 illustrates the Commission's key work in these areas, which are critical to delivering value-based health care.

Figure 22: Examples of Commission key work in supporting value-based health care

Commission action to strengthen clinical governance:

National Safety and Quality Health Service Standards (1st and 2nd ed.), accreditation scheme, National Model Clinical Governance Framework, clinical trials framework, electronic medication management, ehealth systems.

Commission action to support evidence-based policy and guidance:

Clinical care standards (ACS, stroke, colonoscopy, delirium, HMB, Hip fracture, OAK, VTE), policies and guidance (antimicrobial stewardship, mental health, cognitive impairment, comprehensive care, healthcare-associated infection, blood management, falls, clinical communication, pressure injuries, end-of-life care, medication safety) Atlas recommendations.

Commission action to embed national systems:

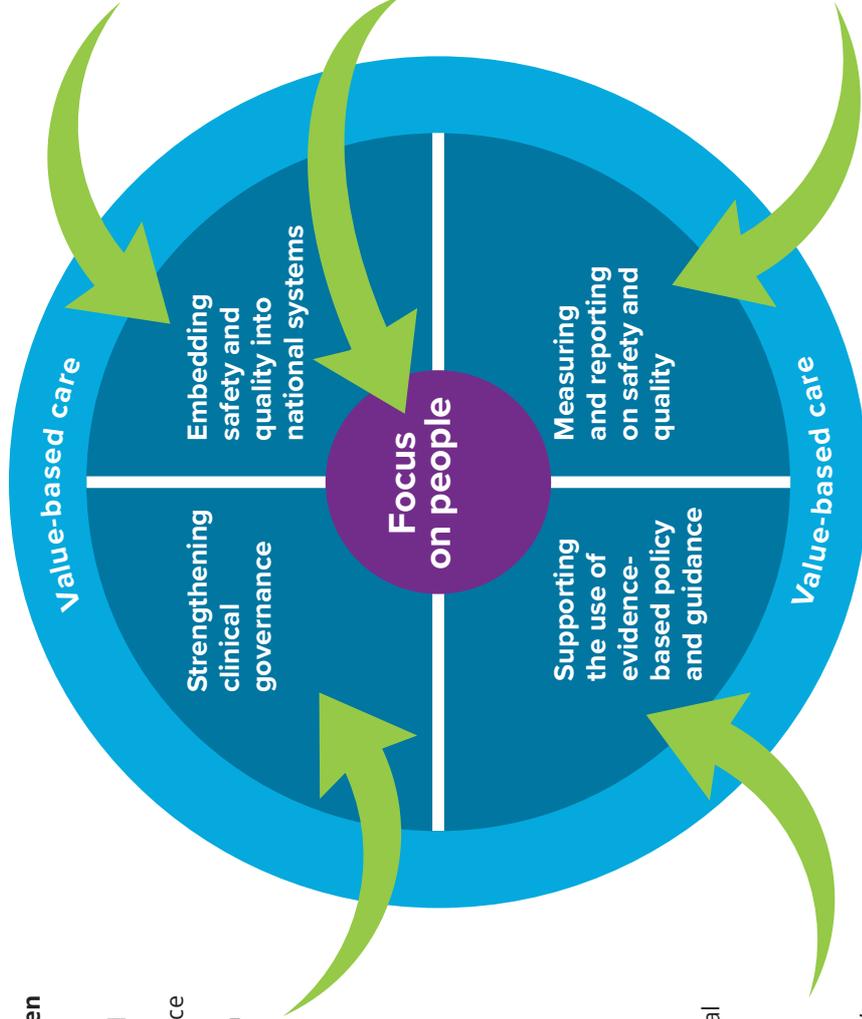

National Safety and Quality Health Service Standards (1st and 2nd ed.), accreditation scheme, funding and pricing models, MBS reviews, credentialing changes, clinical trials framework, MyHealth record safety, certification framework for digital mental health, electronic medication management, ehealth systems.

Commission action to focus on people:

Charter of Healthcare Rights, policy (person-centred care, health literacy, shared decision making, comprehensive care, clinical communication, teamwork, informed consent) AHPEQs, PROMs, safety culture, National Model Clinical Governance Framework, Australian Safety and Quality Framework for Healthcare.

Commission action on measuring and reporting on safety and quality:

Patient safety learning, and measurement systems; public and private reporting, registries, HACs, AHPEQs, sentinel event reporting, adverse event reporting, CHBOI, safety culture, Atlas reporting, Antimicrobial Use and Resistance Australia, patient reported outcome measures clinical trials, clinical care standards indicators, National Safety and Quality Health Service Standards indicators.

Source: Australian Commission on Safety and Quality in Health Care, 2019.

Note: acute coronary syndrome (ACS), Australian Hospital Patient Experience Questions (AHPEQs), core hospital based outcome indicators (CHBOI), heavy menstrual bleeding (HMB), Medicare Benefit Schedule (MBS), osteoarthritis of the knee (OAK), patient-reported outcome measures (PROMs), venous thromboembolism (VTE).

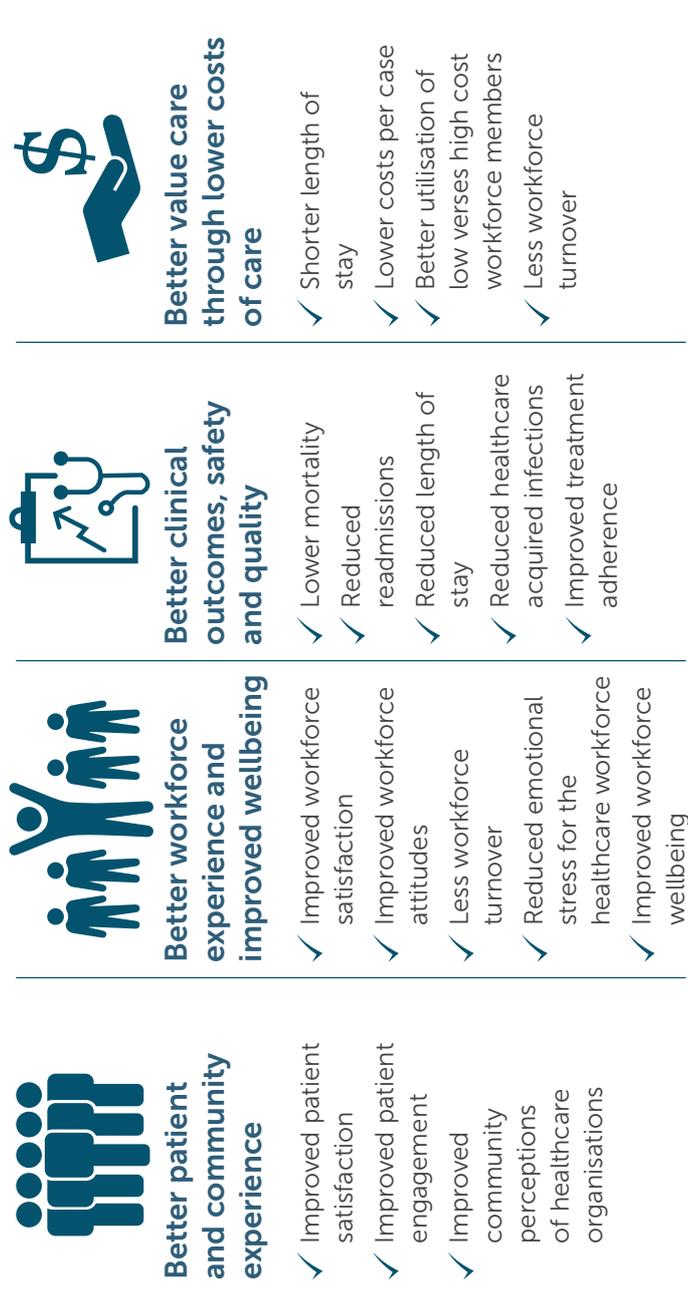

Focus on people

A key principle is to reorganise health care around patient values, rather than focusing on volume and throughput. Placing people at the centre of health care offers clear potential to improve the value delivered by health service organisations as it is integral to delivering care that matters to the patient. The potential benefits of having a focus on person-

centred health care are widely recognised and are illustrated in **Figure 23**.

In Australia, a person-centred focus is not new. An understanding of the importance of patient and staff experience, and the goal of delivering care that meets the needs and preferences of consumers, is reflected in national, state and territory policies, as well as in activities within individual health service organisations.

Figure 23: Benefits of person-centred care

Source: Australian Commission on Safety and Quality in Health Care, 2018.

The Commission's action

The Commission has embedded the principles of person-centred care within a range of national policies and frameworks such as the Australian Safety and Quality Framework for Health Care²¹, Australian Safety and Quality Goals for Health Care⁹⁴ and the Australian Charter of Healthcare Rights.²² This has been reinforced through the Partnering with Consumers Standard in the first and second editions of the NSQHS Standards, which places an increasing emphasis on the need for health service organisations to engage with consumers as partners in their own care, as well as involving consumers as partners in governance systems and processes.

The Commission has also provided guidance on measuring patient experience as a means of identifying whether health care is person-centred, and has developed the AHPEQS, a non-proprietary question survey instrument which assesses core aspects of patient experience.³³

CASE STUDY 6

Identifying attributes of organisations that excel in person-centred care

In 2018, the Commission published a review identifying key attributes of high-performing person-centred healthcare organisations and the benefits of embedding person-centred care into systems.⁹⁵

The identification of these attributes helps healthcare organisations identify and prioritise areas of action to support a person-centred focus. See **Figure 24** for the seven attributes identified through this work.

Figure 24: Attributes of high-performing person-centred healthcare organisations

Source: Australian Commission on Safety and Quality in Health Care, 2018.

Measure and report on safety and quality

A fundamental step towards creating a high-performing health system is the standardised measurement of outcomes that matter to the patient. Standardised measures can be used by clinicians to improve interventions and care for patients, and can be used by system managers, government and national agencies to encourage gains in safety, quality and patient outcomes.

This requires monitoring, measurement, reporting, learning and action at all levels of the health system – making the information available to patients, carers and consumers, clinicians, hospitals, administrators, policy-makers and government, so that learning and improvements can be made.

A multifactorial approach to monitoring and reporting on patient safety and quality is becoming increasingly common nationally and internationally, and systems implementing this approach are realising improved outcomes as a result.

People want to be assured that health care is safe and high-quality. Providing this assurance requires robust measurement and reporting of data that meaningfully and usefully assesses patient safety, and appropriateness of care.

Measurement and reporting on safety and quality informs people designing, delivering and funding health care about any gaps or variation in the

delivery of health care; the impact of improvement activity; and how a health service organisation performs compared with national and international standards. Key to effective measurement is:

- Ensuring robust health information standards and clinical indicators are available for health service organisation and system use
- Providing a model for local, regional and national monitoring of patient safety and quality
- Supporting consistent and transparent public reporting on safety and quality by all sectors of the health system, including both public and private hospitals.

Some guiding principles that are core to safety and quality measurement are identified in **Box 9**.

Box 9: Ten guiding principles for safety measurement and monitoring

In 2014, Vincent described ten guiding principles for safety measurement and monitoring in health care. These included:

1. “A single measure of safety is a fantasy
2. Safety monitoring is critical and does not receive sufficient recognition
3. Anticipation and proactive approaches to safety
4. Integration and learning: invest in technology and expertise in data analysis
5. Mapping safety measurement and monitoring across the organisation
6. A blend of externally required metrics and local development
7. Clarity of purpose is needed when developing safety measures
8. Empowering and devolving responsibility for the development and monitoring of safety metrics is essential
9. Collaboration between regulators and the regulated is critical
10. Beware of perverse incentives.”⁹⁶

National reporting

Australia has been described as lagging behind and ‘less advanced’ than many countries when it comes to public reporting of healthcare safety and quality. In Australia, there are multiple channels of public reporting across the public and private sectors and locally, but no consistent, readily accessible, national public reporting of patient safety and quality healthcare outcomes across the hospital sector.

A number of reports have signalled a commitment by the Australian Government for increased transparency in reporting about health services, particularly to:

- Promote informed decision-making by the people using those services
- Contribute to quality improvement and quality assurance.

In October 2017, the Australian Government Productivity Commission released the report *Introducing Competition Informed and User Choice into Human Services: Reforms to human services*.⁹⁷ One area of focus for the report was improving consumer choice through increased transparency and public reporting. Recommendation 11 focused on information to support patient choice and self improvement by healthcare providers, and included strengthening and expanding public reporting.

In 2011, the Australian Government introduced the MyHospitals website⁹⁸, the only nationally consistent and comparable public reporting system for public and private providers (mandatory for public hospitals, but voluntary for private sector providers). Currently, owing to methodological challenges and

lack of data, only seven of the 17 proposed indicators are reported.

Despite the extent of public reporting of health information occurring in Australia, this information is not well known to clinicians and the public, and there is limited awareness of the MyHospitals website.

Australian governments are committed to increased transparency in reporting about public services, and recently created the Australian Health Performance Framework (AHPF)⁹⁹ which provides a single health-system wide reporting framework that takes into account factors that influence service delivery and health and workforce outcomes. The AHPF provides a structure for national reporting, but it does not yet contain a contemporary, discrete set of indicators that would give summary information on patient safety and quality health care in both public and private hospitals nationally. The AHPF is designed to ‘support achievement of the National Healthcare Agreement objective: to improve health outcomes for all Australians and ensure the sustainability of the Australian health system.’⁹⁹

In August 2017, the COAG Health Council asked the Commission to identify options to align public reporting standards of patient safety and quality health care across public and private hospitals nationally. The COAG Health Council intended that the output of this work be incorporated into the national work being progressed on the AHPF.

Local reporting

There are varying degrees of public reporting across the states and territories, ranging from well-developed public reporting mechanisms such as those in South Australia¹⁰⁰, Queensland¹⁰¹ and New

South Wales¹⁰², to other less developed models. Although most hospitals in Australia measure and collect information on adverse events, clinical incidents, and other patient clinical record data, the indicators used for collection are not consistent across the sector, and it is not always clear how the information collected is used for local improvement.

The Commission’s action

The Commission has been working on developing a defined set of indicators – common specifications for measuring safety and quality consistently and transparently. The Commission has developed this set of indicators for local monitoring and reporting, and is now working on specifying those indicators for consistent national reporting. The indicators have largely been designed for automatic capture from multiple sources – including the electronic health record in states and territory jurisdictions and (in the future) My Health Record nationally. The Commission acknowledges the importance of contemporary real-time data as a long-term goal and preference.

The set of indicators form the core components of a national patient safety measurement tool, or framework, which the Commission is currently developing. Further information on this framework is included on pages 71 to 73.

The Commission is also proposing that the indicators be specified for use as standards for public reporting – this proposal will form part of the advice to COAG Health Council on options to align public reporting standards of patient safety and quality health care across public and private hospitals nationally. **Table 6** shows the potential indicators mapped against AHPF health system reporting dimensions.

Table 6: Examples of potential indicators mapped to reporting measures for safety and quality

AHPF health system dimension	Reporting measure	Potential indicator / indicator status
Safety	Compliance with national health service standards (NSQHS Standards)	Accreditation status and reason for failure, presented by hospital; standard specifications developed by the Commission
	Patient outcomes	Mortality Avoidable hospital readmissions
	Adverse events	Hospital-acquired complications set <i>Staphylococcus aureus</i> bacteraemia surveillance Australian Sentinel Events list
Appropriateness	Patient reported measures	Australian Hospital Patient Experience Question Set (see Case study 7) <i>Patient reported outcome measures*</i>
	Staff safety culture	<i>Patient safety culture survey*</i>

*The Commission is investigating feasibility of indicators.

CASE STUDY 7

The Australian Hospital Patient Experience Question Set

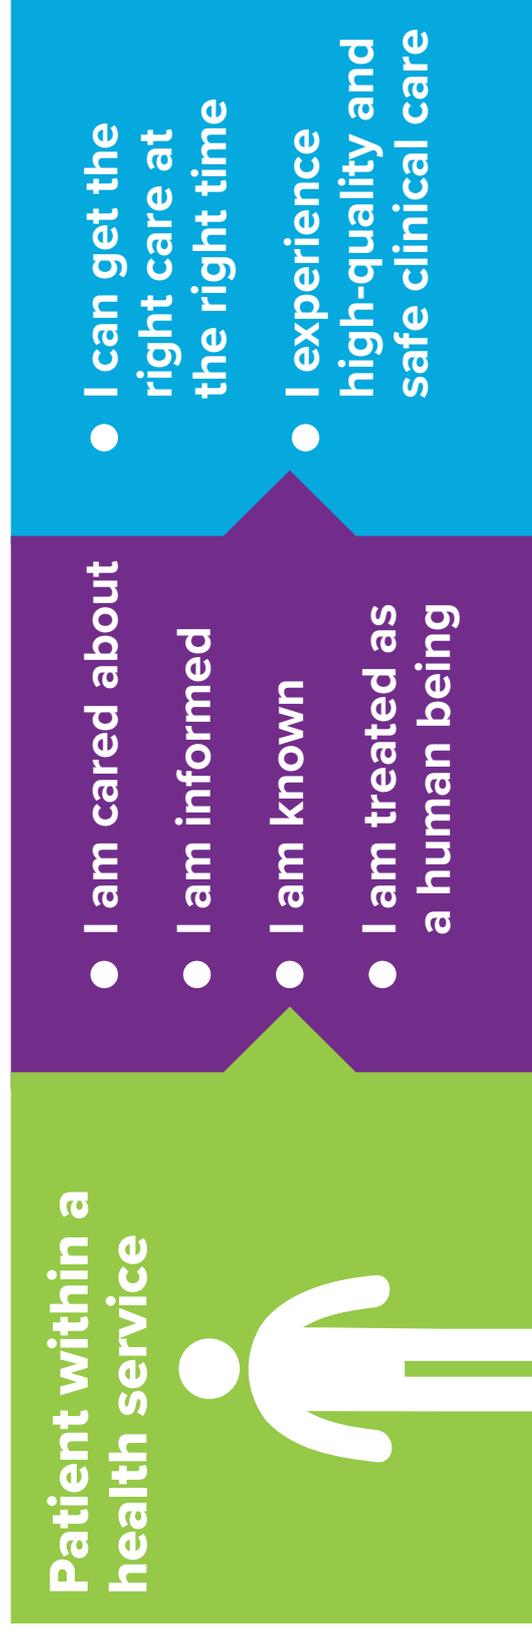

The Australian Hospital Patient Experience Question Set (AHPEQS) is a tool developed to assess the person-centeredness of health service organisations. It was originally commissioned by Health Ministers to be a data source for the

nationally consistent measurement of patients' healthcare experience.

The AHPEQS is a non-proprietary 12-question survey instrument which assesses core aspects of patient experience without placing undue time burdens on the person. The short, generic and simple nature of the tool will enable systematic and routine capture and use of patients' perspectives on the quality

and safety of their health care in a way that is efficient for funders, providers and patients. The questions may be used free of charge by organisations in both public and private sectors. The Commission is now working to establish a methodology for potential future nationally-consistent measurement of patients' experiences using the questions.

Figure 25: Domains for Australian Hospital Patient Experience Question Set

Source: Australian Commission on Safety and Quality in Health Care, 2018.

Use evidence-based policy and guidance

Evidence-based policy and guidance provides a foundation for delivering safe and high-quality care. It provides information about what is known to work in health care, and also reinforces the imperative to continually build the evidence base to better inform future decisions and action. Using an evidence-based approach is grounded in rigorous research, data, analytics, and evaluation of new innovations.

Sometimes it can be challenging for health service organisations and clinicians to keep up to date with changes to the evidence base, guidance and best practice for health care in an environment burdened with competing information and priorities. The collation and distribution of evidence-based guidance and policy from a trusted source provides a valuable service to the health system.

The Commission's action

The Commission's work involves the development of evidence-based policy and guidance, and includes:

- Undertaking and using research to inform new policies and guidance to improve the safety and quality of health care
- Supporting data collection and analysis to inform decision making and approaches
- Developing policies that incentivise the use of evidence-based approaches.

The Commission has developed a range of clinical care standards describing quality care for a range of conditions where there has been variation

in practice. **Box 10** gives information on clinical care standards. In addition, the Commission has developed evidence-based guidance, policies and national consensus statements on a range of topics that have been identified as areas where safety and quality improvement could be made across the health system. The topics for these include mental health, cognitive impairment, comprehensive care, healthcare-associated infection, antimicrobial stewardship, blood management, falls, clinical communication, pressure injuries, end-of-life care, medication safety and others.

Box 10: Clinical care standards

Clinical care standards play an important role in guiding the delivery of appropriate care and reducing unwarranted variation.

The Commission has developed clinical care standards on antimicrobial stewardship, acute coronary syndrome, acute stroke, colonoscopy, delirium, heavy menstrual bleeding, hip fracture, osteoarthritis of the knee, and venous thromboembolism.²⁶

Each clinical care standard is developed in collaboration with a topic working group of clinicians, researchers and consumers, using the most current evidence from guidelines and standards, information about gaps between evidence and practice, their expertise and knowledge of the issues affecting the

appropriate delivery of care, and consideration of issues that are important to consumers.

Clinical care standards:

- Help people to know what care to expect for a particular clinical condition; help them make informed decisions about treatment in collaboration with their health professional
- Provide guidance to health professionals so they can deliver quality care and have informed discussions about treatment options with their patients
- Set out the components of care that health services can use to guide practice and monitor improvement in their hospitals and other services where the clinical care standard is applicable.²⁶

The National Model Clinical Governance Framework

Since 2015, a number of state and territory governments have engaged the Commission to review identified patient safety problems. These reviews have shown that some health service organisations have problems implementing key clinical governance processes. Issues that have been identified during these reviews include problems with:

- Implementing an open disclosure response consistent with national and local standards
- Ensuring that incident management and investigation systems can provide adequate surveillance to recognise major safety failures or risks
- Implementing corrective action in response to identified patient safety risks and failures
- Establishing complaint management systems that include a partnership with patients and carers
- Ensuring a robust and positive safety culture
- Clearly understanding the roles and responsibilities of boards, the executive, clinical teams and clinicians in clinical governance.

Clinical governance is the set of relationships and responsibilities established by a health service organisation between its state or territory department of health (for the public sector), governing body, executive, workforce, patients, consumers and other stakeholders to ensure good clinical outcomes. It ensures that the community and health service organisations can be confident that

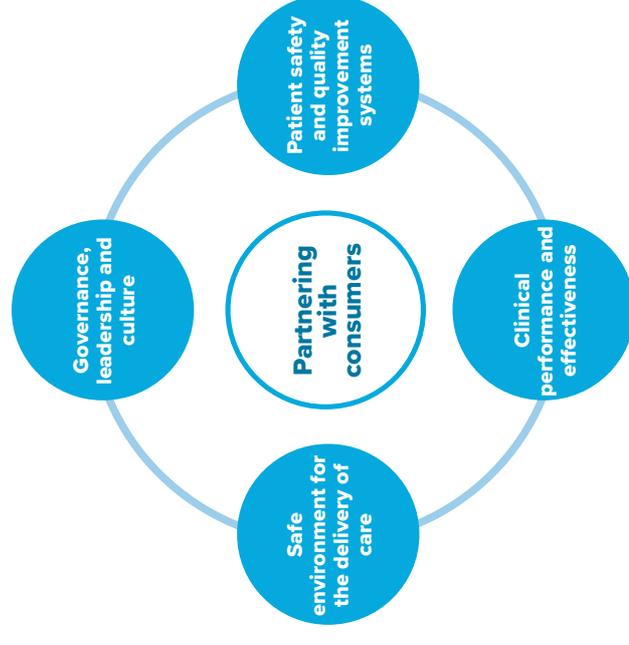

systems are in place to deliver safe and high-quality health care, and continuously improve services.

Clinical governance is an integral component of corporate governance of health service organisations. It ensures that everyone – from frontline clinicians to managers and members of governing bodies, such as boards – is accountable to patients and the community for assuring the delivery of health services that are safe, effective, integrated, high quality and continuously improving.

The Commission developed the National Model Clinical Governance Framework (the Framework)⁹ to improve clinical governance. It provides a consistent national framework for clinical governance that is based on the NSQHS Standards. It supports a shared understanding of clinical governance among everyone working in health service organisations, including clinicians, managers and members of the governing body. The Framework has five components as illustrated in **Figure 26**.

The Framework applies to public and private health service organisations in the acute sector, and is mandatory for health service organisations that need to meet the requirements of the NSQHS Standards.

Figure 26: National Model Clinical Governance Framework

Source: Australian Commission on Safety and Quality in Health Care, 2017.

Embed safety and quality into national systems

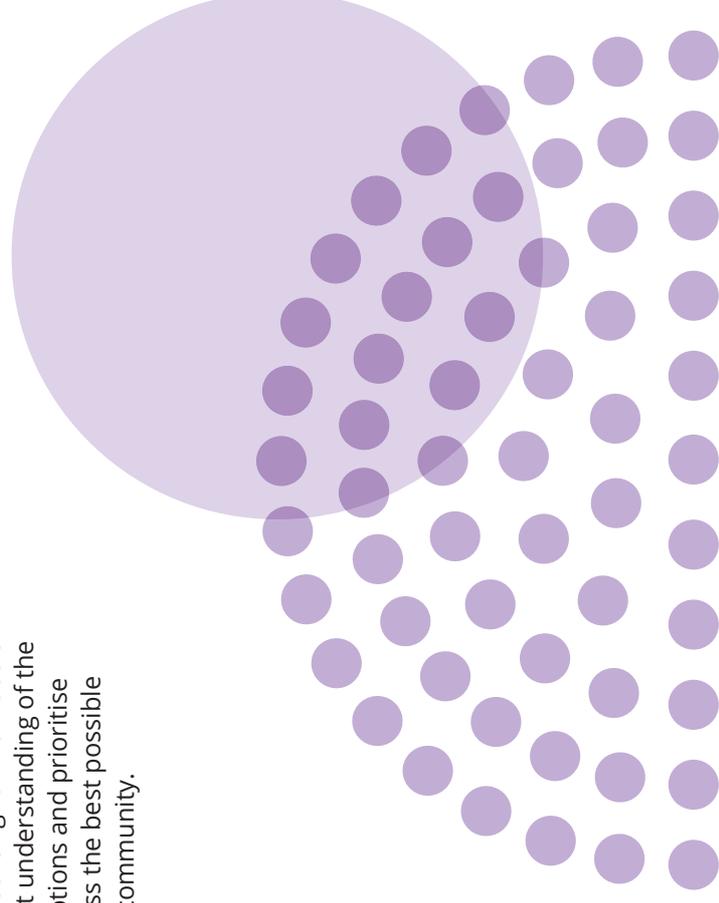

Embedding safety and quality into national systems involves using knowledge and evidence about a person-centred focus; evidence-based policy and guidance; and measurement and reporting of safety and quality into the overarching systems and structures that influence the way health care is delivered. These systems and structures include credentialing, professional registration, professional education, accreditation, funding and legislation.

It is about ensuring that national systems and structures are focused on delivering and funding value-based care that improves patient experience and outcomes, rather than simply rewarding activity. Using knowledge about patients' outcomes and experience, combined with resourcing for individuals and the system help to support understanding of the value of different treatment options and prioritise resourcing for patients to access the best possible care for themselves and their community.

The Commission's action

The Commission has accumulated significant knowledge and expertise in key areas of healthcare variation where safety and quality improvements can be implemented. The NSQHS Standards are a key example of action to support health service organisations to provide safe, quality care that is based on embedding evidence-based approaches into the policies, practices, systems and governance that guide everyday care. **Case study 8** illustrates how developing evidence-based policy and guidance and embedding it into systems through the NSQHS standards can contribute to improved outcomes for patients.

In addition, the Commission has developed credentialing requirements for areas where there have been identified risks for patients. It is also developing a national clinical trials framework for greater consistency and application of clinical trials within health service organisations, and is working with partner agencies to integrate safety and quality into funding and pricing (**Box 11**).

Box 11: Funding and pricing for safety and quality

There is a substantial body of research arguing that healthcare pricing models should reward quality and safety. Therefore having a focus on value-based care requires a consideration of pricing and funding systems in health care. There are four commonly used models for funding or pricing health care in Australia:

- **Best-practice pricing:** evidence-based decisions on what constitutes 'best practice' for treatment of a particular condition, then applying a price to the provision of this best-practice package of service or model of care
- **Normative pricing:** use of price to influence the delivery of care (for example, to provide more in-home care for certain conditions)
- **Quality structures pricing:** linkage of the accreditation standards to funding in the private hospital system
- **Payment for Performance (P4P) or Safety and Quality pricing:** linkage of quality, safety and funding through the imposition of financial incentives and/or disincentives for certain behaviours or outcomes.¹⁰³

In Australia, Australian Government funding for hospitals is directed to Local Health Networks rather than to specific hospitals or to clinical departments within hospitals. However, the international literature indicates that incentives built into the model at this level would not be effective unless those incentives flow down to the hospital or ward.¹⁰³

Research has shown that best practice and normative pricing models are generally considered to be better than pay for performance in creating incentives for new models of care but many models are narrow in scope.¹⁰³ It is important to note that the strongest evidence overall on how to genuinely improve quality and safety exists for clinical quality registry and benchmarking systems, which use clinical registry data to compare the performance of providers, to identify best practice and to drive improvements in quality and patient outcomes.

In 2015 and 2016, IHPA and the Commission investigated best-practice pricing options for funding some hip fracture care. This approach would see purchasing of healthcare services for hip fracture care at a price that reflects the elements that constitute best practice. The best-practice price was proposed to align with the Commission's Hip Fracture Clinical Care Standard as it forms the evidence-base for a national care pathway for hip fracture care which has support from clinicians and consumers. In its annual pricing framework, IHPA noted that it would not proceed with the model in the short term, but would work with jurisdictions and other stakeholders to further examine the viability and implications of implementing a best-practice pricing approach for hip fracture care in future years.²⁵

See page 27 for more information about how the Commission is working to integrate safety and quality into pricing.

CASE STUDY 8

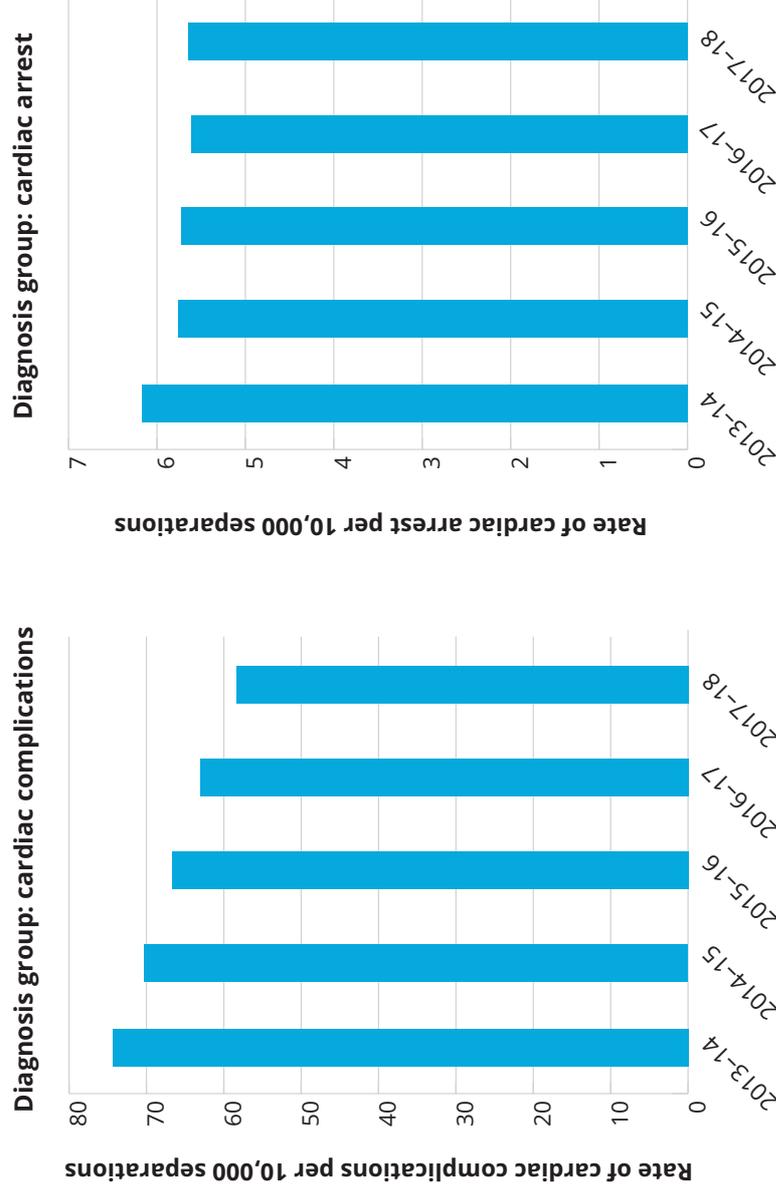

Reducing cardiac complications through better recognition and response systems – from policy to standards to change

Each year, patients in Australia experience almost 31,000 cardiac complications while in hospital.¹⁰⁴ These complications range from unstable angina, through to acute myocardial infarction, arrhythmias, pulmonary oedema and even cardiac arrest.⁴² Reductions over time in the rate of cardiac complications and cardiac arrest rates, demonstrate how evidence-based interventions at the national system, state and territory and local level are working together to enhance patient safety (Figure 27).²⁸

In 2010, the Commission published a National Consensus Statement (the consensus statement) outlining eight essential elements for recognising and responding to clinical deterioration in hospitalised patients.¹⁰⁵ NSQHS Standard 9: Recognising and Responding to Clinical Deterioration in Acute Health Care arose from this consensus statement.²⁸

Many states and territories have been active in this area and there has been considerable change in systems for managing the deteriorating patient and the nature of rapid response systems including a greater use of early warning tools, graded response protocols and structured handover. The reductions in rates of cardiac arrests reflect their work and the initiatives in individual hospitals over more than two decades, as well as the impact of the NSQHS Standards and other Commission initiatives.²⁸

Figure 27: Rates of in-hospital cardiac complications and cardiac arrest, Australia, 2013–14 to 2017–18

Source: Admitted Patient Care National Minimum Data Set, 2013–14 to 2017–18.

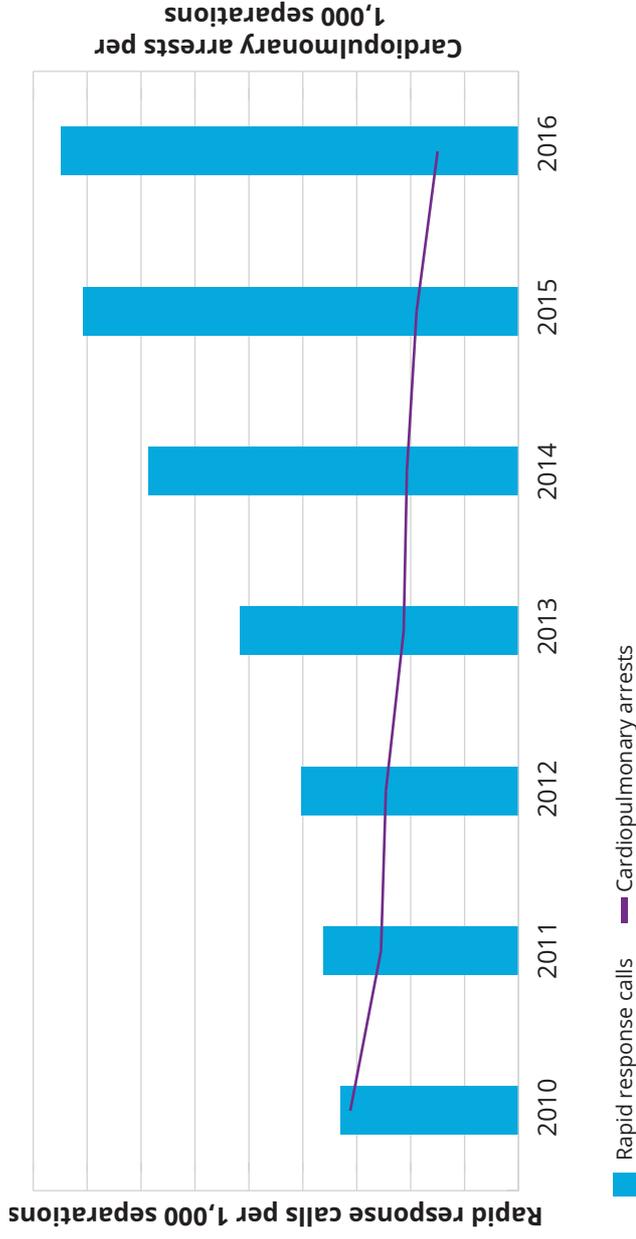

Note: Public hospitals only, which meet the robust condition onset flag coding criteria, all care types. Rates are per 10,000 separations.

Case study 8 continued

An example of the impact of state and territory action can be seen in the findings from the NSW Between the Flags program. Implemented in NSW public health facilities in 2010, the program's key elements align with NSQHS Standard 9 and include a focus on governance, standard calling criteria,

clinical emergency response systems, education and evaluation.¹⁰⁶ Findings from the program indicate that from 2010-2016, the rapid response call rate increased by 156% and the cardiac arrest rate decreased by 51.5% in NSW (**Figure 28**).²⁸

Figure 28: Unexpected cardiopulmonary arrest rates and rapid response call rates per 1,000 acute separations – Between the Flags NSW, 2010–2016

Source: NSW Clinical Excellence Commission, 2017.

THE COMMISSION WILL SUPPORT HEALTH SERVICES DURING 2019–20

Supporting implementation of the second edition of the NSQHS Standards

The second edition of the NSQHS Standards addresses gaps identified in the first edition, including mental health and cognitive impairment, health literacy, end-of-life care, and the health of Aboriginal and Torres Strait Islander peoples. It also updates the evidence for actions, and consolidates and streamlines standards and actions to make them clearer and easier to implement. Assessment to the second edition commenced from 1 January 2019.¹⁰⁷

The Commission is supporting health service organisations in a range of ways to transition to the second edition of the NSQHS Standards through the development of information, education and guidance. This includes:

- Guides, advisories, workbooks and fact sheets on meeting the requirements for hospitals, small hospital and multi-purpose services, and day procedure services
- Tailored information and user guides describing strategies for implementing NSQHS Standards with specific patient populations including children, Aboriginal and Torres Strait Islander peoples, people with mental health conditions,

- chemotherapy patients, people with cognitive impairment, and people at the end of life
- Education modules, fact sheets and user guides for different people working within the health system including assessors, clinicians, quality managers, board members, chief executive officers and others.
- All of this information, education and guidance has been brought together into a custom built microsite to ensure it is easy for health service organisations, consumers, assessors and regulators to find and use.

The Commission is working closely with state and territory regulators, accreditation agencies and health service organisations as implementation of the second edition of the NSQHS Standards progresses to inform the development of new guidance and support, and identify areas for improvement and action.

Improving the reliability of the accreditation process

In 2016-17, the Commission undertook a comprehensive review of accrediting agencies, including a review of the approval process and held performance review meetings with all approved agencies. During this, state and territory regulators and chief executives of health service organisations raised concerns about the reliability of the assessment process. They particularly noted that, in their view:

- Assessment processes did not reliably verify that a health service organisation's safety and quality systems were operational and effective
- There can be variation in how assessors interpret the intent and requirements of the NSQHS Standards
- Accreditation can be awarded, with later reviews finding clinical governance was not fully embedded.¹⁸

The Commission is responding to industry concerns and is implementing six strategies to improve the reliability of the accreditation process, described in **Box 12**. Combined, these strategies will ensure the accreditation process will more accurately assess a health service organisation's compliance against the NSQHS Standards, rather than examine their preparedness for an assessment. Implementation of these strategies commenced, along with the second edition of the NSQHS Standards, from January 2019.

Box 12: Strategies to improve the reliability of the accreditation process

Strategy 1: Improve the veracity of health service organisation assessments
Standardise the length of cycle and assessments; amend rating scale; test high-risk scenarios; assessment conducted at short notice; standardise reporting by accrediting agencies to health service organisations; require repeat assessment if actions are not met; use of patient journey methodology; clinical governance attestation statements; describe flexible transition arrangements for the first year of operation

Strategy 2: Improve the effectiveness and expertise of the assessment team
Improve the oversight and feedback on accreditation agency performance; develop a structured assessment methodology for the Clinical Governance and Partnering with Consumers Standards; provide orientation and training for assessors in the NSQHS Standards

Strategy 3: Assess the health service organisation's safety and quality data to better inform assessment processes
Use administrative and clinical data to target assessments; prescribe the data to be reviewed by assessors

Strategy 4: Improve regulatory oversight
Reduce the need to comply with other safety and quality standards; address conflicts of interest

Strategy 5: Improve communications about the assessments and their outcomes
Public reporting on assessment outcomes; communicate with stakeholders about accreditation

Strategy 6: Improve resources and support for health service organisations
Support health service organisations before assessment; formalise internal assessments against the NSQHS Standards for health service organisations; provide guidance about the use of patient journey methodology by health service organisations.¹⁸

Promoting rapid knowledge exchange through the establishment of a national safety and quality portal

The Commission will establish a national centralised repository for reviews of important patient safety practices. This will provide clinicians, health service organisations, patients, carers, consumers and others with an accessible mechanism for obtaining objective, detailed information on the evidence supporting the effectiveness of patient safety practices.

The establishment of this portal complements the Commission's work in supporting the use of evidence-based guidance, strategies and standards for the improving the safety and quality of health care. It is expected that a range of patient safety practices will be reviewed against the following domains: scope of the problem, strength of evidence for effectiveness, evidence on potential for harmful unintended consequences, estimate of costs, how much is known about implementation and how difficult the practice is to implement.

Collection and review of patient safety practices for inclusion in the portal is likely to involve:

- Commissioning the development of systematic reviews to provide comprehensive, evidence-based information on common, costly medical conditions, and new healthcare technologies and strategies

- Developing a tool to allow comparison of patient safety practices, which would allow the generation of side-by-side comparisons for any combination of two or more practices
 - Establishing an electronic forum for exchanging information on patient safety practices, their development, implementation and use
 - Compiling a centralised annotated bibliography of patient safety practices where users can search for citations for publications and resources
- safety practices, including practice development and methodology, structure, evaluation and implementation.

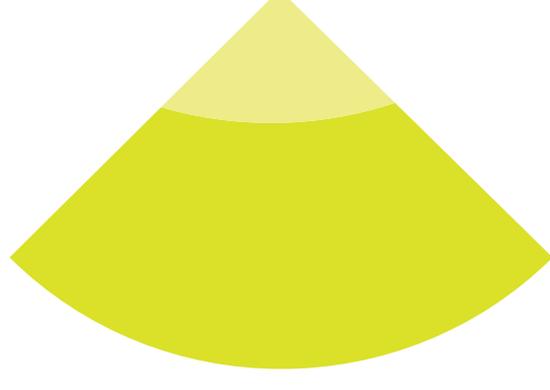

Supporting quality improvement and health learning systems through measuring and monitoring safety

Measurement is an important part of safety and quality improvement. Collecting, reporting and acting on data about safety and quality supports accountability and transparency in service provision, but effective reporting is an ongoing challenge, as it requires multiple measures at different levels of the system.²⁹

Measurement and reporting are tools which can be used to inform policy levers, which ensure that action is taken to improve, learn from, and spread good practice. Action is enabled at practice level, organisational level and system level through sound reporting and information sharing.²⁹

In Australia, reporting standards and measures differ across states and territories, and between the private and public sectors, and there is little publicly available information on health service quality and patient safety. The lack of a single source of data that provides comprehensive information, or a single set of measures or indicators that could be used to reflect the state of safety and quality, compromises understanding and identification of safety and quality issues. It also makes it difficult for patients and consumers to access useful information to inform their decisions and restricts the health system's ability to learn and evolve.

Significant progress has been made, as described in this report, to improve the safety and quality of the Australian health system, and there are many excellent examples of learning systems developed by some states, by the private sector and by health providers. **Box 13** provides some details of the SA Health Safety Learning System.¹⁰⁸

Box 13: SA Health's Safety Learning System

SA Health's Safety Learning System is an application that enables all SA Health services to record, manage, investigate and analyse patient and worker incidents, consumer feedback and notifications. The Safety Learning System facilitates good clinical governance by providing a single coordinated system that allows for consistent and coordinated review and reporting. The domains included are:

- Clinical incidents
- Worker incidents
- Security incidents
- Consumer feedback
- Notifications, including for medical indemnity, coronial notifications, alleged sexual assault or sexual misconduct and employee disciplinary matters.¹⁰⁸

Introduction of the Australian Health Performance Framework⁹⁹ provides a single, flexible approach for reporting on health and healthcare performance. It will support the assessment and evaluation of value and sustainability, and inform the identification of priorities for improvement and development.

To advance measurement and monitoring of safety and quality further, what is now needed is a national model that details key safety and quality measures and indicators, as well as guidance about how to use this information at different levels of the health system to bring about change and improve outcomes.

Measuring and reporting on patient safety and quality health care

A robust patient safety monitoring system measures multiple elements of patient safety. The Commission continues to progress work on a range of measures that can be monitored together to obtain a comprehensive and accurate picture of patient safety; and provide relevant information that can be fed back to clinicians to encourage improvements. These measures use multiple sources of data including data that is routinely coded from the patient clinical record (International Classification of Diseases) data. They include:

- Accreditation against the NSQHS Standards
- A suite of outcome indicators (mortality)
- The national list of HACs
- Surveys of patient hospital experience (AHPEQS) – patient reported measures
- Structured analyses of selected sets of incident types

- Surveys of organisational safety culture.

The model is being designed to apply across different levels of the health system. The information generated by monitoring and collection of planned core common metrics will help to address the approaches to patient safety, set out below, as suggested by Vincent for safety measurement and monitoring¹⁰⁹:

- Past harm
- Reliability
- Sensitivity to operations
- Anticipation and preparedness
- Integration and learning.

The utility of these core common metrics is that they can be used to evaluate multiple areas concurrently, to give a holistic view of the safety and quality of the health system. These metrics should be reviewed together to identify appropriate safety and quality improvement strategies, and like the work done by the Health Foundation in the United Kingdom, the model will provide a guide to applying the information at different levels of the health system to drive action.¹¹⁰

The Commission has already developed CHBOI (mortality indicators), the HACs set, *Staphylococcus aureus* bacteraemia surveillance indicators, the Sentinel events list, and the AHPEQS. These indicators were largely developed for use as local-level safety and quality monitoring tools, with the aim of supporting safety and quality improvement initiatives in public or private hospitals. Two additional areas of focus for the development of common safety and quality metrics are patient

reported outcomes measures (PROMs), and patient safety culture measurement.

Patient reported outcomes measures

There has been increasing interest and activity in the development of PROMs, as they provide a systematic way to assess the effectiveness of healthcare interventions from the patient's perspective. They record the patient's assessment of how health services and interventions have, over time, affected their quality of life, daily functioning, symptom severity, and other dimensions of health which only patients can know. PROMs promise to fill a vital gap in our knowledge about outcomes and about whether healthcare interventions actually make a difference to people's lives.

Evidence to support the use of PROMs to inform quality improvement is growing internationally. The evidence is strongest for their use in understanding variation in clinical practice, as they can help in determining the relative effectiveness of different treatments and interventions. However, there is also emerging evidence that using PROMs can improve the patient-clinician interaction.¹¹¹

In Australia, PROMs are an emerging method of assessing the quality of health care. While exciting and innovative work is happening in many places, PROMs are not yet embedded in routine measurement at regional, jurisdictional or national level and current work in PROMs is scattered and uncoordinated. In 2017–18, the Commission completed a literature review, environmental scan and stakeholder interview report to shape the work of PROMs in Australia¹¹¹⁻¹¹³ and established an expert advisory group to guide this national work program.

The Commission will continue to take a leading role in providing strategic, policy and practical support for the large-scale evidence-based collection and meaningful use of PROMs in Australia.

Patient safety culture measurement

Within health service organisations, intelligence about emerging safety and quality issues is gathered by frontline staff during the normal course of their everyday work. These clinicians, administrators, managers and auxiliary staff are the closest observers of concerning patterns, and of workplace conditions which allow these patterns to emerge and persist.

Developing a culture of safety is an essential task for health service organisations as they strive to eliminate the factors that contribute to medical errors, patient harm, and unsafe conditions. For example, a 2017 systematic review of 62 studies found that organisational and workplace cultures were correlated with patient outcomes in over 90% of studies.¹¹⁴ However, this important source of safety information is not always routinely captured. This has prompted an increasing interest in patient safety culture measurement.

The Commission conducted an environment scan and literature review in 2016–17 and found that while most jurisdictions use staff survey tools, tools to assess the staff perspective on safety culture within their organisation were not widely used. Research evidence shows associations between staff experiences of organisational safety culture and other safety and quality outcomes, including adverse event rates and patient experience. Consequently, the Commission will be working in collaboration with

stakeholders to progress work to identify common measures for patient safety culture that could be used nationally.

Patient safety diagnostic service

The Commission can add value to the work already being undertaken in states and territories and across the private sector by setting national benchmarks, providing national comparison and predictive and prescriptive analysis, and setting consistent standards of reporting safety and quality.

To date, the Commission has been progressing work on individual elements of the learning system for patient safety measuring and monitoring. But there are gaps: feedback on safety reporting and experiential learning, lack of awareness of the range of patient safety issues and shortage of opportunities for professional and system-based improvement efforts.

To complement work on the patient safety measuring and monitoring model, the Commission plans to develop a national online audit and surveillance platform to support the learnings from some of the elements of the model. The Commission will establish a confidential diagnostic service to help clinicians and health service organisations measure and improve safety across acute health systems.

In the first instance, this will be a multi-modal approach that draws on different measurement methods as necessary to understand patient safety, using the measures the Commission has already developed.

Initially, the following data sources will be used to enable health service organisations to compare

The Commission will support health services during 2019-20

themselves to peer groups across Australia, using risk adjusted data in the following categories:

- Sentinel event data
- Serious adverse events or clinical incidents
- HACs at a granular level
- Potentially preventable hospital readmissions
- Patient-reported measures – patient experience and patient reported outcomes.

Figure 29 shows a sample of the type of information that could be provided to health service organisations by the patient diagnostic safety service.

Figure 29: Sample of information provided by a patient safety diagnostic service

CONCLUSION

Australia has come a long way in understanding and improving the safety and quality of health care since the *Quality in Australian Health Care Study*¹, was first published in 1995. Australia's approach to safety and quality is maturing. It increasingly acknowledges that patient harm is not just a result of human fallibility, but can be a result of system failures in the way care is organised and coordinated, and is potentially preventable through improvement efforts targeted at clinical practice, organisations and systems.

Key safety and quality risks have been identified nationally, and strategies exist and are being implemented to improve the safety and quality of health care in Australia at local, regional, state and territory and national levels.

The majority of health care that people receive in Australia today is safe and high quality. Australia's clinicians are highly regarded as skilled professionals who are committed to meeting the healthcare needs of their patients², and Australian health service organisations have been integrating safety and quality improvement systems into their organisational governance processes for some time.

Internationally, and within the Australian health system, there has been an increasing focus on delivering value-based health care for consumers and funders. Value-based health care is about achieving the best care possible for each patient while maintaining an efficient use of resources.⁵

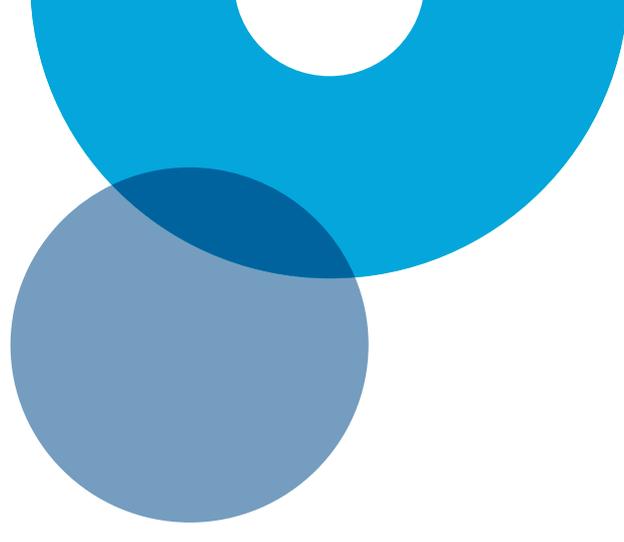

The Commission and partners have been supporting the achievement of value-based health care by fostering system change in five key areas to:

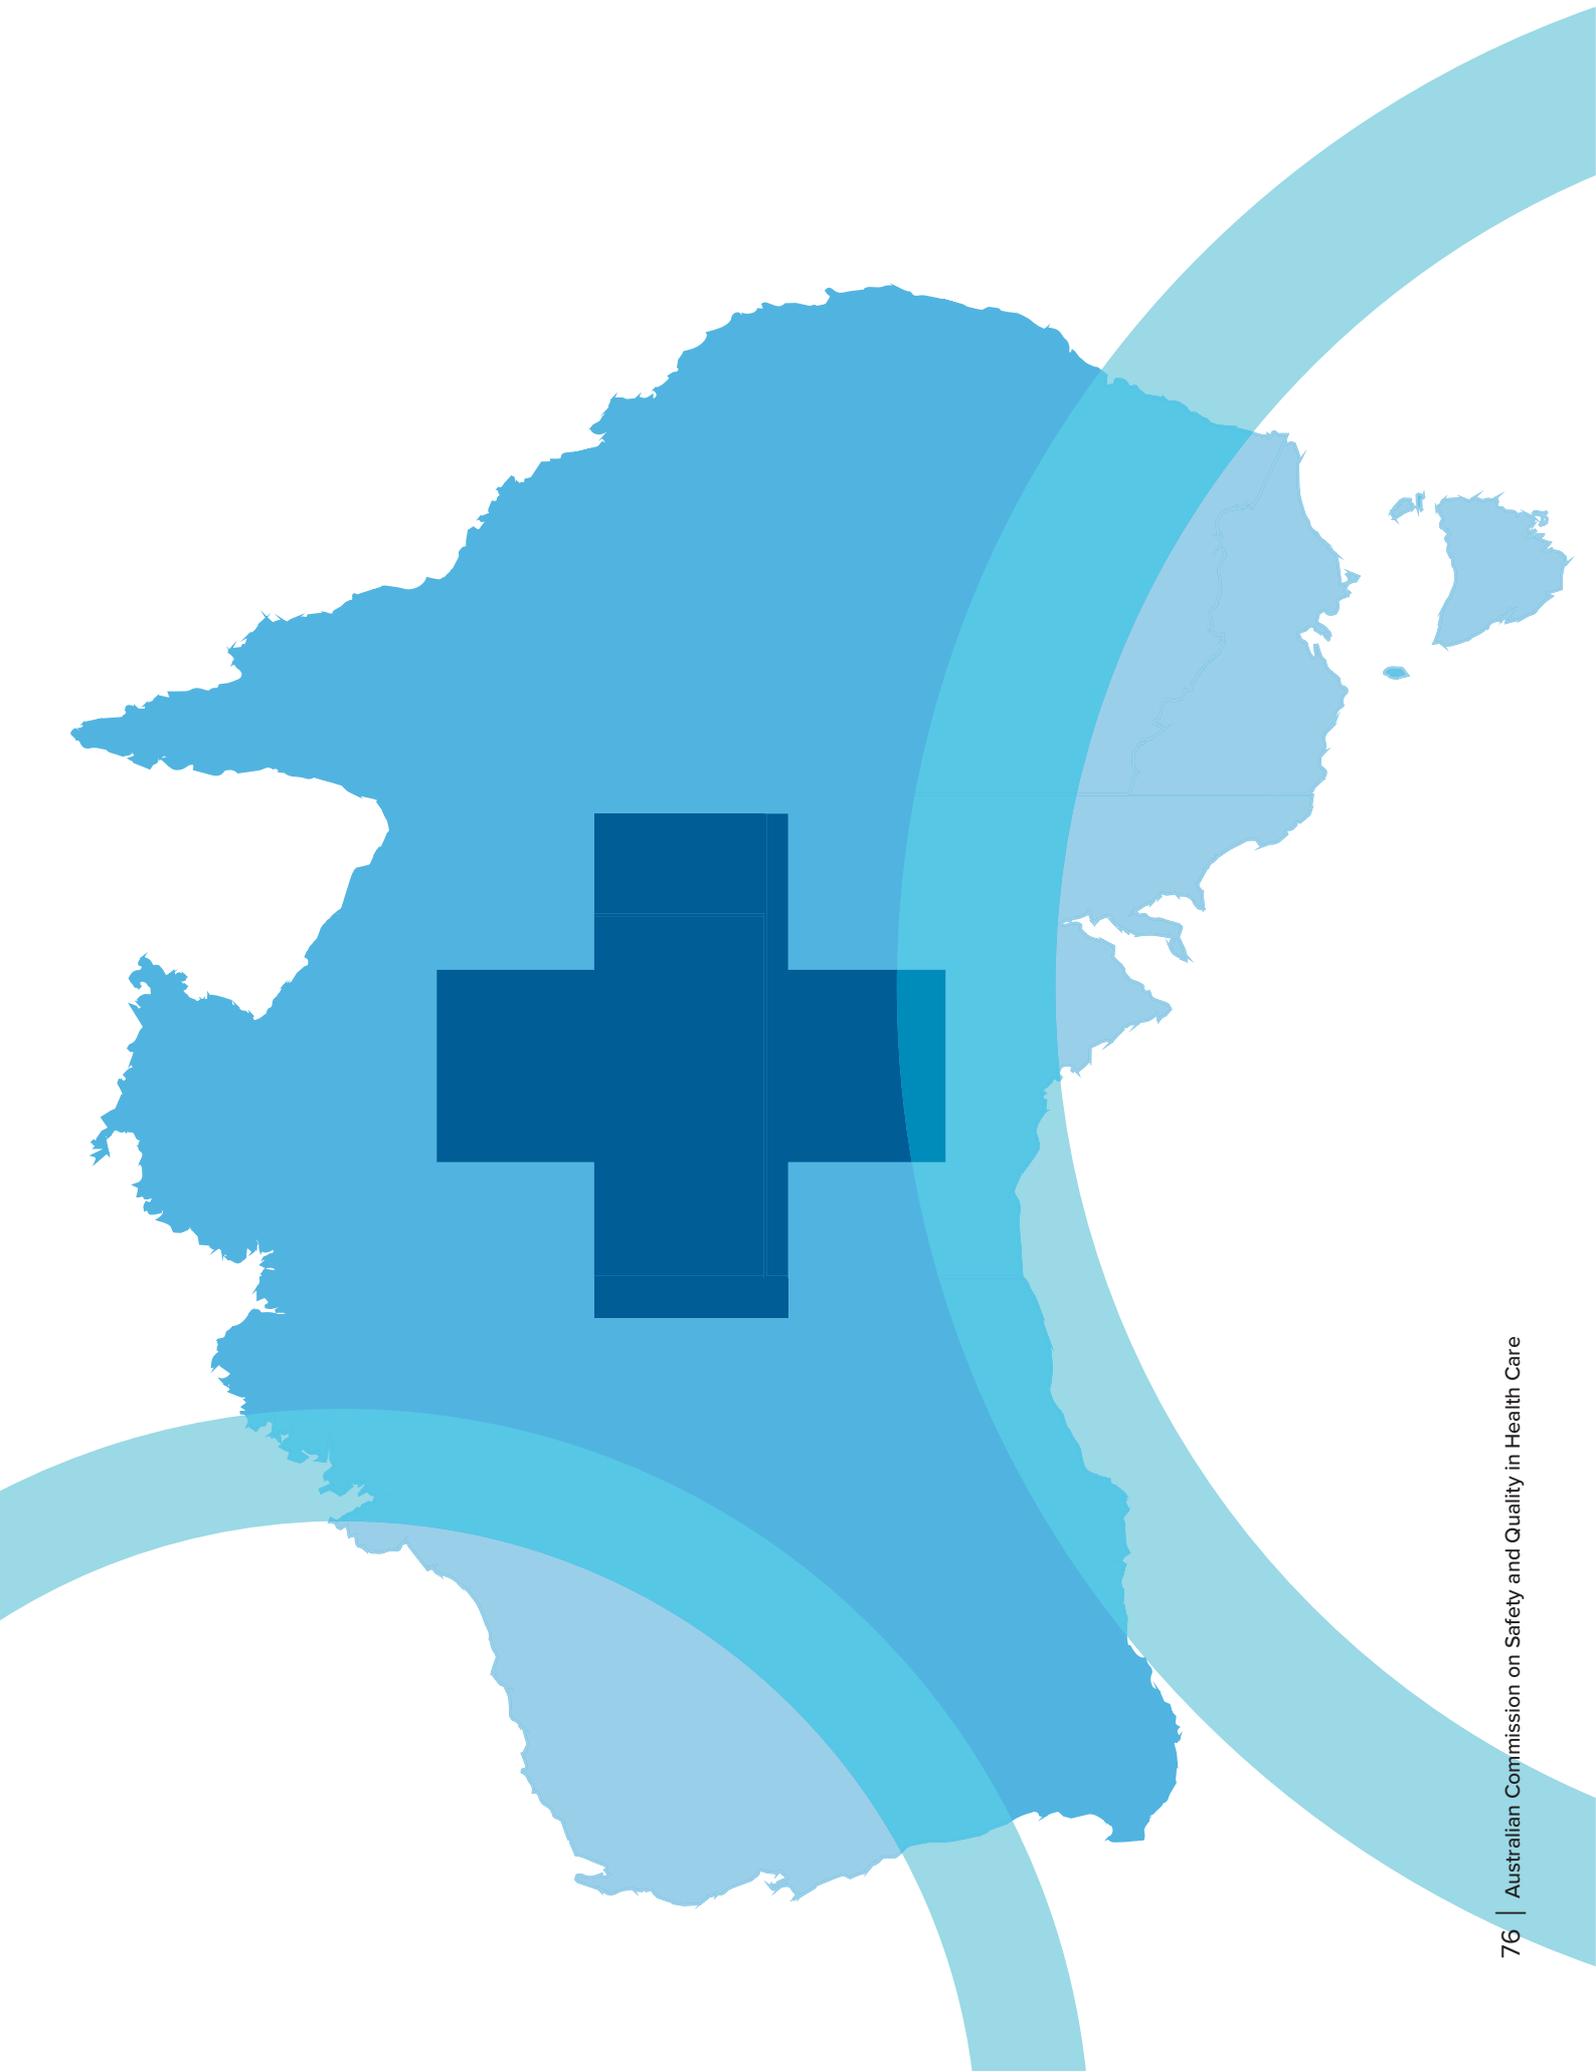

- Focus on people
- Measure and report on safety and quality
- Use evidence-based policy and guidance
- Strengthen clinical governance
- Embed safety and quality into national systems.

The Commission, in collaboration with the Australian Government, states and territories, the private sector, clinicians and patients, has been driving safety and quality improvement by identifying systemic risks to patients, and providing standards, guidance and policy to mitigate those risks and improve patient outcomes through clinically appropriate risk management responses.

Measurement is a particularly important part of safety and quality improvement, and delivering value-based health care. Moving forward, the Commission is developing a National Patient Safety Learning Model that will help health service organisations measure safety and quality consistently, and identify where improvements can be made both locally and nationally. In addition, emerging work on a patient safety clearing house and diagnostic service will complement the support, guidance and improvements to the NSQHS Standards and AHSSQA Scheme.

Providing safe and quality care has always been a focus of those working in the health system. The Commission continues to work with stakeholders in the health system to create greater consistency, coordination and reliability of data about what is happening within the system, as well as providing evidence policy and guidance to inform actions to improve health care.

ADELAIDE NANCY ROSENTHAL, 447 COLLINS STREET, MELBOURNE VIC 3000
An Australian Legal Practitioner within the meaning of the Legal Profession Uniform Law (Victoria).
A person authorised under section 19(1) of the Oaths and Affirmations Act 2018 to take an affidavit.

Low value care is a health hazard that calls for patient empowerment

To protect themselves from the potential harms of low value care, patients must take an active role in clinical decision making

Low value care is care that is ineffective, harmful or confers marginal benefit at disproportionately high cost.¹ Professionally-led campaigns such as Choosing Wisely Australia and the Royal Australasian College of Physicians' EVOLVE program aim to reduce the prevalence of such care. However, similar overseas campaigns have been marred by selective focus on infrequent, low impact, or less financially lucrative practices;² uncertainty about the most effective de-adoption strategies;³ and limited success to date in reducing overuse.⁴ While clinician-targeted education programs, audit and feedback, and decision support feature prominently, evidence appears stronger and impact seems greater for strategies directed to, or mediated by, patients.⁵

Framing low value care as a health hazard for patients

Although clinicians accept responsibility for resource stewardship, they also believe their primary care obligation is to the individual patient, with costs being a secondary consideration.⁶ Most patients hold similar views, until out-of-pocket expenses become unaffordable.⁷

Reframing low value care as having negative consequences, not just "worth a go" or "better safe than sorry", may incentivise patients, clinicians and policymakers to engage more in mitigation efforts.⁸ Negative consequences can arise directly from an episode of low value care, or indirectly from subsequent downstream care cascades, such as invasively investigating incidental but benign findings from a previous unnecessary investigation. Harms can be physical, psychological, social, financial and relational (mistrust). Even providing potentially beneficial care to patients who do not want it can cause harm, at least psychologically. Moreover, giving low value care to one individual may result in delayed delivery of high value care to another individual, who may then suffer preventable harm.

The burden of negative consequences

Recent studies have begun to quantify the negative consequences of different forms of low value care. A review of 54 case descriptions of 63 overused services revealed an average of 3.2 negative consequences per case, most (33/54, 61%) featuring an overuse cascade feedback loop.⁹ Reported harms (91 in total) comprised injury (69%), psychological harm (16%), treatment burden (9%), financial loss (3%), and dissatisfaction (2%).⁹

Recent care cascades were reported by 374 internists in the United States following incidental findings from

tests that a third deemed clinically inappropriate but which led to a new invasive test (77.2% of instances), an emergency department visit (54.8%), or hospitalisation (50.6%).¹⁰ These caused patients physical (15.6%) or psychological harm (68.4%), financial loss (57.5%), social disruptions (8.7%), and dissatisfaction (27.6%).¹⁰

Seven low value procedures characterised 9330 admissions to 225 Australian hospitals, including endoscopy for dyspepsia or colonoscopy for constipation in young people, knee arthroscopy for osteoarthritis and meniscal tears, and spinal fusion for uncomplicated low back pain.¹¹ Between 0.2% and 15.0% of patients, depending on the procedure, developed one or more hospital-acquired complications, most commonly infection (26.3% of instances), with a twofold or more increase in the median length of stay.¹¹ Among 72 unnecessary admissions to one US hospital of low risk syncope patients, one in eight had an adverse event from tests and treatments.¹²

In a study of 405 695 individuals with new onset, non-specific low back pain, those receiving lumbar spine magnetic resonance imaging (MRI) within 6 weeks, compared with matched controls without an early MRI, incurred significantly more surgery (1.48% *v* 0.12%), greater opioid use (35.1% *v* 28.6%), and worse pain scores (3.99 *v* 3.87).¹³ Among 5057 individuals with incidentally detected lung nodules on chest x-rays, those receiving intense diagnostic investigation versus guideline-concordant care had more procedure-related adverse events (8.1% absolute increase) and more radiation exposure, with no higher incidence of advanced cancer at 2 years' follow-up.¹⁴

In a study of 1488 hospitalised patients who received antibiotics for at least 24 hours, 287 (19%) of the antibiotic regimens were not indicated (eg, asymptomatic bacteriuria, aspiration pneumonitis, congestive heart failure), with 56 (20%) being associated with an adverse drug event, including seven cases of *Clostridium difficile* infection.¹⁵ Adding aspirin with no clear

indication to 1107 of 3280 patients (33.8%) prescribed direct oral anticoagulants (DOACs) for confirmed indications was associated with more bleeding events (31.6 *v* 26.0 bleeding events per 100 patient years) and hospitalisations (9.1 *v* 6.5) than matched controls receiving direct oral anticoagulants only.¹⁶

The role of patients in reducing low value care

While clinicians often complain of patients demanding inappropriate care,⁷ many patients perceive the negative consequences of overuse,¹⁷ and interventions that empower patients to challenge such overuse are effective in decreasing it by 25–40%.¹⁸ In a review of 22 studies, 19 (86%) reported significant reductions in unnecessary use of antibiotics and benzodiazepines, Caesarean deliveries, elective labour inductions, surgery for knee and hip osteoarthritis, non-beneficial intensive care treatments, computed tomography scans for mild head injury in children, cardiac stress testing in low risk adults, and routine screening tests (full blood counts, electrocardiograms).¹⁸ These empowerment interventions comprised patient-oriented educational materials and shared decision-making protocols, the latter having greater effect. In another study, encouraging patients to identify their health concerns before a clinical encounter, and increasing their knowledge about their condition and care options, also rendered clinician advice more concordant with best practice by 33–60%.¹⁹

However, successful engagement depends on several factors: motivation and ability of clinicians to engage patients in decision making; clinician knowledge of, and agreement with, what constitutes low value care; the clinical context; and availability of decision support resources for both parties within clinical workflows. Clinicians do not always attempt to facilitate patient involvement and may not adjust care to patient preferences.²⁰ Such engagement is time-consuming for clinicians and inadequately remunerated, impractical in emergency situations or for patients unable or unwilling to engage, and may incite patient anxiety or dissuade them from further consultations.

In response, evidence-based strategies can overcome these barriers²¹ and reinforce patient perceptions of receiving optimal care and their desire to reconsult. More research needs to define the most effective mix of techniques for supporting patient engagement (eg, educating clinicians on communication techniques, deploying multidisciplinary teams, using trained decision coaches and patient decision aids), and their effects on consultation time and costs.²² Whether such engagement, by specifically reducing low value care, actually improves patient health remains uncertain, although its absence predisposes to worse clinical outcomes, lower quality care and increased health care utilisation.²³

Empowering patients to engage in reducing low value care

Many patients refrain from participating in discussions aimed at avoiding overuse because of a power asymmetry wherein they sense the

need to seek clinician permission to discuss their options, feel they have insufficient knowledge to ask pertinent questions or understand the jargon (“doctor knows best”), and fear repercussions from being seen to challenge clinician credibility (desire to be a good patient). Alternatively, patients may want to avoid responsibility for making a wrong decision they will later regret, or feel unable to participate because of illness symptoms, cognitive impairment, language or cultural barriers, or need for emergency or intensive care.¹⁷

Nevertheless, clinicians must avoid making false assumptions about how much a patient desires involvement in decision making. Methods are needed for identifying which patients, encounters and clinicians need more support to enact the most appropriate form of shared decision making. Patients usually desire a more active role when the matter is serious, invasive interventions are being considered, or if significant out-of-pocket costs, lengthy time off work, or interruptions to social activities may be incurred. Younger patients, women and those with higher educational and socio-economic status are more likely to participate.²⁴ Greater engagement and less overuse are seen within long term clinician–patient relationships characterised by mutual trust and continuity of care,²⁵ and where public messaging within practice environments encourages and legitimates engagement.²⁶

Patients can be trained to ask questions, and adult learning programs can assist those with low health literacy.²⁷ Choosing Wisely Australia (www.choosingwisely.org.au) and other organisations²⁸ provide conversation starter patient resources; other sources provide topic-specific lists of questions (eg, www.prosdex.com for prostate-specific cancer antigen testing, and www.bresdex.com for breast cancer surgery). Decision aids, option grids and fact boxes can also assist.

As a minimum, patients should be encouraged to ask these questions:

- Is there a decision we need to make? In urgent situations, clinicians may need to reach out and not wait for patients to ask.
- What are my options? All clinically viable options should be presented, including doing nothing.
- What are potential benefits and harms of each option? Where possible, these should be expressed using natural numbers (eg, four out of 100 people like you will experience a stroke every year; this treatment will reduce that to two out of 100, although one person of 100 will have a significant bleeding event).
- How will each option affect me in terms of what I consider important? Patients may want to know costs involved, duration of inability to work or perform social activities, skill and place of those performing a procedure.

Consumer organisations should be resourced to run community education campaigns focused on

engagement, while clinicians must be educated about the benefits of patient engagement and receive the tools, time and remuneration to support it within busy work schedules.

Conclusion

Efforts to increase patient empowerment in decision making should be seen as foundational for reducing low value care, and should underpin all other strategies targeting clinicians, payers and policymakers.

Competing interests: Adam Elshaug reports personal fees from the Australian Department of Health, the NSW Bureau of Health Information, Cancer Australia, Queensland Health, Victoria Department of Health and Human Services, SA Health, and Private Healthcare Australia; grants from HCF Research Foundation, the National Health and Medical Research Council, the Medical Research Future Fund, the Laura and John Arnold Foundation, and the Australian Department of Veterans Affairs, outside the submitted work. Melissa Fox reports grants and personal fees from Queensland Health, and personal fees from the Australian Commission on Safety and Quality in Health Care, outside the submitted work.

The value of inpatient rehabilitation after uncomplicated knee arthroplasty: a propensity score analysis

Justine Maree Naylor^{1,2,3}, Andrew Hart¹, Rajat Mittal¹, Ian Harris^{1,2,3}, Wei Xuan^{1,2}

The known Privately insured patients often undertake inpatient rehabilitation after total knee arthroplasty, but there is no evidence that it improves recovery after surgery.

The new Rehabilitation pathways incorporating inpatient rehabilitation were significantly more expensive, but did not achieve patient-reported recovery superior to that of pathways not including inpatient rehabilitation.

The implications Given the substantial difference in costs, better value alternatives than inpatient rehabilitation should be considered for patients who have not experienced a major complication or progressed slowly after total knee arthroplasty.

Annual rates of total knee arthroplasty (TKA) have been increasing in Australia since 2003; 50 623 primary TKA procedures were undertaken in 2015, 6.1% higher than in 2014.¹ This trend is consistent with those in other countries.^{2,3} The procedure reduces pain, improves function, and enhances health-related quality of life, but is expensive;⁴ TKA is often cited as a major driver of increases in private health insurance premiums.^{5,6}

An important but underappreciated contributor to the overall cost of TKA is post-operative care in an inpatient rehabilitation facility. Two large private insurers in Australia indicated that the average rebate per overnight stay in 2015 was \$700 (personal communication); as the average length of stay is 12 days, the average total rebated cost is \$8400. Inpatient rehabilitation is more common in the private sector because privately insured health care consumers have ready access to (private) rehabilitation beds, but public health care patients do not; about 40% of TKA patients with private insurance reportedly undergo inpatient rehabilitation, compared with 5–10% of those not privately insured.⁷

It is unknown whether inequity in access undermines recovery from surgery, as little research has been undertaken in this area.^{8,9} Because privately insured patients are reluctant to be randomised to a therapy other than the one to which they feel entitled, it is difficult to conduct a randomised controlled trial (RCT) that compares the most resource-intensive pathway (inpatient rehabilitation) with less resource-intensive alternatives. The preferences of orthopaedic surgeons and carers, the preferences of patients about being discharged directly home, and the relationships between treatment centres and rehabilitation facilities are other factors that make RCTs difficult.

In an attempt to redress the lack of research in this area, we conducted a propensity score-matched cohort study of privately insured TKA patients, in which we compared the effectiveness of a rehabilitation pathway including inpatient rehabilitation with one that did not. A propensity score is the conditional probability of treatment assignment according to observed baseline characteristics.^{10,11} We matched

Abstract

Objective: To compare the effectiveness of rehabilitation after total knee arthroplasty (TKA) in models with or without an inpatient rehabilitation component.

Design, setting and participants: A propensity score-matched cohort of privately insured patients with osteoarthritis who underwent primary, unilateral TKA in one of 12 Australian hospitals between August 2013 and January 2015 were included. Those discharged to an inpatient facility because of poor progress or who experienced significant complications within 90 days of surgery were excluded.

Intervention: Discharge after surgery to an inpatient rehabilitation facility or home.

Main outcome measures: Patient-reported knee pain and function (Oxford Knee Score; at 90 and 365 days after surgery) and health rating (EuroQol “today” health scale; at 35, 90 and 365 days). Inpatient and community-based rehabilitation provider charges were also assessed.

Results: 258 patients (129 pairs) from a sample of 332 were matched according to their propensity scores for receiving inpatient rehabilitation; covariates used in the matching included age, sex, body mass index, and markers of health and impairment. The only significant difference in outcomes was that EuroQol health scores were better on Day 35 for patients not undergoing inpatient rehabilitation (median difference, 5; IQR, –10 to 19; $P = 0.01$). Median rehabilitation provider charges were significantly higher for those discharged to inpatient therapy (total costs: median difference, \$9500; IQR, \$7000–11 497; $P < 0.001$; community therapy costs: median difference, \$749; IQR, \$0–1980; $P < 0.001$).

Conclusions: Rehabilitation pathways incorporating inpatient rehabilitation did not achieve better joint-specific outcomes or health scores than alternatives not including inpatient rehabilitation. Given the substantial cost differences, better value alternatives should be considered for patients after uncomplicated TKA.

people on their propensity scores to minimise bias associated with being allocated to a particular treatment (in this case, inpatient therapy) on the basis of baseline patient characteristics.^{10–13} This approach is superior to traditional multiple regression techniques because treatment effects are reported in the same manner as if an RCT had been undertaken, facilitating interpretation.^{10,11} We hypothesised that the more expensive inpatient rehabilitation pathway would yield better joint-specific and general health outcomes in the short and longer term than a pathway not including inpatient rehabilitation. We also estimated rehabilitation provider charges for the two pathways.

Method

This study was nested in a national, prospective observational investigation of the relationships between care received and

outcomes after knee or hip arthroplasty ([ClinicalTrials.gov](https://clinicaltrials.gov/ct2/show/study/NCT01899443) identifier: NCT01899443).

Sampling and hospital recruitment

In the larger study, public and private hospitals performing more than 275 TKA or total hip arthroplasty procedures during 2012 were eligible to participate. Eligible hospitals were identified by their listing in the Australian Orthopaedic Association National Joint Replacement Registry.¹ The sampling procedure has been described in detail elsewhere.¹⁴ The original sample included ten public and nine private hospitals from five Australian states (all except Western Australia).

Patient enrolment and eligibility

During August 2013 – December 2014, people awaiting arthroplasty secondary to osteoarthritis were screened by site coordinators during their pre-admission review. Patients were eligible for the larger study if the arthroplasty was the primary surgery and undertaken no later than January 2015; no further arthroplasty within 3 months of the first was planned; and the patient was able to understand the protocol, and could be followed up by telephone for 12 months. An additional inclusion criterion for this nested study was that the patient had private insurance cover for the surgery. To eliminate treatment selection bias and to improve generalisability to uncomplicated TKA, we excluded patients referred to inpatient rehabilitation because of slow progress, and those who had conditions that would alter their typical recovery and rehabilitation pathway, such as simultaneous bilateral surgeries, as well as those who experienced a significant complication within 90 days of surgery. We therefore only included patients for whom the rehabilitation pathway was not dictated by a medical or physical indication and the decision for inpatient therapy was probably made prior to surgery.

Data collection

The following baseline data were collected at the time of patient consent: weight and height; insurance status; comorbid conditions, including requirement for daily medication; education level; presence of other lower limb or back conditions that impair mobility; and the patient-reported outcomes measures described below. Site coordinators provided additional patient-specific data in forms completed by clinicians, including American Society of Anesthesiologists (ASA) scores, complications, hospital length of stay (LOS), and discharge destination, with reason for the specific destination. Thirty-five day, 90-day, and 365-day outcomes, and data on time off work (for patient and carer) were obtained in telephone follow-up interviews. For quality control, clinician-reported data were re-abstracted from medical records, and significant complications reported by patients during follow-up were verified by treating hospitals, general practitioners, or orthopaedic surgeons.

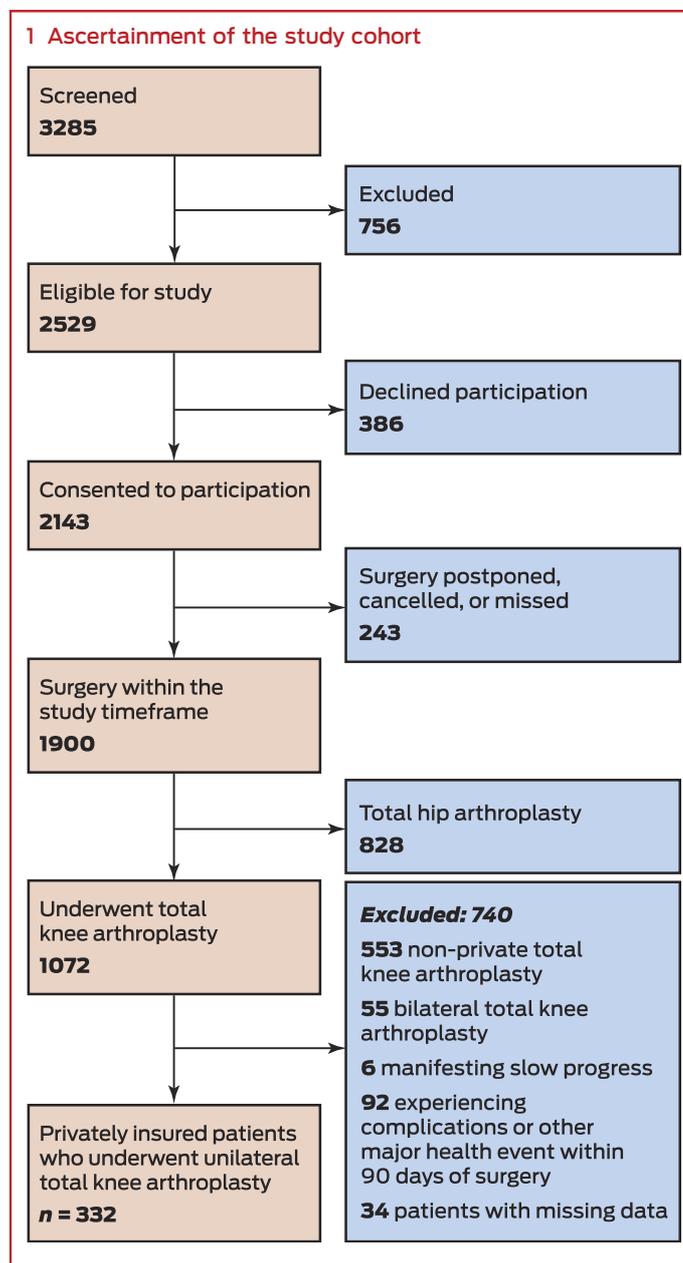

Complications

Acute complications were coded according to the Clavien–Dindo classification,¹⁵ based on the type of care deviation necessitated by the complication. Patients experiencing a complication during their acute admission (typically grade 3 or higher) that probably required referral to inpatient rehabilitation were flagged. Complications graded as less severe, but which would probably undermine rehabilitation (such as footdrop or knee instability requiring bracing), were also flagged. Complications and unrelated health events manifested after discharge (including

re-admission within 90 days) were also captured, as they potentially affect the continuity of rehabilitation.

Outcomes

Primary patient-reported outcomes included the Oxford Knee Score (OKS; at 90 and 365 days)¹⁶ and the EuroQol Visual Analogue Scale for “today” health (EQ-VAS; at 35, 90 and 365 days).¹⁷ The OKS comprises 12 joint-specific Likert-style questions about pain and functional impairment during the previous month; responses are scored from 0 (maximal discomfort/pain or maximal impairment) to 4 (no pain/discomfort or impairment), providing a total score out of 48; higher scores indicate better joint status. EQ-VAS is a scaled measure of how the respondent perceives their own overall health on the day, from 0 (worst health imaginable) to 100 (best health imaginable). Baseline scores were based on responses by patients to the printed survey, while follow-up scores were collected by telephone interview; the two approaches have been shown to be equivalent.¹⁷

Rehabilitation charges were determined from the perspective of the provider. Adjustments for inflation were made if the source document for costs was published before 2015.¹⁸ Overall provider charges for each participant were based on the types of therapy received up to ten weeks after surgery. The unit costs applied and the associated justification are provided in online [Appendix 1](#).

Statistical analysis

The sample size for this nested study was dictated by the projected sample size for the main study ($n = 2000$). Given the sample size required to detect a conventionally defined moderate treatment effect¹⁹ (half the standard deviation of the baseline mean) for a continuous outcome is 128, we conservatively anticipated we would have sufficient power (at $\alpha = 0.05$) to detect a moderate effect.

Normality of data was assessed prior to analysis. Descriptive statistics were used to characterise the cohorts. The covariates of the unmatched cohorts were assessed in independent t and χ^2 tests; outcomes data were analysed in paired t tests, Wilcoxon signed rank tests, and McNemar tests, as were the covariates in the matched cohorts.

Propensity scores (PSs) for the prediction of referral to inpatient rehabilitation were estimated for all eligible patients and used to match each patient who received inpatient rehabilitation with one

who did not (1:1). PSs were determined by unconditional logistic regression, with the outcome being treatment group; the predictors (covariates) were variables known or thought to influence either treatment allocation prior to surgery or the primary outcomes.¹⁰⁻¹³ Covariates included in the model were the continuous variables baseline OKS and EQ-VAS scores, age and body mass index, and the categorical or ordinal variables sex, ASA scores, comorbidity, other lower limb or back problems limiting mobility, and education level.

We applied caliper matching without replacement to determine the matched pairs.^{10,11} An absolute difference in PS of 0.05 was initially trialled; a caliper distance of 0.03 (equivalent to one-fifth of the pooled standard deviation of the PS) improved matching.¹¹ Successful matching was primarily deemed to be indicated by a standardised difference between the groups of less than 0.10 for a variable;^{11,13} a marginally greater difference was tolerated if the variable was not significantly different in both the pre- and post-matched cohorts. We did not rely upon changes in significance alone (from significance to non-significance), given the reduction in sample size that inevitably accompanies matching and the consequently increased likelihood of type II errors.¹³ Variables not included in the matching were interaction terms, employment status (presumed not to influence treatment allocation or primary outcomes), and “surgeon” and “hospital” (their inclusion caused non-convergence of the estimate in the PS calculation, a

EQ-VAS = EuroQol Visual Analogue Scale. SD = standard deviation. For the Oxford Knee Score and EQ-VAS, higher scores indicate lesser joint impairment and better health respectively. * Standardised mean difference = $(\text{mean}_1 - \text{mean}_2) / \sqrt{\frac{\text{SD}_1^2 + \text{SD}_2^2}{2}}$ ◆

consequence of the high correlation between surgeon or hospital and treatment). In response to this last problem, we performed multiple linear regression analyses that incorporated “hospital” for the entire eligible cohort (online [Appendix 2](#)).

Several patients had a second arthroplasty (different joint) or experienced a major health event, such as hip surgery, between 90 and 365 days after surgery. We conducted sensitivity analyses of the 365-day outcomes that excluded these patients, as these events could have affected the primary outcomes and were deemed to be unrelated to the mode of rehabilitation provided.

Ethics approval

Ethics approval for the main study was provided by nine human research ethics committees (HRECs): the Hunter New England HREC (New South Wales; reference, LNR/12/HNE/390); St Vincent's Health and Aged Care HREC (Queensland; reference, HREC #13/10); Austin Health HREC (Victoria; reference, LNR/14/Austin/208 LNRR MAP); Barwon Health HREC (Victoria; reference, 13/82); Epworth HREC (Victoria; reference, LR138-13); Calvary Health Care Clinical and Research Ethics Committee (Tasmania; references, 2:05:13 and 5:13:12), and Calvary Healthcare Adelaide HREC (South Australia; reference, 13-CHREC-E007). Each participating patient provided written informed consent before their operation.

Results

Cohort ascertainment is summarised in [Box 1](#). A total of 129 pairs were matched from an eligible sample of 332 privately insured patients from 12 hospitals; 98% of patients had had their operations in private hospitals.

In the unmatched cohort, the group of patients discharged to inpatient rehabilitation had a lower mean “today” health score ($P = 0.08$), included more patients with lower ASA scores, and a higher proportion of men ($P = 0.009$), and had longer mean acute care LOS ($P = 0.009$) ([Box 2](#)). Matching reduced the standardised difference for 12 covariates included in the matching; the largest remaining mean difference in this group of covariates was 0.12 ([Box 3](#)). For the remaining covariates (including three of the four education categories), between-treatment group differences were not statistically significant in either the pre- or post-matched comparisons.

Matched cohort

Outcomes for the inpatient rehabilitation group were not superior at any time point ([Box 4](#)), and their “today” health ratings were significantly worse than those of the comparison group on Day 35 ($P = 0.01$). Median rehabilitation provider costs were 26 times as

high for the inpatient group as for the comparison group ($P < 0.001$). After excluding inpatient rehabilitation charges, provider charges for the inpatient rehabilitation group were still three times as high because of the greater number of community physiotherapy visits (median, 8 visits; interquartile range [IQR], 5–11; for non-inpatients: median, 5 visits; IQR, 0–9; $P < 0.001$). The patients in this group also preferred comparatively expensive day hospital rehabilitation to other community-based alternatives (online Appendix 3). Time off work for patients and carers was not statistically significantly lower for the inpatient group (Box 4).

Sensitivity analysis of 365-day outcomes yielded similar results (online Appendix 4).

Discussion

The authors of a Canadian RCT of knee and hip arthroplasty recipients reported that 18 days' inpatient rehabilitation was not associated with better outcomes than an average of eight domiciliary physiotherapy sessions.⁹ Our own group recently completed the only RCT to have compared the efficacy of inpatient rehabilitation with that of a simple home program after TKA for public patients;⁸ we found that recovery of mobility and patient-reported outcomes were not superior for patients receiving inpatient therapy. The results of our current study of privately insured patients reinforce these findings. Further, the results for patients undergoing inpatient rehabilitation were not

superior despite the fact that they received more community-based therapy.

Our study has several strengths. Propensity-based scoring helps reduce the bias inherent to observational studies, permitting researchers to more reliably estimate treatment effects.¹⁰⁻¹³ We used a national cohort from hospitals with high volumes of arthroplasty procedures, and the characteristics of the unmatched cohort were typical for patients who undergo TKA in Australia.^{4,8,17,20,21} Our matched cohort should therefore be a representative sample of such patients. Our PS strategy achieved acceptable matching between the cohorts on many variables purported to influence treatment allocation and outcomes. In addition to matching, our comprehensive screening and sensitivity analysis excluded patients with conditions that predisposed them to either requiring inpatient rehabilitation or a worse outcome, thereby eliminating these sources of confounding and bias.

A limitation of propensity-based scoring is that the extent to which bias is reduced depends on the degree to which covariates are matched.¹⁰⁻¹³ While the PSs and exclusion criteria accounted for many factors, unrecognised covariates may have remained unbalanced. Most notably, we could not account for the effects of "surgeon" or "hospital" because most surgeons and hospitals almost routinely referred patients to one pathway or the other. Our supplementary regression analysis (online Appendix 2) indicated that adding "hospital" ("hospital" and "surgeon" are highly correlated) did not influence the OKS outcome, but did affect

EQ-VAS health scores, with a negative effect on the scores of those in the inpatient group. Prosthesis type was also not included in the matching, but patient-reported recovery in the short term appears not to be influenced by this factor.^{22,23}

Recall bias may be a limitation of a study with respect to data on return to work and community-based therapy visits (and by extension, provider charges), but we have no reason to assume that this bias would have been more prominent in either treatment group. A larger sample size may have clarified the trends in time off work. The lack of objective markers of recovery might also be considered a limitation, although earlier research has not detected differences in such outcomes.^{8,9} Perhaps the most important limitation is that our results cannot be extrapolated to patients who experience significant complications, nor to those who are referred to inpatient rehabilitation because of poor progress. We therefore acknowledge that inpatient rehabilitation may be more beneficial for some subgroups of patients, and thus remains a valid treatment option.

In conclusion, our study provides new observations on the comparative effectiveness and costs of rehabilitation pathways for privately insured patients after uncomplicated TKA. Pathways involving inpatient rehabilitation are more expensive because of the costs of both the inpatient treatment and subsequent community-based therapy, but were not found to be associated with improved patient-reported outcomes. Alternatives to inpatient rehabilitation after uncomplicated TKA should therefore be considered first.

Doctors warn against unnecessary arthroscopic knee surgery

Doctors warn against unnecessary arthroscopic knee surgery

New medical advice suggests arthroscopic knee surgery for osteoarthritis is 'low-value' and can be harmful for some patients.

The advice is one of five recommendations released today by the Australian Rheumatology Association (ARA), one of the Royal Australasian College of Physicians (RACP) specialty societies as part of the Evolve initiative.

Discussing the recommendations, Professor Rachelle Buchbinder from the ARA said:

“Arthroscopy is used to treat osteoarthritis of the knee and can involve washing out the joint or cleaning up the lining,” Professor Buchbinder said.

“The research shows that arthroscopic surgery for knee osteoarthritis does not seem to affect a patient’s outcome and in some cases, the procedure can actually do more harm than good.

“Doctors and their patients should be considering the benefits and risks of this procedure and discussing alternatives before performing this surgery, especially for those over the age of 50 as health insurer statistics suggest approximately half of these procedures are for this age group.

“We hope these latest recommendations will help doctors and patients avoid unnecessary and potentially harmful tests and rheumatology procedures.”

Despite the lack of scientific evidence that the procedure works, approximately 43,000 Medicare Benefit Scheme funded arthroscopic knee surgeries were performed in the 2016-2017 financial year, costing around \$22 million in Medicare benefit payments.

Ms Leanne Wells, CEO of Consumer Health Forum of Australia, said:

“Patients depend on their doctors to recommend treatments that are evidence-based. “These days it is all about value-based care. We want the system and patients to be paying for treatments that get the best outcome for people.

“We don’t want to see arrangements where procedures continue to be performed for years despite a dearth of evidence of their benefit. That’s why CHF welcomed the MBS Review and participates in profession-led initiatives such as Evolve and Choosing Wisely to support the development of more patient-focused information and resources to help informed decisions about treatment.”

To help patients make informed decisions about their treatments, Choosing Wisely Australia has developed '[5 Questions to Ask your Doctor.](#)'

The Evolve initiative highlights a specialty group’s ‘top five’ clinical practices that may be overused, provide little or no medical benefit or cause unnecessary harm.

Read the full list of recommendations from the ARA at <https://evolve.edu.au/published-lists/australian-rheumatology-association/>.

There are now 19 Evolve lists published, with further ‘top five’ lists in development. For more information go to: <https://evolve.edu.au>.

Australian Commission on Safety and Quality in Health Care. Colonoscopy Clinical Care Standard. Sydney: ACSQHC; 2020

First released 2018. Updated (minor revisions) January 2020.

Disclaimer

The Australian Commission on Safety and Quality in Health Care has produced this clinical care standard to support the delivery of appropriate care for a defined condition. The clinical care standard is based on the best evidence available at the time of development. Healthcare professionals are advised to use clinical discretion and consideration of the circumstances of the individual patient, in consultation with the patient and/or their carer or guardian when applying information contained within the clinical care standard. Consumers should use the information in the clinical care standard as a guide to inform discussions with their healthcare professional about the applicability of the clinical care standard to their individual condition.

The Commission does not accept any legal liability for any injury, loss or damage incurred by the use of, or reliance on, this document.

Colonoscopy Clinical Care Standard

1 Initial assessment and referral

When a patient is referred for consideration of colonoscopy, the referral document provides sufficient information for the receiving clinician to assess the appropriateness, risk and urgency of consultation. The patient is allocated an appointment according to their clinical needs.

2 Appropriate and timely colonoscopy

A patient is offered timely colonoscopy when appropriate for screening, surveillance, or the investigation of signs or symptoms of bowel disease, as consistent with national evidence-based guidelines. Decisions are made in the context of the patient's ability to tolerate the bowel preparation and colonoscopy, and their likelihood of benefit. If colonoscopy is not appropriate, the receiving clinician advises the patient and their referring clinician of alternate recommended management.

3 Informed decision making and consent

Before starting bowel preparation, a patient receives comprehensive consumer-appropriate information about bowel preparation, the colonoscopy and sedation or anaesthesia. They have an opportunity to discuss the reason for the colonoscopy, its benefits, risks, financial costs and alternative options before deciding to proceed. Their understanding is assessed, and the information provided and their consent to sedation, colonoscopy and therapeutic intervention is documented.

4 Bowel preparation

A patient booked for colonoscopy receives a bowel preparation product and dosing regimen individualised to their needs, co-morbidities, regular medicines and previous response to bowel preparation. The importance of good bowel preparation for a quality colonoscopy is discussed with the patient. They are provided with consumer-appropriate instructions on how to use the bowel preparation product and their understanding is confirmed.

5 Sedation

Before colonoscopy, a patient is assessed by an appropriately trained clinician to identify any increased risk, including cardiovascular, respiratory or airway compromise. The sedation is planned accordingly. The risks and benefits of sedation are discussed with the patient. Sedation is administered and the patient is monitored throughout the colonoscopy and recovery period in accordance with Australian and New Zealand College of Anaesthetists guidelines.

6 Clinicians

A patient's colonoscopy is performed by a credentialed clinician working within their scope of clinical practice, who meets the requirements of an accepted certification and recertification process. Sedation or anaesthesia and clinical support are provided by credentialed clinicians working within their scope of clinical practice.

7 Procedure

When a patient is undergoing colonoscopy their entire colon – including the caecum – is examined carefully and systematically. The adequacy of bowel preparation, clinical findings, biopsies, polyps removed, therapeutic interventions and details of any adverse events are documented. All polyps removed are submitted for histological examination.

8 Discharge

Following recovery and before discharge, the patient is advised verbally and in writing about the preliminary outcomes of the colonoscopy, the nature of any therapeutic interventions or adverse events, when to resume regular activities and medication, and arrangements for medical follow-up. The patient is discharged into the care of a responsible adult when it is safe to do so.

9 Reporting and follow-up

The colonoscopist communicates the reason for the colonoscopy, its findings, any histology results and recommendations for follow-up in writing to the general practitioner, any other relevant clinician and the patient, and documents this in the facility records. Recommendations for surveillance colonoscopy, if required, are consistent with national evidence-based guidelines. If more immediate treatment or follow-up is needed, appropriate arrangements are made by the colonoscopist.

About the clinical care standards

Clinical care standards aim to support the delivery of appropriate evidence-based clinical care, and promote shared decision making between patients, carers and clinicians.

A clinical care standard is a small number of quality statements that describe the clinical care a patient should be offered for a specific clinical condition. The quality statements are linked to a number of indicators that can be used by health service organisations to monitor how well they are implementing the care recommended in the clinical care standard. A clinical care standard differs from a clinical practice guideline; rather than describing all the components of care for managing a clinical condition, the quality statements address priority areas for improvement.

Each clinical care standard intends to support key groups of people in the healthcare system in the following ways:

- The public will have a better understanding of what care should be offered by the healthcare system, and will be better able to make informed treatment decisions in partnership with their clinician
- Clinicians will be better able to make decisions about appropriate care
- Health services will be better able to examine the performance of their organisation and make improvements in the care they provide.

This clinical care standard was developed by the Australian Commission on Safety and Quality in Health Care (the Commission) following consultation and development of a national safety and quality model for colonoscopy (the safety and quality model). The development of a clinical care standard was an integral component of the safety and quality model. The Commission collaborated and consulted with consumers, clinicians, researchers and health organisations during the development of the safety and quality model and many of these groups were represented on the Colonoscopy Clinical Care Standard Topic Working Group. The clinical care standard complements existing efforts that support care of patients undergoing colonoscopy for screening and diagnostic purposes, including state and territory-based initiatives.

For more information about the development of this clinical care standard and the indicators, visit: www.safetyandquality.gov.au/ccs.

Updates in 2020

The Colonoscopy Clinical Care Standard was amended in 2020. The update included the addition of a fourth indicator for sessile serrated adenoma detection.

Introduction

Context

Colonoscopy refers to the examination of the entire large bowel using a camera in a flexible tube, or colonoscope. It is a complex task that requires the colonoscopist to manipulate the colonoscope effectively in order to visualise the bowel, while performing therapeutic interventions such as removing polyps or tissue samples when required.

Colonoscopy is often performed as a diagnostic intervention to investigate possible bowel cancer, either in people with symptoms and signs of bowel disease, or those with an increased risk of bowel cancer as indicated by a positive screening test, previous pathology, or family history or genetic conditions. It may also be used to help diagnose the cause of symptoms in conditions such as inflammatory bowel disease.

Bowel cancer is one of Australia's most common cancers, particularly in people over 50 years of age.¹ Evidence-based guidelines describe when colonoscopy should be used and how frequently testing should occur, according to the patient's presenting symptoms, history and risk.

In Australia, most screening for bowel cancer involves a faecal occult blood test (FOBT), which occurs either through the National Bowel Cancer Screening Program (NBCSP) or when the test is requested as a Medicare-subsidised test by a clinician. For people whose personal and/or family health history puts them at significantly higher than average risk of bowel cancer, screening is by regular colonoscopy.

The National Bowel Cancer Screening Program (NBCSP) is a government funded, population based screening program which aims to reduce illness and death from bowel cancer through early detection or prevention of the disease. Eligible Australians aged 50 to 74 are sent a free FOBT kit to screen for bowel cancer. Participants with a positive screening result, indicated by blood in the stool sample, are advised to consult their primary health care provider to discuss further diagnostic assessment—in most cases, this will be a colonoscopy. During the colonoscopy, small growths inside the bowel (polyps) can be removed and examined for signs of cancer. Some polyps have no cancerous cells while others

show abnormal changes which may lead to cancer. These abnormal polyps are called adenomas.

High quality colonoscopy is critical to the early detection and treatment of bowel cancer. Removal of polyps and adenomas may prevent bowel cancer developing, while early diagnosis of bowel cancer can improve treatment outcomes and survival. Colonoscopy can also identify those who require regular colonoscopy surveillance due to having an increased risk of bowel cancer.

The NBCSP has been shown to reduce illness and mortality from bowel cancer in Australia.² Planned expansion of the NBCSP means that by 2020, all eligible Australians aged between 50 and 74 will be invited to screen every two years, with an associated increase in the number of diagnostic colonoscopies.³

The NBCSP Register records details of participants and their health care and outcomes related to bowel cancer screening. It relies on the information provided by GPs and colonoscopists to maintain accurate and comprehensive records and to assess the outcomes of the national program.

The quality of colonoscopy is also important for minimising the risk of complications from the procedure. Complications associated with colonoscopy include:

- Risks of the procedure itself such as perforation and bleeding
- Risks associated with bowel preparation including dehydration and electrolyte imbalances which can be serious.⁶
- Complications arising from sedation or anaesthesia.

The risk of serious complications is approximately 4 perforations and 8 major bleeding events per 10,000 screening colonoscopies⁴ with an estimated mortality rate of 0.007%.⁵ Risk increases with age, with the number of colonoscopies and when polyps are removed.⁴ While the risk of complication is relatively small, a large number of people undergo colonoscopy, many of whom are not diagnosed with any disease.

More than 900,000 colonoscopies are performed in Australia annually. Despite the large number of procedures performed annually, there is considerable geographic variation in diagnostic colonoscopy, with up to a 30-fold variation in age-standardised rates of MBS funded colonoscopies across Australia.⁷

Between 20% and 25% of colonoscopies are performed in public hospitals, with the remainder performed in private hospitals and day procedure centres. A relatively small proportion (4.7% in 2015)* is performed on people with a positive FOBT through the NBCSP.

In 2016–17, a safety and quality model for colonoscopy was developed by the Commission through national consultation and agreement with the public and private hospital sectors, clinical colleges and societies, and consumers. Its development was funded by the Australian Government Department of Health. The safety and quality model comprises three elements:

- A Colonoscopy Clinical Care Standard (this document)
- Initial certification, and periodic recertification of colonoscopists' performance, in accordance with defined quality indicators and performance targets determined by the Conjoint Committee for the Recognition of Training in Gastrointestinal Endoscopy, a national body comprising representatives of the Royal Australasian College of Physicians (RACP), the Gastroenterological Society of Australia (GESA), and the Royal Australasian College of Surgeons (RACS)
- Implementation of the Colonoscopy Clinical Care Standard in all public and private hospitals and day procedure services.

This clinical care standard supports the delivery of high quality colonoscopy in terms of:

- Processes to support a high quality procedure including bowel preparation, sedation, colonoscopy and recovery
- Clinical skills and ongoing competence required to deliver all aspects of care
- Appropriate use of colonoscopy according to evidence-based guidelines
- Information provided to consumers before and after a colonoscopy and their participation in shared decision-making
- Clinical communication during referral, reporting and follow-up.

Goal

The goal of the clinical care standard is to ensure the safe and appropriate use of colonoscopy, and to maximise patients' likelihood of benefit from the procedure while reducing their risk of avoidable harm.

Scope

The Colonoscopy Clinical Care Standard relates to the care of adult patients undergoing colonoscopy for screening, diagnosis, surveillance, or treatment. It covers the period from when a patient is referred for consideration of colonoscopy through to discharge including planning for follow-up care. The Colonoscopy Clinical Care Standard is relevant to the care provided in primary and acute healthcare settings including general practice, specialist's rooms, and public and private hospitals including day procedure services.

* Medicare data, Australian Government Department of Health

Using the clinical care standard

Related standards and guidelines

Implementation of the Colonoscopy Clinical Care Standard should be undertaken within the context and requirements of the National Safety and Quality Health Service (NSQHS) Standards and other relevant standards and guidelines for health service organisations and clinicians providing colonoscopy services.

Key guidelines

Key evidence sources referred to in the development of this clinical care standard are the Cancer Council Australia Guidelines including:

- *Clinical practice guidelines for the prevention, early detection and management of colorectal cancer.*⁸
Accessed at: https://wiki.cancer.org.au/australia/Guidelines:Colorectal_cancer
- *Clinical practice guidelines for surveillance colonoscopy.*⁹

The clinical care standard supports the use of current guidelines for sedation and anaesthesia from the [Australian and New Zealand College of Anaesthetists](#) including:

- *Guidelines for the perioperative care of patients selected for day stay procedures (PS 15)*¹⁰
- *Guidelines on sedation and/or analgesia for diagnostic and interventional medical, dental or surgical procedures (PS 09).*¹¹

The National Safety and Quality Health Service (NSQHS) Standards

The Commission developed the NSQHS Standards in collaboration with the Australian government, states and territories, clinical experts, and consumers. The NSQHS Standards aim to protect the public from harm and improve the quality of health service provision. They provide a quality assurance mechanism that tests whether relevant systems are in place to ensure that expected standards of safety and quality are met.

The second edition of the NSQHS Standards was launched in November 2017, and health service organisations have been assessed against the new standards since January 2019.

In the NSQHS Standards (2nd ed.), the Clinical Governance Standard and the Partnering with Consumers Standard combine to form the clinical governance framework for all health service organisations.

The Clinical Governance Standard aims to ensure that there are systems in place within health service organisations to maintain and improve the reliability, safety and quality of health care.

The Partnering with Consumers Standard aims to ensure that consumers are partners in the design, delivery and evaluation of healthcare systems and services, and that patients are given the opportunity to be partners in their own care.

It is expected that colonoscopy will be provided by a health service organisation that has been assessed to the NSQHS Standards.

The NSQHS Standards require that all hospitals and day services providing colonoscopy in Australia are to be accredited to the Colonoscopy Clinical Care Standard.

Health service organisations are expected to implement the NSQHS Standards in a manner that suits the services provided and their associated risks. Individual standards within the NSQHS Standards (2nd ed.) that are particularly relevant to the safety and quality of colonoscopy services, and their associated actions, are as follows:

- The Clinical Governance Standard, including actions related to:
 - Governance, leadership and culture (for example, action 1.1)
 - Safety and quality monitoring, including incident reporting systems (1.8 and 1.11)
 - Policies and procedures (for example 1.7)
 - Credentialing and scope of clinical practice (1.23 and 1.24)
 - Evidence-based care (1.27)

- Variation in clinical practice and health outcomes (1.28)
- Safe environment (1.29) including for Aboriginal and Torres Strait Islander people (1.33)
- The Partnering with Consumers Standard, including actions related to:
 - Informed consent (2.4)
 - Information for consumers (2.9) and communication of clinical information (2.10)
- The Preventing and Controlling Healthcare-Associated Infection Standard, including actions related to:
 - Infection prevention and control systems (3.5–3.13)
 - Reprocessing of reusable medical devices (3.14)
- The Communicating for Safety Standard, including actions related to:
 - Communication of critical information (6.9 and 6.10)
 - Documentation of information (6.11)
- The Recognising and Responding to Acute Deterioration Standard, including actions related to:
 - Responding to deterioration (8.10 to 8.13).

Competencies and service capability

This clinical care standard recognises that safety and quality of care may be at risk if the workforce does not have the appropriate skills or experience.¹³ The medical, nursing, procedural, and sedation/ anaesthetic competencies required for high-quality and safe colonoscopy should be considered as part of health service organisations clinical services planning.^{12, 14} For colonoscopy, health service organisations should take into account the work of the Conjoint Committee for the Recognition of Training in Gastrointestinal Endoscopy (CCRTGE) as well as the requirements of individual professional organisations.

Credentialing, certification and recertification of colonoscopists

Certification (of training) and recertification (of ongoing competency) in adult colonoscopy are now mandatory for all practitioners working in health service organisations being assessed to the NSQHS Standards (second edition).

Health service organisations will be asked to demonstrate that colonoscopists working in their facility have provided evidence of certification and recertification.

Certification

Certification of gastroenterologists, surgeons and general practitioner endoscopists is through the CCRTGE.

The CCRTGE is a national body comprising representatives of the Gastroenterological Society of Australia (GESA), the Royal Australasian College of Physicians and the Royal Australasian College of Surgeons. It sets the minimum standards for training in adult colonoscopy.

Recertification

GESA is the only organisation currently providing recertification of colonoscopists in Australia. The GESA program provides for triennial recertification and incorporates:

- a formal recertification program using evidence from the clinician’s online logbook
- training and education opportunities for practising colonoscopists.

More information on recertification is available in the fact sheet titled [*Certification and recertification of practising adult colonoscopists*](#) available from the Commission’s website.

Indicators to support local monitoring

The Commission has identified a set of indicators to support healthcare providers and local health service organisations to monitor how well they implement the care described in the clinical care standard. The indicators are a tool to support local clinical quality improvement and may be relevant to other quality assurance and peer review activities.

The indicators described in this clinical care standard align with the performance indicators for certification and recertification developed by the CCRTGE and GESA.

The process to develop the indicators specified in this document comprised:

- An environmental scan of existing local and international indicators
- Prioritisation, review and refinement of the indicators with the Colonoscopy Clinical Care Standard Topic Working Group.

Measuring and monitoring patient experience

Systematic routine monitoring of patients' experiences of healthcare is an important way to ensure that service improvements and patient-centredness are driven by the patients' perspective. This is the case in all health service organisations, including those performing colonoscopy.

While there are no indicators in this standard specific to patient experience measurement, the Commission strongly encourages health service organisations to adopt the Australian Hospital Patient Experience Question Set (AHPEQS). The AHPEQS is a short 12 question generic patient experience survey which has been tested and found reliable and valid for both day-only and admitted hospital patients across a wide variety of clinical settings. The instrument is available free of charge to both private and public sector health service organisations. The Commission's website contains more information about this tool at www.ahpeqs.safetyandquality.gov.au.

Where to find the indicator specifications

In this document, the indicator titles and hyperlinks to the specifications are included with the relevant quality statement under the heading *Indicators for local monitoring*. Full specifications of the *Colonoscopy Clinical Care Standard* indicators can be found in the Metadata Online Registry (METeOR) at meteor.aihw.gov.au/content/index.phtml/itemId/697168.

METeOR is Australia's web-based repository for national metadata standards for the health, community services and housing assistance sectors. Hosted by the Australian Institute of Health and Welfare (AIHW), METeOR provides users with online access to a wide range of nationally endorsed data and indicator definitions.

Templates

- Colonoscopy Referral Information Template
- Colonoscopy Report Template
- Colonoscopy Follow Up letter Template – from the specialist to the GP and patient

Quality statement 1 – **Initial assessment and referral**

When a patient is referred for consideration of colonoscopy, the referral document provides sufficient information for the receiving clinician to assess the appropriateness, risk and urgency of consultation. The patient is allocated an appointment according to their clinical needs.

Purpose

To ensure that communication of information from referring clinicians to colonoscopy clinics and specialists enables the timely and accurate assessment of patients according to clinical urgency and appropriateness.

What the quality statement means

For patients

People might have a colonoscopy for different reasons and every person's situation is different. Just because you are referred to a specialist to consider having a colonoscopy does not mean that it will be the right thing for you. It is important that the doctor or health service organisation that you are referred to has the right information about you and your medical history. This will help them decide if a colonoscopy is likely to help you. Your current and past medical conditions, your age, your family medical and cancer history, current medicines and the results of previous tests, imaging and colonoscopies should all be included in the referral document. In some health service organisations, the referral is also used to decide how soon to book your appointment.

The doctor who writes the referral will explain what you need to do next, how soon you need the appointment and what to do if you are not given an appointment within that time.

For clinicians

When referring patients for consideration of colonoscopy, provide a comprehensive referral to prevent delays and enable accurate assessment of the patient's suitability for colonoscopy. Standard (electronic) templates can help, for example those included in local Health Pathways. The referral should include:

- The indication for the referral including presenting symptoms and the preliminary diagnosis
- All relevant medical and family history, including of bowel and other cancers, known genetic predispositions
- Current medicines and other medical conditions.
- Previous relevant treatment
- Results of previous investigations, including of FOBT (indicating whether this was through the NBCSP), colonoscopies and histopathology.

Consider the indications and surveillance intervals recommended in current evidence-based guidelines such as the Cancer Council Australia's [*Clinical practice guidelines for the prevention, early detection and management of colorectal cancer*](#)⁸, and *Clinical practice guidelines for surveillance colonoscopy*⁹, the patient's co-morbidities and the patient's willingness to proceed. Advise the patient that the specialist receiving the referral will assess them individually before undertaking the colonoscopy. Provide clear instructions to the patient on what they need to do to act on the referral, the degree of urgency, and what to do if they cannot get an appointment in the recommended timeframe.

For clinicians receiving referrals, ensure that there are processes for allocating appointments according to clinical need.

For health services

For health service organisations that refer patients, use consistent processes for referring patients for colonoscopy to ensure that referrals are comprehensive and accurate to enable assessment and triage. For health service organisations receiving, allocating or prioritising referrals for clinical assessment or colonoscopy (including open access services) ensure that clear referral guidelines are available for referring clinicians, identifying the type and format of clinical information required. Use of this information will support the provision of services according to patient's clinical priority. Using agreed, standardised templates can assist the communication of important information between referring clinicians and colonoscopy services; these may be in electronic format.

Related resources:

A referral template is available to support implementation. See www.safetyandquality.gov.au/colonoscopy-ccs

Quality statement 2 – **Appropriate and timely colonoscopy**

A patient is offered timely colonoscopy when appropriate for screening, surveillance, or the investigation of signs or symptoms of bowel disease, as consistent with national evidence-based guidelines. Decisions are made in the context of the patient's ability to tolerate the bowel preparation and colonoscopy, and their likelihood of benefit. If colonoscopy is not appropriate, the receiving clinician advises the patient and their referring clinician of alternate recommended management.

Purpose

To ensure colonoscopy is offered to patients who are most likely to benefit from the procedure and within a timeframe concordant with their risk, in a manner consistent with current national evidence-based guidelines.

What the quality statement means

For patients

Colonoscopy is used when doctors want to look at the inside of the bowel to check for signs of disease. It may be recommended if you are experiencing certain bowel problems, to follow-up a previous bowel condition, because of test results (such as a CT scan or FOBT) or your family history. You should only be offered a colonoscopy if the benefits outweigh any risks of the procedure for you. While most people do not have any complications, the bowel preparation, the sedation and the colonoscopy all have some risks. Your doctor or nurse will discuss these risks with you, considering your general health. You should also talk about the risks of not having the colonoscopy. For some people a colonoscopy may need to be carried out as soon as possible, while for other people it may need to be done less urgently. If a colonoscopy is not recommended then the doctor may suggest an alternative test.

For clinicians

Consider whether colonoscopy is indicated for the patient according to national evidence-based guidelines and the epidemiology of colonic disease. Assess the likely benefits to the patient, as well as the risks associated with the bowel preparation, sedation, the procedure itself, and the risks associated with not having the procedure.

- For people with symptoms suggestive of bowel cancer or a positive immunochemical FOBT, refer to Cancer Council Australia's [*Clinical practice guidelines for the prevention, early detection and management of colorectal cancer*](#)⁸, and the recommended triage criteria to ensure prompt scheduling for patients.
- For people requiring surveillance colonoscopy, refer to the Cancer Council Australia's *Clinical practice guidelines for surveillance colonoscopy*.⁹ regarding the frequency and surveillance intervals for colonoscopy in high-risk individuals.

If colonoscopy is not appropriate, advise the patient and their referring clinician about recommended alternative diagnostic strategies or management.

For health services

Ensure that policies and processes support the timely and appropriate provision of colonoscopy. This includes:

- Supporting and promoting clinicians' use of national evidence-based guidelines including Cancer Council Australia's [*Clinical practice guidelines for the prevention, early detection and management of colorectal cancer*](#), and *Clinical practice guidelines for surveillance colonoscopy*.^{8, 9}
- Supporting and encouraging clinician participation in quality improvement and peer-review processes.

For health service organisations that receive referrals, reflect guideline recommendations from the Cancer Council Australia in policies and procedures for triage and scheduling of colonoscopy appointments.

Quality statement 3 – **Informed decision making and consent**

Before starting bowel preparation, a patient receives comprehensive consumer-appropriate information about bowel preparation, the colonoscopy, and sedation or anaesthesia. They have an opportunity to discuss the reason for the colonoscopy, its benefits, risks, financial costs and alternative options before deciding to proceed. Their understanding is assessed, and the information provided and their consent to sedation, colonoscopy and therapeutic intervention is documented.

Purpose

To ensure that each patient is provided with adequate information and time to consider the risks and benefits of colonoscopy before providing informed consent and before starting bowel preparation or any other aspect of the procedure.

What the quality statement means

For patients

If your doctor recommends that you have a colonoscopy, you will need to decide whether to go ahead with it. If you decide to have the colonoscopy, you will be asked to give consent. Giving consent means that you understand what is involved in having the colonoscopy, what the risks and benefits are for you, and that you agree to have the colonoscopy. To help you make your decision, you will be informed about all the parts of the process including:

- Bowel preparation – the process for clearing your bowel before the colonoscopy using medicines, changing your diet and fasting (not eating for a period of time)
- Sedation – medicines given to minimise discomfort during the colonoscopy
- The colonoscopy procedure – how the colonoscope is used to look at your bowel, and to help remove polyps or tissue samples.

The discussion will include:

- Why the doctor is suggesting a colonoscopy
- Benefits to your health
- Risks of the bowel preparation, sedation and the colonoscopy
- Risks of not having the colonoscopy
- Any out-of-pocket costs
- Any alternatives to colonoscopy.

It is important that you understand this information before giving consent and that you ask questions if you need more information before you make your decision. This should happen before you start the bowel preparation. If you need an interpreter, this can be arranged. If you choose to have the colonoscopy, your consent will be recorded in writing. Even after you have given your consent, you can ask for more information or change your mind about having the colonoscopy at any time before the colonoscopy begins.

For clinicians

Provide the patient (or their responsible decision-maker where relevant) with clear and comprehensive information about all aspects of the colonoscopy relevant to the patient's decision and consent including the bowel preparation, sedation (or anaesthesia) the colonoscopy and any therapeutic interventions, using language that they can understand. Arrange an interpreter if required. Inform the patient the reason for the colonoscopy, its likelihood of benefit and potential adverse events including those related to the bowel preparation or sedation, perforation, bleeding (immediate and delayed) and missed pathology. Provide information about the financial costs and the alternatives to having the colonoscopy, including any risks of not having the colonoscopy. Provide adequate time for the patient to consider the information provided and to ask questions before consenting. Respect the patient's decision and document it and their informed consent in the medical record, with a description of the information discussed and provided to the patient.

For health services

Ensure that clear, written information is available to patients for all aspects of the colonoscopy for which the health service organisation is responsible, which may include bowel preparation, the colonoscopy and associated sedation or anaesthesia. When consent is being obtained, ensure protocols and procedures enable patients to receive adequate information to inform their decision, are supported to ask questions and consent before the start of bowel preparation. Ensure interpreter services are accessible and their use is supported. Ensure policies and procedures support the principles and practices of informed consent and appropriate documentation.¹⁵⁻¹⁷

Related resources:

A fact sheet describing the informed consent requirements for the Colonoscopy Clinical Care Standard is available. See www.safetyandquality.gov.au/colonoscopy-ccs.

Quality statement 4 – **Bowel preparation**

A patient booked for colonoscopy receives a bowel preparation product and dosing regimen individualised to their needs, co-morbidities, regular medicines and previous response to bowel preparation. The importance of good bowel preparation for a quality colonoscopy is discussed with the patient. They are provided with consumer-appropriate instructions on how to use the bowel preparation product and their understanding is confirmed.

Purpose

To ensure that patients who present for colonoscopy have a clear bowel that enables a thorough examination.

What the quality statement means

For patients

Before you have a colonoscopy, you need to make sure your bowel is as clear as possible. If your bowel is not clear, polyps or even cancers may be missed, or you may need to have the colonoscopy again. This means it is important for you to follow the instructions carefully and ask questions if you do not understand what to do.

To get your bowel ready for the colonoscopy, you will be told what (and what not) to eat and drink, including when to drink extra fluids to stop you from getting dehydrated. You will be given, or asked to buy, medicine to clear out your bowel by causing diarrhoea. Make sure you understand when to take the medicines, usually starting the day before the colonoscopy. Your doctor or nurse will explain how these medicines may affect you. You should tell them about any previous experience you have had with bowel preparation.

Preparation for colonoscopy can also affect your other health conditions or medicines, such as medicines for diabetes or medicines to prevent blood clots. You may need to change the way you take your other medicines or follow special instructions in the days before your colonoscopy. Your doctor will discuss with you any changes you may need to make. Some people may need extra personal or health support during bowel preparation and a few may need an overnight stay in hospital.

If at any time during the bowel preparation you are unsure what to do, ring your doctor or clinic to check.

For clinicians

Provide written and verbal consumer-appropriate information to patients preparing for colonoscopy, using interpreter services where necessary. Select an appropriate bowel preparation agent and ensure the patient knows how to obtain and use it, taking into account individual risks, co-morbidities, current medicines, and the patient's previous experience with bowel-cleansing medicines.⁶ Clearly explain the purpose of bowel preparation, the importance of following the prescribed procedure, the regimen and the potential side effects of the bowel preparation products. Allow the patient appropriate time to ask questions and confirm that they understand what to do and its importance.

A split-dose regimen is recommended as this results in a higher quality colonoscopy examination compared with ingestion of the entire preparation on the day or evening before the colonoscopy, and has been associated with increased adenoma detection rates.¹⁸ Typically this involves splitting the standard dose of the bowel preparation between the day before and the morning of the colonoscopy (3-6 hours before the planned start of the procedure).¹⁸

Ensure patients on diabetes medicines, anticoagulants, antiplatelets or other medicines are provided with individualised instructions about how to adjust their medicines and manage their condition as they undergo bowel preparation. Consider whether a patient with relevant co-morbidities needs specific health or personal support whilst undergoing bowel preparation, for example, overnight admission for patients who are unlikely to manage bowel preparation independently.

For health services

Ensure that policies and procedures support best practice for bowel preparation. Support patients by enabling access to information about bowel preparation. For health service organisations with responsibility for providing bowel preparation and advice, provide clear, written patient information about the bowel preparation procedure and a telephone number for any inquiries patients may have as the bowel preparation proceeds; ensure interpreter services or translated materials are available. Ensure patient information is approved and periodically reviewed by clinical staff. Where relevant to the facility, ensure policies support the provision of extra assistance to patients who are unlikely to manage bowel preparation independently, including overnight admission if needed.

Indicator for local monitoring

Bowel preparation

Indicator: Proportion of patients scheduled for a colonoscopy whose bowel preparation was adequate.

METeOR link: meteor.aihw.gov.au/content/index.phtml/itemId/691696

More information about this indicator and the definitions needed to collect and calculate it can be found online in the above METeOR link.

Related resources:

A consumer video is available to support implementation.
See www.safetyandquality.gov.au/colonoscopy-ccs.

Quality statement 5 – Sedation

Before colonoscopy, a patient is assessed by an appropriately trained clinician to identify any increased risk, including cardiovascular, respiratory or airway compromise. The sedation is planned accordingly. The risks and benefits of sedation are discussed with the patient. Sedation is administered and the patient is monitored throughout the colonoscopy and recovery period in accordance with Australian and New Zealand College of Anaesthetists guidelines.

Purpose

To ensure the safe and appropriate sedation of patients undergoing colonoscopy.

What the quality statement means

For patients

During your colonoscopy you will be given medicines to minimise your pain or discomfort (sedation). Before the colonoscopy, a doctor or nurse will check whether there are any particular risks for you when you are having the sedation. They will ask about your health, other medical conditions, medicines and previous experiences with sedation or anaesthesia. This is to make sure that you are given sedation safely. They will also talk with you about the medicines they will use during your sedation, their risks and benefits, and what you can expect to be aware of during the colonoscopy and as you recover. Discuss any concerns or preferences with your doctor. Your sedation will be given according to current professional recommendations, guidelines and taking into account your risks. Your sedation may sometimes be given by a specialist anaesthetist but this is not always required.

For clinicians

Ensure that the patient's suitability for sedation and any increased risks such as cardiovascular, respiratory or airway compromise are assessed in advance of the colonoscopy by a clinician who is appropriately trained to make such an assessment. Ensure that the facility is appropriate for the patient taking into account their clinical requirements and co-morbidities, as described in [ANZCA Guidelines for the Perioperative Care of Patients Selected for Day Stay Procedures](#).¹⁰ If an increased risk is identified, an anaesthetist, or other trained and credentialed medical practitioner within his/her scope of practice, should assess the patient and be present during the colonoscopy to care for the patient. The sedationist should discuss the risks and benefits with the patient and obtain their informed decision and consent. Ensure that the patient understands that their awareness of the colonoscopy will depend upon the depth of sedation, and that this in turn depends on the scope of practice of the clinician providing the sedation. Sedation must be administered by a credentialed practitioner working within their scope of practice. Provide sedation as described in current [ANZCA](#) guidelines such as the *Guidelines on Sedation and/or Analgesia for Diagnostic and Interventional Medical, Dental or Surgical Procedures (PS09)*, with respect to:

- The number of staff present during the sedation and their level of training, competence and scope of clinical practice

- Facilities, equipment and medicines
- Administration of sedation
- Monitoring of patients during the colonoscopy and in the recovery room.

For health services

Sedation should be provided in accordance with current [ANZCA](#) recommendations such as the *Guidelines on Sedation and/or Analgesia for Diagnostic and Interventional Medical, Dental or Surgical Procedures*¹¹ and *Guidelines for the Perioperative Care of Patients Selected for Day Stay Procedures*.¹⁰ Ensure that systems are in place, and services adequately resourced, to implement the ANZCA guidelines. Policies should ensure that pre-sedation assessment is carried out by appropriately trained clinicians, in order to identify patients who are not suitable for intravenous sedation in the absence of an anaesthetist, and to plan for sedation accordingly. Ensure that clinicians who administer sedation or anaesthesia for colonoscopy are credentialed by the health service organisation and operating within their defined scope of clinical practice and that they maintain their skills by participating in ongoing professional development and review of performance. Implement and ensure compliance with policies and procedures for the safe supervision of trainees, where relevant to the facility.

Quality statement 6 – **Clinicians**

A patient's colonoscopy is performed by a credentialed clinician working within their scope of clinical practice, who meets the requirements of an accepted certification and recertification process. Sedation or anaesthesia, and clinical support are provided by credentialed clinicians working within their scope of clinical practice.

Purpose

To ensure all colonoscopies and associated sedation and clinical care are provided by skilled clinicians at a high level of safety and quality.

What the quality statement means

For patients

When you have a colonoscopy you can expect to be cared for by qualified doctors and nurses who have met necessary health service organisation and professional requirements and standards. This includes those providing your nursing care, sedation or anaesthesia, and your colonoscopy. You can expect that the doctor or specialist nurse who carries out the colonoscopy will keep their skills and knowledge up to date.

For clinicians

Ensure that your training, skills and experience allow you to provide safe, high quality care to a patient undergoing colonoscopy, in accordance with expected professional standards. Comply with your health service organisation's policies and procedures regarding your scope of clinical practice. Interact with your peers to ensure your performance, and theirs, meets the accepted requirements for safety and quality (for example, participate in peer review meetings, quality clinical improvement processes including the collection of quality indicators, and reviews of evidence-based best practice). If you are a colonoscopist, undergo certification and participate in a recertification process that is accepted by your professional association and employer. Supervise trainees at a level appropriate to their skill and experience.

For health services

Identify credentials that are required for clinicians to perform colonoscopy or provide sedation or anaesthesia for patients undergoing colonoscopy, and ensure credentialing processes are adequate, as set out in *Credentialing health practitioners and defining the scope of clinical practice: A guide for managers and practitioners*¹⁴. For clinicians performing colonoscopy, identify accepted certification and recertification processes according to their clinical speciality and professional body and use this when credentialing clinicians and defining their scope of clinical practice. Ensure non-anaesthetist practitioners who provide sedation meet a defined standard of competency for sedation.¹¹ Support participation by clinicians in peer review activities. Monitor and periodically review individual and service performance against accepted quality indicators and ensure under-performance is addressed promptly and effectively. Where relevant to the health service organisation, implement and ensure compliance with policies and procedures for the safe supervision of trainees.

Related resources:

A fact sheet about the certification and recertification requirements for practising colonoscopists is available. See www.safetyandquality.gov.au/colonoscopy-ccs.

Quality statement 7 – Procedure

When a patient is undergoing colonoscopy their entire colon – including the caecum – is examined carefully and systematically. The adequacy of bowel preparation, clinical findings, biopsies, polyps removed, therapeutic interventions and details of any adverse events are documented. All polyps removed are submitted for histological examination.

Purpose

To optimise detection and management of disease, to minimise adverse outcomes for all patients who undergo colonoscopy, and to ensure the colonoscopy is documented adequately in the patient's health record.

What the quality statement means

For patients

Your colonoscopy will be performed to a high standard. During the colonoscopy, the whole length of your bowel will be carefully examined. This will make it more likely that bowel problems can be found and that growths such as polyps can be seen and removed. If bowel tissue or polyps are removed from your bowel they will be sent to pathology laboratories for examination under a microscope. All the records kept by health service organisations will have information about your colonoscopy, the findings and any problems that may have occurred, which you can ask to see if you want to.

For clinicians

To maximize adenoma detection, intubate the caecum or terminal ileum and allow adequate time for mucosal inspection whenever performing colonoscopy.¹⁹ In people with previous resection, examine the remaining bowel thoroughly. Document the quality of the bowel preparation, whether caecal intubation was achieved (with photo-documentation if feasible), withdrawal time, clinical findings, the details of polyps removed, how they were removed and whether they were retrieved. Ensure all polyps that are removed are retrieved where possible and are sent for histopathology examination. Clearly identify histology samples generated through participation in the NBCSP to enable pathologists to complete data collection on screening outcomes recommended by the NBCSP. Record adverse events including perforation, post-polypectomy bleeding and sedation-related cardio-respiratory compromise in the patient record and relevant quality systems (for example the facility's incident monitoring system). Inform the patient if these have occurred and how they have been managed.

For health services

Ensure that the number of patients booked on each list enables the colonoscopist to undertake a careful and systematic examination of each patient's colon. Provide systems that require and support colonoscopists to maintain accurate records of the colonoscopy including the adequacy of bowel preparation, biopsies taken, polyps removed and retrieved, all diagnostic and therapeutic interventions, procedure duration and details of any adverse events. Ensure complications or adverse events of colonoscopy are reported in the health service organisation's incident management system, monitored and reviewed as part of quality monitoring and clinical quality improvement activities (such as morbidity and mortality reviews or clinical review meetings).

Indicators for local monitoring

Indicator: Caecal intubation

Proportion of patients undergoing a colonoscopy who have their entire colon examined

METeOR link: meteor.aihw.gov.au/content/index.phtml/itemId/691703

Indicator: Adenoma detection rate

Proportion of patients who had a colonoscopy that detected one or more adenoma(s)

METeOR link: meteor.aihw.gov.au/content/index.phtml/itemId/691715

Indicator: Sessile serrated adenoma detection rate

Proportion of patients who had a colonoscopy that detected one or more sessile serrated adenoma(s)/polyp(s)

METeOR link: <https://meteor.aihw.gov.au/content/index.phtml/itemId/717364>

More information about the indicators and the definitions needed to collect and calculate them can be found online in the above METeOR links.

Related resources:

A colonoscopy report template is available for use by colonoscopists. See www.safetyandquality.gov.au/colonoscopy-ccs.

Quality statement 8 – **Discharge**

Following recovery and before discharge, the patient is advised verbally and in writing about the preliminary outcomes of the colonoscopy, the nature of any therapeutic interventions or adverse events, when to resume regular activities and medicines, and arrangements for medical follow-up. The patient is discharged into the care of a responsible adult when it is safe to do so.

Purpose

To ensure patients recover and are discharged safely with available information about the outcomes of the colonoscopy and arrangements for follow-up.

What the quality statement means

For patients

After your colonoscopy, you will be cared for while you recover from the sedation. Before you go home, a doctor or nurse will tell you what happened during the colonoscopy, whether any polyps or other tissue was removed and whether there were any problems during the procedure. They will tell you about any arrangements or follow-up appointments you need to make. You may find it difficult to remember this information so it will be also given to you in writing.

You will be able to go home once your doctor or nurse is satisfied that you have recovered from the sedation. You should not drive and will need an adult to accompany you home. It is also recommended that you have someone stay with you on the night after the colonoscopy. If this is not possible, discuss this with your doctor before you have the colonoscopy.

You will be given written instructions on how to care for yourself when you go home and when to start your regular medicines and diet again. You will be provided with information about what to do if you have any problems after going home including a phone number that you can call after hours.

For clinicians

Before discharge, the responsible clinician or their delegate should talk to the patient and briefly describe what happened during the colonoscopy, whether the colonoscopy was completed satisfactorily, initial observations, whether biopsies or polypectomies were performed, and if any adverse events occurred. Advise patients of any arrangements for follow-up medical consultation and when final results and recommendations will be provided to them and their referring clinician.

Ensure patients are discharged by authorised clinical personnel into the care of a responsible adult, once satisfactory discharge criteria are met. Provide instructions about early post-procedure care and resumption of normal activities, including making legally binding decisions, operating machinery and resuming regular medication. Advise patients of what to do if they experience symptoms suggesting a complication of the colonoscopy, and provide them with specific contact details for obtaining appropriate advice. Any information given verbally about the procedure or post-discharge should also be provided in written format. Consider admission for a patient at high risk of an adverse outcome if they are to be discharged without adequate adult support at home, or who is otherwise not suitable for discharge.

For health services

Ensure that policies and procedures for monitoring, supervising and discharging patients align with current recommendations for post-operative care following anaesthesia (for example ANZCA guidelines for perioperative care [PS15]¹⁰). Ensure that procedures are in place for discharging patients into the care of a responsible adult, and that written instructions are provided about early post-procedure care and resumption of normal activities including medicines. Ensure that there is a response plan for patients in the event of problems arising post-discharge, and that the discharge information includes specific health service contact details after hours. Policies should allow for overnight admission if needed for patients who have comorbidities and cannot be cared for adequately at home in the immediate period post-discharge or who do not meet discharge criteria (as appropriate to the type of facility).

Quality statement 9 – Reporting and follow-up

The colonoscopist communicates the reason for the colonoscopy, its findings, any histology results and recommendations for follow-up in writing to the general practitioner, any other relevant clinician and the patient, and documents this in the facility records. Recommendations for surveillance colonoscopy, if required, are consistent with national evidence-based guidelines. If more immediate treatment or follow-up is needed, appropriate arrangements are made by the colonoscopist.

Purpose

To ensure the results of colonoscopy are effectively communicated and that patients are offered follow-up treatment or ongoing surveillance in accordance with evidence-based guidelines.

What the quality statement means

For patients

The results of your colonoscopy will be given to you, your general practitioner, and any of your other doctors who may need to be informed. The letter or report will say why you had the colonoscopy, and what was found, whether any tissue or growths (such as polyps) were removed from your bowel and sent for testing, and the results of those tests.

The report will also say whether you need to go and see a doctor for a follow-up visit, have further tests or treatment or another colonoscopy in the future and when this should happen. These recommendations will be different for each person and will depend on your medical and family history and what was found during the colonoscopy.

For clinicians

Provide follow-up recommendations to the patient, general practitioner and other relevant clinician based on the colonoscopy findings and final histology results, which are consistent with national evidence-based guidelines. Include the reason for the colonoscopy in the report, and ensure that both positive and negative patient's medical history, histology findings are communicated. The need and time interval for future screening and surveillance colonoscopies should be guided by evidence-based guidelines, such as the Cancer Council Australia's [*Clinical practice guidelines for the prevention, early detection and management of colorectal cancer*](#)⁸, and *Clinical practice guidelines for surveillance colonoscopy*.⁹ If prompt treatment or investigation is required (such as for histologically-confirmed colorectal cancer or high-risk lesions), make the necessary arrangements and ensure these are communicated to the patient and their referring clinician. For NBCSP participants, provide colonoscopy outcomes, results and adverse events to the NBCSP Register.

For health services

Ensure that policies and procedures for information management and communication support the complete reporting of colonoscopy and histology outcomes to referring clinicians, other relevant clinicians and the patient, and that responsibilities are clearly delineated. These policies should include arrangements for the reporting of all histology results if any tissue was removed, regardless of the histological findings. Ensure systems are in place for the prompt communication and management of histologically-confirmed colorectal cancer or high-risk lesions as appropriate for the type of facility. Support and promote clinicians' use of national evidence-based guidelines on surveillance colonoscopy, such as the Cancer Council Australia's [*Clinical practice guidelines for the prevention, early detection and management of colorectal cancer*](#)⁸, and *Clinical practice guidelines for surveillance colonoscopy*⁹, when making recommendations for future surveillance and follow-up. Support reporting to the NBCSP for patients referred through participation in this program.

Related resources:

The following templates for colonoscopists are available to support implementation:

- a colonoscopy report template
- a template for follow-up letters to GPs and patients.

See www.safetyandquality.gov.au/colonoscopy-ccs.

Glossary

Adenoma

A benign (non-cancerous) growth which has specific characteristics that can be seen using pathology testing techniques (proliferation of neoplastic epithelial cells). Adenomas may be protuberant, flat or depressed. Some adenomas may change over time and develop into malignant growths (cancers).

Benign growth (tumour)

A benign growth is one which is not able to spread to other parts of the body. It may also be described as pre-cancerous or pre-malignant.

Bowel

Part of the digestive tract extending from the stomach to the anus. It has two main sections – the small and large bowel (also known as the small and large intestine). The small bowel continues from the stomach – its various parts are the duodenum, jejunum and ileum. The small bowel joins up with the large bowel at the terminal ileum. The large bowel is made up of the colon and rectum. The rectum joins up with the anus.

Bowel cancer

Cancer of the large bowel; also known as colorectal cancer, colon cancer or rectal cancer.⁸

Bowel preparation

The use of medicines and changes in the diet to clean out the bowel in preparation for a test, scan or operation, allowing the lining of the bowel to be seen more clearly.

Caecum

The first part of the ascending colon of the large bowel. This is one of the important landmarks when performing a colonoscopy, to ensure the procedure has examined the whole bowel.

Clinician

A qualified and trained health professional who provides direct patient care (that is, the diagnosis and/or treatment of patients including recommending preventative action). In this document it may refer to a doctor, nurse or nurse practitioner, depending on the care that is being described and the individual's scope of professional practice.^{20, 21}

Colon

The main part of the large bowel, which absorbs water and electrolytes from undigested food (solid waste). Its four parts are the ascending colon, transverse colon, descending colon and sigmoid colon.⁸

Colonoscopist

A clinician with the necessary qualifications and training who performs the colonoscopy. This may be a physician, surgeon, general practitioner or nurse. In a health service organisation, this person will be credentialed to perform colonoscopy within their scope of practice and have demonstrated suitability to do so in accordance with local requirements and with reference to the requirements of the relevant national professional body.

Colonoscopy

An examination of the entire large bowel using a camera on a flexible tube, which is passed through the anus.⁸ Colonoscopy can be performed to establish if there is something wrong in the bowel (diagnostic) or to treat a known bowel problem (therapeutic). (See also Flexible Sigmoidoscopy)

Colorectal

Referring to the large bowel, comprising the colon and rectum.⁸

Credentialing

The formal process used to verify the qualifications, experience, professional standing and other relevant professional attributes of health practitioners for the purpose of forming a view about their competence, performance and professional suitability to provide safe, high-quality health services within specific organisational environments.¹⁴

Dehydration

Dehydration occurs when the body loses more fluid than it takes in. It can result in problems like feeling dizzy, falls, chemical imbalances and kidney problems. It is important to follow instructions about fluid intake during bowel preparation to prevent dehydration.

Faecal occult blood test (FOBT)

A test that can detect microscopic amounts of blood in stools. Types of FOBT include immunochemical FOBTs (iFOBTs), which directly detect haemoglobin using antibodies specific for the globin moiety of human haemoglobin, and guaiac FOBTs (gFOBTs), which detect peroxidase activity, an indirect method for identification of haemoglobin.⁸

The NBCSP sends a free FOBT to eligible Australians aged 50 to 74 to screen for bowel cancer, every two years.

Family history

A family history of cancer is present when there are members of the family who have been diagnosed with cancers. Although bowel cancer is the most important, other cancers such as the uterus, breast and stomach are also relevant. The risk of getting bowel cancer is related to the number of affected relatives and the age at which they were diagnosed with cancer.

Familial syndromes

Genetic disorders in which inherited genetic mutations in one or more genes predispose a person to developing cancer, particularly at an early age.⁸

First presentation

The first presentation occurs when an individual first seeks advice leading to their first colonoscopy – this may be because of a positive faecal occult blood test in the NBCSP or symptoms.

Flexible sigmoidoscopy

A procedure used by doctors to examine the inner lining of the rectum and sigmoid colon (unlike a colonoscopy, in which the entire colon is examined).⁸

General anaesthesia

The use of medicines to bring about a state of controlled unconsciousness, where the person is unaware of pain and has no awareness of what is going on around them.²²

A drug-induced state characterised by absence of purposeful response to any stimulus, loss of protective airway reflexes, depression of respiration and disturbance of circulatory reflexes.¹¹

See also 'Sedation'.

iFOBT

Immunochemical Faecal Occult Blood Test (see entry for Faecal occult blood test)

Informed consent

Informed consent involves a conversation with the patient in which the risks and benefits are discussed and the patient has the opportunity to ask questions before making a decision.²³

Inflammatory bowel disease

A group of inflammatory conditions of the colon and small intestine, including Crohn's disease and ulcerative colitis.²⁴

Laxative

A medicine used to stimulate the bowel and clean it of faecal matter. Laxatives are important as part of preparation of the bowel prior to colonoscopy so the lining of the bowel can be seen clearly.

Malignant tumour

A growth that is able to spread into nearby normal tissue and travel to other parts of the body.²⁴
A malignant growth is a cancer.

National Bowel Cancer Screening Program (NBCSP)

A national program available to people ≥ 50 years of age which aims to decrease bowel cancer and illness and death related to it.

In Australia, government-funded, population-based bowel cancer screening is available through the National Bowel Cancer Screening Program (NBCSP). The NBCSP started in 2006 and is managed by the Department of Health in partnership with state and territory governments. The Program sends a free Faecal Occult Blood Test (FOBT) to eligible Australians aged 50 to 74 to screen for bowel cancer every two years. Participants with a positive screening result, indicated by blood in the stool sample, are advised to consult their primary health care provider to discuss further diagnostic assessment—in most cases, this will be a colonoscopy.

The NBCSP Register maintains records of participants and the outcomes of screening, using information provided by clinicians.

Open Access Colonoscopy

An open access colonoscopy service is a service where a patient can be referred by a clinician for a colonoscopy without a prior consultation with the specialist performing the colonoscopy. A number of open access models have been developed to improve access to services. More appropriate services provide contact between the patient and a suitably trained clinician. This allows consideration of the patient's co-morbidities, discussion of the procedure and preparation, potential risks and benefits of the procedure and any residual questions to be answered.

Polyp

A growth of colonic tissue which protrudes into the lumen (space) above the lining of the bowel. Polyps are usually asymptomatic, but sometimes cause visible rectal bleeding and, rarely, other symptoms. Polyps may be neoplastic (for example, adenomas) or non-neoplastic (for example, inflammatory polyps).

Rectum

The final section of the large bowel, ending at the anus.

Referring clinician

The doctor or nurse practitioner who refers the patient for a specialist consultation. In most cases this is the general practitioner.

Sessile serrated adenoma:

A sessile serrated adenoma (SSA) is a flat (or sessile) lesion, or growth in the colon, thought to lead to colorectal cancer.

Scope of clinical practice

As defined by health service organisations, follows on from credentialing and involves delineating the extent (scope) of an individual practitioner's clinical practice within a particular organisation based on:

- the individual's credentials, competence, performance and professional suitability
- the needs of the organisation and its capability to support the practitioner's scope of clinical practice.

A practitioner's scope of clinical practice can be separated into:

- routine scope of clinical practice (core scope of clinical practice) based on qualifications, professional awards and statements of competency from relevant education and training bodies such as a professional college in a speciality or sub-speciality area of practice
- Scope of clinical practice requiring specific credentialing (specific scope of clinical practice) based on additional training, the introduction of new clinical procedures, equipment or where any other significant change in practice occurs.

Screening

Screening is the performance of a test in an individual at average risk of a disease who does not have symptoms. A positive test identifies an individual in whom further tests are usually needed to exclude or detect the disease being screened for.

For bowel cancer screening in Australia, those ≥ 50 years are invited to undertake a faecal occult blood test (FOBT) through the national screening program. If the test is positive, a colonoscopy is usually recommended.

Screening colonoscopy

Individuals who are at markedly higher than average risk for bowel cancer are advised to undergo screening colonoscopy, as per NHMRC screening recommendations. This includes those with familial syndromes such as Lynch Syndrome.

Sedation

Sedation refers to the use of medicines to allow a person to tolerate uncomfortable or painful procedures. Sedation is a form of anaesthesia.

Sedation occurs along a continuum, which can range from 'conscious sedation' through to 'deep sedation' and 'general anaesthesia'. While different medicines are used for sedation and general anaesthesia, people can respond differently to the same medicines.

Conscious sedation refers to depression of consciousness during which patients are able to respond to verbal commands or light touch. Conscious sedation may be achieved by a wide variety of drugs including propofol, and may accompany local anaesthesia. All conscious sedation techniques should provide a margin of safety that is wide enough to render loss of consciousness unlikely. However interventions to maintain a patent airway, spontaneous ventilation and/or cardiovascular function may be required in exceptional cases.¹¹

Deeper sedation is characterised by depression of consciousness that can readily progress to the point where consciousness is lost and patients respond only to painful stimulation. It is associated with loss of the ability to maintain a patent airway, inadequate spontaneous ventilation and/or impaired cardiovascular function, and has similar risks to general anaesthesia, requiring an equivalent level of care.¹¹

Sigmoid colon

The last section of the colon before it connects to the rectum.⁸

Surveillance colonoscopy

A colonoscopy performed in:

- Someone who has previously had disease to see if it has returned or if new disease is present (for example, after previous bowel cancer or adenoma removal)
- Someone who currently has disease to see if it has progressed (for example, inflammatory bowel disease).

Surveillance intervals are recommended in the Cancer Council Australia guidelines.

Terminal ileum

The end of the small bowel (intestine) where it joins the large bowel (intestine).

5.2 Repeat colonoscopy MBS services, all ages

Why is this important?

Colonoscopy is used to investigate bowel problems or symptoms. Repeat colonoscopy is mainly used to monitor for bowel cancer and its precursor, polyps (adenomas), in people with an increased risk of developing bowel cancer. Less commonly, colonoscopy is repeated to manage chronic inflammatory conditions of the bowel.

The first and third Atlases in the *Australian Atlas of Healthcare Variation* series found substantial variation in rates of colonoscopy according to where people live.^{1,2} Differences in adherence to surveillance guidelines were identified as a possible reason for the variation. Guideline recommendations on the timing of repeat colonoscopies are based on bowel cancer risk. There are limited reasons for repeating a colonoscopy after a period of less than three years.

The fourth Atlas examines rates of colonoscopy that are repeated within two years and 10 months of an earlier colonoscopy, using Medicare Benefits Schedule (MBS) data.

What did we find?

In 2018–19, there were almost 148,000 MBS-subsidised services for repeat colonoscopy performed within two years and 10 months in people of all ages.

The rate in the area with the highest rate was **19.9 times as high** as the rate in the area with the lowest rate. Rates were markedly higher in major cities than elsewhere. In major cities, rates increased with socioeconomic advantage.

What can be done?

More needs to be done to improve the consistent application of the national guidelines on bowel cancer screening and surveillance. A concerted focus by clinicians, medical colleges and health service organisations to drive implementation of the *Colonoscopy Clinical Care Standard* and national guidelines could reduce inappropriate requests for repeat colonoscopies and free up services for people at high risk of bowel cancer.³⁻⁵

Structured referral forms could aid assessment of requests for repeat colonoscopies against guidelines. Health service organisations could ensure that re-credentialing requirements for clinicians performing colonoscopy include clinical audit against guidelines to promote high-quality colonoscopies.

Wider consumer awareness about the impact of lifestyle on cancer risk is needed. Educating people on ways they can reduce their risk of bowel cancer and improve their general health should be an integral part of surveillance. Integration of data about cancer incidence and lifestyle into healthcare pathways, training guidelines and consumer resources could help prompt discussion between clinicians and patients and may reduce inappropriate repeat colonoscopy.

Repeat colonoscopy MBS services, all ages

Context

This item examines rates of MBS-subsidised services for repeat colonoscopy performed within two years and 10 months of an earlier colonoscopy for people of all ages in Australia in 2018–19.

What is colonoscopy?

Colonoscopy is the examination of the large bowel (colon) using a small, flexible tube with a camera on the end, called a colonoscope. It can also include removal of polyps (adenomas) or other abnormal growths, and a biopsy. Polyps can be precursors of bowel cancer and are a marker of increased risk.

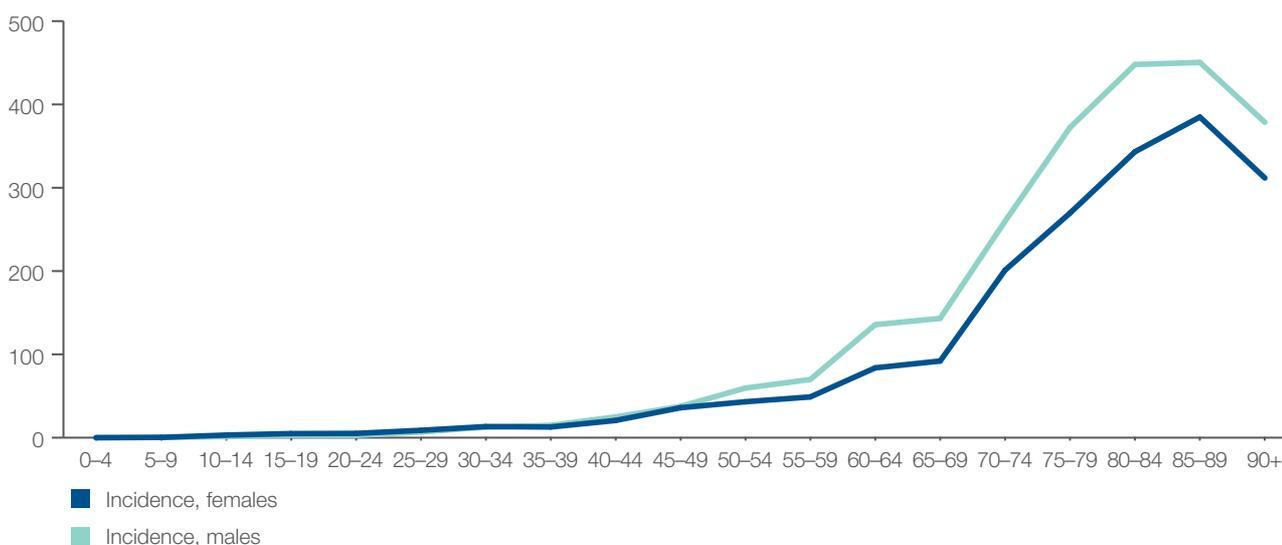

What is it used for?

Colonoscopy is used to investigate bowel problems or symptoms. It is also used to monitor for and detect polyps or bowel cancer (colorectal cancer) in people with no symptoms but with an increased risk, and to manage chronic conditions of the bowel, such as inflammatory bowel disease (IBD). Increased

risk of bowel cancer can be identified from a faecal occult blood test (FOBT) of a person's bowel motion (possibly done as part of the National Bowel Cancer Screening Program [NBCSP]), previous results of a colonoscopy, a family history of bowel cancer or a high-risk genetic condition.³ Bowel cancer is the fourth most commonly diagnosed cancer in Australia.^{6,7} After the age of 50, the incidence of bowel cancer steadily increases (Figure 5.10).⁴ About 55% of the bowel cancer burden in Australia can be attributed to lifestyle factors including diet (high in processed meat, red meat and sugar), physical inactivity, being overweight, smoking and alcohol use.⁷

While the age-standardised incidence of bowel cancer in Australia declined from 2001 to 2020* (from 66 to 51 cases per 100,000 people), the estimated number of people diagnosed with bowel cancer increased (from 12,806 to 15,494 people) because of the ageing population.⁸

Figure 5.10: Colorectal cancer rates (per 100,000 people), by sex and age group, 2020*

* 2020 incidence estimates are projections based on 2007–2016 incidence data.

Source: Australian Institute of Health and Welfare.⁸

When does a colonoscopy need to be repeated?

The most common reasons to repeat a colonoscopy are^{4,5}:

- Monitoring (surveillance) of the bowel after colorectal surgery or removal of polyps that can lead to bowel cancer
- Monitoring (surveillance) of chronic conditions of the bowel such as IBD
- Regular screening of people with a strong family history of bowel cancer, or a hereditary cancer syndrome that can lead to bowel cancer
- Removal (treatment) of previously identified polyps
- Onset of new signs or symptoms thought to be from the lining of the bowel
- Inadequate previous colonoscopy; for example, because of an incomplete colonoscopy or poor bowel preparation.

High-quality colonoscopy can detect about 95% of bowel cancers and polyps, but it is an invasive and costly procedure with a risk of complications.⁵ For this reason, colonoscopy for population screening is reserved for people with an increased risk of bowel cancer, if there is a higher chance of diagnosing significant disease.⁷ Similarly, recommendations for a repeat colonoscopy and its timing for greatest benefit are based on a person's risk of bowel cancer.

The national *Colonoscopy Clinical Care Standard* mandates that, if surveillance is required, colonoscopy is repeated at intervals consistent with evidence-based guidelines.³ Two Australian national guidelines address the need for and timing of repeat colonoscopy – one focuses on the use of colonoscopy in screening high-risk groups (that is, people with a family history of bowel cancer or a hereditary cancer syndrome), while the other focuses on the use of colonoscopy for surveillance.^{4,5}

If guidelines are followed, a small proportion of people who have an initial colonoscopy might be expected to need a repeat within three years. These would usually be people identified as having a high risk of bowel cancer or who have IBD. A poor-quality colonoscopy, or uncertainty about when a previous colonoscopy was performed, are also reasons a colonoscopy may be repeated within one or two years.^{4,5} However, the *Colonoscopy Clinical Care Standard* addresses the problem of uncertainty about the timing of a previous colonoscopy by stipulating that the results of colonoscopies are communicated to the person who had the procedure, the general practitioner (GP) and any other relevant clinicians involved in the person's care.³

Colonoscopy surveillance guidelines identify a person's risk of bowel cancer based on the results of their previous colonoscopy or colonoscopies.^{5,9} These guidelines apply to anyone who has had a colonoscopy, including participants in the NBCSP who had a colonoscopy because of a positive FOBT. The timing of the next colonoscopy, if needed, depends on the number, size and type of polyps removed.⁹ The greater the risk, the smaller the interval before repeating the procedure. People at potentially high risk will generally require a repeat colonoscopy every one to two years. Yearly colonoscopies are also recommended for high-risk people with IBD, and a repeat colonoscopy is also recommended within 12 months of bowel resection (surgery).⁵

A colonoscopy is also recommended every one to two years for people with, or at high risk of having, a hereditary cancer syndrome, such as Lynch syndrome, and may start at 25 years or younger for people with this syndrome.⁴

Repeat colonoscopies are also recommended for other groups, such as people with a strong family history and people otherwise at moderate risk of bowel cancer. However, for most people in these groups, the recommended intervals between colonoscopies are longer than that examined in this Atlas.^{4,5}

Repeat colonoscopy MBS services, all ages

Why examine repeat colonoscopy?

The first and third Atlases in the *Australian Atlas of Healthcare Variation* series examined MBS-subsidised services for colonoscopy and hospitalisations for colonoscopy, respectively.^{1,2} Although these Atlases used different datasets, each found substantial variations in colonoscopy rates according to where people live. They also found patterns of use that did not match the burden of disease. Outer regional areas and areas of socioeconomic disadvantage have the highest rates of bowel cancer incidence and mortality in Australia^{7,10}, yet both Atlases found the highest rates of colonoscopy in the most socioeconomically advantaged areas of major cities.

Clinical practice that is not supported by guidelines, such as repeating colonoscopies sooner than is recommended, was identified as a possible reason for the high rates of colonoscopy in some metropolitan areas. Differences in uptake of the NBCSP were also identified as a possible reason for the variation between major cities and other areas.^{1,2}

Little is known about the rate of repeat colonoscopies in Australia. This Atlas examines variation in rates of short-interval repeat colonoscopy using MBS-subsidised services performed in the same person in 2018–19. The interval of two years and 10 months was chosen to exclude services to people who present early for their three-yearly colonoscopy.

Data from this Atlas item should provide a baseline for evaluating changes to MBS items for colonoscopy introduced by the Australian Government in 2019, which included new item numbers with guideline-recommended surveillance intervals.¹¹ It should also be helpful for evaluating implementation of the *Colonoscopy Clinical Care Standard*, mandated in 2019, as part of the National Safety and Quality Health Service (NSQHS) Standards for the accreditation of all hospitals and day procedure services performing colonoscopy.^{3,12}

About the data

Data are sourced from the MBS dataset. This dataset includes information on MBS claims processed by Services Australia. It covers a wide range of services (attendances, procedures, tests) provided across primary care and hospital settings.

The dataset does not include:

- Services for publicly funded patients in hospital
- Services for patients in outpatient clinics of public hospitals
- Services covered under Department of Veterans' Affairs arrangements.

The dataset does not allow analysis by Aboriginal and Torres Strait Islander status.

Rates are based on the number of MBS-subsidised services for repeat colonoscopy per 100,000 people of all ages, age and sex standardised, in 2018–19.

Because a record is included for each service rather than for each patient, patients who receive the service more than once in the financial year will have more than one service counted.

In the patient count analysis, patient counts reflect the number of unique patients, regardless of the number of services the patient may have received in the year.

The analysis and maps are based on the patient's postcode recorded in their Medicare file and not the location of the service.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

What do the data show?

Magnitude of variation

In 2018–19, there were 147,875 MBS-subsidised services for repeat colonoscopy performed within two years and 10 months, representing 522 services per 100,000 people of all ages (the Australian rate).

The number of MBS-subsidised services for repeat colonoscopy across 324* local areas (Statistical Area Level 3 – SA3) ranged from 62 to 1,236 per 100,000 people. The rate was **19.9 times as high** in the area with the highest rate compared with the area with the lowest rate. The number of MBS-subsidised services for repeat colonoscopy varied across states and territories, from 191 per 100,000 people in the Northern Territory to 596 in Queensland (Figures 5.13–5.16).

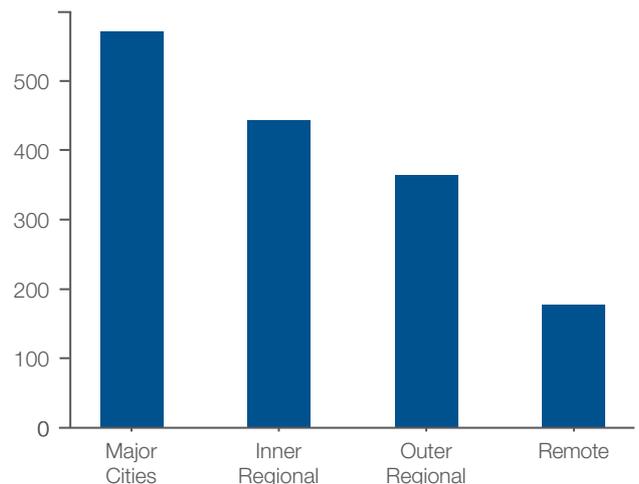

After the highest and lowest 10% of results were excluded and 260 SA3s remained, the number of MBS-subsidised services per 100,000 people was 2.7 times as high in the area with the highest rate compared with the area with the lowest rate.

Analysis by remoteness and socioeconomic status

Rates for MBS-subsidised services for repeat colonoscopy were higher in major cities than elsewhere. The rate for major cities was 3.2 times as high as the rate for remote areas (Figures 5.11 and 5.17).

Rates increased with socioeconomic advantage in major cities and overall. The rate in the highest socioeconomic group was 1.6 times as high as the rate in the lowest (Figures 5.12 and 5.17).

Figure 5.11: Number of MBS-subsidised services for repeat colonoscopy per 100,000 people of all ages, age and sex standardised, by remoteness of patient residence, 2018–19

The data for Figures 5.11 and 5.12 are available at safetyandquality.gov.au/atlas

* There are 340 SA3s. For this item, data were suppressed for 16 SA3s due to a small number of services and/or population in an area, or potential identification of individual patients, practitioners or business entities.

Notes:

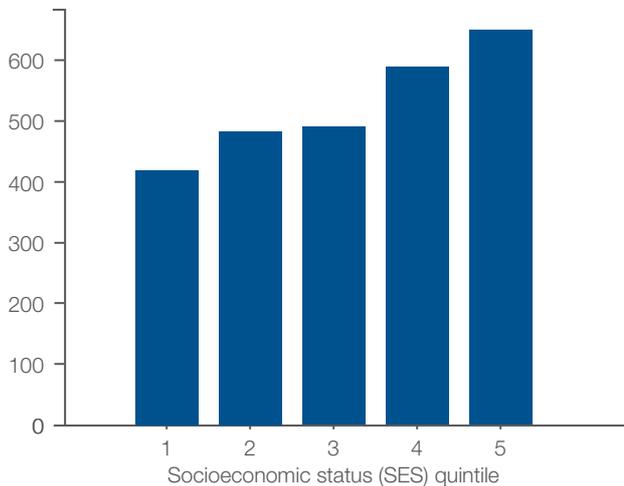

Some SA3 rates are more volatile than others. These rates are excluded from the calculation of the difference between the highest and lowest SA3 rates in Australia.

For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of Medicare Benefits Schedule data and ABS Estimated Resident Population 30 June 2018.

Repeat colonoscopy MBS services, all ages

Figure 5.12: Number of MBS-subsidised services for repeat colonoscopy per 100,000 people of all ages, age and sex standardised, by socioeconomic area of patient residence, 2018–19

Analysis by number of people who had at least one repeat colonoscopy

In 2018–19, there were 139,072 people who had at least one MBS-subsidised service for repeat colonoscopy, representing 491 people per 100,000 people of all ages.

Analysis by number of repeat colonoscopy services without polyp removal

In 2018–19, there were 71,464 MBS-subsidised services for repeat colonoscopy without polyp removal, representing 257 services per 100,000 people of all ages (the Australian rate). The percentage of MBS-subsidised services for repeat colonoscopy without polyp removal was 49%, and varied across states and territories, from 35% in the Australian Capital Territory to 55% in Victoria and the Northern Territory.

The data and graphs for analysis by number of people who had at least one repeat colonoscopy, analysis by number of repeat colonoscopy services without polyp removal, and analysis by Primary Health Network are available at safetyandquality.gov.au/atlas

Notes:

Areas with a low SES (=1) have a high proportion of relatively disadvantaged people. Areas with a high SES (=5) have a low proportion of relatively disadvantaged people.

For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of Medicare Benefits Schedule data and ABS Estimated Resident Population 30 June 2018.

Interpretation

Variation is warranted when it reflects variation in underlying disease and need for care; however, the rates of repeat colonoscopy do not appear to match this pattern, nor do they match the epidemiology of disease. There was widespread variation in repeat colonoscopy use, with rates much higher in major cities compared with elsewhere. Rates were also lower in areas of socioeconomic disadvantage.

These findings are consistent with the findings in the first and third Atlases, which examined rates of MBS-subsidised colonoscopy, and public and private hospitalisations for colonoscopy, respectively.

Variation in rates of repeat colonoscopy is likely to be due to the geographical differences in the factors discussed below.

Variation between areas may not directly reflect the practices of the clinicians who are based in these areas. The analysis is based on where people live rather than where they obtain their health care. Patients may travel outside their local area to receive health care.

Clinical decision-making

High rates of early repeat colonoscopy may be related to clinical practice that is not supported by guidelines. Australian and international studies have found that one-third of colonoscopies are repeated at intervals sooner than the guidelines recommend, with some reporting this to be as high as half.¹³⁻¹⁸ Difficulties in keeping up to date with guidelines and differences in clinical opinion on management may also contribute.¹⁹

Fear of litigation for not investigating symptoms may also influence clinicians' decisions about when and how often to provide repeat colonoscopies for the same person, particularly if they are unaware of current recommendations, or of evidence about the incidence of gastrointestinal (GI) cancers and the risk of symptoms leading to significant disease. Concerns about late diagnosis and subsequent litigation, and a lack of disincentives for over-testing, may also contribute to overuse.¹⁹

Some colonoscopies may be repeated because the previous report was not easily accessible or did not contain the information required to guide clinical decision-making.

Quality of bowel preparation

High-quality bowel preparation is essential for a successful colonoscopy.⁵ In the United Kingdom, poor bowel preparation has been reported to account for up to 25% of failed colonoscopies.²⁰ Poor bowel preparation results in poor visualisation of the colon, and has been associated with up to 47% lower likelihood of detecting and removing polyps that can lead to the development of bowel cancer.²¹ For this reason, people who had a colonoscopy with poor bowel preparation require a repeat colonoscopy within a year.^{5,22} Poor bowel preparation also results in considerable inconvenience and waste. Australian guidelines recommend that successful bowel preparation should be achieved in at least 90% of colonoscopies.⁵

The training and experience of the colonoscopist may also contribute to variation. International studies report a three-to-six-fold difference in adenoma detection rate variability between colonoscopists.⁵

Consumer expectations

A person's understanding about their risk of bowel cancer and the rate of development of bowel cancer may drive anxiety and lead to more frequent surveillance. Anxiety about interval cancers – cancers that occur between routine surveillance – has been suggested as a reason for repeating colonoscopies at shorter intervals than guidelines currently recommend.²³ Lack of access to a GP, specialist or surgeon who is informed about the evidence to help allay a person's anxiety about their risk of developing cancer may also lead to inappropriate repeat colonoscopies.

Repeat colonoscopy MBS services, all ages

People often have incorrect perceptions of their cancer risk and the benefits of interventions such as screening and surveillance to detect GI cancer.^{24,25} These perceptions can influence their preference and demand for investigations, even when their risk of cancer is low.²⁶

Access to services and number of clinicians providing services

Access to clinicians may influence the likelihood of people seeking care and the rates of repeat colonoscopy. The practice styles of individual clinicians may be more likely to affect rates in areas with fewer clinicians, such as rural and regional locations, than in areas with more clinicians.

Availability and affordability of services may also influence patterns of use. Ability to pay out-of-pocket costs for services is likely to be lower in areas of socioeconomic disadvantage, and access is likely to be more difficult in areas with fewer services. Open-access endoscopy services, in which GPs are able to request colonoscopy without specialist review, may also influence patterns of use.

Financial incentives

Greater remuneration for providing a service rather than a consultation may lead to variation and over-servicing in some areas.

Promoting appropriate care

More must be done to improve the consistent application of the national guidelines on bowel cancer screening and surveillance. The Atlas shows a pattern of repeat colonoscopy use that is not consistent with the prevalence of disease, indicating possible overuse in some areas and underuse in others. Repeating the procedure in people who are unlikely to benefit puts them at risk of procedural harms and may reduce opportunities for people who are at high risk of bowel cancer and more in need of the procedure. It also results in inconvenience, cost and confusion to the individual and the health system.

A concerted focus by clinicians, medical societies and colleges, and health service organisations across Australia to implement the *Colonoscopy Clinical Care Standard*³ is needed to drive improvements in the appropriate use of colonoscopy, reduce inappropriate short-interval repeat colonoscopies and free up services for people at high risk of bowel cancer.

The *Colonoscopy Clinical Care Standard* aims to ensure colonoscopies are used appropriately and performed safely, and is mandated as part of the NSQHS Standards for the accreditation of hospitals and day procedure services performing colonoscopy in Australia.^{3,12} To improve the follow-up and reporting of a colonoscopy, it recommends that the clinician who performs the colonoscopy communicates in writing the reason for the colonoscopy, its findings, any histology results, and recommendations for management to the person having the procedure, the GP, and any other relevant clinicians, and documents this in the facility records. It recommends that, if surveillance colonoscopy is required, it must be consistent with the intervals in national evidence-based guidelines.

Health service organisations could improve the implementation of the *Colonoscopy Clinical Care Standard*³ by ensuring that credentialing requirements for clinicians performing colonoscopy include a clinical audit against the clinical care standard, and that they provide audit results to the hospital's clinical review meetings and re-credentialing committee. Resources for colonoscopists to support implementation include a colonoscopy report template and a template for follow-up letters to GPs and patients (see Resources).

The low rates of short-interval repeat colonoscopies in disadvantaged remote areas are concerning, because they suggest that people at high risk of bowel cancer could be missing out on appropriate surveillance. These low rates are consistent with participation rates reported in the NBCSP.⁷ Strategies to improve participation in the NBCSP and access to colonoscopy services for people living in remote areas are a priority.

Unwarranted variation in repeat colonoscopy could be addressed in the following ways.

Quality colonoscopy and clinical audit

Recertification of ongoing competency is now mandatory for all practitioners working in health service organisations that are assessed against the NSQHS Standards.¹² Only colonoscopists who meet the certification and recertification standards can perform colonoscopy independently in Australia. The quality indicator together with the standard for reporting should reduce the proportion of repeat colonoscopies performed because of uncertainty about the quality of another clinician's colonoscopy.

Clinical audit could be used more widely to support decision-making about repeat colonoscopies. Audits in this area could also be part of continuing education requirements for clinicians.

Structured referral forms and checklists outlining the appropriate reasons for, and frequency of, repeat colonoscopy for greatest benefit, as recommended in the *Colonoscopy Clinical Care Standard*³ and national guidelines, could aid assessment of requests that do not meet guideline-recommended intervals.

Clinician education

Educational programs for clinicians could improve the appropriateness of requests for repeat colonoscopies. Improving clinician familiarity with guidelines, with the evidence base for recommended surveillance intervals and with the consequences of overuse of colonoscopy could better equip them to manage requests for performing colonoscopy earlier than the guidelines recommend.

Consumer education and reassurance

Informing and reassuring people of their risk of developing bowel cancer, and that the rate of progression from polyp formation to bowel cancer is generally slow may reduce demand for more frequent surveillance. Improving a person's understanding about their cancer risk is important to reduce anxiety and dispel myths about cancer. Interactive tools that identify a person's cancer risk – such as the Australian Institute of Health and Welfare cancer summary data tool (see 'Resources' on page 282) – may aid understanding.⁸

Integration of data about cancer incidence and lifestyle into healthcare pathways and consumer resources could help prompt these discussions between consumers and clinicians.

Reducing risk factors

Wider consumer awareness about risk factors and the impact of lifestyle on bowel cancer risk is needed. Bowel cancer incidence could be significantly reduced with successful modification of the key population attributable risks – that is, addressing diet (21.8%), physical inactivity (16.5%), being overweight or obese (12.5%), smoking (7.4%) and alcohol use (5.5%).^{7*} Public health initiatives to address risk factors should be targeted to areas with a high prevalence of these.

Educating consumers on ways they can reduce their risk of bowel cancer and improve their general health should be an integral part of colonoscopy surveillance, and may reduce requests for colonoscopies to be performed sooner than the guidelines recommend.

* Attributable burden from multiple risk factors cannot be combined or added together due to the complex pathways and interactions between risk factors.

Repeat colonoscopy MBS services, all ages

Triage systems

Many states and territories are introducing evidence-based triage systems for prioritising and allocating people for gastroscopy and colonoscopy, with the aim of reducing variation in use of these procedures:

- Victorian health services require clinicians to refer people for colonoscopy according to the categorisation guidelines²⁷
- Tasmania has adopted the Victorian categorisation guidelines and formed a statewide endoscopy network to monitor the quality of its services²⁸
- New South Wales has developed categorisation guidelines to support the appropriate use of colonoscopy across all healthcare settings²⁹
- Queensland and Western Australia have introduced clinical prioritisation criteria for many clinical areas, including gastroenterology, to triage patients referred to public specialist outpatient services.³⁰⁻³²

Wider use of such systems could result in more appropriate prioritisation of colonoscopy, as well as gastroscopy.

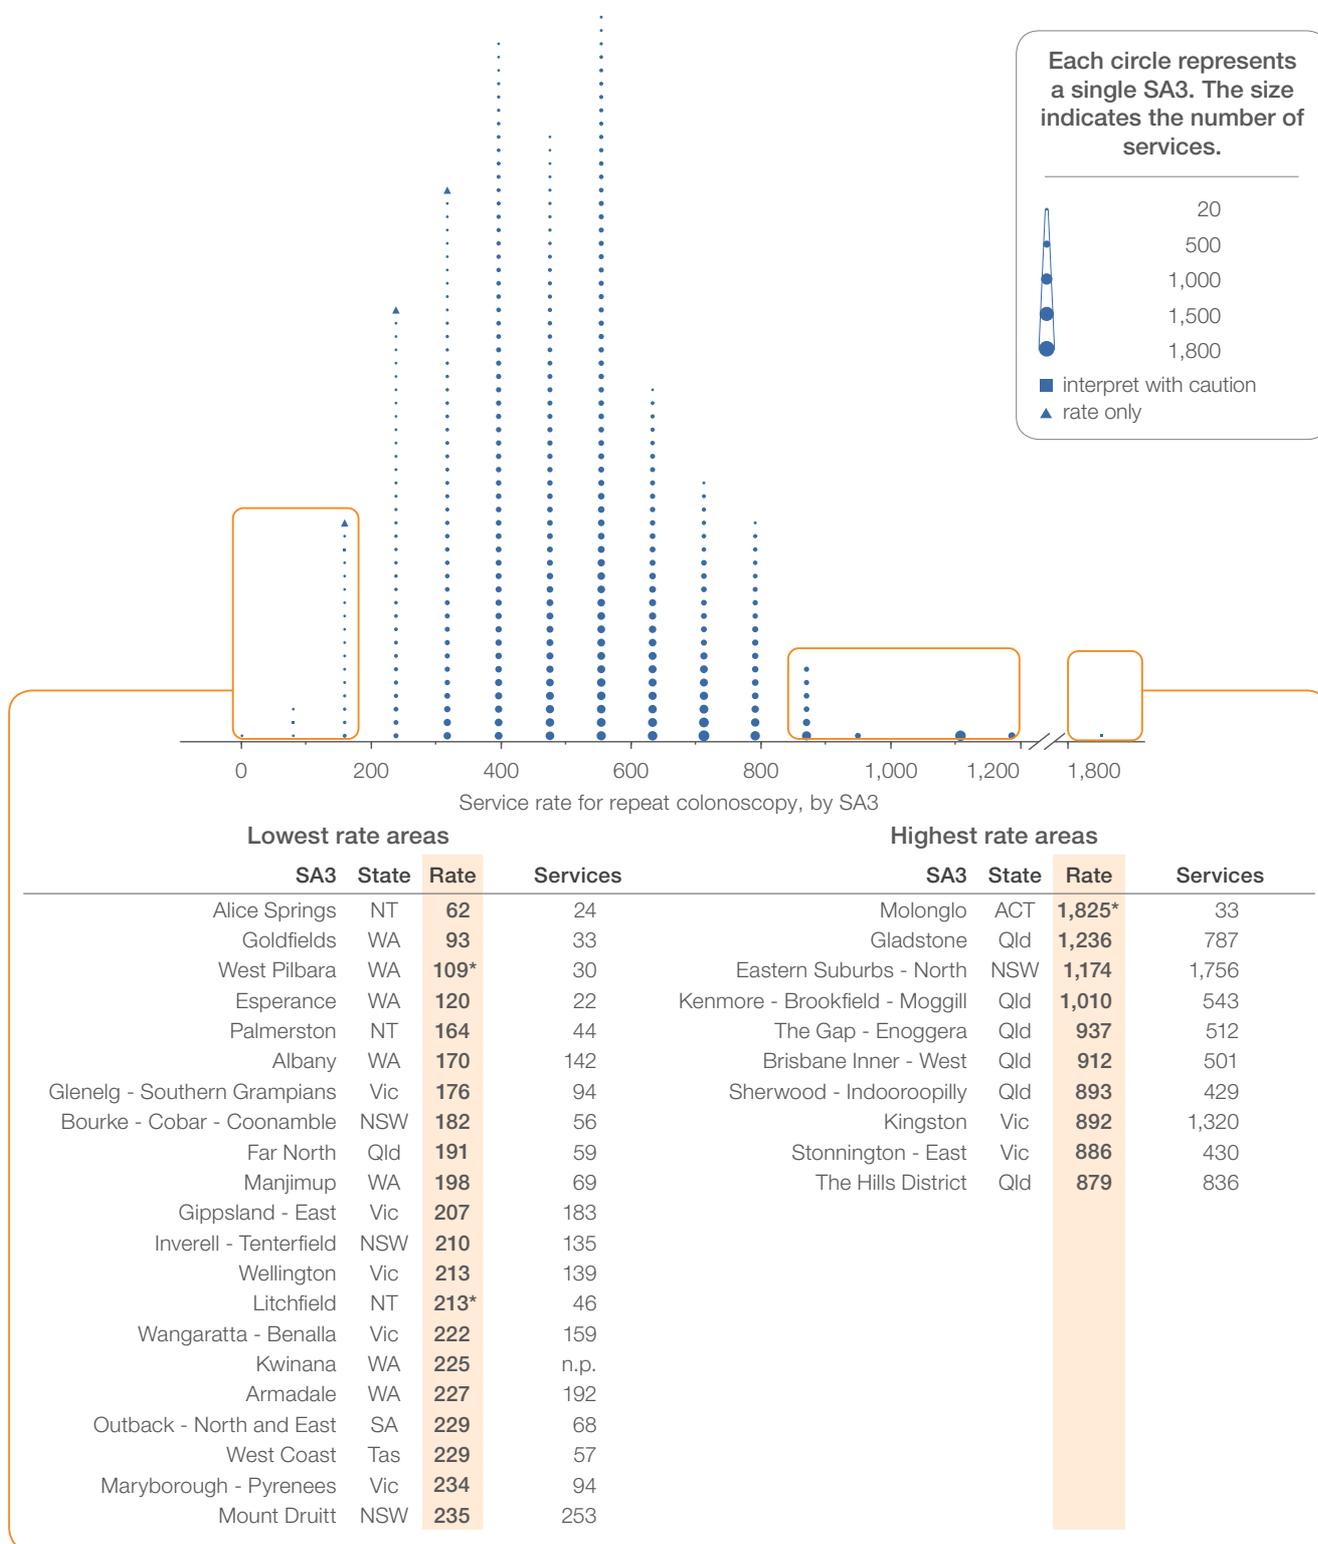

Promoting existing initiatives

As part of the Choosing Wisely Australia initiative, the Gastroenterological Society of Australia made the following recommendation in 2016, to promote the appropriate use of surveillance colonoscopy³³:

- Do not repeat colonoscopies more often than recommended by the National Health and Medical Research Council–endorsed guidelines.

Rates by local area

Figure 5.13: Number of MBS-subsidised services for repeat colonoscopy per 100,000 people of all ages, age and sex standardised, by Statistical Area Level 3 (SA3) of patient residence, 2018–19

Notes:

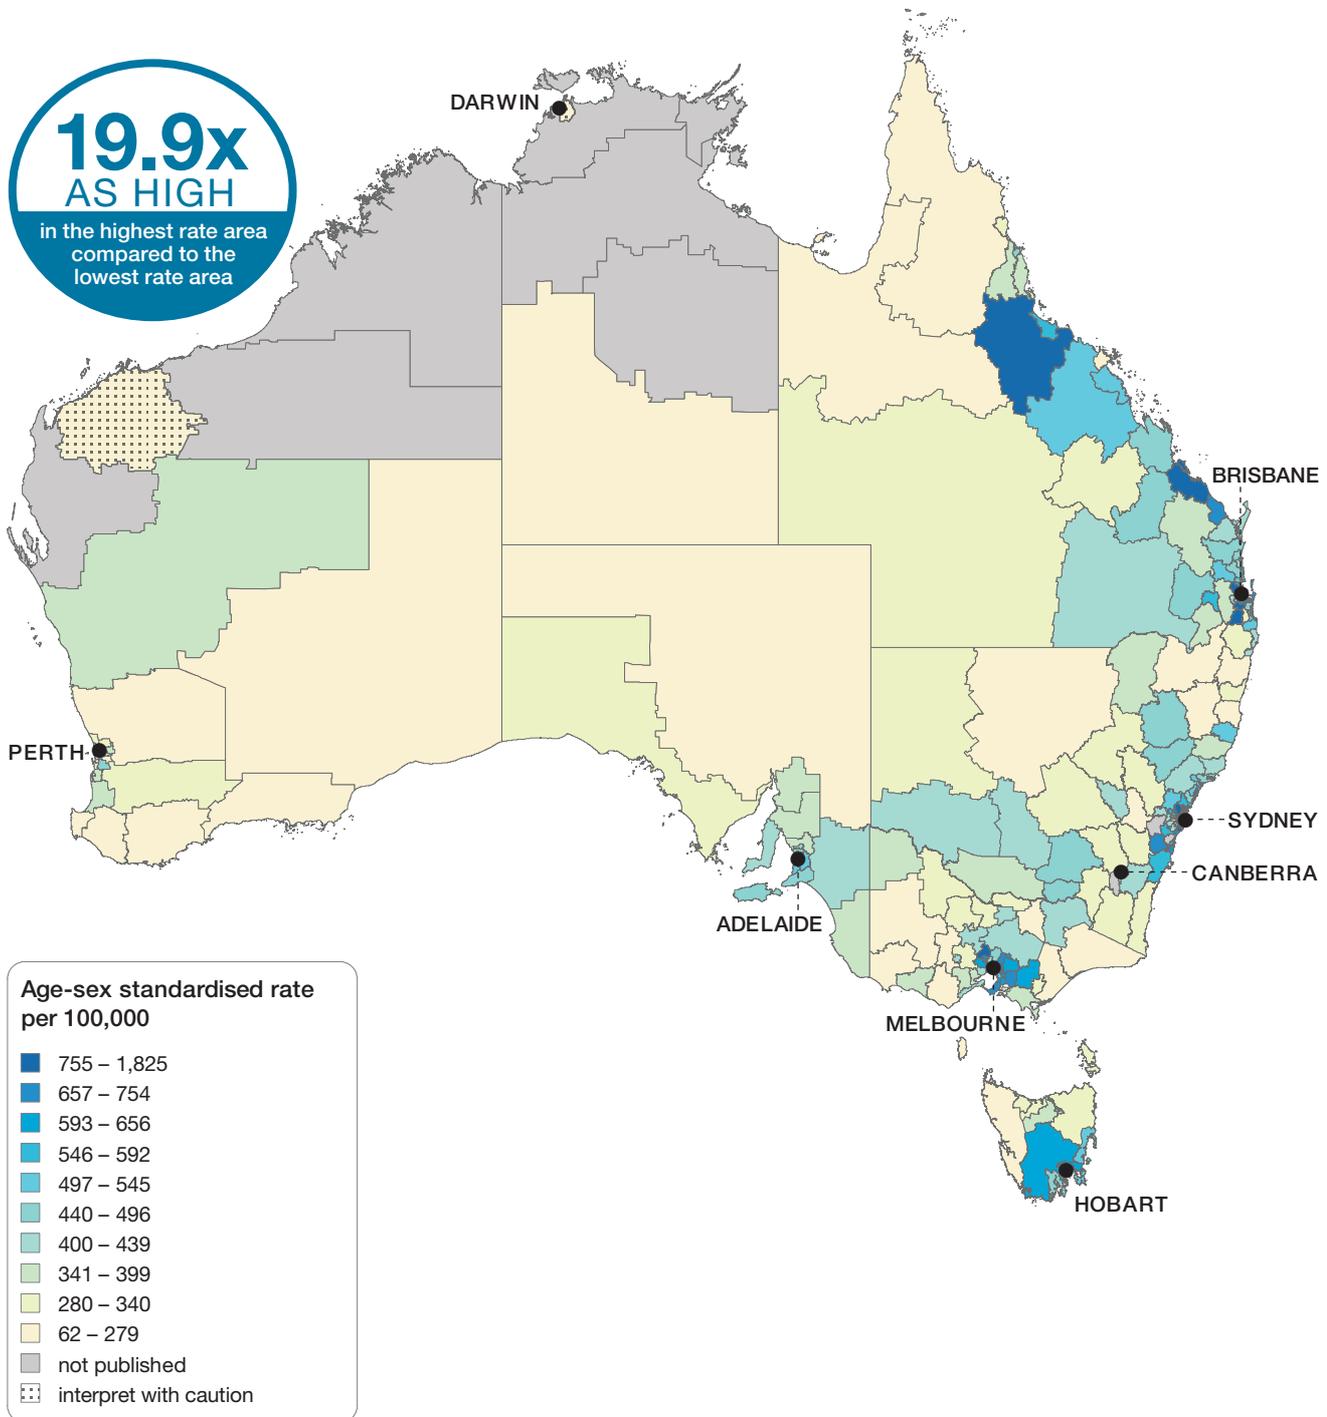

Squares (■) and asterisks (*) indicate rates that are considered more volatile than other published rates and should be interpreted with caution. Triangles (▲) indicate SA3s where only rates are published. The numbers of services are not published (n.p.) for confidentiality reasons. For further detail about the methods used, please refer to the Technical Supplement.

Australian initiatives

Information in this chapter will complement work already underway to prevent inappropriate repeat colonoscopy in Australia. At a national level, this work includes:

- Australian Commission on Safety and Quality in Health Care, *Colonoscopy Clinical Care Standard*³
- Gastroenterological Society of Australia, Choosing Wisely recommendation 1: Do not repeat colonoscopies more often than recommended by the National Health and Medical Research Council–endorsed guidelines.³³

Many state and territory initiatives also aim to improve colonoscopy use, including:

- Clinical Priority Category: Colonoscopy²⁹, Agency for Clinical Innovation, New South Wales
- *Colonoscopy Categorisation Guidelines*, Victoria³⁴
- *Endoscopy Action Plan*, Queensland³⁵
- Clinical prioritisation criteria: endoscopy³⁶ and Clinical prioritisation criteria: gastroenterology³⁰, Queensland
- *Referral Guidelines: Direct access gastrointestinal endoscopic procedures*, Western Australia³¹
- *Urgency Categorisation and Access Policy for Public Direct Access Adult Gastrointestinal Endoscopy Services*, Western Australia³²
- Statewide endoscopy care network, which monitors and assesses the quality of endoscopy services, Tasmania.²⁸

Choosing wisely recommendations	Australasian Faculty of Rehabilitation Medicine	Recommendations from the Australasian Faculty of Rehabilitation Medicine. The Australasian Faculty of Rehabilitation Medicine (AFRM) is a Faculty of the Royal Australasian College of Physicians (RACP). AFRM provides training and continuing education for Rehabilitation Medicine Fellows and trainees throughout all stages of their career. AFRM trainees and Fellows are committed to providing high quality rehabilitation care to individuals and communities in Australia and New Zealand.	How was this list made: A working group within AFRM initially identified 10 recommendations on low value practices in the field of rehabilitation medicine that may be widespread in Australia and New Zealand. Following a review of the evidence these were reduced to seven. An online survey based on these seven recommendations was distributed to all AFRM members asking them to rate these recommendations based on whether they thought they were evidence based, whether the low-value practices targeted were still being undertaken in significant numbers, and whether the recommendation was important in terms of reducing harm and unnecessary costs to patients. The working group reviewed the feedback and finalised the 'top 5' recommendations which were approved by AFRM Executive in mid-2017.	https://www.choosingwisely.org.au/recommendations/afrm
Recommendation1	Do not discharge patients with osteoporotic fractures without an assessment and/or treatment for osteoporosis.	Studies of patients with osteoporotic fractures have found that they are at significantly greater risk of suffering a new fracture compared to the general population. This risk is particularly marked in but not restricted to elderly patients, particularly given that recent clinical guidelines recommend that all individuals over the age of 50 who sustain a fracture following minimal trauma (such as a fall from standing height or less) should be considered to have a presumptive diagnosis of osteoporosis. Despite this, there have been reports of insufficient provision for the management of these patients before discharge. Osteoporosis assessments and/or treatments before discharge are clinically very important and moreover may be highly cost effective even after taking account of the additional resources associated with providing these services.	Johansson H, Siggeirsdóttir K, Harvey NC, et al. Imminent risk of fracture after fracture. Osteoporos Int 2016; 28 (3):775-80. Johnell O, Kanis JA, Odén A, et al. Fracture risk following an osteoporotic fracture. Osteoporosis Int 2004; 15:175-9. Lih A, Nandapalan H, Kim M, et al. Targeted intervention reduces refracture rates in patients with incident non-vertebral osteoporotic fractures: a 4-year prospective controlled study. Osteoporos Int 2011; 22(3):849-58. McLellan AR, Wolowacz SE, Zimovetz EA, et al. Fracture liaison services for the evaluation and management of patients with osteoporotic fracture: a cost-effectiveness evaluation based on data collected over 8 years of service provision. Osteoporos Int 2011; 22(7):2083-98. Otmar R, Henry MJ, Kotowicz MA, et al. Patterns of treatment in Australian men following fracture. Osteoporos Int 2011; 22(1):249-54. The Royal Australian College of General Practitioners and Osteoporosis Australia.	https://www.choosingwisely.org.au/recommendations/afrm1
Recommendation2	Do not prescribe spinal orthotics or bed rest for patients with non-specific low back pain.	There is insufficient and conflicting evidence on the effectiveness of spinal orthotics and other forms of lumbar support for treating or preventing low back pain, either as an intervention in its own right or as a supplement to other interventions. While there is no evidence that short term bed rest is harmful, long periods of bed rest can lead to complications such as muscular atrophy. The only randomised control trial to assess optimal periods of bed rest suggests two days is as effective as any longer period but the evidence is of low quality. There is evidence to support other approaches, such as advice to stay active and exercise which help with pain relief and improved function.	Belavy DL, Armbrecht G, Richardson CA, et al. Muscle atrophy and changes in spinal morphology: is the lumbar spine vulnerable after prolonged bed-rest? Spine 2011; 36(2):137-45. Dahm KT, Jamtvedt G, Hagen KB, et al. Advice to rest in bed versus advice to stay active for acute low-back pain and sciatica. Cochrane Database Syst Rev 2009; (1):CD007612. Deyo RA, Diehl AK, Rosenthal M. How many days of bed rest for acute low back pain? A randomized clinical trial. N Engl J Med 1986; 23;315(17):1064-70. NICE. Low back pain and sciatica in over 16s: assessment and management. NICE Guideline NG59 2016. Oleske DM, Lavender SA, Andersson GBJ, et al. Are back supports plus education more effective than education alone in promoting recovery from low back pain? Results from a randomized clinical trial. Spine 2007; 32(19):2050-7. van Duijvenbode I, Jellema P, van Poppel M, et	https://www.choosingwisely.org.au/recommendations/afrm2

Recommendation3	Do not use Mini Mental State Examination as the only tool to assess cognitive deficit in acquired brain injury.	Numerous studies suggest that the Montreal Cognitive Assessment (MoCA) is one of the most effective means of assessing cognitive deficits in acquired brain injury (for instance after transient ischemic attack and stroke) and is to be preferred to the Mini Mental State Evaluation (MMSE). MMSE may under-detect cognitive impairment in acquired brain injury; it is more appropriate for assessing dementia.	<p>Burton L, Tyson SF. Screening for cognitive impairment after stroke: a systematic review of psychometric properties and clinical utility. <i>J Rehabil Med</i> 2015; 47(3):193-203.</p> <p>Pendlebury ST, Cuthbertson FC, Welch SJV, et al. Underestimation of cognitive impairment by Mini-Mental State Examination versus the Montreal Cognitive Assessment in patients with transient ischemic attack and stroke: a population-based study. <i>Stroke</i> 2010; 41(6):1290-3.</p> <p>Pendlebury ST, Mariz J, Bull L, et al. MoCA, ACE-R, and MMSE versus the National Institute of Neurological Disorders and Stroke-Canadian Stroke Network Vascular Cognitive Impairment Harmonization Standards Neuropsychological Battery after TIA and stroke. <i>Stroke</i> 2012; 43(2):464-9.</p> <p>Srivastava A, Rapoport MJ, Leach L, et al. The utility of the Mini-Mental Status Exam in older adults with traumatic brain injury. <i>Brain Inj</i> 2006; 20(13-14):1377-82.</p>	https://www.choosingwisely.org.au/recommendations/afm3
Recommendation4	Do not routinely use splinting for prevention and/or management of contractures after stroke.	Reviews of the evidence and individual case studies on the use of hand splinting for stroke patients have been unable to find conclusive evidence that it leads to improvements in managing spasticity and preventing contractures or more generally improving upper limb function. Moreover, there is high quality evidence that stretch, whether administered from splints or other means, does not have clinically important effects on joint mobility in people with or without neurological conditions, at least for the periods it is typically prescribed of less than seven months.	<p>Basaran A, Emre U, Karadavut KI, et al. Hand splinting for poststroke spasticity: a randomized controlled trial. <i>Top Stroke Rehabil</i> 2012; 19(4):329-37.</p> <p>Harvey LA, Katalinic OM, Herbert RD, et al. Stretch for the treatment and prevention of contractures. <i>Cochrane Database Syst Rev</i> 2017 1:CD007455.</p> <p>Lannin NA, Herbert RD. Is hand splinting effective for adults following stroke? A systematic review and methodologic critique of published research. <i>Clin Rehabil</i> 2003;17(8):807-16.</p> <p>Lannin NA, Cusick A, McCluskey A, et al. Effects of splinting on wrist contracture after stroke: a randomized controlled trial. <i>Stroke</i> 2007; 38(1):111-6.</p>	https://www.choosingwisely.org.au/recommendations/afm4
Recommendation5	Do not use imaging for diagnosing non-specific acute low back pain in the absence of red flags.	The majority of acute low back pain episodes are benign, self-limited cases that do not warrant the use of imaging (e.g. X-rays, CT or MRI). There is evidence that early imaging for low back pain in the absence of red flags does not facilitate improvements in primary outcomes such as pain and function, even for older patients. If anything such imaging may be harmful insofar as it may reveal incidental findings that divert attention and increase the risk of having unnecessary interventions and invasive treatments including unnecessary surgery.	<p>Chou R, Fu R, Carrino JA, et al. Imaging strategies for low-back pain: systematic review and meta-analysis. <i>Lancet</i> 2009; 373:463-72.</p> <p>Graves JM, Fulton-Kehoe D, Martin DP, et al. Factors associated with early magnetic resonance imaging utilization for acute occupational low back pain: a population-based study from Washington State Workers' Compensation. <i>Spine</i> 2012; 37(19):1708-18.</p> <p>Jarvik JG, Gold LS, Comstock BA, et al. Association of early imaging for back pain with clinical outcomes in older adults. <i>Jama</i> 2015; 313(11):1143-53.</p> <p>Webster BS, Bauer AZ, Choi Y, et al. Iatrogenic consequences of early magnetic resonance imaging in acute, work-related, disabling low back pain. <i>Spine</i> 2013; 38(22):1939-46.</p>	https://www.choosingwisely.org.au/recommendations/afm5

Acknowledgements

This report benefitted from advice from a number of individuals and organisations with interest and expertise in best-practice pricing and clinical quality information.

The Australian Commission for Safety and Quality in Health Care (the Commission) and Independent Hospital Pricing Authority (IHPA) acknowledge the contribution of members of the Sub-Committee on Best-practice Pricing and Clinical Quality Information (the Sub-Committee) and staff who contributed to this report. Members were appointed by the Commission and were chosen by the Commission and IHPA on the basis of their individual experience and expertise. The Sub-Committee's Co-Chairs managed actual or potential conflicts of interest according to the Commission's Disclosure of Interest Policy.

Acknowledgements are extended to experts in South Australia, Queensland, Victoria and Western Australia who made presentations at Sub-Committee meetings.

Member	Position
Dr Robert Herkes (Co-chair)	Clinical Director, Australian Commission for Safety and Quality in Health Care
Dr Diane Watson (Co-chair)	CEO National Health Performance Authority (NHPA)
Ms Janet Anderson	First Assistant Secretary, Safety, Quality and Research, Commonwealth Department of Health
Dr Stephen Christley	Chief Public Health Officer and Executive Director, Public Health and Clinical Systems at SA Health
Professor Jaqueline Close	Conjoint Professor, UNSW Consultant Geriatrician, Prince of Wales Hospital
Ms Frances Diver	Deputy Secretary, Health Service Performance and Programs, Victorian Department of Health
Professor Ian Harris, AM	Professor of Orthopaedic Surgery, University of NSW, Director of surgical specialties, South Western Sydney Local Health District
Dr Karen Luxford	Director Patient Based Care, NSW Clinical Excellence Commission
A/ Professor Brian McCaughan	Cardiothoracic surgeon, Board Chair, NSW Clinical Excellence Commission and Agency for Clinical Innovation

Dr Bernard Whitfield	Otolaryngology Head and Neck Chair – Royal Australasian College of Surgeons (QLD)

Staff member	Position
Mr Luke Clarke	Director, Policy Development, IHPA
Mr Michael Frost	Executive Director, Strategic Initiatives, NHPA
Ms Amanda Mulcahy	Senior Program Officer, the Commission
Ms Janelle Painter	Senior Policy Officer Quality and Safety, IHPA
Mr Luke Slawomirski	Program Manager, the Commission
Dr Tony Sherbon	Chief Executive Officer, IHPA

Executive Summary

This report by the Sub-Committee on Best-Practice Pricing and Clinical Quality Information (the Sub-Committee) was endorsed by the Joint Working Party on Pricing for Safety and Quality in Australian Public Hospitals (JWP) of the Independent Hospital Pricing Authority (IHPA) and the Australian Commission on Safety and Quality in Health Care (the Commission) on 29 June 2015. It outlines the requirements and a potential approach to implementing national best-practice pricing and the provision of hospital-level safety and quality data for hip fracture care in Australian public hospitals. This report was endorsed by the JWP on 29 June 2015, and endorsed by the Commission and IHPA Boards in September and August 2015 respectively.

The Sub-Committee's work was informed by domestic and international consultations, review of literature and analyses of data. A summary of recommendations is provided in Table 1, page vii.

Best-practice pricing describes an approach to purchasing of healthcare services for a specific procedure or intervention at a price that reflects the elements that constitute best-practice. Under a best-practice pricing model, a tariff is set proactively, based on the expected cost of providing best-practice services. Although financial incentives are one lever to influence delivery of care, evidence points to the utility of providing timely, relevant comparable data to front line clinicians.

There is local and international experience in incentivising best-practice hip fracture care to be drawn on in designing a national best-practice pricing approach. Two Australian jurisdictions have implemented a hip fracture pricing scheme; however, it is early days to assess outcomes. One scheme is based on six best-practice criteria (Western Australia) and the other (Queensland) is based on one criterion which is time to surgery. Internationally, a region in Italy introduced a tariff for hip fracture patients who underwent surgical treatment within 48 hours of admission. The United Kingdom's National Health Service (NHS) also has a hip fracture best-practice tariff (BPT). This scheme involves payment of a tariff, based on 8 criteria. The scheme has resulted in a reduction in hip fracture mortality. The simultaneous availability of comparable clinical information was deemed essential to early and successful efforts to achieve these outcomes.⁷

Accordingly, the Sub-Committee recommends that IHPA, in its national price setting role, should work with the Commission to simultaneously provide timely, relevant and comparable clinical information to hospitals should it chose to implement a best-practice pricing scheme for hip fracture (see **Recommendation 1**).

In Australia, there are existing national clinical guidelines and standards that should be utilised in defining criteria for a best-practice pricing scheme. The Sub-Committee recommends that IHPA develop a national best-practice price (BPP) that incentivises care that aligns with the Commission's Hip Fracture Clinical Care Standard (CCS) which has been distributed for community consultation in May 2015 (see **Recommendation 2**). The proposed quality statements are:

- Quality statement 1 – Care at presentation
- Quality statement 2 – Pain management
- Quality statement 3 – Orthogeriatric model of care
- Quality statement 4 – Timing of surgery

- Quality statement 5 – Mobilisation and weight bearing
- Quality statement 6 – Minimise the risk of another fracture
- Quality statement 7 – Transition from hospital care.

The technical design of a hip fracture best-practice pricing scheme requires clarity on which separations are eligible for funding under the scheme, what aspects of the CCS are considered as criteria for the BPP, and how much the BPP is.

Accordingly, the Sub-Committee recommends that the hip fracture cohort eligible or targeted for an initial BPP include:

- Patients aged 50 years and over (which represents 96% of activity and 94% of costs)
- Admissions with a care type of acute (since the Commissions standards focus on the acute episode and IHPA pays for acute and sub-acute separately)*
- Specified principal diagnoses (covering 90% of hip fractures and 88% of costs among those aged 50 years or more), and excluding multiple trauma episodes; and
- Specified hip surgery procedure codes and Australian Refined Diagnosis Related Groups (AR-DRGs) (see **Recommendation 3**).

Best-practice pricing is recommended for surgical and non-surgical interventions (two tariffs) to prevent unintended incentives toward any particular approach to management of hip fractures. In surgical cases where patients are transferred between hospitals, it is recommended that the operating hospital receive the BPP if criteria are met. More information on the rationale for this target cohort and these recommendations is on pages 7 to 11.

In Australia, there are approximately 21,000 hip fracture separations per annum at a total operational cost of just under \$350 million to the health care system. If these criteria were used to establish an initial hip fracture cohort then best-practice pricing would apply to 13,914 separations at a total operational cost of \$258.2 million.

Members recommend that the size of the best-practice price be set after IHPA undertakes or commissions a study to determine the cost of best-practice hip fracture care, as defined using the above-mentioned criteria, compared to the price paid under IHPA's current national efficient price (NEP) methodology. A discussion about implications, for incentives and Commonwealth expenditures, depending on whether the best-practice price is higher, lower or the same as the price paid under the NEP is provided on pages 11 and 12.

Furthermore, IHPA should signal its intention to explore the implementation of a best-practice scheme in its Pricing Framework for Australian Public Hospitals 2016-17 (see **Recommendation 4**).

* Agreement on this recommendation among Sub-Committee members was not universal, though all members agreed on the importance of subacute care to a patient's resultant health status. The lack of existing information systems that follow separations across their care types, however, was seen as a sizable issue to resolve before best-practice pricing could be attributed across the full pathway of care.

Sub-Committee members recommend that performance relevant to one or more of the following priority indicators, based on the Hip Fracture CCS, be considered as criteria relevant to determination of an initial BPP:

- i. Surgery occurred on the same day or the day following presentation for patients who had surgery
- ii. An orthogeriatric model of care was used for patients aged over 65 years, and over 50 years for Indigenous patients
- iii. The opportunity to mobilise occurred on the day after surgery (for surgical patients)
- iv. A cognitive assessment was conducted for all patients; pre-operatively for surgical patients
- v. A falls and bone health assessment was undertaken before the patient was discharged.

Sub-Committee members recommend the Commission and IHPA determine which one or more of these indicators are to be included in an initial BPT. Members considered that indicators need to be meaningful to patients and clinicians, simple to understand and easy to communicate, feasible to collect, precise, achievable, measurable, and cover a spectrum of the standards (see **Recommendations 5 and 6**).

The Sub-Committee noted the evidence that time to surgery has high predictive power for patient outcomes and this measure formed the basis of BPT in the NHS, Italy, WA and Qld. In 2012 the Audit Commission found that NHS organisations found the detail of the BPT for hip fracture difficult to understand (i.e. the eight criteria and how it translates into pricing).

The design and implementation of a best-practice pricing scheme requires reliable information on quality of care to determine eligibility for funding, and the Sub-Committee recommends that the scheme's implementation should be coupled with or preceded by the provision of timely, relevant and comparable clinical information for clinicians.

Interestingly, in 2014 the NHS introduced a new BPT for hip and knee replacement – this is a combination of pay for data and pay for patient reported outcome measures. Payment for performance is expected to follow. In Australia, the Sub-Committee envisions that the Commission might opt to include in its Work Plan activities that support the collection, analyses and provision of timely, comparable hip fracture care information to Local Hospital Networks and relevant public hospitals.

There are two main sources of nationally consistent information on patients who are admitted with hip fracture – the National Non-Admitted Patient Emergency Department Care Database (NNAPED) and the Admitted Patient Care National Minimum Data Set (APC). Both might be useful to measure some of the above-mentioned indicators.

There are other sources of valuable information on clinical quality, though these data are not yet nationally available (e.g. Australian and New Zealand Hip Fracture Registry, ANZHFR) or are not nationally consistent (e.g. patient experience data). The ANZHFR includes data that can be used to calculate indicators for each of Commission's Hip Fracture CCS. Any clinical quality registry used for best-practice pricing in hip fracture care should meet existing national standards, including having an amenable governance structure and national coverage as per the Commission's Framework for Clinical Quality Registries.⁹

Importantly, the ANZHFR has its own governance, funding and ownership arrangements which would need to be considered before implementation of a best-practice pricing model that depends on access, use and disclosure of information derived from ANZHFR data.

IHPA and the Commission would need to include best-practice data items in their Three Year Rolling Data Plans (see **Recommendation 7**).

Members recommend further consultation with stakeholders on the design approach for a best-practice pricing scheme coupled with the provision of timely, relevant clinical information, following any endorsement by the Pricing Authority and Commission Board. A full implementation plan, including an approach to evaluation, should be developed and an indicative plan is provided on page 19 (see **Recommendations 8, 9 and 10**).

Table 1. The ten recommendations made by the Sub-Committee for the Commission and IHPA Boards.

BEST-PRACTICE PRICING RECOMMENDATIONS TO THE JOINT WORKING PARTY ON PRICING FOR SAFETY AND QUALITY IN AUSTRALIAN PUBLIC HOSPITALS

Recommendation 1.1: IHPA, in its national price setting role, should consider the Sub-Committee's and subsequent JWP's advice in relation to best-practice pricing to support best care for hip fracture.

Recommendation 1.2: The design and implementation of a best-practice pricing scheme requires reliable information on quality of care to determine eligibility for funding. Implementation should be coupled with the provision of timely, relevant and comparable clinical information being fed back to clinicians. Jurisdictions may want to target their efforts towards this aspect.

Recommendation 2: Existing CCS and national guidelines be used as a basis of a best-practice pricing approach for hip fracture care, in particular the Hip Fracture CCS established by the Commission in 2015.

Recommendation 3: IHPA, in its national price setting role, should consider implementation of a best-practice pricing model for hip fracture care. This should include:

- Targeting the acute episode of care in public hospitals for people aged 50 years and over;
- Targeting episodes with a hip fracture diagnosis code as specified in Table F1, Appendix F as a principal diagnosis;
- Excluding multiple trauma events as specified in Table F4, Appendix F;
- Targeting episodes that have hip fracture surgery as specified in Table F6, Appendix F;
- Targeting episodes assigned to the AR-DRGs I03A, I03B, I08A, and I08B which account for the majority of separations.

Recommendation 4.1: IHPA should use a purpose designed study to cost best-practice hip fracture care to determine the incremental cost of best-practice care compared to the average cost of care.

Recommendation 4.2: IHPA should determine a best-practice hip fracture care adjustment that provides an incentive for service providers (clinicians and managers) to change practices and deliver care that meets the best-practice criteria.

Recommendation 4.3: IHPA should signal its intention to explore the implementation of a national best-practice price for hip fracture care through the *Pricing Framework for Australian*

Public Hospital Services 2016-17 and, if new data elements are required to support its implementation, through the IHPA Three Year Data Plan 2016-17 to 2018-19.

Recommendation 5.1: Based on the advice of the Sub-Committee, IHPA should determine which of the Hip Fracture CCS indicators will be used to determine whether best-practice has been delivered.

Recommendation 5.2: The Hip Fracture CCS indicators selected for inclusion into a national best-practice pricing model should be coupled with defined, more comparable information than is needed for pricing and funding determinations, and should be provided to support clinical improvement.

Recommendation 5.3: This quality improvement information should be provided through the ANZHFR to Local Hospital Networks and public hospitals in advance of the commencement of any best-practice pricing model on a quarterly basis (even if initially provided on a six-monthly basis).

Recommendation 6.1: That the JWP endorse the Sub-Committee's preferred Hip Fracture CCS indicators for best-practice pricing.

Recommendation 6.2: Subject to consultation with the relevant stakeholders, IHPA should determine which of the initial set of indicators are to be included in the preferred initial model for best-practice pricing for hip fractures to be applied to surgical separations.

Recommendation 7.1: IHPA must include appropriate best-practice data items within their *Three Year Rolling Data Plan* and the Commission similarly within their work program, as the mechanism to stimulate both data to support clinical improvement and a best-practice pricing approach for hip fracture care in Australia.

Recommendation 7.2: JWP must further consult with states and territories about participation in the ANZHFR so that issues such as access, use and disclosure of data derived from this registry will need to be prospectively negotiated to support pricing and funding determinations. These arrangements will also be necessary if the Commission, states and territories are to play a role in the provision of timely, comparable hospital-level information on hip fracture care to clinicians and hospital managers. Importantly, the National Health Information and Performance Principal Committee (NHIPPC) could serve as a national forum for IHPA and the Commission to resolve these important issues.

Recommendation 8: Further consultation with stakeholders on the design approach for the best-practice pricing model for hip fracture care should be undertaken following the Pricing Authority and Commission Board endorsement and be complementary to development of an implementation plan.

Recommendation 9: A phased approach to implementation of a national hip fracture best-practice price should be taken. This should be based around the timing of the development and implementation of the Hip Fracture CCS indicators, and in recognition of IHPA and the Commission's Data Plans and Work Plans, and in recognition of the work and time required to establish processes to support the routine provision of timely, hospital-level comparable information on hip fracture care.

Recommendation 10: An evaluation process should be built into any implementation plan for an Australian national approach to best-practice pricing in hip fracture care.

1. Introduction

This report to the Joint Working Party on Pricing for Safety and Quality in Australian Public Hospital Services (JWP) of the Independent Hospital Pricing Authority (IHPA) and the Australian Commission on Safety and Quality in Health Care (the Commission) outlines a potential approach and requirements for implementing national best-practice pricing and the provision of hospital-level safety and quality data for hip fracture care in Australian public hospitals.

In June 2014, the JWP established the Sub-Committee on Best-Practice Pricing and Clinical Quality Information (the Sub-Committee) to address issues in relation to best-practice pricing schemes supported by evidence, with a particular focus on hip fracture. Hip fracture was selected as the initial area of focus because it is a well-defined patient cohort and a there is reasonable consensus on best-practice management within Australia.

This report supported the JWP by offering advice in relation to the Sub-Committee's terms of reference to explore:

- a. the requirements and feasibility of introducing best-practice pricing in Australian public hospitals, with a specific focus on hip fracture patients; and
- b. an appropriate mechanism and format for providing safety and quality data to clinical teams and hospital leaders to drive quality improvement in ways that support implementation of best-practice in care teams and hospital leaders to drive quality improvement.

The Sub-Committee's terms of reference are provided at Appendix A.

Given this context, this report comprises:

- background and context, including the current approach to Australian public hospital pricing, an outline of, and evidence for, best-practice pricing, current local and international hip fracture best-practice pricing schemes and existing hip fracture care best-practice models;
- a discussion of the technical aspects and requirements for an Australian hip fracture care best-practice pricing model;
- a discussion of the complementary provision of data and information to drive quality improvement; and
- a series of recommendations for consideration by the Commission Board and the Pricing Authority.

2. Background

2.1 Activity Based Funding overview

The majority of public hospital services in Australia are funded on the basis of activity through the introduction of a national activity based funding (ABF) system under the *National Health Reform Agreement 2011* (NHRA). The National Efficient Price (NEP) is the basis for the price paid for an ABF activity. The NEP is empirically derived based on activity and cost data from Australian public hospitals.

Every episode of care provided in Australian public hospitals has a price derived from applying a price weight to the NEP. This is modelled using activity and cost data from the majority of Australian public hospitals. This means that the price of a particular service is constructed from the cost and case-mix data from hospitals.

In the national ABF system, IHPA's current pricing approach is based on the average cost at the patient level, and payments are made with adjustments for certain factors (e.g. remoteness, Indigeneity). Hospitals receive separate payments across emergency, admitted acute, admitted subacute and non-admitted episodes of care.

The National Weighted Activity Unit (NWAU) is the unit of measure of activity for the national ABF system. The NWAU is weighted by complexity, so an admission which is more complex and costly attracts a higher NWAU than an admission that is less complex and less expensive. The NEP is the price for a single NWAU. The NWAU is multiplied by the NEP to calculate the total efficient price of a public hospital service.

For example, in Australia there are approximately 21,000 hip fracture separations per annum at a cost of just under \$350 million to the health care system. Based on the 2015-16 NEP (\$4,971) if one of these hip fracture patients presented to hospital and was assigned to one of the hip fracture Australian Refined Diagnosis Related Groups[†] (AR-DRGs) this episode would have a weight of 3.0929 NWAUs and be priced at \$15,375.

2.2 Joint Working Party between IHPA and the Commission

Since 2012, the Commission and IHPA have examined potential options to incorporate safety and quality into national pricing of Australian public hospital services. The JWP was established to advise the two agencies on this work.

The evidence examined by the JWP indicated that quality of care in the hospital setting is best influenced by the systematic and timely provision of information to clinical teams on quality and performance. This led to the JWP establishing a Clinical Reference Group to develop and pilot a national set of high priority hospital complications and explore how information can be provided to clinical teams in the hospital environment to improve safety and quality. Along with commissioning other work, the JWP established the Sub-Committee to address issues in relation to best-practice pricing schemes supported by evidence, with a particular focus on hip fracture. The intention was that this work would be informed by best-practice pricing principles, domestic and international experiences, work of the Clinical Reference Group and work by the Commission to develop a Hip Fracture Care Clinical Care Standard (CCS). This document is the final report from the Sub-Committee which was endorsed by the JWP on 29 June 2015.

[†] I08B Other Hip and Femur Procedures without Catastrophic Complications and/ or Comorbidities, assuming average length of stay and that no patient adjustments (such as remoteness or Indigeneity) are applied.

2.3 Best-practice pricing principles

Best-practice is commonly specified through clinical standards, guidelines and clinician consensus. Best-practice pricing describes purchasing of healthcare services for a specific procedure or intervention at a price that reflects the elements that constitute best-practice. The approach described in this report encompasses best-practice pricing and providing clinical quality information as mechanisms to improve the quality of care and health outcomes.

Under a best-practice pricing model, provider remuneration is set proactively, based on the expected and agreed cost of providing an evidence-based package of services or elements for an intervention. This is in contrast to other approaches where fees are set based on *ex post* calculation of average costs, or through funder-provider negotiation. The best-practice pricing approach incentivises care that maximises the probability of optimal outcomes.

Behavioural economics and implementation science feature in the literature on development of best-practice pricing schemes. The motivation (utility functions) of individual practitioners is difficult to analyse and predict.¹ These functions become even more complex at the aggregate level of clinical teams and hospitals. Mehrotra et al (2010) also stated that the psychology of how people respond to incentives is not considered enough in the design of pricing incentives in healthcare (refer to Appendix B).² To account for this complexity, the Sub-Committee explored the development of a best-practice pricing approach complemented with providing meaningful data and information to clinicians.

The evidence examined to date supports investigating schemes based on a best-practice pricing model, and focusing on clearly delineated interventions or procedures. The common characteristics of successful best-practice pricing initiatives are:³

- i. **Clinically relevant** and built on an explicit evidence base.
- ii. **Uncomplicated** and, where possible, focused on **outcomes** of care.
- iii. Based on **reliable and timely data** that is trusted by clinicians.
- iv. Aimed at **discrete clinical interventions** and acute care (e.g. surgical procedures rather than care of chronic conditions).
- v. Impact/outcomes correlate with the size of the incentive (**materiality**).
- vi. Rewards or incentives are distributed to, or reinvested at, the **clinical level** (or at the level where behaviour change needs to occur).
- vii. **Aligned** with other quality improvement initiatives and broader policy objectives.
- viii. Clinician-led, with **support** provided to change behaviour.

Clarity on who to pay, what to pay for, the criteria for bonuses or penalties and how much to pay is important in the technical design of a best-practice pricing scheme.⁴

Therefore, Australian national best-practice pricing models should include these principles:

- Who to pay will be determined in line IHPA's current pricing approach, where Local Hospital Networks would receive the best-practice pricing payment
- What to pay for will be established by determining best-practice indicators
- When it comes to how much to pay, it has been suggested that the optimal incentive size should "follow the Goldilocks principle: not too little, but not too much".⁵ Local experience in hip fracture care from Australian states reflects this, as outlined below.

There are local and international experiences in incentivising best-practice hip fracture care to be drawn on, which are outlined below.

2.3.1 Australian initiatives

Two Australian jurisdictions have implemented specific best-practice pricing programs in hip fracture care. A third, South Australia, is considering a similar initiative in 2015-16. The Sub-Committee's recommendations are informed by testimony received from senior health officials from these three jurisdictions, as well as from a senior health official from Victoria regarding relevant initiatives that cross clinical areas.

A summary of each of the initiatives is provided below. For more detail, refer to Appendix E.

Table 2. Australian best-practice pricing initiatives specific to hip fracture care.

Jurisdiction	Program Name	Year Implemented	Details
WA	Hip Fracture Premium Payment	2012/13	From 2012/3, a bonus payment of \$200 is awarded per patient (aged >65 years) in tertiary hospitals where six clinical indicators are met.
QLD	Quality Improvement Payment	2012/13	In 2014/15, the price was reduced for a weighted activity unit for fractured neck of femur (patients aged >60 years) by 20 per cent if the time to surgery is over 48 hours.

2.3.2 National Health Service Best-practice Tariffs

The United Kingdom's National Health Service (NHS) best-practice tariff (BPT) program pays differential prices for a set of hospital procedures/interventions in which specified processes and multiple elements of best-practice are met. The fragility hip fracture BPT, one of several conditions to which an incentive has been applied, was established in 2010-11 and has evolved to reward care meeting the following elements:

Table 3. The eight NHS Fragility Hip Fracture clinical care elements

1	Surgery within 36 hours of admission
2	Shared care by surgeon and geriatrician
3	Admission using a care protocol agreed by geriatrician, surgeon and anaesthetist
4	Assessment by geriatrician within 72 hours of admission
5	Pre- and post-operative abbreviated mental test score (AMTS) assessment
6	Geriatrician-led multidisciplinary rehabilitation
7	Secondary prevention of falls
8	Bone health assessment

In a 2012 audit of the BPT program, the Audit Commission found that NHS organisations found the detail of the payment models difficult to understand and sometimes complex to implement.⁶ Consistency in achieving all of the elements in every case was deemed to be the main stumbling block within the hip fracture payment in delivering both high quality care and claiming the payment. Data quality was also an issue with Primary Care Trusts often making payments without proper evidence of compliance.

A more recent evaluation found evidence of improvements in process quality and outcomes for the hip fracture BPT.⁷ Testimony to the Sub-Committee by individuals in the UK suggests that the availability of comparable clinical information was essential to early and successful efforts to improve outcomes. In this expert testimony, it was claimed that there was a

reduction in mortality of patients with hip fracture associated with the BPT. Most importantly, in addition, the evaluations of the UK experience suggest that good quality care costs less.

In 2014/15, the NHS introduced a new BPT for hip and knee replacement. Effectively this is a combination of pay for data and pay for patient reported outcome measures. This appears to be a signal from the NHS that: (a) the completeness, accuracy and utility of clinical information may have been deemed pre-requisite to supporting efforts to improve patient care in these new clinical areas, and (b) that 'pay for data and useful measures' would commence before paying for shifts in delivery of care.

Australian public hospital services are yet to develop standardised Patient Reported Outcome Measures. Further discussion of available data sources is referred to in Chapters 5 and 7.

2.3.3 Lazio (Italy)

The Lazio region in Italy also recently introduced a tariff mechanism for hip fracture surgery to reduce inappropriate admissions and improve quality of care. The full Diagnosis Related Groups (DRG) rate is paid only for patients that underwent surgical treatment within 48 hours of admission. Rates for surgeries performed more than 48 hours after admission are proportionately reduced on the basis of the interval between admission and surgery.

An impact study concluded that elderly patients with hip fracture benefited from improved quality of care, especially in hospitals that only used the DRG system. This was a short term evaluation with only one year of data pre and post introduction of the new payment method.⁸

Recommendation 1.1: IHPA, in its national price setting role, should consider the Sub-Committee's and JWP's advice in relation to best-practice pricing to support best-practice care for hip fracture.

Recommendation 1.2: The design and implementation of a best-practice pricing scheme requires reliable information on quality of care to determine eligibility for funding. Implementation should be coupled with the provision of timely, relevant and comparable clinical information being fed back to clinicians. Jurisdictions may want to target their efforts towards this aspect.

3. Best-practice in hip fracture care: national consensus

Designing a best-practice pricing model and a mechanism for providing reliable information on quality of care is contingent on defining best-practice care and agreeing on the necessary elements that constitute best practice.

3.1 *The Australian and New Zealand Guideline for Hip Fracture Care*

The Australian and New Zealand Guideline for Hip Fracture Care was approved by the National Health and Medical Research Council and published on their Clinical Practice Guidelines portal in 2014. It is designed to help professionals providing care for hip fracture patients to deliver consistent, effective and efficient care. The guideline includes aspects of care for hip fracture patients from diagnosis and preoperative care, through to post-operative mobilisation strategies, models of care, and patient and carer perspectives. For further information, the guideline is available at:

<http://www.anzhfr.org/images/resources/Guidelines/ANZ%20Guideline%20for%20Hip%20Fracture%20Care.pdf>.

3.2 **The National Hip Fracture CCS**

The Commission is developing a series of CCS for a specified set of conditions and procedures. The Standards specify a set of elements (quality statements) that describe the elements of best-practice for a clinical condition. The standards are being developed in close consultation with clinical experts and consumers.

The hip fracture CCS was released for public consultation in May 2015 (Appendix C). It is due for publication in early 2016. Its finalisation will be instrumental in designing the national best-practice pricing model. For example, the group developing the Standard has discussed limiting it to the acute episode of care, and considered an element relating to re-fracture prevention. The former has clear implications for the model, while the latter would prove challenging to integrate with a financial incentive.

Recommendation 2: Existing CCS and national guidelines should be used as a basis of a best-practice pricing approach for hip fracture care, in particular the Hip Fracture CCS established by the Commission in 2015.

4. Designing a national best-practice pricing model for hip fracture care

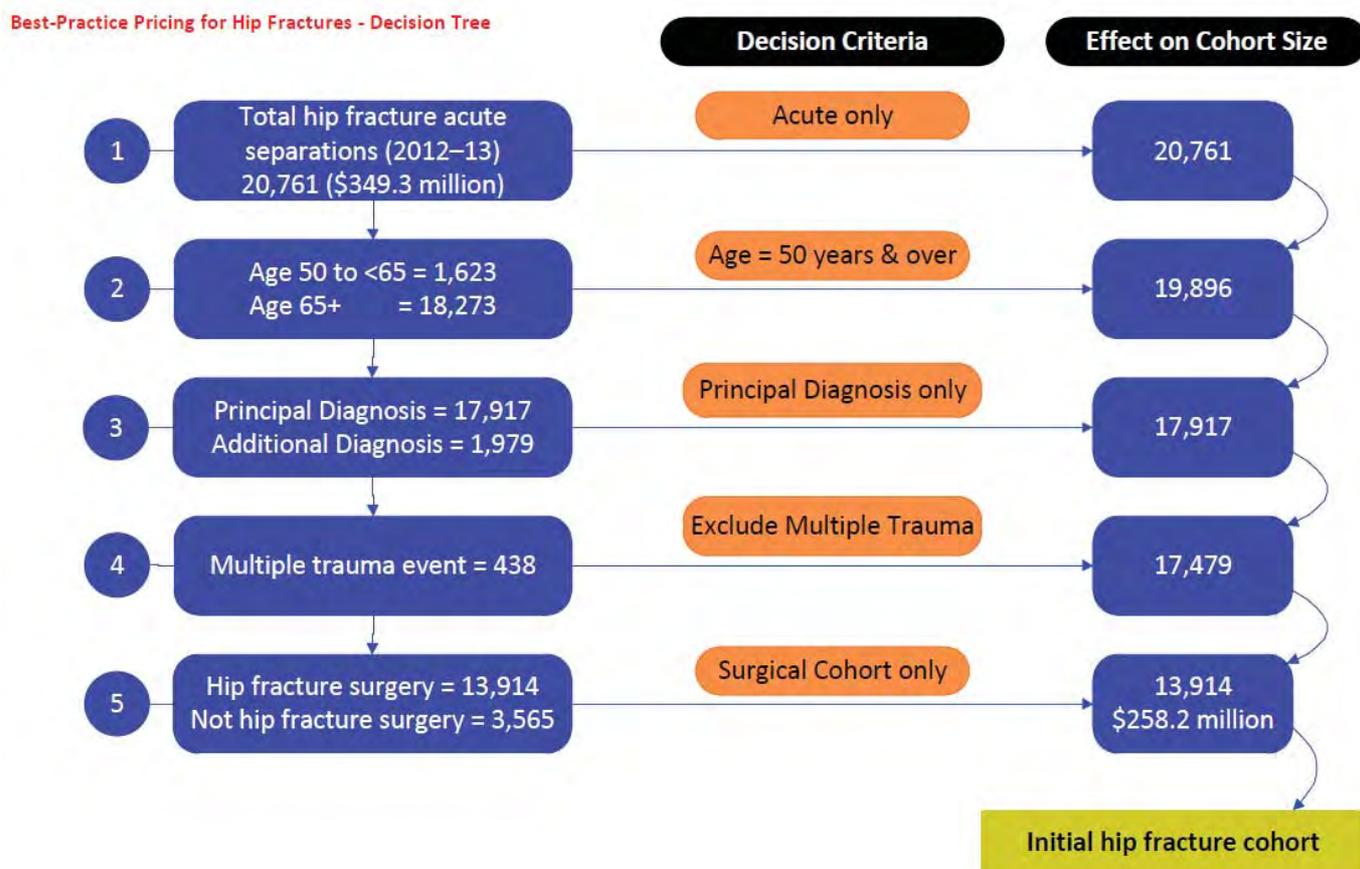

This chapter discusses the summary analysis of national hip fracture separations based on the most recently available national costing and activity data. The analysis uses the relevant hip fracture diagnosis and procedure codes in the ABF national data sets to inform the hip fracture cohort selection and a corresponding pricing approach.

4.1 Defining the target separations and episodes of care

Analyses of national hip fracture cost and activity data were conducted to define the target population. In summary, in 2012-13 there were 20,761 acute hip fracture separations in public hospitals nationally at a total cost of \$349.3 million.

The Sub-Committee further refined the analysis to establish a target hip fracture cohort (Table F1, Appendix F) based on decisions relating to factors including care type, patient age, principal and additional diagnosis, procedure and AR-DRGs. The algorithm is represented in Figure 1 with supporting detailed analysis included in Appendix F. A summary of the subsequent effect on the cohort size from each stage of the Sub-Committee’s decision logic algorithm follows.

Figure 1. Target cohort for a best-practice pricing approach to hip fracture care

4.1.1 Target Age

In 2012-13, eighty-eight per cent of the total acute hip fracture separations, at a cost of \$297.3 million, were for patients aged 65 years or more and 7.8 per cent were for people aged 50 to 65 years. Separations for patients aged 50 years and over account for 95.8 per cent of activity and 94.4 per cent of the cost of care for acute hip fracture separations across all hospitals that participated in the National Hospital Cost Data Collection (NHCDC), (Table F2, in Appendix F).

The NHS's BPT for Fragility Hip Fracture targets patients aged 60 years or more and Queensland and Western Australia target patients 60 and 65 or more years of age respectively, in their payment models.

The Sub-Committee received clinical advice and conducted analyses that suggest that a national best-practice pricing approach should target separations for patients aged 50 years or more because Aboriginal and Torres Strait Islander peoples comprise a disproportionately higher proportion of hip fracture patients aged 50 to 65 years (5.7 per cent) than non-Indigenous Australians due to the particular health needs of Indigenous Australians.

4.1.2 Target episode of care

In relation to episode of care decisions, IHPA's current approach is to determine prices separately across emergency, admitted acute, admitted subacute and non-admitted care types. As the Commission's Hip Fracture CCS focuses on the acute episode, particularly the timely receipt of surgery for those who warrant surgical intervention, the Sub-Committee's advice is to focus a national best-practice pricing approach on the admitted acute episode measured from the time of presentation at the initial emergency department. This incentivises both hospitals to perform timely surgery and to actively facilitate timely patient transfers. For more information, refer to 4.2.4 below. For some hospitals, there may be geographical challenges in this. However, from a patient perspective delays at the non-operating hospital may have a significant effect on patient outcomes.

Agreement on this recommendation among Sub-Committee members was not universal, though all members agreed on the importance of subacute care to a patient's resultant health status. The lack of existing information systems that follow separation of patients across their care types, however, was seen as a sizable issue to resolve before best-practice pricing could be attributed across the full pathway of care.

4.2 Defining best-practice hip fracture care for the purposes of pricing

4.2.1 Target cohort based on principal diagnosis

Eligible hip fracture episodes are those with diagnosis codes as outlined in Table F1 in Appendix F. Of the 19,896 admitted acute separations for patients aged 50 years or more, the data show that there were 17,917 separations (90.1 per cent) where hip fracture was the principal diagnosis. This represents 87.9 per cent of hip fracture costs for this cohort (Table F3, Appendix F). This means that the majority of activity and cost is attributable to cases where a hip fracture is the primary reason for an admission.

Separations for patients with a hip fracture as an additional diagnosis were excluded from the patient cohort selection following clinical advice that the most prevalent principal diagnoses for these episodes related to follow up care after surgery, such as rehabilitation type services.

4.2.2 Additional adjustment to further refine the cohort

The analysis showed that there was a relatively small number of cases (n=438) where the hip fracture diagnosis was related to a multiple trauma event (Tables F4 and F5, Appendix F) and the Sub-Committee advised that the consequential serious or life threatening issues, such as a severe head injury or multiple fractures, would directly affect the ability of clinicians and/or the appropriateness of delivering on some of the quality standards, particularly time to surgery. Therefore, multiple trauma episodes were excluded from the target cohort.

Hip fracture surgery was defined using principal or additional procedure codes as outlined in Table F6 in Appendix F. The analysis showed that hip fracture surgery was performed in 13,914 episodes (Table F7, Appendix F).

There were 968 episodes where patients were on anticoagulants. The group considered excluding these from the cohort as these medications may directly affect meeting the time to surgery indicator. The Sub-Committee also noted that the Queensland approach also excludes anticoagulant use. However, the Sub-Committee decided that patients with hip fracture who are on anticoagulants should remain in the target cohort as anticoagulant use is not necessarily a barrier to treatment; other medical issues are not excluded; and anticoagulant use is not comprehensively captured in the administrative data set.

4.2.3 Analysis on non-surgical separations

Further analysis of the separations (n=3,565) that did not have the nominated surgical procedures showed there were 2,038 cases where the patient was transferred to another acute hospital. It is likely that many of these transferred patients had surgery at the second hospital and, if they did, these separations would be included in the initial cohort (13,914 separations) discussed in Section 4.2.2.

690 of these patient separations went home and a further 488 patient separations were transferred to subacute care types such as palliative care or rehabilitation (see Table F9, Appendix F).

4.2.4 Initially targeting hospitals that undertake hip fracture surgery

Best-practice pricing is recommended for both episodes with surgery and without surgical interventions to introduce financial incentives into the system to deliver good quality care and to prevent unintended incentives toward any particular approach to management of hip fractures.

Nonetheless, the Sub-Committee emphasised that the strongest incentive for quality care created through the Hip Fracture CCS (described in Chapter 3) most closely aligns the care provided in hospitals performing surgery during the acute period of an admission. The Sub-Committee advised that IHPA should develop a national best-practice price that incentivises the key elements of the Hip Fracture CCS.

The Sub-Committee noted the evidence that time to surgery has high predictive power for patient outcomes. For the time to surgery indicator, the Sub-Committee's advice is that the 48-hour time limit should commence upon arrival to the emergency department and, for patients who are transferred from other hospitals for surgery, this time should commence from arrival at the initial emergency department. There was some debate about the terminology of '48 hours' compared with the Hip Fracture CCS quality statement which says 'surgery on, or the day after, presentation with hip fracture'. The Sub-Committee has

maintained its terminology consistent with the draft CCS, understanding that this may change dependent on the current public consultation around the standard.

As some patients initially present at a hospital with limited surgical infrastructure, such as small regional and remote hospitals, before being transferred to large or major hospitals for surgery, the Sub-Committee's advice is that the operating hospital should receive the best-practice payment if the best-practice indicators are met. Patients who present to an initial remote hospital should still be included in the cohort. The rationale is as follows:

- i. The best-practice pricing model should ensure compliance with the Clinical Care Standard and match its indicators. (The draft CCS is currently out for consultation and all feedback, including for the 48-hour target, will be considered before the CCS is finalised).
- ii. It encourages appropriate care, in that remote hospitals should have 'upstream' coordinated care networks to ensure that the management of the patient is effective and the patient gets to the incentivised operating hospital as quickly as possible
- iii. There should be no positive or negative discrimination in the best-practice pricing approach based on remoteness, noting that networks should be aware of the referral patterns in their areas
- iv. Often these patients have had longer to travel to present to the remote service, and so they have already experienced delays in care compared with metropolitan hospitals
- v. Non-ABF'd hospitals have no incentive from a pricing perspective which encourages the operating hospital to facilitate timely admission to achieve the best-practice price
- vi. In IHPA's National Efficient Price determination (2014-15), there are adjustments for admitted acute (and admitted subacute care) episodes where patient postcode is listed as outer regional, remote and very remote, at 8%, 16% and 22% respectively.

Commencing the time to surgery target from presentation to the emergency department at the initial hospital incentivises the hospital that performs the surgery to actively facilitate timely patient transfers and mitigate the perverse risk of gaming the time limit by holding patients at the hospital where the patient initially presents.

The Sub-Committee's advice therefore is that the national best-practice price should initially be targeted at episodes where hip fracture surgery is undertaken. The Sub-Committee also advised that IHPA should work with jurisdictions, clinicians and other stakeholders to consider whether additional steps are required for the non-surgical cohort to incentivise quality care and to prevent unintended incentives toward any particular treatment.

4.2.5 Target AR-DRGs

After the exclusions discussed in Sections 4.1.1 to 4.2.2 were applied to the data, the initial target hip fracture surgical cohort includes 13,914 separations at a cost of \$258.2 million. Table F10 presents the initial hip fracture surgical cohort grouped by AR-DRG which shows that four AR-DRGs account for 99.2 per cent of activity and 97.5 per cent of cost. The NHS BPT determined that episodes need to be assigned to specified hip fracture Health Resource Groups as part of the eligibility criteria for receiving the premium payment (Appendix E).

The Sub-Committee therefore recommended that in establishing a best-practice price, IHPA should have regard to limiting the number of AR-DRGs eligible to receive the best-practice price incentive to the top four AR-DRGs.

Recommendation 3: IHPA, in its national price setting role, should consider implementation of a best-practice pricing model for hip fracture care. This should include:

- Targeting the acute episode of care in public hospitals for people aged 50 years and over;
- Targeting episodes with a hip fracture diagnosis code as specified in Table F1, Appendix F as a principal diagnosis;
- Excluding multiple trauma events as specified in Table F4, Appendix F;
- Targeting episodes that have hip fracture surgery as specified in Table F6, Appendix F;
- Targeting episodes assigned to the AR-DRGs I03A, I03B, I08A, and I08B that account for the majority of patients.

In 2012-13 there were 20,761 acute hip fracture separations in public hospitals nationally at a total cost of \$349.3 million. If these criteria were used to establish an initial hip fracture cohort then best-practice pricing would apply to 13,914 separations at a total cost of \$258.2 million.

4.3 Costing and pricing best-practice hip fracture care

The next steps in a national best-practice pricing model after determining an initial target hip fracture cohort are to cost and price the best-practice delivery of admitted acute care.

4.3.1 The incremental cost of best-practice hip fracture care

Costing best-practice care may be undertaken through analysing existing data collections with the potential to augment this analysis with detailed investigations into the costs of providing best-practice care at the hospital level. The key challenge to overcome in costing best-practice care will be costing the elements of care that are not readily captured in existing data collections.

IHPA would then establish the incremental cost for best-practice care for the target hip fracture cohort, then compare the cost of best-practice care to the average cost of care. The incremental cost may be higher than, lower than or the same as the average cost of care.

For example, if delivering best-practice care required a number of hospitals to increase the health and medical workforce for hip fracture care or invest in new data collection systems, then the incremental cost may be higher than the average cost, at least in the initial years. Conversely, reducing time to surgery (with a flow-on effect of decreasing length of stay) may result in an incremental cost that is lower than the average cost because length of stay is a major cost driver.

Understanding whether the incremental cost of best-practice care is higher, lower or the same as the average cost is important because incremental cost will inform the best-practice incentive price differential. If the incremental cost is lower than the average cost, the way in which the incentive price differential is determined will be different because adjustments to the NEP are normally based on empirical cost differences.

4.3.2 Pricing best-practice hip fracture care

IHPA's existing pricing approach includes a number of price adjustments where there are material patient-based empirical cost differences that are not adequately recognised in the classification systems (such as Indigenous status, remoteness and Intensive Care Unit usage). In establishing the best-practice pricing model, IHPA would determine a new adjustment to the NEP (a best-practice hip fracture adjustment) that may or may not be revenue neutral.

A best-practice hip fracture adjustment where the incremental cost of best-practice care is higher than the average cost of care is consistent with the existing approach of basing adjustments on empirical cost differences. The Sub-Committee noted that a key learning from the NHS BPT for fragility hip fractures is that there needed to be an "incentive" price and it needed to be material enough to encourage the service providers (both managers and clinicians) to change practices and deliver care that met the best-practice criteria. This scenario would require existing funds to be re-allocated from other patients, or additional funding to pay for the price adjustment.

However, a best-practice hip fracture adjustment where the incremental cost of best-practice care is the same as or lower than the average cost of care would be a departure from the existing approach because there would not be an empirical cost differential on which to base the adjustment.

Recommendation 4.1: IHPA should use a purpose designed study to cost best-practice hip fracture care to determine the incremental cost of best-practice care compared to the average cost of care.

Recommendation 4.2: IHPA should determine a best-practice hip fracture care adjustment that provides an incentive for service providers (clinicians and managers) to change practices and deliver care that meets the best-practice criteria.

Recommendation 4.3: IHPA should signal its intention to explore the implementation of a national best-practice price for hip fracture care through the *Pricing Framework for Australian Public Hospital Services 2016-17* and, if new data elements are required to support its implementation, through the *IHPA Three Year Data Plan 2016-17 to 2018-19*.

5. Providing quality data to drive improvement

The design and implementation of a best-practice pricing scheme requires reliable information on quality of care to determine eligibility for funding, and its implementation should be coupled with or preceded by the provision of timely, relevant and comparable clinical information fed back to clinicians.

5.1 What information is needed to support quality improvement and payment determinations?

The evidence examined by the JWP indicates that quality of care in the hospital setting is best influenced by the systematic and timely provision of comparable information to clinical teams on quality and performance. Accordingly, the JWP asked the Sub-Committee to provide advice on an appropriate mechanism and format for providing safety and quality data to clinical teams and hospital leaders.

An NHS payment reform report recently described data as a “key limitation to the design, implementation and success of payment systems”⁵ and, at the same time, those familiar with the NHS BPT report that the increased availability of comparable performance information to clinicians on clinical quality of hip fracture care was instrumental to the success of this initiative.

There are two main sources of nationally consistent information on patients who are admitted with hip fracture – the NNAPED and the APC. There are other sources of valuable information on clinical quality, though these data are not yet nationally available (e.g. ANZHFR, see Table 2) or are not nationally consistent (e.g. patient experience data).

Table 4: The Australian and New Zealand Hip Fracture Registry.

The ANZHFR is a clinically owned and clinically driven Registry which provides real time comparative data for hospitals. It has representation from a number of key professional bodies and organisations with an interest in hip fracture care.

The development of the ANZHFR will allow for timely comparison of meaningful data around hip fracture care. It aims to understand practice and trigger the case for change in places where care might be improved. For more information, the registry details are at <http://www.anzhfr.org/home/history>.

Data collection commenced in 2014 with 14 Australian hospitals now collecting data and 17 more in the pipeline awaiting ethics approvals (May 2015). The ANZHFR dataset is modelled on the UK’s National Hip Fracture Database, with modifications for the Australian context. It includes the majority of the key measures that the Commission is considering in the development of the Hip Fracture CCS. However, it has some limitations with only a handful of Australian hospitals currently collecting and recording data in the registry. Data collection is also currently undertaken in a voluntary capacity.

Further investment in the registry will be required to enable all states and territories to collect the measures for purposes of a best-practice pricing approach. These issues are discussed in Chapter 7.

Any clinical quality registry used for best-practice pricing in hip fracture care must meet existing national standards, including having an amenable governance structure and national coverage as per the Commission's Framework for Clinical Quality Registries.⁹

If IHPA, or states and territories elect to commence best-practice pricing using existing nationally consistent information on patients who are admitted with hip fracture, then the Sub-Committee's advice must be specific about the degree to which CCS indicators in the Commission's Hip Fracture CCS could be measured with the NNAPED and APC. Appendix C contains the full list of indicators at time of public consultation of the CCS. It includes:

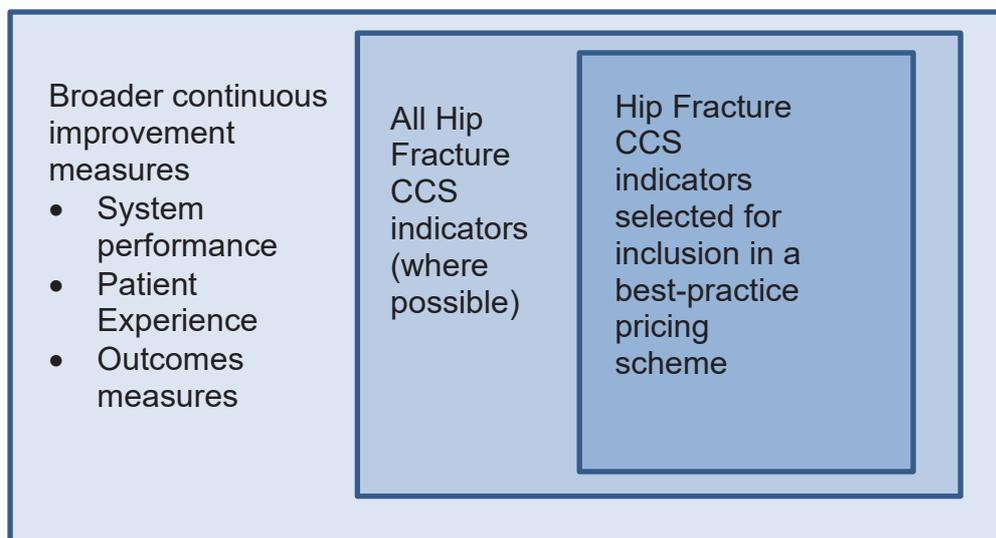

- Quality statement 1 – Care at presentation
- Quality statement 2 – Pain management
- Quality statement 3 – Orthogeriatric model of care
- Quality statement 4 – Timing of surgery
- Quality statement 5 – Mobilisation and weight bearing
- Quality statement 6 – Minimise the risk of another fracture
- Quality statement 7 – Transition from hospital care.

The indicators for each of these quality statements are included in the ANZHFR dataset. Furthermore, the Sub-Committee heard that there may also be a need for information beyond that required to support reporting on the Hip Fracture CCS that can be used by clinicians to support quality improvement. Such information would include, for example:

- System performance measures – such as length of stay and surgery cancellation rates
- Patient experience measures not covered by the CCS
- Outcomes measures – that can demonstrate the benefits of quality improvements over time, including Patient Reported Outcome Measures
- Information on cost drivers.

Figure 2 illustrates how information to inform best-practice price and funding determinations can be considered a subset of information needed across all the Hip Fracture CCS, which can be considered a subset of information that clinicians may desire to support quality improvement. Appendix G provides a broad list of possible measures across these categories.

Figure 2: Subsets of continuous improvement information in relation to hip fracture.

5.2 The audience and timing of providing quality improvement information

The target audience for quality improvement information is clinical teams and hospital managers. The requirements of this audience have particular implications for the timing of information provision and the appropriate level at which it is provided. Clinical information should be frequently used to drive improvements, and with a higher level of detail than the information that would be required for the purposes of determining best-practice for pricing purposes.

To best support clinical teams and hospital leaders to drive continuous improvement, the provision of comparable information would need to commence before a best-practice pricing model. This will give clinicians and hospital managers an understanding of the baseline for continuous improvement before any form of incentive pricing takes effect.

A determination in relation to the timeliness and frequency of this information is important to inform and enable monitoring of continuous improvement initiatives by clinicians and hospital managers. This might initially mean providing information at six-monthly intervals, but in time this would ideally increase to quarterly provision.

Recommendation 5.1: Based on the advice of the Sub-Committee, the ACSQHC and IHPA should determine which of the Hip Fracture CCS indicators will be used to determine whether best-practice has been delivered.

Recommendation 5.2: The Hip Fracture CCS indicators selected for inclusion into a national best-practice pricing model should be coupled with defined, more comparable information be provided to support clinical improvement than is needed for pricing and funding determinations.

Recommendation 5.3: This quality improvement information should be provided through the ANZHFR to Local Hospital Networks and public hospitals in advance of the commencement of any best-practice pricing model on a quarterly basis (even if initially provided on a six-monthly basis).

6. Preferred initial national model for best-practice pricing of hip fracture care

The preferred initial national model for best-practice pricing for hip fractures would require a set of indicators to be established so that it can be determined whether best-practice had been achieved.

The Sub-Committee reviewed the Hip Fracture CCS quality statements and associated indicators (included in Appendices C and D) and selected an initial set of indicators.

The Sub-Committee considered that the indicators need to be meaningful to patients and clinicians, simple to understand and easy to communicate, feasible to collect, precise, achievable, measurable, and cover a spectrum of the standards.

Members recommended including the following preferred indicators for consideration by the JWP:

- i) Surgery occurred on the same day or the day following presentation for patients who had surgery
- ii) An orthogeriatric model of care was used for patients aged over 65 years, and over 50 years for Indigenous patients
- iii) Remobilisation occurred on the day after surgery (for surgical patients)
- iv) An abbreviated mental state test was conducted for all patients; pre-operatively for surgical patients
- v) A falls and bone health assessment was conducted before the patient was discharged.

Subject to consultation with stakeholders, the Commission and IHPA should determine which of the five indicators are to be included in the initial model. That is, there may be one to five indicators initially chosen in the first iteration of a pricing model.

The preferred initial national model for best-practice pricing for hip fractures would apply the best-practice price to all relevant hip fracture episodes that have met all the agreed indicator(s). That is, if data is supplied for an episode that satisfies that the indicator(s) has/have been met, the best-practice price will apply for that episode.

Beyond the preferred initial national model for best-practice pricing for hip fractures, future iterations of the model may include all aspects of the patient journey. This would be dependent on clinical care standards and indicators being available.

Recommendation 6.1: That the JWP endorse the Sub-Committee's preferred Hip Fracture CCS indicators for best-practice pricing. *Note: the recommendations were endorsed by the JWP on 29 June 2015.*

Recommendation 6.2: Subject to consultation with the relevant stakeholders, IHPA should determine which of the initial set of indicators are to be included in the preferred initial model for best-practice pricing for hip fractures to be applied to surgical patients.

7. Implementation approach

7.1 Using existing data to support pricing and quality improvement

In accordance with established processes, the Sub-Committee envisions that IHPA would work with jurisdictions including through the IHPA Jurisdictional Advisory Committee (JAC) to seek advice and guide implementation of any best-practice pricing scheme. IHPA would signal its intention in relation to best-practice pricing for hip fractures to the Australian community in its *Pricing Framework for Australian Public Hospital Services*.

Following the public consultation around the hip fracture CCS, the Sub-Committee envisions that the Commission might opt to include in its Work Plan activities that support the collection, analyses and provision of timely, comparable hip fracture care information to Local Hospital Networks and relevant public hospitals. These activities would support answers to questions such as:

- How might comparable hospital-level information be routinely created from existing, nationally consistent databases to support efforts to improve hip fracture care?
- How might comparable hospital-level information be routinely created with the new national clinical registry to support efforts to improve hip fracture care?
- How might the Commission support this work?

There are established processes for accessing and using existing national databases through *IHPA's Three Year Data Plan* and the Commission's work plan respectively. If the development of new data elements is required, consultation should occur with jurisdictions and IHPA and the Commission, as these data elements might already exist in state and territory data collections (e.g. time to surgery), or might need to be specified through national data governance processes to support their nationally consistent collection.

7.2 Potential data to support pricing, funding and quality improvement

In the NHS, Queensland and WA, the introduction of best-practice pricing has focused on time to surgery and, in the case of the NHS, full participation in their clinical registry.

The Sub-Committee was advised that the new ANZHFR collects information relevant to many more indicators across the seven proposed Hip Fracture CCS quality statements than existing nationally consistent information systems. However, these ANZHFR data are not yet nationally complete for major and large public hospitals, though hospital participation rates are increasing.

If IHPA was to commence best-practice pricing using some of the proposed Hip Fracture CCS indicators, then it should promote early and rapid adoption of the ANZHFR by public hospitals for future use of this data as a source of clinical quality improvement information as well as for establishing whether best-practice has been met for pricing and funding purposes. The Administrator and the National Health Funding Body would need to access the resultant data for the purposes of funding determinations.

IHPA could promote adoption of the ANZHFR by including a requirement for these data in its *Three Year Rolling Data Plan* or by requiring the data as pre-requisite to be eligible for best-practice pricing. IHPA and the Commission could support national coordination of state and territory effort through the National Health Information and Performance Principal Committee (NHIPPC) and, potentially, facilitate a national approach to funding the registry via the NHIPPC.

Importantly, the ANZHFR has its own governance, funding and ownership arrangements which would need to be considered before implementation of a best-practice pricing model that depends on access, use and disclosure of information derived from ANZHFR data.

Recommendation 7.1: IHPA must include appropriate best-practice data items within their *Three Year Rolling Data Plan* and the Commission similarly within their Work Program, as the mechanism to stimulate both data collection to support clinical improvement and a best-practice pricing approach for hip fracture care in Australia.

Recommendation 7.2: JWP must further consult with states and territories about participation in the ANZHFR so that issues such as access, use and disclosure of data derived from this registry will need to be prospectively negotiated to support pricing and funding determinations. These arrangements will also be necessary if the Commission, states and territories are to play a role in the provision of timely, comparable hospital-level information on hip fracture care to clinicians and hospital managers. Importantly, NHIPPC could serve as a national forum for IHPA and the Commission to resolve these important issues.

7.3 Further stakeholder engagement and implementation plans

Engaging and persuading stakeholders of the merits of a national best-practice pricing scheme will be important for clinical behaviour change. Key stakeholders include the Commonwealth, states and territories, Local Hospital Networks, Clinical Colleges, clinicians and consumer groups. The existing Commission CCS Hip Fracture Topic Working Group has also been important to elucidate best-practice. Comprising clinicians, consumers and hospital administrators, this is a valuable group for development of an implementation plan.

A formal communication and consultation strategy will need to be developed to manage expectations, refine the best-practice price, and facilitate positive implementation. Subject to public consultation on the Hip Fracture CCS, further consultation will need to be undertaken with relevant clinical groups. These include, for example:

- Australian Orthopaedic Association
- Royal Australian College of Surgeons
- The Royal Australasian College of Physicians
- Australasian College for Emergency Medicine
- Australian and New Zealand College of Anaesthetists
- Australian and New Zealand Society for Geriatric Medicine.

Recommendation 8: Further consultation with stakeholders on the design approach for the best-practice pricing model for hip fracture care should be undertaken following the Pricing Authority and Commission Board endorsement and be complementary to development of an implementation plan.

A full implementation plan should be developed, but the Sub-Committee envisions that an indicative plan might include phases and key activities as illustrated in Figure 3.

Figure 3. Indicative phasing of a best-practice pricing approach to hip fracture care

Key responsibilities	Phasing of key activities				
Timeframe	2014-15	2015-16	2016-17	2017-18	2018-19
Key communication messages	Hip Fracture CCS		Best-practice pricing approach		Implementation
Key communication targets	Sub-Committee JWP Clinicians	Pricing Authority Jurisdictions Clinicians AHMAC Consumers Colleges	Pricing Authority IHPA Committees AHMAC Jurisdictions Other stakeholders	Pricing Authority IHPA Committees The Administrator AHMAC Jurisdictions Other stakeholders	
Commission	Finalise CCS	Incorporate activities into the Commission's Work Plan	Supports work that ensures baseline comparable information is provided locally	Supports work to enhance the provision of comparable information	Continue work to enhance the provision of comparable information
IHPA	BPP development Create dataset specifications for preferred initial model indicators		BPP signalled in Three Year Data Plan, including new data item(s). Price development.	NEP determination	Implementation
Enhance data infrastructure	Enhance nation-wide participation in the ANZHFR		Data extracts support work to enhance the provision of comparable information and, potentially, the next NEP determination		
	Establish agreements around access, use and disclosure of data to support best-practice pricing				

Recommendation 9: A phased approach to implementation of a national hip fracture best-practice price and provision of clinical quality information should be taken. This should be based around the timing of the development and implementation of the Hip Fracture CCS indicators, and in recognition of IHPA and the Commission's Data Plans and Work Plans. It should also recognise the work and time required to establish processes to support the routine collection and provision of timely, hospital-level comparable information on hip fracture care.

7.4 Evaluation

An evaluation process must be considered a key part of implementation of a best-practice pricing approach in Australia. Lessons learned from the NHS recommended building an evaluation process into the approach from the beginning of development.

The evaluation could consider issues such as the impacts of best-practice pricing; intended and unintended consequences; and should carefully identify how pricing and quality information provision separately and/or concurrently influenced behaviour and health outcomes.

Recommendation 10: An evaluation process should be built into any implementation plan for an Australian national approach to best-practice pricing in hip fracture care.

Appendix A. Sub-Committee on Best-practice Pricing and Quality Information Terms of Reference

TRIM (ACSQHC): D14-28232

TERMS OF REFERENCE

Joint Working Party on Pricing for Safety and Quality in Australian Public Hospital Services (JWP) of the Australian Commission on Safety and Quality in Health Care (the Commission) and Independent Hospital Pricing Authority (IHPA)

SUB-COMMITTEE ON BEST-PRACTICE PRICING AND CLINICAL QUALITY INFORMATION

1. Purpose

To investigate and advise the JWP on potential approaches to (a) best-practice pricing, and (b) provision of hospital-level safety and quality data in relation to select clinical areas identified as a priority by the JWP.

2. Background

The JWP was established in August 2012 to advise the Commission and IHPA on:

1. Emerging local and international literature on, and evidence for, pricing schemes and mechanisms, including how these would translate to the Australian context.
2. The project aiming to develop and pilot ways in which data and information can be provided to clinical teams in the hospital environment to promote improvement in safety and quality. Specifically, the JWP will provide advice on a proof of concept to test the draft national set of high priority hospital complications in selected Australian hospitals.
3. Ongoing consideration of the objectives of incorporating safety and quality in the pricing of Australian public hospital services, including:
 - a. identifying necessary features of potential schemes
 - b. emerging risks and opportunities unique to the Australian context.
4. Possible options for national implementation of mechanisms identified, studied and piloted, including:
 - a. the potential effects, consequences, risks and benefits to the Australian community of the options identified
 - b. strategies and specific issues for consideration prior to, and as part of, implementation of the identified options, including requirements to obtain the support of Australian governments and other stakeholders.

In early 2014 the JWP established a Sub-Committee to undertake work in relation to the proof of concept to test a draft national set of high priority hospital complications (item 2 above).

In June 2014 the JWP agreed to establish a second Sub-Committee to address issues in relation to items 1, 3 and 4 above, with a particular focus on the selected clinical area of hip fracture.

3. Terms of reference

The Sub-Committee on Best-practice Pricing and Clinical Quality Information (the Sub-Committee) is established to support the JWP by developing advice on proof of concepts in select clinical areas identified as a priority by the Chair of the JWP. Specifically, the Sub-Committee will explore, and advise the JWP on the following:

1. The requirements and feasibility of introducing best-practice pricing in Australian public hospitals, with a specific focus on priority clinical areas, focusing on hip care (fractured hip). This includes:
 - a. closer examination of local and international schemes
 - b. process for adopting or developing a clinical pathway or achieving consensus on 'best-practice', with initial focus on management of fractured hip
 - c. preliminary scoping of a national best-practice pricing model in the Australian public hospital funding context in light of (a) and (b).
2. An appropriate mechanism and format for providing safety and quality data to clinical teams and hospital leaders to drive quality improvement (including patient experience). This mechanism should support implementation of best-practice pricing in priority clinical areas, with a focus on hip care.

The Sub-Committee is not expected to undertake pilot work, or explore mechanisms that would involve public reporting.

In exploring and advising the JWP on these matters, the Sub-Committee will communicate with the appropriate agencies including, but not limited to, the Commission, IHPA and clinical specialty groups.

4. Membership

Member	Position
Dr Diane Watson (Co-Chair)	CEO National Health Performance Authority
Dr Robert Herkes (Co-Chair)	Clinical Director, Australian Commission on Safety and Quality in Health Care
A/ Professor Brian McCaughan	Cardiothoracic surgeon, Board Chair, Clinical Excellence Commission Board Chair, Agency for Clinical Innovation
Dr Stephen Christley	Chief Public Health Officer and Executive Director, Public Health and Clinical Systems at SA Health
A/ Professor Graham Reynolds	Consultant Paediatrician and Associate Dean (admissions) Australian National University Medical School
Dr Karen Luxford	Director Patient Based Care, Clinical Excellence Commission, NSW Health

Ms Janet Anderson (or Commonwealth nominee)	First Assistant Secretary, Acute Care Division Australian Government Department of Health
Prof Bernard Whitfield	Otolaryngology Head and Neck Chair – Royal Australasian College of Surgeons (QLD)
Ms Cindy Schultz-Ferguson	Nominee Consumers' Health Forum
Professor Jaqueline Close	Conjoint Professor, UNSW Consultant Geriatrician, Prince of Wales Hospital
Professor Ian Harris	Professor of Orthopaedic Surgery, University of NSW, Director of surgical specialties, South Western Sydney Local Health District
Ms Frances Diver	Deputy Secretary, Health Service Performance and Programs, Victorian Department of Health

Other attendees

Mr Luke Clarke	Director, Policy Development, IHPA
Mr Luke Slawomirski	Program Manager, the Commission
Ms Janelle Painter	Senior Policy Officer, IHPA
Ms Amanda Mulcahy	Senior Program Officer, the Commission (Secretariat)
Mr Michael Frost	Executive Director, National Health Performance Authority

5. Reporting

The Sub-Committee will provide a report at each meeting of the JWP, as a standing agenda item.

6. Timeframe

These Terms of Reference are effective from date of acceptance until 30 June 2015.

7. Acceptance

Version	Date accepted	Accepted by
1.0	19 September 2014	Dr Tony Sherbon, CEO, IHPA Prof D Picone AM, CEO, the Commission

Appendix B. Suggested design improvements to increase impact of pay for performance schemes²

Commonly currently used design	Suggested Improvement
Incentive given as a lump sum	Divide the lump sum into a series of smaller incentive payments
Relative thresholds (e.g. top 25% of physicians)	Tiered absolute thresholds (e.g. 25%, 50%, 75%, 90%)
Long lag time between care and receipt of incentive	Shorten lag time to as short as possible
Use of withhold payments	Bonus payment or use of deposit contracts
Complex uncertain structure of program (e.g. shared savings program)	Simplify program so that uncertainty minimized
Incentive often given as an increase in fee schedule reimbursement	Decouple incentive payment so that it is given separately, consider a lottery
Dollar incentives	“In kind” incentives

Appendix C. Australian Commission on Safety and Quality in Health Care draft Hip Fracture Clinical Care Standard quality statements

Note: public consultation on this standard is available at <http://www.safetyandquality.gov.au/our-work/clinical-care-standards/hip-fracture-care-clinical-care-standard/>

Hip Fracture Clinical Care Standard as at May 2015	
1	<p>Care at presentation A patient presenting to hospital with a suspected hip fracture receives care guided by timely assessment and management of the medical conditions, including diagnostic imaging, pain assessment and cognitive assessment.</p>
2	<p>Pain management A patient with a hip fracture is assessed for pain at the time of presentation and regularly throughout their hospital stay, and receives pain management including the use of multimodal analgesia as clinically appropriate.</p>
3	<p>Orthogeriatric model of care A patient with a hip fracture is offered treatment based on an orthogeriatric model of care as defined in the Australian and New Zealand Guideline for Hip Fracture Care.</p>
4	<p>Timing of surgery A patient presenting to hospital with a hip fracture or sustaining a hip fracture while in hospital, receives surgery on the day of or the day after, where clinically indicated and surgery is preferred by the patient.</p>
5	<p>Mobilisation and weight-bearing A patient with a hip fracture is offered mobilisation without weight-bearing restriction the day after surgery and at least once a day thereafter, depending on the patient's clinical condition and agreed goals of care.</p>
6	<p>Minimise the risk of another fracture Before a patient with a hip fracture leaves hospital, they are offered a falls and bone health assessment, and a management plan based on this assessment to reduce the risk of another fracture.</p>
7	<p>Transition from hospital care Before a patient leaves hospital, the patient and their carer are involved in the development of an individualised care plan that describes the ongoing care that the patient will require after they leave hospital. The plan includes a summary of any changes in medicines, any new medicines, mobilisation, wound care and function post injury, recommendations for future fracture prevention and referral to ongoing rehabilitation if clinically indicated.</p> <p>This plan is provided to the patient and their general practitioner or ongoing clinical provider within 48 hours of discharge.</p>

Appendix D. Australian Commission on Safety and Quality in Health Care draft Hip Fracture Clinical Care Standard indicators

	Supports improvement	Outcome measure
<p>Quality statement 1 – Care at presentation:</p> <ul style="list-style-type: none"> - Indicator 1a: Evidence of local arrangements for the management of patients with hip fracture in the emergency department. - Indicator 1b: Proportion of patients with a hip fracture who have had their pre-operative cognitive status assessed. 	<p>✓</p> <p>✓</p>	
<p>Quality statement 2 – Pain management:</p> <ul style="list-style-type: none"> - Indicator 2a: Evidence of local arrangements for timely and effective pain management for hip fracture. - Indicator 2b: Proportion of patients with a hip fracture who receive analgesia or have documented assessment of pain within 30 minutes of presentation to the emergency department. 	<p>✓</p> <p>✓</p>	
<p>Quality statement 3 – Orthogeriatric model of care:</p> <ul style="list-style-type: none"> - Indicator 3a: Evidence of orthogeriatric (or alternative physician) management during their admitted hip fracture episode of care. - Indicator 3b: Proportion of patients with a hip fracture receiving orthogeriatric (or alternative physician) assessment prior to hip fracture surgery. 	<p>✓</p> <p>✓</p>

Appendix E. International and Australian Hip Fracture Care Best-Practice Pricing Initiatives

WA Health

WA Health has integrated safety and quality into ABF since 2010. One of three WA performance based payments is for fracture neck of femur (others are for Stroke and Acute Myocardial Infarction). A bonus payment of \$200 is awarded per patient with fracture neck of femur over 65 years of age where all of these six clinical indicators are met:

1	Time to surgery within 36 hours from arrival in ED, or time of diagnosis if an inpatient [‡]
2	Admitted under the joint care of a consultant geriatrician and an orthopaedic surgeon
3	Admitted using and assessment protocol agreed by geriatric medicine, orthopaedic surgery and anaesthetics
4	Assessed by a geriatrician in the peri-operative period (within 72 hours of admission)
5	Post-operative geriatrician-directed multi-professional rehabilitation team
6	Fracture prevention assessments (falls and bone health)

The hip fracture bonus payment is implemented at the three tertiary hospitals in WA. Patients who transfer between hospitals only have the data entered at the operating tertiary hospital. Specifically, the time to surgery item is measured from the time the patient arrived in ED at the operating hospital. Patient level data are collected by hospital staff (usually an Orthopaedic Nurse) within a purpose built online clinical registry. To avoid duplication in collecting data items, approximately 1/3 of items migrate across to the clinical registry from existing Patient Administration System data. Data are then extracted by the Department of Health quarterly for payment to the appropriate Health Service.

Queensland Health

The Queensland Health quality improvement incentive for care of fractured neck of femur relates principally to time to surgery and has evolved over the past three financial years. In 2012-13, a target of 95% for patients admitted as an emergency for fractured neck of femur repair to be taken to theatre within 48 hours of admission was set. If the target was achieved, a bonus payment would be paid to the associated health service. The target was not reached in its first year, and was reduced to 80% in 2013-14. In 2014-15 the program was further amended, and Queensland now reduces the price for a weighted activity unit for fractured neck of femur by 20% if the time to surgery is not achieved (refer to appendix 4). Queensland's lessons learned from this project include:

1. Achievability of the target is essential.
2. Executive buy-in and quarterly performance information feedback at the executive team level is an important motivator.
3. Clinical engagement through networks and individual clinicians is essential during development process because it provides a sense of ownership.

[‡] Note: this is time to surgery from admission to Emergency Department of the operating hospital only

SA Health

At time of writing, SA Health was exploring areas of best-practice pricing. The clinical areas of focus are likely to be stroke and hip fracture, with the aim of aligning to national standards and quality indicators where possible. SA Health is reviewing the programs implemented in Queensland and WA, and will keep the Secretariat informed of progress in the coming months.

NHS Best-practice Tariff Program – Fragility Hip Fracture

The NHS United Kingdom’s Best-practice Tariff (BPT) program pays differential prices (tariff) for a set of hospital procedures/interventions in which specified processes and elements of best-practice are met. It is a key feature of the NHS ‘payment by results’, tariff-based payment system for acute care (i.e. activity based funding).

The aim of BPTs is to reduce unwarranted clinical variation and improve quality of care. The number of clinical areas, conditions and procedures covered by the scheme has grown from four to 18 since its inception in 2010-11. The criteria for selecting BPT clinical areas include:¹⁰

1. High impact (high volume, high variation in practice, or impact on outcomes)
2. A strong evidence base on what constitutes best-practice (and demonstrated benefit and cost effectiveness to the patient)
3. Clinical consensus on the characteristics of best-practice
4. The episode of care has a well-defined start and finish point
5. The care is planned in advance.

The fragility hip fracture BPT rewards care meeting the following specified elements:

Table 1. The eight NHS Fragility Hip Fracture clinical care elements

1	Surgery within 36 hours of admission
2	Shared care by surgeon and geriatrician
3	Admission using a care protocol agreed by geriatrician, surgeon and anaesthetist
4	Assessment by geriatrician within 72 hours of admission
5	Pre- and postoperative abbreviated mental test score (AMTS) assessment
6	Geriatrician-led multidisciplinary rehabilitation
7	Secondary prevention of falls
8	Bone health assessment

Data collection

The data are collected in an online clinical registry at www.nhfd.co.uk. Data are entered by hospital staff with new admissions for hip fracture and collected at 30 days, 120 days and 1 year post discharge. The BPT data items are mandatory fields. Data can be exported at any time into excel to be used by hospitals for local reporting and improvements. An annual report is also commissioned by the Healthcare Quality Improvement Partnership and managed by the Royal College of Physicians.

For hip fracture care, the BPT is disbursed only if all elements of care are completed and submitted to the registry. In effect, the scheme also contains a ‘pay for data’ component.

Incentive mechanism

The incentive mechanism has been a progressive reduction in the base tariff, and the concomitant introduction of an additional payment for meeting best-practice elements. This is illustrated in Figure 1.

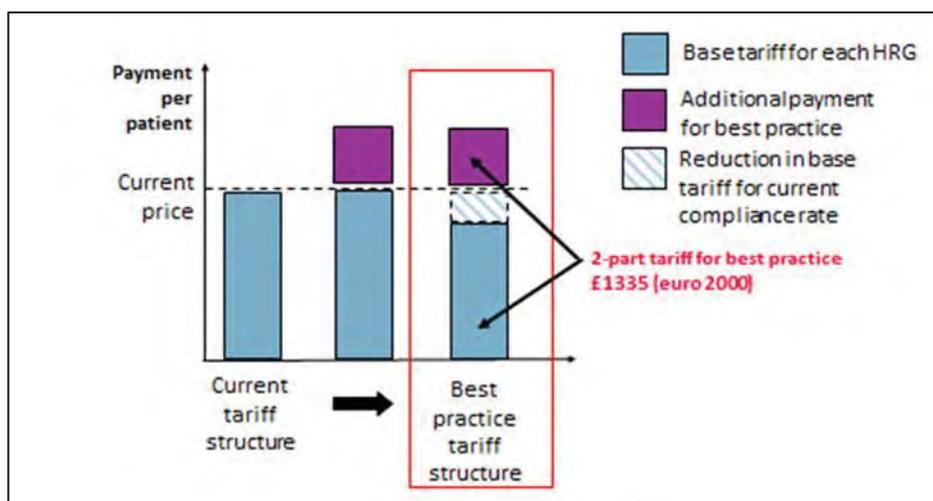

Figure 1. NHS BPT structure and implementation¹¹.

The differential between the base tariff and additional payment has increased since 2010-11,¹² and is now at £1,335. This has been principally achieved by lowering the base tariff and increasing the additional payments (Table 2). The overall payment for hip fracture has been reduced slightly between 2013-14 and 2014-15, in tandem with a reduction of episode-based tariffs across acute services in the NHS as part of a strategy to deliver efficiency dividends.

Table 2. NHS Fragility hip fracture differential between base and best-practice tariff.

Financial year	Differential
2010-11	£445
2011-12	£890
2012-13	£1,335
2013-14	£1,335
2014-15	£1,335

The approach to determining the differential price evolved year by year in consultation with health service managers, senior clinicians and consumers.¹³ To establish the first differential price in 2010-11, a costing exercise was undertaken by the NHS to determine a compliance adjustment to the average price for hip fracture HRGs. The differential between the base and best-practice prices was calculated at 7%, i.e. best-practice care was 7% more expensive than current average (base) care. In 2011-12, the differential was doubled as services improved their compliance with the best-practice elements. It was then then tripled to 21% in 2012-13. The price differential has remained the same since.¹⁴ This is believed to be due to soft intelligence feedback from stakeholder groups. That is, clinicians were wary of the potential of any unintended systemic effects on care if the differential was increased further

(e.g. safety concerns about reprioritizing theatre waitlists).¹³ A list of the 2014-15 base tariffs, best-practice tariffs and differentials for hip fracture HRGs is below in table 3.

Table 3: Base tariffs, BPTs, differential and percentage of base for hip fracture HRGs 2014-15¹⁵.

HRG code	HRG name	Base tariff (£)	Best-practice tariff (£)	Differential	% base
HA11A	Major Hip Procedures category 2 for Trauma with Major CC	7,569	8,904	1,335	18%
HA11B	Major Hip Procedures category 2 for Trauma with Intermediate CC	6,741	8,076	1,335	20%
HA11C	Major Hip Procedures category 2 for Trauma without CC	5,508	6,843	1,335	24%
HA12B	Major Hip Procedures category 1 for Trauma with CC	7,329	8,664	1,335	18%
HA12C	Major Hip Procedures category 1 for Trauma without CC	5,237	6,572	1,335	25%
HA13A	Intermediate Hip Procedures for Trauma with Major CC	5,932	7,267	1,335	23%
HA13B	Intermediate Hip Procedures for Trauma with Intermediate CC	4,549	5,884	1,335	29%
HA13C	Intermediate Hip Procedures for Trauma without CC	4,548	5,883	1,335	29%
HA14A	Minor Hip Procedures for Trauma with Major CC	1,662	2,997	1,335	80%
HA14B	Minor Hip Procedures for Trauma with Intermediate CC	1,052	2,387	1,335	127%
HA14C	Minor Hip Procedures for Trauma without CC	428	1,763	1,335	312%
VA11A	Multiple Trauma Diagnoses score <=23, with Interventions score 1-8	482	1,817	1,335	277%
VA11B	Multiple Trauma Diagnoses score 24-32, with Interventions score 1-8	1,445	2,780	1,335	92%
VA11C	Multiple Trauma Diagnoses score 33-50, with Interventions score 1-8	3,130	4,465	1,335	43%
VA11D	Multiple Trauma Diagnoses score >=51, with Interventions score 1-8	6,657	7,992	1,335	20%
VA12A	Multiple Trauma Diagnoses score <=23, with Interventions score 9-18	2,259	3,594	1,335	59%
VA12B	Multiple Trauma Diagnoses score 24-32, with Interventions score 9-18	3,942	5,277	1,335	34%
VA12C	Multiple Trauma Diagnoses score 33-50, with Interventions score 9-18	5,446	6,781	1,335	25%
VA12D	Multiple Trauma Diagnoses score >=51, with Interventions score 9-18	8,669	10,004	1,335	15%

Results

There has been a considerable increase in the achievement of best-practice elements over the course of the initiative. In the last quarter of 2013, care for 64% of hip fracture patient episodes qualified for the BPT. This figure was 59% for the same period in 2012. Two English hospitals report that none of their patients received care that was eligible for BPT throughout 2013.¹⁶

Overall, hip fracture care has been one of few clinical domains included in the BPT scheme to impact on outcome measures, with a modest but significant reduction in patient 30-day mortality¹². Patient-reported outcomes have not yet been formally evaluated.

Internal reviews of the Hip Fracture BPT have also demonstrated that there was no expenditure by the NHS in implementing the program. The total expenditure on hip fracture care by NHS purchasers has actually slightly reduced year by year (from £320 million in the year prior to the BPT implementation to £295 million two years after implementation).⁴

NHS England 2014-15 National Tariff Payment System Report – Patient Reported Outcome Measures¹⁷

This BPT is the first step towards linking payment to outcomes achieved for patients for the NHS. The system believes that through linking payment more closely to what matters to patients, namely their outcomes and experiences of care, incentives can be created for a more consistent delivery of efficient and clinically effective care.

The aim of the BPT is to reduce the unexplained variation that exists between providers in terms of the outcomes of surgery as reported by patients. The new BPT applies to all elective admissions that generate HRGs HB12B, HB12C, HB21B and HB21C. This BPT replaces the BPT for primary hip and knee replacements set out in previous 2013/14 guidance under the Payment by Results system. Payment of the BPT is conditional on criteria linked to data collected through Patient Reported Outcome Measures (PROMs) and the National Joint Registry (NJR), set out below.

There are considerable differences between individual providers' levels of compliance with both the PROMs and NJR collections. Collecting data on quality of care through PROMs and clinical audits is important as these data underpin high quality care and can inform choices made by commissioners and patients, as well as the development of policy. By linking payment for the BPT to achieving minimum levels of compliance and consent rates, we aim to improve data collection, submission and response rates.

Payment of the new BPT is therefore conditional on two areas of best-practice. The criteria for payment of the BPT are:

1. the provider not having an average health gain significantly below the national average (defined as 3 standard deviations (99.8% significance) below the mean)
2. the provider adhering to the following data submission standards:
 - a minimum PROMs participation rate of 50%;
 - a minimum NJR compliance rate of 75%; and
 - an NJR unknown consent rate below 25%.

Where these criteria are not met, providers will receive a price 10% below the best-practice price.

Health gain will be measured by the condition-specific Oxford hip score and Oxford knee score after applying a casemix adjustment for primary joint replacement procedures only. The casemix adjustment controls for patient characteristics, including the patient's health status before the operation and the average health that would be expected.

Collections of these data are well established so we do not expect this new requirement to be burdensome to providers. These particular collections contain all of the information a commissioner would need to help identify whether a provider is achieving best-practice. As data are regularly updated and published, commissioners will need to use the latest available data sets to assess whether or not providers have met the best-practice payment criteria. These are to be found at:

- PROMs: www.hscic.gov.uk/proms
- NJR: www.njrcentre.org.uk

This is a new and innovative approach to BPTs and the payment criteria have been set accordingly. The minimum criteria required to receive the BPT have been set at a level

thought achievable by most providers but below levels currently delivered by the highest achieving providers. The intention is that these rates will increase in future years in line with improvements. Therefore, all providers should strive to improve regardless of whether or not they meet the current standard. The intention is that providers and commissioners will monitor their data and, where identified as outliers, improve their performance. We recognise that there are circumstances where some providers will not be able to demonstrate that they meet all of the best-practice criteria, but where it would be inappropriate for the full BPT not to be paid.

Appendix F. Supporting analysis for Chapter 5 - Designing a national best-practice pricing model for hip fracture care

Table F1 Defining hip fracture diagnoses for the initial cohort

Diagnosis code	Diagnosis
S72.00	Fracture of neck of femur, part unspecified
S72.01	Fracture of intracapsular section of femur
S72.02	Fracture of upper epiphysis (separation) of femur
S72.03	Fracture of subcapital section of femur
S72.04	Fracture of midcervical section of femur (Transcervical Not Otherwise Specified)
S72.05	Fracture of base of neck of femur (Cervicotrochanteric section)
S72.08	Fracture of other parts of neck of femur (Fracture of hip Not Otherwise Specified, Head of femur)
S72.10	Fracture of trochanteric section of femur, unspecified, (Greater trochanter, lesser trochanter, transtrochanteric fracture)
S72.11	Fracture of intertrochanteric section of femur
S72.2	Subtrochanteric fracture

Clinical advice confirmed that the diagnoses in Table F1 are the relevant International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification (ICD-10-AM) hip fracture diagnosis codes for the cohort of interest.

Table F2 Age of patient separations with hip fracture diagnoses*

Age Split	Total number of patients	Average length of stay (days)	Average Cost	Total Cost
0 to <50 years	865	9	\$22,548	\$19,504,265
50 to <65 years	1,623	9.9	\$20,071	\$32,575,118
65 years and over	18,273	9.1	\$16,267	\$297,252,824
Subtotal: 50 years and over	19,896	9.2	\$16,578	\$329,827,942
Total acute episodes	20,761	9.2	\$16,826	\$349,332,206

*Hip fracture diagnoses are those identified in Table F1.

Table F3 Principal and additional diagnoses of hip fracture cohort

Age	Diagnosis split	Number of cases	Average length of stay (days)	Average Cost	Total Cost
50 years and over	Principal diagnosis	17,917	8.7	\$16,179	\$289,873,606
	Additional diagnosis	1,979	13.2	\$20,189	\$39,954,336
	Total aged 50 years and over	19,896	9.2	\$16,578	\$329,827,942

Table F4 Multiple trauma codes (Major Diagnostic Category 21A) AR-DRG version 7

DRG code	DRG Long Descriptions

Inherent Limitations

This Report has been prepared as outlined in the Introduction Section. The services provided in connection with this engagement comprise an advisory engagement which is not subject to Australian Auditing Standards or Australian Standards on Review or Assurance Engagements, and consequently no opinions or conclusions intended to convey assurance have been expressed.

No warranty of completeness, accuracy or reliability is given in relation to the statements and representations made by, and the information and documentation provided by stakeholders consulted as part of the process.

KPMG have indicated within this report the sources of the information provided. We have not sought to independently verify those sources unless otherwise noted within the report.

KPMG is under no obligation in any circumstance to update this report, in either oral or written form, for events occurring after the report has been issued in final form.

The findings in this report have been formed on the above basis.

Third Party Reliance

This report is solely for the purpose set out in the Introduction section and for the Independent Hospital Pricing Authority.

This Report has been prepared at the request of the Independent Hospital Pricing Authority in accordance with the terms of KPMG's engagement letter/contract dated 5th July 2018. Other than our responsibility to the Independent Hospital Pricing Authority, neither KPMG nor any member or employee of KPMG undertakes responsibility arising in any way from reliance placed by a third party on this Report. Any reliance placed is that party's sole responsibility.

1 Introduction

Around the world, health systems are looking to reform the way that they fund, organise and pay for health care. This is a response to the challenge of ensuring the sustainability of health care systems in the face of rising demand, as well as recognition that there needs to be a sharper focus on the outcomes that matter most to patients. These two elements inform the move towards value-based approaches to health care.

Australians enjoy good access to high quality health care. On most measures, Australia's system of health care is affordable, and delivers care that is appropriate and high quality. This is not to say that the Australian system is perfect; no health system is. Australia faces challenges that are similar to many confronting OECD economies – population growth, ageing, the challenges associated with higher rates of chronic disease, rising costs associated with advancing medical technology and workforce shortages. In addition, Australia faces the significant challenge of improving health outcomes for Aboriginal and Torres Strait Islander people.

There is growing interest from policy makers about whether the current arrangements for organising, delivering and funding health care in Australia are best suited to meet the current and emerging health care challenges. Against a backdrop of increasing prevalence of chronic disease, ageing populations and a health care system built around delivering care in discrete episodes, it is imperative that policy makers consider whether current payment mechanisms are best suited to efficient, effective and sustainable health care delivery into the future.

The way health services are funded and paid for forms a crucial element of this equation. In many respects, diagnosing the problems is an easier task than defining solutions. The complex structure of Australia's health system is reflected in its funding arrangements. The health system is funded by all levels of government. Funding also comes from non-government organisations, private health insurers, and individuals when they pay for some products and services without full, or with only partial, reimbursement.¹ This complexity should not deter investigation of alternative funding models that improve on the current arrangements and do not lead to unintended consequences or greater complexity without commensurate benefit.

The Independent Hospital Pricing Authority (IHPA) is responsible for the national approach to funding for public hospital services across Australia. Its primary responsibility is to determine the National Efficient Price (NEP) for public hospital services funded on an activity basis and the National Efficient Cost (NEC) for block funded services. The NEP has two key purposes²:

1. determine the amount of Government funding for public hospital services
2. provide a price signal or benchmark about the efficient cost of providing public hospital services.

Costing information used to determine the NEP is drawn from the National Hospital Cost Data Collection (NHCDC) as provided by States and Territories on an annual basis. Approximately 460 public hospitals nationwide, including all of the large metropolitan hospitals, receive funding based on their activity levels.³

IHPA recognised in the *2018-19 Pricing Framework*⁴ that there is tension between an activity based funding system oriented to treating health care episodically, and the increasing prevalence and financial significance of patients with chronic conditions, whose interaction with health services is far from episodic. IHPA also has a role to advise Australian Governments on alternative approaches to health

funding and has identified the growing interest in value-based approaches to health funding as an issue requiring detailed consideration.

Value-based programs are a broad set of performance-based payment strategies that link financial incentives to providers' performance on a set of defined measures, in an effort to achieve better value by driving improvements in quality and slowing growth in health care spending. This report presents the findings of a global horizon scan of value-based approaches to health care informed by a review of the published literature and case studies from the United States of America.

2 Current funding approaches in Australia

Total expenditure on health goods and services in Australia was \$180.7 billion in 2016–17.⁵ This represents around \$7,400 per person and 10 per cent of overall economic activity. In 2016–17, governments spent \$124.2 billion on health, or 68.7 per cent of total health expenditure in Australia. The proportion of expenditure by governments has remained relatively stable over recent years, increasing by 1.5 percentage points between 2015–16 and 2016–17.

In 2016–17, overall government contributions grew by 8.3 per cent, including a 6.1 per cent increase in the Australian Government contribution (\$74.6 billion or 41.3 per cent of total health expenditure) and an 11.7 per cent increase in the State and Territory contribution (\$49.6 billion or 27.4 per cent of total health expenditure). Non-government sources (individuals, private health insurance and other non-government sources) provided the remaining \$56.5 billion—about one-third of total health expenditure.

Expenditure on public hospital services was \$53.5 billion in 2016–17. This was up from \$52.0 billion the previous year—a real growth of 2.9 per cent—below the average annual real growth over the decade of 4.1 per cent. In 2016–17, Australian Government expenditure on public hospital services (\$21.7 billion) was up by 6.2 per cent in real terms from 2015–16—1.6 percentage points above the 10-year average annual growth of 4.6 per cent. State and Territory and local government expenditure was \$27.3 billion—a 0.1 per cent real increase from 2015–16, well below the 10-year average annual growth of 3.4 per cent.

The responsibility for delivering health care for Australians is jointly shared by the Commonwealth, State and Territory governments. The complex structure of Australia’s health system is reflected in its funding arrangements. Commonwealth, State and Territory governments have a funding and delivery role across different care settings. Funding for health care also comes from non-government organisations, private health insurers, and individuals when they pay for some products and services without full, or with only partial, reimbursement.

Australia’s national public health insurance scheme, Medicare, funded and administered by the Australian Government, comprises of three components – medical services (including visits to general practitioners (GPs) and other medical practitioners), prescription pharmaceuticals, and hospital treatment as a public patient. The latter is jointly funded by the Australian and State/Territory governments.⁶

The health care system has multiple settings, often described as:

- **Primary Care** – broadly encompasses care that is not related to a hospital visit, including activities undertaken by general practitioners (GPs) and health promotion.⁷
- **Secondary Care** – medical care provided by a specialist or facility upon referral by a primary care physician (e.g. GP) and that requires more specialised knowledge, skill or equipment than that which the primary care physician can provide.⁸

⁸ Merriam-Webster (2018). ‘*Secondary Care*’ - accessed at <https://www.merriam-webster.com>.

- **Hospitals** – deliver a range of services to admitted and non-admitted patients (emergency department and outpatient services). Public hospitals are primarily run by State and Territory governments with the Australian government providing funding through the National Health Reform Agreement between the Australian Government and the States and Territories.

In the public hospital setting, the Commonwealth, States and Territories contribute to hospital services using activity based funding where practicable and block funding in other cases.⁹

Payment mechanisms utilised for primary care and public hospitals are outlined in Table 1 below.

Table 1 - Australia's health care payment mechanisms – primary care and public hospitals

Payment method	Description	Setting
Fee-for-service	Retrospective payment for individual services and patient contacts. Under this model, consumers pay providers directly for services received.	Predominant mode of payment for GPs
Case payment	In Australia, Activity Based Funding (ABF) is a way of funding hospitals whereby they get paid for the number and mix of patients they treat. If a hospital treats more patients, it receives more funding. Because some patients are more complicated to treat than others, ABF also takes this into account. ¹⁰	Payment for public hospital inpatient cases

A number of reforms are tackling the complexities of Australia's health care system. This includes addressing the fragmentation of health system and accountabilities between different layers of government. The February 2018 Heads of Agreement between the Commonwealth and the States and Territories on Public Hospital Funding (the Heads of Agreement), establishes the basis of negotiation for a new five-year, national health agreement commencing in July 2020.¹¹

The Heads of Agreement is based on four strategic pillars of health reform, including:

1. improving efficiency and ensuring financial sustainability
2. delivering safe, high quality care in the right place at the right time
3. prioritising prevention and helping people manage their health across their lifetime
4. driving best practice and performance using data and research.

The Heads of Agreement also articulates a number of key areas of focus for longer term reform. This includes new long-term, system-wide reforms focused on, among other areas, paying for value and outcomes.

Changing patterns of illness, increasing demand for health services, and growing health expenditure are providing the impetus to consider the effectiveness of Australia's current hospital payment mechanisms. While health systems around the world face similar problems, the approaches they have taken to addressing them, particularly with reference to the way that health services are funded, are widely different.

⁹ Council of Australian Governments (2018). *Heads of Agreement between the Commonwealth and the States and Territories on public hospital funding and health reform* <https://www.publichospitalfunding.gov.au/national-health-reform/agreement>

¹⁰ Independent Hospital Pricing Authority (2019). *Activity based funding*, <https://www.ihpa.gov.au/what-we-do/activity-based-funding>.

¹¹ Council of Australian Governments (2018). *Heads of Agreement between the Commonwealth and the States and Territories on public hospital funding and health reform*. Accessed at: <https://www.coag.gov.au/about-coag/agreements/heads-agreement-between-commonwealth-and-states-and-territories-public-0>

While activity based funding provides a price signal for public hospitals to provide services more efficiently (technical efficiency¹²), it does not consider whether the provision of that service is the most effective way to care for the patient (allocative efficiency). It also has the potential to provide a financial incentive for hospitals to prioritise service volume over patient outcomes.¹³ While measures of cost are definitive, benefit measures are more complex to construct. As countries grapple with issues facing their health systems, including the rising costs of health care, there has been a push to implement financial incentives linked to value-based programs.

The Productivity Commission estimates the benefits of better integration of health services to be in the order of over \$200 billion over 20 years.¹⁴ Reform of payment systems offer the potential to address some of the systemic problems in the Australian health system. The way health is funded, paid for and the alignment of incentives across the health system are vital contributors to health system performance and outcomes.

It is important however to recognise that, while they are important, payment systems form part of a wider system of health care organisation and delivery. Payment reform on its own is unlikely to deliver transformational change to the Australian health system. Payment reform should be considered as part of a suite of policy responses available to improve the way care is organised and delivered according to a broader policy objective (e.g. reducing fragmentation of service delivery, improving integration of care across the primary and hospital based services or improving patient outcomes in a particular clinical area).

Being clear about policy objectives, whether they be broad or quite specific, is an important ingredient for success. Any effort to reform payment systems to deliver better “value” from health care spending needs to be clear about:

- the objectives of the reforms, ie how value is defined, measured and delivered
- a detailed analysis of the likely benefits of the reform, including the impacts on patient outcomes, quality of health care services and the patient experience of health care and costs of implementation
- consideration of potential unintended consequences of the reform.

Just as there is no perfect health system, there is no perfect health payment model. Importing payment models from other systems is far from easy. We need to consider how well the schemes from other jurisdictions fit to the Australian context and assess how well they are likely to work in practice.

There have been a handful of pay for performance programs trialled in Australia, and a number of jurisdictions are undertaking detailed consideration of value-based approaches. IHPA has previously considered the introduction of a bundled pricing approach for maternity services before deciding that data limitations, particularly in relation to a paucity of data in relation to shared antenatal care, were such that a robust model could not be put forward with confidence, at this stage.

As noted in the *Pricing Framework for Australian Public Hospital Services 2019-20*, some State and Territory governments are developing funding models for some patient groups to drive the adoption of patient-centred models of care. The Victorian ‘HealthLinks: Chronic Care’ program was included on the General List of In-Scope Public Hospital Services for 2018–19, and IHPA is block funding the program on a trial basis with a number of conditions specified by the Pricing Authority for NEP18. The program is a capitation funding model for patients with chronic disease and aims to reduce avoidable readmissions and presentations to emergency departments. It is expected that States and Territories will continue to trial innovative funding models alongside the current ABF system, with IHPA continuing to explore new developments in health funding nationally and internationally and opportunities to explore their impact on providing efficiency and transparency in public health systems.

¹² **Technical efficiency** is a measure of how well an input is converted into an output. It is measured as the ratio of physical output to physical input. **Allocative efficiency** is a measure of how well the available resources are allocated to production that meets the preferences of the population. It is measured as a change in net benefits (broadly defined). *Productivity Commission 2013 On efficiency and effectiveness: some definitions*, Staff Research Note, Canberra.

¹³ Independent Hospital Pricing Authority (2017). *Bundled pricing for maternity care: Final report of IHPA and the Bundled Pricing Advisory Group*. Accessed at : <https://www.ihoa.gov.au/publications/bundled-pricing-maternity-care>

¹⁴ Productivity Commission (2017). *Shifting the Dial: 5 Year Productivity Review, Report No. 84, Canberra*

There is evidence that the national introduction of activity based funding in 2011-12 has slowed the growth in the costs of providing public hospital services across Australia.¹⁵ The activity based funding approach is also reviewed annually through a public consultation process, and there is scope for it to be refined and improved in response to changing health needs.

¹⁵ Independent Hospital Pricing Authority (2018). 2017-18 Annual Report.

3 Approach

3.1 Literature review

A review of the published academic and ‘grey’ literature was undertaken to identify how health systems around the world were reforming their approaches to health funding and payment systems. The focus was on value-based purchasing, pay for performance, accountable care organisations, bundled payments, capitation payments and block funding. The review included English-language literature published from 1st January 2008 using the PubMed electronic database.

This literature scan¹⁶ highlighted that many programs of payment reform are yet to mature. This makes evaluating their impact on health outcomes difficult to assess. The level of detail available regarding program design also varied considerably and understanding how programs work ‘on the ground’ was difficult to assess from the published reports. The evidence is summarised in Section 5 in this report.

It was clear from the scan that many of the programs recently introduced in different jurisdictions in the United States may provide valuable insights from an Australian perspective. Reform of payment approaches in the United States is being driven in large part by concerns regarding the sustainability of the health care system which is grappling with growth in the costs of health care as well as rising demand for services. The concerns, particularly in relation to cost and affordability, cut across both the public and private providers and payers.

There has been significant reform of the Medicare and Medicaid public insurance schemes which are overseen by the Centers for Medicare and Medicaid (CMS). The Center for Medicare and Medicaid Innovation was established within CMS to test and disseminate promising payment and service delivery models designed to reduce spending while preserving or improving quality. The Innovation Center supports the development and testing of innovative health care payment and service delivery models. CMS is testing more than 20 models under this authority that create new incentives for clinicians and organisations with the aim of delivering better care at lower cost. A key enabler to the payment reform program in the United States has seen CMS working with states as a convener for dialogue between multiple payers, clinicians and health care organisations, and other stakeholders in each state.¹⁷

3.2 Study tour

The concerns in the United States about containing the growth of health care expenditure, and the development of a range of value-based programs by the CMS, provides a useful comparison point for what might be possible in Australia.

A study tour undertaken by IHPA during March 2019 comprised visits to the Centers for Medicare and Medicaid in Baltimore, the Health Services Cost Review Commission in Baltimore, the New York State Health Department and the Staten Island Performing Provider System. The focus of these meetings with these organisations was to assess:

- how programs were being implemented on the ground
- barriers to implementation
- how outcomes from the programs are being evaluated.

The tour also included a visit to 3M to assess how coding and classification is being used to inform the development of indicator sets across various programs in the United States.

¹⁶ KPMG (2018). *Global Horizon Scan: innovations in health funding literature review*. (unpublished)

¹⁷ Rajkumar, R., Conway, P. and Tavenner, M. (2014). *CMS – Engaging multiple payers in payment reform*, Journal of the American Medical Association 311: 1967-8.

A meeting was held with the RAND Corporation to consider their research across the United States' health system, in particular work undertaken in relation to the evidence for value-based payment programs. A visit to the Commonwealth Fund provided insights into the overall direction of health policy in the United States as well as the examples of best practice in value-based approaches from around the country. Selected case studies, prepared following these visits, are presented in the Appendix to this report.

4 Literature review findings

A global horizon scan was undertaken to identify innovations in health service pricing, payments and funding that might be considered for implementation in Australia. A key component of the project is a literature review focusing on these key elements.

The objectives of the literature review were to identify international initiatives and innovations in health funding to inform consideration of innovative approaches in Australia and to provide IHPA with an analysis of the available evidence from the international literature.

The literature review was focused on five key approaches to value-based payment.

- **Value-based purchasing (VBP)**¹⁸ refers to a broad set of performance-based payment strategies that link financial incentives to providers' performance on a set of defined measures. Both public and private payers are using VBP strategies in an effort to drive improvements in quality and to slow the growth in health care spending.
- **Pay-for-performance**¹⁹ refers to a payment arrangement in which providers are rewarded (bonuses) and/or penalised (reductions in payments) based on meeting pre-established targets or benchmarks for measures of quality and/or efficiency. These financial incentives are intended to change provider behaviour to achieve a set of objectives specified by the payer.
- **Accountable care organisation (ACO)**²⁰ refers to a health care organisation composed of doctors, hospitals, and other health care providers who voluntarily come together to provide coordinated care and agree to be held collectively accountable for the overall costs and quality of care for an assigned population of patients. The ACO payment model ties provider reimbursements to performance on quality measures and reductions in the total cost of care. Under an ACO arrangement, providers in the ACO agree to take financial risk and are eligible for a share of the savings achieved through improved care delivery, provided they achieve quality and spending targets negotiated between the ACO and the payer.
- **Bundled payments**^{21,22} are a method in which payments to health care providers are based on the expected costs for a clinically defined episode or bundle of related health care services. The payment arrangement includes financial and quality performance accountability for the episode of care. Episodes can be defined in different ways and cover varying periods of time (e.g. one year for a chronic condition, the period of a hospitalisation etc).
- **Capitation payments** involve paying a provider or group of providers to cover the majority (or all) of the care provided to a specified population across different care settings and time periods. The regular payments are calculated as a lump sum per patient.²³ Capitation models are used to control the use of health care resources by sharing risk between payer and provider, or putting the physician at financial risk for services provided to patients. To ensure that patients do not receive sub-optimal levels of care, in some systems, managed care organisations measure rates of resource utilisation in physician practices. These reports are made available to the public as a measure of health care quality, and can be linked to financial rewards, such as bonuses. Outcome measures can also be applied to assess safety and quality.

²⁰ *ibid*

²¹ *ibid*

²² Other common terms used for bundled payment arrangements are episode-based payment, episode of care payment, case rate, evidenced-based case rate, global bundled payment and global payment.

²³ NHS (2016). *Capitation: an introduction*. Retrieved from <https://www.gov.uk/guidance/capitation>

The literature review was based on the following search strategy:

- a systematic search of English-language literature published from 1st January 2008 using the PubMed database
- database searching supplemented by snowball searching
- search of relevant websites, including government, professional organisations and academic institutions.

The review involved screening of 1,127 published articles and, following assessment, 34 studies were included in the review. Most (29 studies) related to pay-for-performance programs in the United States and the United Kingdom. These studies involve a wide range of care settings, financial incentives and outcome measures.

The findings of the literature review support the findings from published systematic reviews of the evidence.

A systematic review of research published between 2000 and 2009 focused on the question of whether financial incentives impacted on the quality of care provided by primary care physicians. The review set out to identify the different types of financial incentives that have improved quality, the characteristics of patient populations for whom quality of care has been improved by financial incentives, and the characteristics of primary care providers who have responded to financial incentives.

The authors conclude that “there is insufficient evidence to support or not support the use of financial incentives to improve the quality of primary health care”.²⁴

A systematic review of value-based purchasing programs in health care was undertaken for the US Department of Health and Human Services by the RAND Corporation based on English language articles published between January 2000 and December 2012. The detailed review included 103 studies on pay-for-performance programs. The review found mixed evidence that pay-for-performance was associated with modest improvements in process-of-care outcomes but had little effect on patient outcomes.²⁵

The RAND review was extended to include articles published over the period 2007 to 2016. This systematic review found 69 studies examining the effects of pay for performance programs targeted at the physician, group, managerial or institutional level on process-of-care and patient outcomes in ambulatory and inpatient settings. The review found:

- in the ambulatory setting, low-strength evidence that pay-for-performance programs may improve process of care outcomes over the short term (2-3 years)
- limited evidence of longer-term effects of pay-for-performance
- many of the studies reporting positive findings were conducted in the United Kingdom, where incentives are much larger than the incentives in the United States
- the largest improvements were observed in areas where the baseline performance was poor
- low-strength evidence that pay for performance had little or no effect on intermediate health outcomes, although there were inconsistencies among study results
- the evidence regarding patient health outcomes was insufficient because few methodologically rigorous studies reported these outcomes
- in the hospital setting, low strength evidence showed that pay for performance had a neutral effect on patient health outcomes and a positive effect on reducing hospital readmissions.²⁶

Defining value in health care

The literature also considered the definition of value in health care. “20th Century healthcare was dominated by clinicians, effectiveness and efficiency. 21st Century healthcare will be dominated by patients, outcomes and value, because the challenges facing 21st Century healthcare in every society are massive and growing”.²⁷

Defining what is meant by “value” is an important first step in considering payment reform. Defining value is not straightforward and, as noted in Section 5 the the definition of ‘value’ is often opaque and the relationship between value and payment design is often not explained. There are different approaches to the meaning of value in health care.

Value is often defined as ‘the health outcome per dollar of cost expended’.^{28 29}

The concept of the Triple Aim in health care, advanced by the Institute for Healthcare Improvement, is also gaining support in Australia. Value is constructed as the ‘maximum health benefit at minimum cost, and—operationally—better value translates into a combination of improved health outcomes and processes of care (clinical quality), better patient experience, and reduced costs of care’.^{30 31}

The definition of value also reflects the subjective judgements regarding what matters to whom in the health system. This will vary depending on the perspective of the patient, provider or payer. In outlining a theoretically preferred design for value-based provider payment, Cattell et al. (2018) identified five dimensions of value:³²

1. **High-quality care:** Care is safe, effective, patient-centred and timely. High quality comprises ‘technical’ or clinical quality as well as patient reported measures and outcomes (e.g. PROMS).
2. **Cost-conscious behaviour:** Scarce resources are efficiently used (i.e. no misuse or overuse).
3. **Well-coordinated care:** Multidisciplinary providers communicate and cooperate well in order to realise integrated, well-orchestrated care across the continuum of care.
4. **Cost-effective innovation:** Cost-saving services result in equal or better health and health-promoting innovations are worth the additional costs.
5. **Cost-effective prevention:** Deteriorations of health problems are prevented in a cost-effective way.

Establishing the definition of “value:” is critical in informing the payment program design, particularly in developing relevant measures, during implementation and engagement, and evaluation.

5 Options for consideration

This section summarises the developments in health funding observed during the study tour and consideration of the opportunity for their application to the Australian health payments system. The discussion recognises that IHPA and several jurisdictions are already undertaking detailed consideration of value-based payment reform.

These options are not exhaustive; they are presented based on consideration of the challenges facing the Australian health care system, the existing funding and health system policy architecture and lessons from the literature. The approaches aim to refocus health financing arrangements away from payments based on the type and volume of services delivered and towards payments which are based on the value of care which is actually provided to patients. However, these trends have implications for how IHPA will count, classify, cost and price public hospital services.³³

Bundling

Current trends and evidence

Bundled payment schemes are gaining traction in the United States. For example, the Centers for Medicare and Medicaid have developed bundled pricing programs across 48 areas of clinical practice. Among those programs, the Comprehensive Joint Replacement Payment Reform Program (the Program) in Maryland illustrates how the state of Maryland is using bundled pricing to incentivise hospitals to reduce costs while maintaining or improving quality (see Appendix for a more detailed description).

The Program provides evidence for a bundle or episode-based payment in which costs of a patient's office visits, tests, treatments and hospitalisations associated with a patient's illness, medical event, or condition are grouped together. Under such arrangements, the value-based payment 'contractor' assumes responsibility for both the outcomes and the costs of the care across the continuum of the patient's trajectory for that condition.³⁴

Considerations

In an episode-based arrangement, several related episodes can be brought together. This requires data to be available, linked and of quality. Key enablers of the Comprehensive Joint Replacement payment reform program were robust data collection systems and clinician buy-in and engagement.

Bundled pricing offers particular benefit with regard to hospital based services, but it has also been used in relation to mental health and for chronic conditions such as diabetes. Bundled payments aim to incentivise efficient use of resources across the pathway, effective care co-ordination, appropriate treatment and reduction in avoidable activity.

Australian context

IHPA has previously detailed the potential benefits of the bundled pricing approach, the practical difficulties associated with designing a bundle and recommendations regarding how these difficulties might be overcome. IHPA's work to develop a bundled pricing approach for maternity care concluded that a single person identifier was a precondition to implementation, as a robust person identifier would

³³ Independent Hospital Pricing Authority (2019). *Pricing Framework for Australian Public Hospital Services 2019-20*

³⁴ New York Department of Health (2017). *DSRIP Program Roadmap (November 2017)*.

allow IHPA to accurately identify service delivery to patients across settings of care, financial years and hospitals.³⁵ This is an important difference when comparing the US and Australian health systems.

Consideration should be given to revisiting the options for bundling in maternity care, joint replacement and some areas of cancer treatment. There are two important issues that need to be resolved in the design phase:

- the clinical 'buy-in' and agreement on what constitutes good quality care
- data linkage to enable full understanding of the relationships between primary care, secondary care and hospital-based care and to enable better measurement of meaningful clinical outcomes. Effective data linkage is more complicated when data is fragmented among different payers and providers.

Capitation models

Current trends and evidence

Capitation models involve paying a provider or group of providers to cover the majority (or all) of the care provided to a specified population across different care settings and time periods. The regular payments are calculated as a lump sum per patient.³⁶

Considerations

This approach presents some challenges that would need to be considered and managed. The challenges include:

- a risk that the payment mechanism may create an incentive to reduce appropriate care for patients
- difficulties associated with prospectively setting appropriate resource use and defining the capitation price
- adjusting for severity of illness across different cohorts of patients to ensure fairness across different regions
- defining how risks and gains are shared and managed between funders and providers (noting that a capitation based-model for community-based chronic disease management would likely require multiple providers to work collaboratively).

These challenges can be addressed through careful design and need to be set against the potential for this payment reform to drive better integration of care for patients with chronic disease.

Australian context

In the Australian context, implementation of capitation models could involve a prospective payment to a local health authority (or some other vehicle or organisation) to manage care across different settings on behalf of a defined cohort of patients with an inherent incentive to provide the care at the lowest cost. Consideration could be given to whether this might be jointly managed by a Local Health Network and a Primary Health Network with an appropriate governance agreement setting out responsibilities, data sharing arrangements and reporting requirements. HealthLinks provides a useful example and future evidence-base to further develop capitation models across different settings.

³⁵ Independent Hospital Pricing Authority (2019). *Pricing Framework for Australian Public Hospital Services 2019-20*

³⁶ NHS (2016). *Capitation: an introduction*. Retrieved from <https://www.gov.uk/guidance/capitation>

In Victoria, HealthLinks: Chronic Care ('HealthLinks') enables health services to use funding for a specific cohort of patients with chronic and complex health needs more flexibly to deliver a different suite of services to better meet their needs. There is no new HealthLinks funding stream – the trial is funded from the current total weighted inlier equivalent separation (WIES) funding pool.

Health services have the flexibility to use projected inpatient activity-based WIES funding to design packages of care around the needs of some of their highly complex patients. The projected funds are converted into a separate funding pool ('HealthLinks capitation grant'). Although health services may choose to design packages for a subset of the enrolled patients, funding is based on the predicted average number of HealthLinks-enrolled patients.³⁷

Regionally-coordinated service responses to improve system-wide outcomes

Current trends and evidence

The Staten Island Performing Provider System (SI PPS) provides insight into how groups of providers can work together to tackle community-level challenges and proactively address service demand influenced by social determinants. The SI PPS focuses on improving the quality of care and overall health for Staten Island's Medicaid and uninsured populations, which include more than 180,000 Staten Island residents. Its goals are to:

- improve access to high quality, culturally sensitive care
- improve population health and health literacy
- reduce avoidable emergency room visits by 25 per cent
- reduce preventable hospital admissions and readmission.

Through partnership agreements, each PPS partner is collectively accountable for measurable improvements in clinical outcomes, system utilisation, population health and patient experience. Participating providers receive incentive payments for achieving project milestones via a managed care contract, with PPSs determining the method for distributing these funds.

Considerations

The successful application of the PPS program in Staten Island can be attributed to, among other things, the way its governance mechanisms facilitate provider collaboration, use of data and analytics to deliver real insights, its commissioning approach, and access to dedicated funding streams aligned to achievement of outcomes. These enablers to success are explored further below:

- **Health information exchange:** A critical underpinning of SI PPS is the use of health information exchange capabilities to support team-based care across PPS members and health care settings. This enables members to securely access patient data, and for members to view notifications of patient events, such as admissions and emergency department visits. This infrastructure is a fundamental component of the PPS program achieving its intended project outcomes, where the main interventions require robust, collaborative care planning and documentation³⁸. Moreover, patient-level data linked through the health information exchange provides a powerful, analytical basis for targeted interventions.
- **Turning data into business intelligence:** SI PPS operates on the philosophy that data is fundamental in delivering system reform. SI PPS and its partners leverage an integrated platform that gathers data from multiple sources, including claims data, core reports (including ambulance, schools and community data), Department of Health information and public data which feeds

³⁷ DHHS (2019). HealthLinks, <https://www2.health.vic.gov.au/about/publications/Factsheets/Healthlinks-factsheet>

³⁸ Medicaid (2017). *Achieving Coordination of Care to Improve Population Health: Provider collaboration in Delivery System Reform Incentive Payment Programs*, <https://www.medicaid.gov/medicaid/section-1115-demo/downloads/evaluation-reports/1115-ib2-508-dsrip-provider-collaboration.pdf>

directly into the electronic data warehouse. With geospatial-mapping, SI PPS can identify areas lacking in key services, filter in on specific conditions, and undertake trend and predictive analysis. This includes utilisation trends (including hospitalisation and medication usage) and claims data trends. Analysis can be filtered by demographics, chronic illness, and other key variables. This supports SI PPS and its partners to design and implement projects which are evidenced-based, and provide the basis to test and monitor innovative service delivery models.

- **Governance:** SI PPS is co-led by Staten Island University Hospital and Richmond University Medical Center, with a network of over 70 partners which includes skilled nursing facilities, behavioural health providers, home health care agencies and a wide range of community-based clinical facilities. A key enabler for SI PPS has been a strong governance structure and central staff that support all providers in the network to provide services in a coordinated manner that directly impacts system outcomes. This approach is also facilitated through the partnership agreement and funding mechanisms.
- **Funding mechanism:** A key focus in implementing SI PPs was to include a base payment, in addition to incentive funding to provide an impetus for providers to work collaboratively together to deliver community-level outcomes. Funding was also leveraged to build capability for all providers to deliver coordinated care. This included undertaking a comprehensive inventory of the health workforce to identify capability, supply and demand issues, and emerging job categories.
- **Building the capacity of the whole system:** A key focus for SI PPS has been on building capacity across the health care system with its partners at the organisation and workforce level. This has been undertaken through joined up training programs, regular symposiums, establishment of project working groups with clear governance arrangements, and partnership reporting. SI PPS has also prioritised engaging with patients in the design and implementation of projects and their active monitoring.

Australian context

The SI PPS case study provides a compelling case study in understanding how financial and regulatory levers can be used to collaboratively transform the delivery of health services within a defined region to deliver better outcomes. In the Australian health system, while existing service-delivery and governance structures have some of the same objectives, there is no obvious comparator. For example, while Primary Health Networks (PHNs) play a key commissioning role, and often work closely with other care providers within a given region, they are established and resourced to influence rather than manage the regions they govern. Specific challenges are outlined below.

- Shorter term funding cycles prevalent in the PHN funding environment create significant limitations in achieving sustainable community-level outcomes.³⁹ The SI PPS case study highlights the need for non-transactional approaches to commissioning to develop coordinated and collaborative models.
- While an overarching objective in its commissioning approach, co-commissioning requires significant effort to develop a shared understanding and objectives, navigate funding allocations, share data and commence co-planning.⁴⁰

As a major policy initiative, PHNs have significant potential to impact the integration of care and to improve the health of populations through devolving responsibilities for health planning and commissioning to the regional level.⁴¹ However, to achieve the outcomes associated with the SI PPS program, the following areas require consideration:

⁴¹ University of New South Wales (2019). *The National Evaluation of the Primary Health Network Program* <https://cphce.unsw.edu.au/research/health-system-integration-and-primary-health-care-development/national-evaluation-primary>

- An effective and supported health information exchange which provides service providers with access to a real-time data and analytical capability. The integration of data from multiple sources requires the resolution of a range of technical, privacy and security aspects
- Funding mechanisms which incentivise providers to deliver services in a coordinated and collaborative manner commensurate with the health needs of the community
- Governance structures which provide an impetus for coordinated and collaborative care delivery
- Redefined role of PHNs to enable them to intervene at the regional level to positively impact social determinants of health. This includes supporting legal instruments and agreements with partners.

Appendix

Appendix A: Case Studies

A.1 Innovative funding approaches in the United States

No country spends more on health than the United States. In 2017, health care expenditure was \$3.7 trillion.⁴² This represents around 17.2 per cent of Gross Domestic Product. This compares with the OECD average of 8.8 per cent and the 9.1 per cent in Australia. The expenditure per person in 2017 was \$10,209 in the United States, compared with the OECD average of \$3,992 and the Australia per person expenditure of \$4,543.⁴³

This expenditure on health care is not reflected in better health outcomes. On a range of health outcome measures, the United States does not perform as well as might be expected. The performance of the United States' health care system consistently rates last among high income countries. The major challenges facing the United States' health system include:

- Lack of access to health care for a large proportion of the population which do not have access to health insurance or who are under-insured
- Relative under-investment in primary care in the United States compared with other countries
- Administrative inefficiency of the United States' health care system resulting from the complexity of obtaining care and paying for it.⁴⁴

Addressing these challenges is complex and made doubly so by the 'hyper partisan' nature of health policy debate in the United States. The concerns regarding rising health care costs for both public payers and private payers (insurers), access to health care for a significant proportion of the population and the complexities of the organisation and delivery of health care are driving reform. While many of the issues confronting policy makers in the United States are different to those in Australia, the similarities with regard to the federal system of health care and the concerns about sustainability mean that the reform programs being pursued within the United States hold lessons for policy makers in Australia.

The *Affordable Care Act*, enacted in 2010, led to significant insurance and health systems reforms. The *Medicare Access and CHIP Reauthorization Act of 2015* (MACRA) was intended to align financial incentives for providers with high-value care. The reforms under the MACRA are designed to support the transition of the US health care system from fee-for-service payment to payments based on the value and quality of care delivered. The Trump Administration has changed aspects of the way programs are delivered under the *Affordable Care Act*, particularly the role of the State and Federal governments but has continued to 'by and large' enforce the law as written. Key programs are:

- Medicare is financed through a combination of payroll taxes, premiums, and federal general revenues.
- Medicaid is tax-funded and administered by the states, which operate the program within broad federal guidelines. States receive matching funds from the federal government for Medicaid at rates that vary based on their per-capita income. The expansion of Medicaid under the *Affordable Care Act* was fully funded by the federal government through 2017, after which the government's funding share will be phased down to 90 per cent by 2020 (subject to change under the new administration and Congress).

⁴² Martin A, Hartman M, Washington B, Catlin A et al. (2018). *National Health Care Spending In 2017: Growth Slows To Post–Great Recession Rates; Share Of GDP Stabilizes Health Affairs 38 (1)*

Accessed 4 May 2019.

A number of reforms included in the *Affordable Care Act* attempt to develop payment methods in the Medicare and Medicaid programs that reward high-quality, efficient care. Some of these use pay-for-performance mechanisms, whereas others rely on bundled payments, shared savings, or global budgets to incentivise integration and coordination among health care providers.

In 2015, the U.S. Department of Health and Human Services announced a goal to move 50 per cent of Medicare payments to alternative payment models, including Accountable Care Organisation based arrangements.

A.2 Center for Medicare and Medicaid Innovation

In 2015, the Department of Health and Human Services established a goal to move to 50 per cent of Medicare payment to alternative payment models by 2018. The *Affordable Care Act* included a series of reforms to payment systems and established the Center for Medicare and Medicaid Innovation within CMS to test and disseminate promising payment and service delivery models designed to reduce spending while preserving or improving quality.

The Innovation Center within CMS supports the development and testing of innovative health care payment and service delivery models. CMS is testing more than 20 models under this authority that create new incentives for clinicians and organisations that deliver medical care through CMS programs to deliver better care at lower cost. The Innovation Center’s Innovation Models are organised into seven categories:

1. Accountable Care
2. Episode-based Payment Initiatives (e.g. Comprehensive Care for Joint Replacement Model – see following section for a case study)
3. Primary Care Transformation
4. Initiatives Focused on the Medicaid and CHIP Population
5. Initiatives Focused on the Medicare-Medicaid Enrollees
6. Initiatives to Accelerate the Development and Testing of New Payment and Service Delivery Models
7. Initiatives to Speed the Adoption of Best Practices.

A key enabler to the payment reform program in the United States has been CMS working with states to act as a convener for multiple payers, clinicians and health care organisations, and other stakeholders in each state.⁴⁵

Table 2: Payment taxonomy framework

Payment method	Description	CMS models
1. Fee-for-service: no link to quality	Payments are based on volume of service and not linked to quality or efficiency	<ul style="list-style-type: none"> • Limited in Medicare Fee for Service; majority of payments are now linked to quality
2. Fee-for-service: link to quality	At least a portion of payments vary based on the quality or efficiency of health care delivery	<ul style="list-style-type: none"> • Hospital Value-Based Purchasing • Physician value-based modifier

⁴⁵ Rajkumar, R., Conway, P. and Tavenner, M. (2014). *CMS – Engaging multiple payers in payment reform*, Journal of the American Medical Association 311: 1967-8.

Payment method	Description	CMS models
		<ul style="list-style-type: none"> • Readmissions/hospital acquired condition reduction program
3. Alternative payment models built on fee-for-service architecture	Some payment is linked to the effective management of a population or an episode of care. Payments still triggered by delivery of services, but opportunities for shared-savings or two-sided risk.	<ul style="list-style-type: none"> • Accountable care organisations • Medical homes • Bundled payments • Comprehensive primary care initiative
4. Population-based payment	Payment is not directly triggered by service delivery, so volume is not linked to payment. Clinicians and organisations are paid and responsible for the care of a beneficiary for a long period.	Eligible Pioneer Accountable Care Organisations in years 3-5

Source: Based on Rajkumar, R., Conway, P. and Tavenner, M. (2014). CMS – Engaging multiple payers in payment reform, *Journal of the American Medical Association* 311: 1967-8.

The models being tested are directly layered on top of fee-for-service architecture. In the case of Medicare, the base architecture is the Medicare Physician Fee Schedule, which also underlies the fee schedules in use in private insurance and Medicaid programs.⁴⁶

Program evaluation, results and implications

Four operational features affect the design and evaluation of new CMS payment and delivery models.⁴⁷ First, for most models, participation by hospitals, physicians and other clinicians, and community-based organisations is voluntary. As such, the design, scope, and implementation of the models are influenced by the need to engage willing partners.

Second, many models are designed to foster multi-payer participation. CMS finances only a portion of health care delivery in the United States. To achieve its aims, CMS must work with other payers to align incentives.

Third, CMS models are not static. Every model is designed with the intent that CMS will make changes incrementally and refine interventions and incentive structures as more is learned about the performance of models. That is, these models have feedback and learning systems embedded into their design to allow them to adapt to better meet their core objectives.

Fourth, the institutional, local, and market context in which model participants operate can vary substantially. It is important to determine how and why model participants succeed or fail in order to provide an accurate sense of what will happen if models are expanded and to inform how best to structure potential expansion activities.

Collectively, these four operational features make CMS models complex to evaluate. Many traditional research designs that may provide a high degree of rigor in evaluating “conceptually neat components of clinical practice,” such as randomised clinical trials, provide minimal insight when applied to complex, multi-component interventions. In short, the optimal evaluation approach varies according to both what

⁴⁶ Berenson, Robert A.; Ginsburg, Paul B. (2019). *Improving The Medicare Physician Fee Schedule: Make It Part Of Value-Based Payment*. Health Affairs. Febv2019, Vol. 38 Issue 2, p246-252. 7p. DOI: 10.1377/hlthaff.2018.05411

⁴⁷ Howell BL, Conway PH, Rajkumar R. (2015). *Guiding Principles for Center for Medicare & Medicaid Innovation Model Evaluations*. JAMA. 2015; 313(23):2317–2318. doi:10.1001/jama.2015.2902

information needs to be learned and what evidentiary threshold will be acceptable for action on evidence.

To manage this complexity, CMS applies three guiding principles when evaluating models:

- examine model progress frequently and in a timely manner so that both CMS and model participants can improve their performance over the life of the model
- apply the most rigorous evaluation methods possible to provide policy makers with the best information available
- evaluate comprehensively to determine whether a model is successful and to describe the drivers of that success.

CMS contracts with external evaluators for all Innovation Center Models to ensure the independence of evaluation results.

One of the models introduced by the CMMI is the Comprehensive Care for Joint Replacement.

Comprehensive Care for Joint Replacement model

The Comprehensive Care for Joint Replacement (CJR) model tests whether an episode-based payment approach for lower extremity joint replacement can incentivise hospitals to reduce costs while maintaining or improving quality.

Participating hospitals are financially accountable for the quality and cost of health care services during the 90 day episode. At the end of each performance year, the hospital's actual episode spending is compared to the hospital's quality adjusted target price, and hospitals can earn or lose money based on their performance. All hospitals in selected areas were required to participate. The mandatory, randomised design allows insights that would not be possible from voluntary models due to the ability to observe results in a wide variety of hospitals and markets.

Table 3: CJR Program Design

CJR strategies	Model Implementation	Model intended Impacts
<ul style="list-style-type: none"> Mandatory, randomised design to observe results in a wide variety of hospitals and markets. CJR hospitals receive separate episode target prices for MS-DRGs 469 and 470, reflecting the differences in spending for episodes initiated by each MS-DRG. Simple risk stratification methodology to set different target prices for patients with hip fractures within each MS-DRG. Participating hospitals receive bonuses or pay penalties based on Medicare spending per hip- or knee-replacement episode (defined as the hospitalisation plus 90 days after discharge). Hospitals share savings with Medicare if spending falls below the benchmark or, starting in 2017, they pay a penalty if spending exceeds the target. As with the accountable care organisation programs in Medicare, the savings or losses of hospitals are adjusted according to their performance in a mix of hip- or knee-replacement quality measures such as rates of complications. 	<ul style="list-style-type: none"> CJR implemented in 67 geographic areas, defined by metropolitan statistical areas (MSAs). On 1 December 2017, participation for all rural and low volume providers in CJR became voluntary as did participation for all providers located in 33 of the 67 MSAs. During a CJR episode, fee-for-service payments are made as usual to all providers. Participating hospitals then undergo an annual retrospective reconciliation process in which their average spending per episode is compared with a hospital-specific benchmark. The episode benchmark prices used to calculate hospitals' target prices are based on a blend of a hospital's own historical standardised spending and regional historical standardised spending on LEJR episodes, moving towards 100% regional pricing for Performance Years 4 and 5. 	<ul style="list-style-type: none"> Reduce spending without compromising quality across an entire episode of care during the index hospitalisation and after discharge.

Source: Based on CMS (2018), *Comprehensive Care for Joint Replacement Model*, retrieved from: <https://innovation.cms.gov/initiatives/CJR> and CMS *Comprehensive Care for Joint Replacement Model: Performance Year 1 Evaluation Report*, retrieved from: <https://innovation.cms.gov/Files/reports/cjr-firstannrpt.pdf>

An evaluation of the first two years of the program identified modest reduction in spending per hip- or knee-replacement episode, without an increase in rates of complications.⁴⁸ While the program yielded a three per cent reduction in payments, this was significantly offset by bonuses paid by Medicare to hospitals with spending below their benchmark.

Decreased Medicare spending on hip- and knee-replacement episodes at participating hospitals was almost exclusively related to reductions in the use of post-acute care services in skilled nursing facilities and inpatient rehabilitation facilities. The two year evaluation results were consistent with previous data demonstrating savings in bundled-payment models, and other alternative payment models have been concentrated in changing the use of post-acute care services.^{49,50} Post-acute care services may be the easiest target for hospitals to decrease episode-level spending because it is often unclear when these services are beneficial or what intensity of post-acute care is most appropriate.

The CJR program is unique in that it is one of the only payment models in Medicare implemented as a mandatory randomised trial. The mandatory participation in the CJR program generated considerable debate, culminating in the Trump administration transitioning the program to a partly voluntary model as of March 2018.⁵¹

While the future of mandatory payment models is uncertain, the CJR program was useful in addressing the question of whether savings seen in previous evaluations of bundled-payment programs were attributable to the select nature of the hospitals that volunteered.

A primary concern about current bundled-payment programs is that they create a financial incentive to treat healthier patients rather than those who are sicker and whose care may be more costly. There has been inconsistent evidence on risk selection in previous evaluations of voluntary bundling and the CJR program. While the CJR program evaluation did not identify any substantive changes in primary risk selection, in treatment areas, researchers found evidence of differential reductions in the percentage of disabled patients undergoing hip- or knee-replacement procedures. Adjustment for these and other observable characteristics of the patients had a minor effect on estimates of savings. However, the authors could not examine whether changes in other unobserved risk factors for high spending after surgery may have contributed to study results. Risk selection under the CJR program therefore requires further investigation.⁵²

Summary

- The CJR payment reform program focused on incentivising hospitals to reduce costs while maintaining or improving quality.
- The model provides evidence for a bundle or episode-based payment in which costs of a patient's office visits, tests, treatments and hospitalisations associated with a patient's illness, medical event, or condition are grouped together. Under such arrangements, the value-based payment 'contractor' assumes responsibility for both the outcomes and the costs of the care across the continuum of the patient's trajectory for that condition⁵³.
- In an episode-based arrangement, several related episodes can be brought together. This requires robust data quality and availability. A key enabler for CJR was robust data collection systems and clinician buy-in and engagement.

- Internationally, more and more countries are implementing emerging best practices to treat chronic conditions as full-year-of-care bundles, emphasizing the continuous nature of this care, including all condition-related care costs.⁵⁴
- New York State has prioritised the Maternity Care Arrangement (spanning the pregnancy, delivery, 60 days postpartum for the mother, and the first month of the baby's care) for bundle-payment.⁵⁵
- In Australia, several of the necessary preconditions for the successful implementation of bundled pricing for maternity care, and bundled pricing schemes generally within Australian public hospitals, was considered by IHPA in 2017.⁵⁶

A.3 The Maryland All Payer System

The state of Maryland has operated an all-payer hospital rate-setting system since the mid-1970s. It is the only state in the United States that was exempt from Medicare's Inpatient Prospective Payment System and Outpatient Prospective Payment System. Until the All-Payer Model took effect in 2014, Maryland maintained these exemptions by meeting the requirement that cumulative growth in Medicare inpatient payments per admission since January 1981 remain below cumulative growth nationally.

However, in recent years, the cost per admission grew at a faster rate in Maryland compared to the rest of the United States. This created concerns that without a change in cost trajectory, Maryland's long-standing waiver could be at risk. Furthermore, the focus on cost per admission was poorly aligned with other health care delivery system reforms underway in Maryland and across the United States that focused on comprehensive, coordinated care across delivery settings.⁵⁷

In response to these concerns, Maryland proposed a new hospital payment model which focused on a move from controlling payments per inpatient admission to controlling total payments for hospital services. On 1 January 2014, Maryland implemented its All-Payer Model for hospitals. This transitioned the state's hospital payment structure to an all-payer, annual, global hospital budget that encompasses regulated inpatient and outpatient hospital services.

Maryland adopted the All-Payer Model as the first step toward a population-based payment model that would hold hospitals responsible for use of all health care services by the populations they serve. Under the new agreement with the CMS, Maryland must do the following:⁵⁸

- limit all-payer per capita inpatient and outpatient hospital cost growth to the previous 10-year growth in gross state product, set at 3.58 per cent annually for the first 3 years of the model, with an opportunity to adjust the rate for Years 4 and 5 based on more recent data
- generate \$330 million in savings to Medicare over five years based on the difference in the Medicare per-beneficiary total hospital cost growth rate between Maryland and that of the nation overall
- reduce its 30-day readmission rate to the unadjusted national Medicare average over five years
- reduce the rate of potentially preventable complications by nearly 30 per cent over five years
- limit the annual growth rate in per-beneficiary total cost of care for Maryland Medicare beneficiaries to no greater than 1.0 percentage point above the annual national Medicare growth rate in that year
- limit the annual growth rate in per-beneficiary total cost of care for Maryland Medicare beneficiaries to no greater than the national growth rate in at least one of any two consecutive years

⁵⁸ *ibid*

- submit an annual report demonstrating its performance along various population health measures.

By July 2014, all 46 general acute-care hospitals in the state were operating under a global budget, with global budgets encompassing 95 per cent of hospital revenue. Under the Maryland All-Payer Model, the Health Services Cost Review Commission establishes an annual global budget, or allowed revenues, for each hospital.

The annual budget is built from revenues during a base period (2013), which are adjusted for future years using a number of factors, both hospital specific and industry wide. Each year the hospital's global budget is updated to reflect an allowed rate of hospital cost inflation, approved changes in the hospital's volume based on changes in population demographics and market share and additional adjustments related to reductions in potentially avoidable utilisation, quality performance, uncompensated care and changes in various adjustments (e.g. user fees).

The Health Services Cost Review Commission then sets rates for services that Maryland hospitals use to bill all payers so that total payments (based on expected utilisation) will match the global budget. Public payers (Medicare and Medicaid) are allowed a 6 per cent discount on charges, which was also in place before the implementation of the All-Payer Model. As under Maryland's previous hospital payment system, each hospital bills payers for services provided using the hospital's service-specific rates. Unlike the previous system, the global budget establishes a ceiling on hospital revenues. Except for certain hospitals, the global budget cap applies to services provided to both Maryland residents and non-residents. In addition to services provided to non-residents at hospitals with an exemption for non-resident services, hospitals are permitted non-regulated revenues for other specified services (for example, home health, outpatient renal dialysis, and skilled nursing facility services).

Hospitals have an incentive to ensure that revenues do not fall short of or exceed their budgets. To the extent that actual utilisation deviates from projected utilisation and hospital revenues vary from the global budget, a one-time adjustment to the approved budget for the following year is made to compensate hospitals for charges less than the approved budget and to recoup charges in excess of approved revenues.

Source: KPMG analysis based on Haber, S. et al. (2018), *Evaluation of the Maryland All-Payer Model: Third annual report.*

Three recent studies have sought to understand more about the effect of Maryland’s payment reforms on the delivery of care. One study reported on the experience of areas served by seven rural hospitals in the pilot period,⁵⁹ a second on the experience of eight counties not previously part of the pilot program during the first two years of the statewide model⁶⁰ and a third on all 24 Maryland counties through the first three years of the model.⁶¹

1. In terms of absolute changes that occurred during the intervention, the three studies all found similar experiences for the Medicare population in Maryland: reductions in hospital admissions and increases in emergency department use without admission.
2. Hospitals moved 100 percent of their revenue across all payers into population-based payments in just three years, and the state surpassed its cumulative savings target of \$330 million in reduced Medicare hospital expenditures, generating \$916 million in savings, relative to what was the estimated projected Maryland spending based on the national growth rate, through 2017.⁶²
3. Hospitals also improved quality, reducing by half the rate of potentially preventable conditions that comprise Maryland’s Hospital Acquired Condition program.⁶³

In the proposed next phase of the model, Maryland plans to commit to achieving savings in the total cost of care delivered to patients, whether in the hospital or the ambulatory setting.⁶⁴ The Maryland Total Cost of Care model, under the authority of the Innovation Center, marks the first time that CMS will hold a state accountable for the total cost of care incurred by resident Medicare fee-for-service beneficiaries.⁶⁵

Summary

- The focus of the Maryland All-Payer Model was on reducing hospital expenditure, primarily through hospital diversion and reduced utilisation.
- A fundamental component of the program was the close coordination between federal and state partners, from program design to execution. It also required extensive resource investment from CMS and the state, given the joint responsibility for administering the model’s programs.

A.4 New York State Delivery System Reform Incentive Payment

There are approximately six million Medicaid beneficiaries across New York State and Medicaid expenditure is around USD\$6 billion each year. In the period from 2003-2011, spending on Medicaid was rising at 10 per cent annually, reaching USD\$50 billion in 2011. Despite the spiraling expenditures, quality measures were declining.

New York embarked on a wide ranging program of Medicaid Redesign designed to improve health outcomes, efficiency of service delivery and value for money over a nine year period commencing in 2011. Through the Medicaid Redesign program, the state was able to curb the growth in spending and demonstrate projected saving of around USD\$17 billion. In 2014, the federal government approved a waiver which enabled New York State to reinvest \$8 billion of the future savings back into the system in the form of the Delivery System Reform Incentive Program (DSRIP). The DSRIP is running over the period 2014–2020.

One of the major components of this program is instituting a new payment model with the goal of converting 80-90 per cent of payments from fee-for-service to value-based by 2020. DSRIP is a major collective effort to transform New York State's Medicaid health care delivery system from a fragmented inpatient care focused system, to an integrated and community based system focused on providing care in or close to the home.⁶⁶

The guiding principles of the New York approach are shown in Table 6.

Table 6: Payment reform guiding principles

- Transparent and fair, increase access to high quality health care services in the appropriate setting, and create opportunities for both payers and providers to share savings generated if agreed benchmarks are achieved
- Be scalable and flexible to allow all providers and communities, regardless of size, to participate, reinforce health system planning, and preserve an efficient and essential community provider network
- Allow for a flexible multi-year phase to recognise administrative complexities including system requirements (i.e. information technology)
- Align payment policy with quality goals
- Reward improved performance as well as continued high performance
- Incorporate a strong evaluation component and technical assistance to assure successful implementation
- Engage in strategic planning to avoid the unintended consequences of price inflation, particularly in the commercial market
- Financially reward, rather than penalise, providers who deliver high value care through emphasising prevention, coordination, and optimal patient outcomes, including interventions that address underlying social determinants of health

Source: New York Department of Health (2017), *DSRIP Program Roadmap*.

Over the last two years of the program, New York has designed 11 different payment reform options ranging from mental health to diabetes to long term care. New York has put together a distinctly flexible 'menu of options' for providers to engage in payment reform. They have clearly articulated that by the end of the program, all providers' performance will be evaluated on a 'value basis' (i.e. reference to quality outcomes and efficiency of spend).

⁶⁶ New York Department of Health (2017). *DSRIP Program Roadmap*.

However, realising that there is a wide range of capability and appetite for adopting a new payment model, New York is allowing providers to 'opt in' when they want, how they want and with varying levels of risk sharing. Providers can select between options such as a capitated budget for a general population (e.g. based on a registered GP list) to a condition-specific bundle (e.g. maternity) to a capitated budget for a specific demographic (e.g. learning disabilities).

Therefore, multiple payment reform options can co-exist and be tailored to a provider's scale and care focus. Providers may also choose to adopt these arrangements virtually, with limited risk sharing for the first year or two to allow them to build up their capacity for risk bearing.

The scheme covers all Medicaid services for patients in the state, including primary, community and hospital care. The only exclusions are high cost drugs and transplantation services which continue to be paid for on a pass-through and fee-for-service basis respectively. All health care providers delivering Medicaid reimbursed services are encouraged to opt in to value-based payments. There is no tendering but there is a range of alternative providers and patient choice.

Providers are given a 'target budget' for a specific population or condition. If they are more cost efficient than the target budget and meet pre-determined quality measures, they are eligible for 'shared savings' which is split between the provider and commissioner. The more risk the provider bears, the higher proportion of the savings it keeps.

While New York is allowing providers to 'opt in' at their own discretion, there are a number of bonus incentive payments to increase early implementation of value-based payment. For example, providers who pilot value-based payment arrangements receive a bonus as do providers who quickly move up in levels of risk sharing.

In addition to the incentivising bonus payments for certain providers, New York also will be enforcing penalties (e.g. decreased future budget) to those providers who by Year 5 are exceeding their target budget and missing their quality measures. Providers who are partnering with others are responsible for coordinating amongst themselves how to distribute both risk sharing and any potential shared savings.

Patients can choose a range of competing systems for Medicaid services and switch away from one system for services when they wish to do so. This means that there is an additional constraint preventing providers from reducing access to or quality of care within a capitated system, alongside the measurement of access and quality standards as part of the scheme.

There is little publicly available information on the costs for purchasers and providers of administering the scheme. These may be quite high, given the costs of billing for reimbursement of services and the costs of monitoring providers' performance.

Since the New York DSRIP is ongoing, there are only preliminary results. Some early results show promise. On national comparisons of avoidable hospital use and cost, for example, New York has moved from 50th to 26th in the last six years. Over the period 2009 to 2015, New York's overall health system quality of care has also improved from 21st to 13th in the country. New York has garnered significant provider and stakeholder buy in with an estimated 15 value-based payment pilots beginning this year.

The scheme gives providers flexibility for providers to decide how to phase in new payments and incentives, allowing more advanced providers to excel and giving struggling providers time to adjust to the new reimbursement method. Many of the payment reform options can be piloted virtually with incremental risk transfer to help build up data on costs and performance and develop providers' capability to operate the new system. The opportunity for shared savings is more attractive to providers than an outcomes-based approach where the budget is top sliced and payment withheld until the achievement of the desired outcomes.

The approach requires strong system leadership, robust governance and a pragmatic timeline to implement multiple payment options. New York had a significant amount of upfront investment from the federal government to help implement this program. Many of the payment reforms focus on promoting prevention and primary care efforts, however it may take many years to truly realise the effects of these efforts. It may require a robust data and analytics capacity to implement the system.

One of the objectives of the DSRIP is to bridge the gap between health and social sectors through value-based payment arrangements in areas such as learning disabilities. They are doing this by incentivising

holistic outcomes (e.g. meaningful day measures) and also by looking at total expenditure across health and social care.

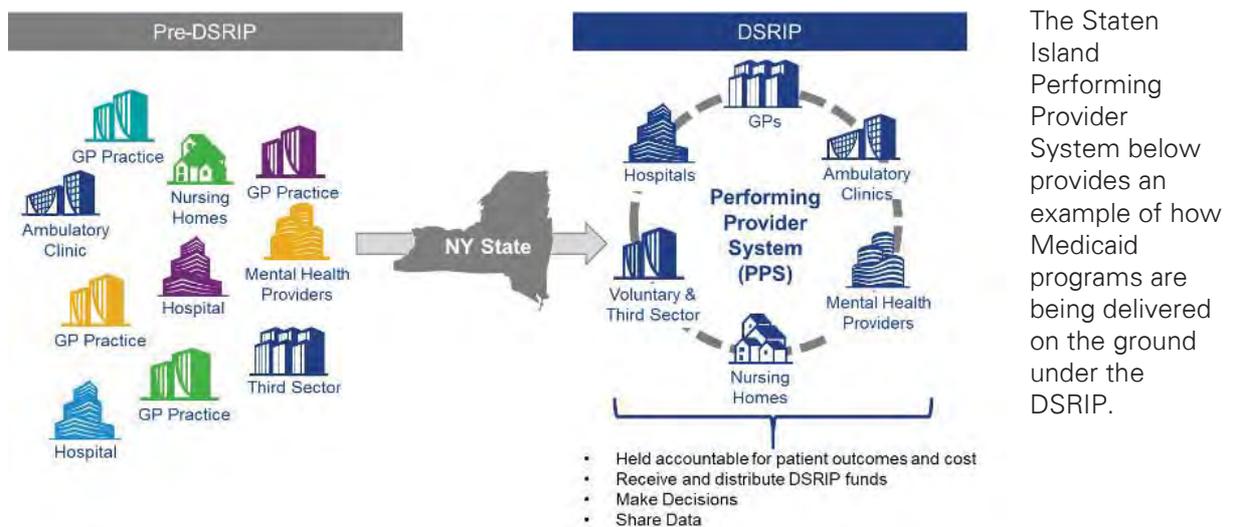

Overall, the New York program is also a good example of how to implement large payment reform across a varied provider landscape. By using a mix of ‘carrots and sticks’ to incentivise providers to adopt value-based payment arrangement, it simultaneously allows for progressive providers to move forward and lagging providers time to adjust.

New York organised its DSRIP by selecting lead entities through an application process to create Performing Provider Systems. The Performing Provider Systems are the provider clusters that are engaged in the Medicaid DSRIP.

A total of 25 Performing Provider Systems have been established in New York State to implement innovative projects focused on system transformation, clinical improvement and population health improvement. All DSRIP funds are based on achievement of performance goals and project milestones.

Performing Provider Systems were required to select between five and 11 clinical projects to implement from a menu of 44 projects curated by the state, in consultation with CMS. The range of projects addresses system transformation, clinical improvement, and population health. Projects are based in hospital, primary care, behavioural health, skilled nursing, and other home- and community-based settings. Performing Provider Systems are responsible for reporting to the state a robust set of process metrics and are accountable for meeting performance metrics, such as reductions in potentially avoidable emergency room visits, potentially avoidable readmissions, and Healthcare Effectiveness Data and Information Set metrics.⁶⁷

Figure 2: Pre and post DSRIP ecosystem

⁶⁷ Bachrach, D. et al. (2016). *Implementing New York’s DSRIP Program: Implications for Medicaid Payment and Delivery System Reform, Commonwealth Fund.*

A number of projects implemented and evaluated by the SI PPS have demonstrated positive impacts. More generally, in the context of the payment model, key findings from the most recent evaluation report regarding PPS include the following:⁶⁸

- Almost all the Performing Provider Systems reported major preparatory activities for the shift to value based payments with their partners. These activities included building educational tools.
- Some Performing Provider Systems began with many partners already having value based payment-equipped models and others with few partners equipped to implement value based payment. Community-based organisations needed more assistance in preparing for value based payments.
- Most stakeholders identified value based payment as fundamental to the DSRIP transformation of health care.
- Performing Provider System did not have full access to all State-wide Health Information Network for New York during Demonstration Years 0-2, which made it difficult to obtain the information they needed to develop projects and track progress.
- Many Performing Provider Systems moved funds to partners quickly and felt that this improved their partnership relationships. Others took a more conservative approach in order to maintain accountability for how funds were spent.

ADELAIDE NANCY ROSENTHAL, 447 COLLINS STREET, MELBOURNE VIC 3000
An Australian Legal Practitioner within the meaning of the Legal Profession Uniform Law (Victoria).
A person authorised under section 19(1) of the Oaths and Affirmations Act 2018 to take an affidavit.

Practice Incentives Program Quality Improvement Incentive (PIP QI) fact sheet

What is the PIP QI?

The Practice Incentives Program Quality Improvement Incentive (PIP QI) is a payment to encourage practices to participate in quality improvement activities, aimed at improving patient outcomes through the delivery of high-quality care. It was launched in August 2019.

What are the eligibility requirements for the PIP QI payments?

To participate in the PIP QI, practices must be accredited against The Royal Australian College of General Practitioners (RACGP) *Standards for general practices* (4th or 5th edition).

Practices need to register to participate in the PIP QI using their Provider Digital Access (PRODA) through their Health Professional Online Services (HPOS). Practices should advise their local Primary Health Network (PHN) when they register for the incentive. PHNs may require additional information from practices once they have applied for the PIP QI via HPOS.

Practices will be required to electronically submit the PIP Eligible Data Set from their general practice clinical information system to their local PHN on a quarterly basis. The PIP Eligible Data Set comprises de-identified patient data collected against 10 specified Improvement Measures.

General practices also need to commit to implement continuous quality improvement activities in partnership with their local PHN.

Do any current incentives cease with the commencement of the PIP QI?

Yes. Some Practice Incentive Payments and Service Incentive Payments have been impacted by the introduction of the PIP QI.

The following four Practice Incentive Payments and any associated Service Incentive Payments will no longer be available from 1 August 2019:

- Asthma Incentive
- Diabetes Incentive
- Cervical Screening Incentive
- Quality Prescribing Incentive.

How much is the PIP QI payment?

The amount of the PIP QI payment is dependent on the size of the practice and is a maximum payment of \$12,500 per quarter. Payments are based on \$5.00 per Standardised Whole Patient Equivalent, per year.

What are the Improvement Measures that are included in the PIP Eligible Data Set?

The 10 Improvement Measures are:

1. Proportion of patients with diabetes with a current glycated haemoglobin (HbA1c) result
2. Proportion of patients with a smoking status
3. Proportion of patients with a weight classification
4. Proportion of patients aged 65 and over who were immunised against influenza
5. Proportion of patients with diabetes who were immunised against influenza
6. Proportion of patients with chronic obstructive pulmonary disease (COPD) who were immunised against influenza
7. Proportion of patients with an alcohol consumption status
8. Proportion of patients with the necessary risk factors assessed to enable cardiovascular disease (CVD) assessment
9. Proportion of female patients with an up-to-date cervical screening
10. Proportion of patients with diabetes with a blood pressure result

In addition, identifying information about general practitioners (GPs) and general practices is collected. This identifying information is not part of the PIP Eligible Data Set and is collected to administer the PIP QI.

Why is data required for the PIP QI?

The intention is that data collected can be used to inform quality improvement at practice, regional and national levels.

How is the PIP Eligible Data Set protected?

It is intended that the privacy of the PIP Eligible Data Set will be maintained through a number of controls, including:

- no identified data should leave the practice's software
- suppression rules are applied to prevent the sharing of information where small numbers of patients are involved
- no data set linkage is permitted if there is a risk the PIP Eligible Data Set could be re-identified
- commercialisation of the PIP Eligible Data Set is not permitted
- collection, use and access is prescribed and monitored.

Access to the PIP Eligible Data Set by external researchers and other interested parties will be controlled by the Australian Institute of Health and Welfare (AIHW).

More information on the privacy controls can be found at the Australian Government Department of Health (DoH) [PIP QI guidance](#) (refer to PIP Eligible Data Set Data Governance Framework).

In addition to providing data, what quality improvement activities does my practice have to undertake to be eligible for the PIP QI?

The aim of the PIP QI is to reward practices for participating in continuous quality improvement activities in partnership with their local PHN.

There are no set targets for the Improvement Measures.

The definition of 'in partnership with your local PHN' is broad, and likely to be determined by the amount of support a general practice requires. For example, this may range from accessing self-service modules available on a PHN website or endorsed by the PHN, to highly supported quality improvement programs. It is up to each general practice to determine what type of support they require from their PHN.

Practices may wish to focus their quality improvement activities on the specified Improvement Measures. Alternatively, practices can choose to focus their activities on other areas. However, these areas must be informed by their clinical information system data and meet the needs of their practice population.

How will PHNs use the PIP Eligible Data Set?

The PIP Eligible Data Set will assist PHNs to:

- work with general practices to support quality improvement through reporting and feedback on managing the practice's patient population
- contribute to service planning and population health mapping at different levels, including PHN boundaries, local health districts, jurisdictional boundaries and at national level.

PHNs will share the aggregated data with the national data custodian – the AIHW – for national analysis and research.

Researchers may apply to access the data securely and in accordance with data access and release protocols, which will be developed in accordance with the PIP Eligible Data Set Data Governance Framework. The AIHW will not be collecting data for the first 12 months of the PIP QI Incentive; however, trial data exchanges will commence to ensure readiness for this to occur

What are the current issues with PIP QI?

Although the PIP QI was launched in August, there remains a number of outstanding issues for general practices wanting to participate, including:

- limited guidance regarding data transfer processes
- lack of clarity regarding privacy obligations for general practices and PHNs
- opt-out provisions for patients and GPs
- inadequate data-sharing agreements that do not provide details of risks and data security obligations
- lack of functionality in some of the data extraction tools to only extract the required data elements.

Many PHNs have been collecting general practice data for some time and have existing agreements and processes in place with practices. These existing arrangements generally collect more data than is required for the PIP QI. The RACGP is aware some PHNs are attempting to replicate these arrangements for PIP QI purposes.

General practices have been incorrectly advised they need to provide all of their data to receive the PIP QI. However, under the rules of the PIP QI, general practices only have to provide the data on the 10 Improvement Measures.

Practice owners should make sure any data-sharing agreements meet their needs, and clearly explain any risk and privacy obligations. The RACGP understands that the DoH is developing guidance for these agreements in response to concerns raised by the RACGP and other groups.

The RACGP is working to address these issues through the DoH, and recommends practices fully consider the PIP QI requirements before signing up.

Practices have until at least mid-October 2019 to sign up and provide data or apply for the PIP QI exemption using the form available at [PIP QI Incentive guidance](#).

Practices can withdraw from the PIP QI at any time via HPOS. Practices should advise their local PHN when they withdraw from the PIP QI.

Does my practice have to use a specific data extraction tool to extract the PIP Eligible Data Set?

No. As long as the PIP Eligible Data Set is submitted to the PHN in accordance with the relevant requirements of the PIP Eligible Data Set Data Governance Framework, the practice will meet the data-sharing eligibility requirement of the PIP QI Incentive. The two main data extraction tools in use are:

- [Pen Computing Systems](#) CAT 4 – compatible with Medical Director 3, Best Practice and Zedmed
- [POLAR GP from Outcome Health](#) – compatible with Best Practice, Medical Director and Pracsoft

The RACGP understands clinical information system vendors are working on PIP QI reporting for general practice.

How can my practice submit the PIP Eligible Data Set?

General practices currently exchanging data with their PHN

A general practice can continue to utilise the data extraction tool method agreed with their local PHN to submit the PIP Eligible Data Set. Practices should be mindful that data beyond the PIP Eligible Data Set is often being extracted.

General practices not currently exchanging data with their PHN

General practices not currently exchanging data with their local PHN can:

- use the data extraction method offered by their local PHN to submit the PIP Eligible Data Set if their current clinical software is compatible with this method
- purchase or license their own data extraction tool that is compatible with their local PHN
- work with their clinical information system provider and local PHN to submit the PIP Eligible Data Set in accordance with the PIP Eligible Data Set Data Governance Framework.

General practices that cannot exchange data with their local PHN

General practices that cannot exchange data with their local PHN because they do not have compatible software or do not want to use the software offered by their PHNs can:

- work with their clinical information system provider and local PHN to create a compatible system to submit the PIP Eligible Data Set in accordance with the PIP Eligible Data Set Data Governance Framework
- apply to the DoH for a time-limited exemption and work towards operationalising a compatible system.

How do I apply for an exemption?

The DoH may give general practices up to 12 months to ensure they have sufficient time to work with their PHN and clinical information system provider on finding a solution that complies with the PIP QI Incentive Guidelines and the PIP Eligible Data Set Data Governance Framework.

If practices are granted an exemption from submitting data, this will remain in place until 31 July 2020 or until the issues preventing the practice from submitting data have been resolved. From 1 August 2020, all general practices participating on the PIP QI Incentive are required to submit PIP Eligible Data set to their local PHN each quarter.

General practices seeking a time-limited extension should review the [PIP QI Incentive Exemption application form and fact sheet](#) carefully to ensure they fully understand the requirements of being exempted from uploading the PIP Eligible Dataset to their PHN.

If a time-limited exemption is approved by the DoH, practices will need to work in partnership with their local PHN to meet the other requirements of the PIP QI Incentive. If a practice can demonstrate it is making genuine efforts to supply the data, the practice will remain eligible for payment for the relevant quarter while these transitions issues are managed.

Can patients opt out of sharing their de-identified data?

General practices should advise patients they are sharing de-identified data, for example by including informing in their practice privacy policy and making this available on the practice website and waiting room. A practice may provide patients with the opportunity to opt out. Software providers are required to support patient opt out with simple options to manage this. Contact your software provider for specific advice on how to do this.

Can GPs opt out of sharing their data?

Yes, software providers will be required to support individual clinician opt out. However, at this stage it is not clear how GPs can opt out. The RACGP is addressing this with the DoH.

National Health Reform Agreement (NHRA) – Long-term Health Reforms – Roadmap

The National Health Reform Agreement

The 2020–25 Addendum to National Health Reform Agreement (NHRA) aims to improve health outcomes for all Australians and ensure our health system is sustainable. Commonwealth, state and territory governments, as parties to the NHRA, are committed to a shared long-term vision for health reform. They will work together to achieve the agreed critical priorities of:

- improving efficiency and ensuring financial sustainability
- delivering safe, high-quality care in the right place at the right time
- prioritising prevention and helping people manage their health throughout their lifetime
- driving best practice and performance using data and research.

Purpose of the reform roadmap

This reform roadmap is attached to the *Addendum to the National Health Reform Agreement 2020-2025 (NHRA)*. Commonwealth, state and territory governments are committed to this reform roadmap and its implementation.

This roadmap provides a flexible approach to achieving the priorities outlined above. It allows programs to evolve and shift direction to incorporate learnings or changes in the health landscape. Implementation of the long-term reform activities set out here will take into account each jurisdiction's circumstances. States and territories will have the flexibility to identify priority reforms and determine the scope and timing of activities to best suit local needs and support local health system diversity, readiness and funder and provider capabilities.

Key areas of reform

The roadmap includes a vision statement, aim, case for change, links to other reforms, intended outcomes, key concepts and COVID related developments for each reform area. The roadmap identifies actions, deliverables and timeframes for these key areas of reform:

- nationally cohesive Health Technology Assessment
- paying for value and outcomes
- joint planning and funding at a local level
- empowering people through health literacy
- prevention and wellbeing
- enhanced health data
- interfaces between health, disability and aged care systems

COVID-19 impact

This program of reform has commenced at a time of unprecedented change due to the impacts of the COVID-19 pandemic. The response to COVID-19 included many novel approaches to providing health services and support and will inform the implementation of these reforms. The reforms will support the COVID-19 recovery by enabling flexible, innovative and data-informed approaches to delivering health care.

Governance

Health Ministers and Chief Executive Officers of Commonwealth, state and territory health departments are responsible for implementing these reforms. A governance diagram is at [Appendix A](#).

Key partners

Key partners in implementing these reforms will include, but not be limited to, Local Hospital Networks, Primary Health Networks, Aboriginal Community Controlled Health Organisations and national bodies such as the Independent Hospital Pricing Authority, the Administrator of the National Health Funding Pool, the Australian Institute of Health and Welfare, and the Australian Commission on Safety and Quality in Health Care. Other partners will be engaged in specific implementation activities.

To implement this program of reform, the Commonwealth and states will work in partnership with Aboriginal and Torres Strait Islander communities to co-design approaches tailored to their needs. This commitment recognises and will enable Aboriginal and Torres Strait Islander leadership, local decision-making processes, co-delivery of culturally safe and secure health services, and Aboriginal and Torres Strait Islander-led evaluation.

Interdependencies

The long-term reforms build on many initiatives aimed at improving patient outcomes and experiences within the health system. These include initiatives delivered by all jurisdictions at national, state, regional and local levels. This set of health reforms takes a system-wide approach and there are critical interdependencies between the streams of reform.

The *Enhanced health data* reform is an enabler for all the long-term system wide reforms and is the first priority. Access to joined-up data that provides an end-to-end view of patient pathways will enable policymakers and governments to develop a more accurate model of the health system, to inform system design, funding and improved patient access and experiences.

The Paying for value and outcomes and Joint planning and funding at a local level reforms are intrinsically linked and complementary. The first aims to deliver system-level payment reform and will create an enabling environment for trials of flexible models of care. The *Joint planning and funding* reform will strengthen governance, funding and accountability arrangements to support better collaboration at the local level. The *Enhanced health data* reform will develop supporting data collections, overarching governance arrangements and enhance linkage capabilities to support these reforms.

The Prevention and wellbeing and Empowering people through health literacy reforms will help reorient the health system around individuals and communities and reduce the prevalence of disease, supported by the structural reforms above.

The goal of the Nationally cohesive Health Technology Assessment (HTA) reform is to increase the consistency, timeliness, efficiency and value of HTA processes nationally. This will contribute to the Paying for value and outcomes reform.

The Interfaces between health, disability and aged care systems reform will develop performance interface indicators to monitor and report on new and existing interface issues and improve governance mechanisms to resolve issues. This reform is linked to the *Enhanced health data* reform given the need to link data across systems.

Review and evaluation

Evaluation and knowledge sharing are key commitments within each reform stream. A common evaluation framework will be developed to outline expectations and methods to review reform implementation. More specific evaluation questions or scope may be required for individual activities within each individual reform as needed.

Long term reforms

Reform stream	Nationally cohesive Health Technology Assessment
Vision	Improved health technology decision-making will deliver safe, effective, efficient care that is financially viable and improves population health.
Aim	Health technology assessment (HTA) is guided by a systematic, cohesive, efficient and responsive national framework for decision making across all levels of the health system.
Case for change	<p>The Commonwealth, states and territories acknowledge that, within the constraints of limited budgets, robust and transparent prioritisation of spending on health technologies is critical for coordinated, equitable and efficient service delivery.</p> <p>The current approach to HTA to inform policy investment and disinvestment decisions in Australia is fragmented. It does not support coordinated and timely responses to rapidly changing, emerging, and disruptive technologies, including high-cost and highly specialised therapies and services. Separate HTA processes exist across all levels of the health system, and across levels of government. This duplicates effort, creates inefficiencies and inconsistent advice, and delays access to innovative and emerging technologies. Current HTA processes often focus on new or emerging technologies before they are put into practice. Processes to compare benefits and cost-effectiveness with existing technologies, and processes for disinvesting in low value care, are under-developed.</p> <p>This reform will support ongoing policy and process development for HTA, implementation, monitoring and evaluation of new technologies, including a process for decisions about disinvesting where appropriate.</p>
Links to other reforms	Increased impact of HTA on funding (investment and disinvestment) and consideration of value in decision-making will contribute to the <i>Paying for value and outcomes</i> reform.
Intended outcomes	<p>During the term of this Addendum, all parties will strive to achieve:</p> <ul style="list-style-type: none"> • nationally consistent, appropriate and evidence-based investment and disinvestment decisions • improved patient access to cost effective health technologies • improved transparency and reduced duplication of effort between HTA bodies • coordinated and timely responses to rapidly changing technologies • effective sharing of information and recommendations between jurisdictions and the Commonwealth, including consistent outputs and standardised advice • improved stakeholder engagement, understanding and public trust in the HTA process
Key concepts	HTA is the systemic evaluation of the properties and effects of a health technology. HTA addresses direct and intended effects, as well as indirect and unintended consequences. It is used primarily to inform decision making. Health technologies include tests, devices, medicines, vaccines, procedures, programs and systems.
COVID-19 related developments	The COVID response resulted in expedited assessments and approvals. This reform will explore what changes to processes supported this and what lessons may be learned to inform nationally consistent HTA practice.

Key components

National health reform agreement commitments	NHRA clause	Deliverable	Timeframes			
			21-22	22-23	23-24	24-25
Agree consistent process for assessing and funding highly specialised therapies under the NHRA	C.11, C.12, Apx. B	Endorsed process				
Establish process to facilitate a cohesive approach to HTA nationally	C.13.a	National Committee				
Develop a national HTA framework, including processes to inform implementation, investment and disinvestment opportunities at Commonwealth and state levels	C.13.b	National framework				
Establish an information sharing platform	C.13.c	Information sharing platform				
Produce public and stakeholder guidance	C.13.d	Guidance materials				
Identify HTA workforce requirements and develop workforce framework	C.13.e	Workforce action plan				
Identify and prioritise technologies that will benefit from national level HTA	C.13.a	Agreed priority list				

Nationally cohesive Health Technology Assessment – Outcomes Map

Rationale: Australia needs a strategic, systematic, cohesive, efficient and responsive national framework for health technology assessment (HTA). The current approach to HTA to inform investment and disinvestment decisions is fragmented. It does not support coordinated and timely responses to rapidly changing technologies. Separate processes exist across all levels of the health system. This duplicates effort, creates inefficiencies and inconsistent advice, and delays access to innovative and emerging technologies. All governments acknowledge that the Commonwealth and states must prioritise spending on health technologies within the constraints of limited budgets, and do so consistently, equitably and efficiently. Improved health technology decision-making will deliver safe, effective, efficient care that is financially viable and improves population health.

Inputs

- Prioritisation matrix, templates and other tools developed by Health Technology Reference Group (HTRG)
- State and Territory HTA expertise
- Commonwealth HTA bodies (OHTA, PBAC, MSAC, PLAC)
- Existing HTA IT infrastructure e.g. OHTA IT platform, TGA, PBS, MBS & HTRG webpages

Activities

- Develop a federated approach to HTA to inform implementation, investment and disinvestment opportunities
- Review existing cross-stakeholder HTA guidance and identify gaps
- Produce public and stakeholder guidance
- Review and support HTA workforce requirements including roles, capabilities, gaps and future needs

Outputs

- A National High Cost and Highly Specialised Services Committee
- NCHTA framework with a standard set of principles and processes used by all jurisdictions to assess technologies
- A single information sharing platform to manage HTA coordination, submissions, inform stakeholders of review progress and recommendations, and host guidance
- Suite of guidance for HTA stakeholders
- HTA workforce framework identifying future requirements and direction

Outcomes

- Improved transparency and reduced duplication between HTA bodies
- Coordinated and timely responses to rapidly changing technologies
- Effective sharing of information and recommendations between jurisdictions and the Commonwealth, including consistent outputs and standardised advice
- Improved stakeholder engagement, understanding and public trust in the HTA process.
- Nationally consistent, appropriate and evidence-based investment and disinvestment decisions
- Improved patient access to cost effective health technologies
- Care delivered is safe, effective, efficient, financially viable and improves population health
- Appropriately supported and resourced HTA workforce

Reform stream	Paying for value and outcomes
Vision	The health financing system is proactive, responsive, supportive of contemporary models of care, value-based and focused on individual and community needs. Future funding models will give providers the flexibility to provide care in the right place, at the right time, by the right workforce.
Aim	State, territory and Commonwealth funding will support value and reduce duplication and fragmentation of health services, which is caused in part by multiple funding sources and programs. Providers will be rewarded for coordinating and delivering care pathways that have the best outcomes for patients in the most efficient way. A stronger focus on preventive health, early intervention, and care that is integrated across a treatment journey will lead to improved quality of care and the health outcomes that matter most to patients.
Case for change	The Commonwealth, states and territories recognise current health funding models do not adequately support and incentivise improvements in clinical care to address current and future population health challenges. The system does not provide the necessary funding flexibility and governance arrangements to address these challenges – such as managing chronic disease and an ageing population – or the responsiveness to support changing models of care. Under this reform, trials of funding and payment reform options will test how innovative funding models can best support contemporary care that leads to better patient outcomes and support.
Links to other reforms	<p>To fully realise its benefits, this reform is critically interdependent with other long-term health reforms, in particular the <i>Joint planning and funding at a local level</i> reform.</p> <p>The <i>Enhanced health data</i> reform will develop supporting data collections and overarching governance arrangements, including a primary and community care national minimum data set and patient reported outcome and experience measures. This will leverage evidence from the Atlas of Healthcare Variation, the National Clinical Quality Registry and Virtual Registry Strategy 2020-2030 and state-based programs.</p> <p>This reform will build on earlier work by the Independent Hospital Pricing Authority (IHPA) on bundled payments for specific conditions and cohorts. It will consider trials currently underway which relate to integrated care in out-of-hospital settings, pooled Commonwealth and state/territory funds, and bundled payments across a pathway of care.</p>
Intended outcomes	<p>During the term of this Addendum, all parties will strive to achieve:</p> <ul style="list-style-type: none"> • core principles for consistent outcome-focused, value-based health care measures across the health system • increased flexibility in national funding arrangements which supports more effective and efficient resource allocation and focuses on the outcomes that matter to patients • increased number of trials of innovative, flexible funding models across Australia (at state and federal level) • robust evaluations of trials and systematic sharing of the evidence • increased number of successful contemporary care models scaled up, systematised and funded recurrently to ensure benefits are realised and ongoing • improved patient-reported health outcomes and care experiences, and health care provider experiences • a reduction in inefficient health care practices (e.g. avoidable hospitalisations) and improved sustainability of health care funding
Key concepts	<p>‘Value’ is achieving the health outcomes that matter most to patients, relative to the cost of delivering those outcomes. Value encompasses and integrates many goals already sought in the delivery of health care, such as health outcomes, quality, safety, patient-centred care, efficiency in terms of cost and eliminating low value practices, and clinical process improvements. Cost is considered in terms of the full cost incurred across the course of care for a patient’s condition.</p> <p>‘Outcomes’ are the results people care about most when seeking treatment, including functional improvement and the ability to live fulfilling and productive lives. This should cover all services or activities required to successfully meet a patient’s health care needs. The outcomes that matter to patients are broad, multi-faceted and cannot be measured by a single, all-encompassing clinical or personal indicator (e.g. self-assessed quality of life, trust, comfort). Comprehensive health outcome and cost data is required to support measurement, including Patient Reported Measures (PRMs).</p> <p>The ‘Quadruple Aim’ in health care has four goals: improved health outcomes, improved patient experiences, improved provider experiences, and improved effectiveness and efficiency.</p>

Reform stream **Paying for value and outcomes**

COVID-19 related developments

In response to the COVID-19 pandemic, many jurisdictions expanded their use of flexibly funded models of care, such as Hospital in the Home, and innovative models of care, such as virtual care and secondary triage for residential aged care facilities, which were supported by the expanded application of MBS telehealth items. This reform will also consider the potential benefits and risks of embedding such initiatives in standard care.

The COVID-19 National Partnership Agreement is supporting a collaborative, cross-sectoral approach to implementing responses to COVID-19 within jurisdictions.

Key components

National health reform agreement commitments	NHRA clause	Deliverable	Timeframes			
			21-22	22-23	23-24	24-25
Identify and support removal of legislative, regulatory and technical barriers to implementing innovative funding and payment approaches	C.21.b	Action plan				
Develop a funding methodology that incorporates flexible funding options within the public hospital funding model that support innovative models of care	A.101.a	Endorsed methodology				
Develop a national health funding and payments framework	C.21.a	Framework				
Trial funding and payment reforms at a program level and progress system level changes	C.21.c	Bilateral and multilateral trials				
Implement a common approach to evaluation of trials and knowledge sharing to inform further decisions about scaling of trials and future reform directions.	C21.d	Evaluation reports				

Paying for value and outcomes – Outcomes Map

Rationale: Current funding models do not adequately support and incentivise improvements in clinical care to address current and future population health challenges. Reform will give service providers and health care organisations greater flexibility to address local population needs, allowing for a stronger focus on clinical outcomes, clinical best-practice and patient equity. State, territory and Commonwealth funding will support the sustainability of the entire health system by reducing duplication and fragmentation of health services, caused in part by multiple funding sources and programs. Trials of funding and payment reform options will test how innovative funding models can best support contemporary care and achieve better patient outcomes.

Inputs

- Stakeholder views
- Technical expertise
- Government staff and resources
- Management/ governance
- Australian Health Performance Framework (AHPF)
- Health Innovation Fund (HIF) Projects
- Appropriate data and performance measures, including from Enhanced Data and Transparency and Performance reforms (e.g. Patient Reported Measures)
- Existing coordinated care reforms
- IHPA advice and expertise
- Clinician and consumer views

Activities

- Develop a National Health Funding and Payments Framework
- Develop a flexible funding methodology within the public hospital funding model
- Identify and support removal of legislative, regulatory and technical barriers to implementing innovative funding and payment approaches
- Trial funding and payment reforms at a program and system level to deliver a financially sustainable future with a focus on outcomes
- Develop a common approach to evaluation of trials and knowledge sharing

Outputs

- Framework developed and agreed by all jurisdictions
- Flexible funding methodology developed within Activity Based Funding and broader health funding model
- Revised governance structures, legislation and regulations are in place to support innovative approaches
- Innovative funding and payment models developed
- Methodology and common measures for evaluation of new models of care developed
- Trials of increasing scope are implemented under bilateral agreements
- Communities of Practice established
- Improved evidence base available to inform future reforms

Outcomes

- | | | | | | |
|------------|---|--|--|--|---|
| Short-Term | Agreed core principles for consistent outcome-focused, value-based health care measures across the health system | Increased flexibility in national funding arrangements supports more effective and efficient resource allocation and focuses on the outcomes that matter to patients | Increased number of trials of innovative, flexible funding models across Australia (at both state and federal level) | Increased number of successful contemporary care models scaled up, systematised and funded recurrently to ensure benefits are realised and ongoing | Robust evaluations of trials and systematic sharing of the evidence |
| Long-Term | Improved provider experience – clinicians are empowered to deliver coordinated care to achieve the best outcomes for patients | Improved use of health funding across the system and greater efficiency and sustainability of allocations | Improved integration of care across the entire patient journey, including prevention and early intervention stages | Increase in patients reporting positive health care experiences | Reduction in inefficient health care practices (eg avoidable hospitalisations) and improved sustainability of health care funding |

Reform stream	Joint planning and funding at the local level
Vision	Better-integrated, patient-centred care will improve people's experiences and health outcomes and support equitable access to care. Integrated planning and funding of health services at a local level will support providers to plan, resource, work together, and coordinate care for patients across their treatment journey.
Aim	Local planning and service commissioning is driven by collaboration, integration and better investment decisions across care settings based on population and patient needs, with clear and shared accountability for outcomes and quality. Innovative governance models will increase flexibility and support providers to deliver value-based care according to the Quadruple Aim in health care - improved health outcomes, improved patient experience, improved provider experience, and improved effectiveness and efficiency.
Case for change	<p>The current health system in Australia is fragmented, making it difficult for people to get well-coordinated care and leading to poorer health outcomes. The system is not well-placed to meet the needs of people with chronic or complex health and social care needs, and older, frailer people who often use a wide range of health services. Poor coordination between providers can cause confusion and duplication and make services hard to navigate.</p> <p>Despite best efforts, providers often work in isolation rather than together. Investment decisions are far removed from service delivery and there is potential for blame and cost shifting between service providers, commissioners, health sectors and levels of government.</p> <p>The Commonwealth, states and territories recognise there is a need for greater collaboration across care settings, support for clinicians to adopt new practices, and a joint commitment across all agencies and governments to ensure better planning and co-ordination of health services at the local level. This reform complements the <i>Paying for value and outcomes</i> reform, which supports more flexible funding arrangements.</p>
Links to other reforms	<p>This reform is critically interdependent with other long-term health reforms, particularly the <i>Paying for value and outcomes</i> reform, which will deliver system-level payment reforms to create a supportive environment to trial effective commissioning arrangements.</p> <p>The <i>Enhanced health data</i> reform will develop new and improved data sets (including primary and community health) and enhance linkage capabilities to support integration and local commissioning.</p> <p>This reform offers a mechanism to address the findings in the Productivity Commission's report on Innovations in Care for Chronic Health Conditions (2021), and the recommendations and outcomes of the Royal Commission into Aged Care Quality and Safety (2021) and the Royal Commission into Violence, Abuse, Neglect and Exploitation of People with Disability (2023). It will leverage COVID-19 responses, existing jurisdiction initiatives and align with Commonwealth reforms to primary care.</p>
Intended outcomes	<p>During the term of this Addendum, all parties will strive to achieve:</p> <ul style="list-style-type: none"> • national principles for local level commissioning to support an increase in effective collaboration between primary, community and acute health care organisations • increased number of sustainable joint planning and funding initiatives to deliver improved experiences for patients and better health outcomes at the local level • increase in patients reporting positive health care experiences, using appropriate care settings and accessing integrated care pathways • increase in provider satisfaction and engagement, and increased participation in training to improve commissioning capability • trials that demonstrate reduction in service duplication and improved efficiency
Key concepts	<p>'Joint planning' involves various organisations collaborating to assess needs, for geographic regions and for specific populations, make decisions on what health services and health literacy and prevention measures are provided, and share accountability for outcomes.</p> <p>'Joint funding' involves using existing and new funding to support integrated care pathways, including pooled models where various funding sources may be combined.</p> <p>'Commissioning' is a continual cycle to develop and implement services based on needs assessment, planning, co-design, funding, monitoring and evaluation.</p>
COVID-19 related developments	This reform may build on relevant COVID developments including the Aboriginal and Torres Strait Islander Advisory Group on COVID-19, co-chaired by NACCHO and Commonwealth Health with all states involved, and local level PHN activities (e.g. emergency responses in Victoria and NSW).

Key components

National health reform agreement commitments	NHRA clause	Deliverable	Timeframes			
			21-22	22-23	23-24	24-25
Identify and support reform of barriers to joint governance, needs assessment, service integration, evaluation and funding, at a national, state and territory level	C28.b	Action plan				
Agree national principles for commissioning at the local level	C28.a	National principles				
Trial, evaluate, refine and scale up joint planning and funding arrangements	C28.c	Bilateral and multilateral trials				
Address workforce matters, including capability gaps for health services commissioning	C28.d	Action plan				
Explore innovative workforce models and potential new roles for care coordination	C28.d	Defined models and roles				
Develop outcome measures, reporting and accountability arrangements shared between local organisations	C28.e	New measures				

Joint planning and funding at the local level – Outcomes Map

Rationale: The current health system is fragmented and is not well-placed to meet the needs of people with chronic or complex health and social care needs, and older people who often use a wide range of health services. Poor coordination between providers can cause confusion and duplication. Reform will drive collaboration, integration, better planning and investment decisions across care settings, with clear accountability for outcomes and quality. It will address service gaps and introduce innovative governance models to increase flexibility and incentivise providers to deliver value-based care. This aligns with the Quadruple Aim in health care – improved patient experience, improved provider experience, improved health outcomes and sustainable cost.

Inputs

- Stakeholder views
- Technical expertise
- Government staff and resources
- Management/ governance
- Australian Health Performance Framework (AHPF)
- Health Innovation Fund (HIF) Projects
- Resources for enabling activities, including workforce capability and digital health infrastructure requirements
- Baseline data on workforce, patients, population and service utilisation
- Information and communications technology
- Existing coordinated care reforms

Activities

- Develop nationally agreed principles for local-level commissioning
- Identify and support removal of barriers to joint governance, needs assessment, service integration, evaluation and funding, at a national, state and territory level
- Trial, evaluate, refine and scale up joint planning and funding arrangements
- Address workforce matters, including capability gaps for effective health services commissioning, and explore innovative workforce models and new roles to support better care coordination
- Monitor and evaluate joint planning and funding arrangements, including shared outcome measures, to determine effectiveness

Outputs

- National Principles for local level commissioning developed and agreed
- Mechanisms in place to facilitate local collaborative planning and investment decision-making, including shared reporting and accountability arrangements
- Trials of joint planning and funding models, including for specific population groups, are undertaken and evaluated
- Innovative workforce models and new roles to support better care coordination are explored
- Models are evaluated in line with minimum agreed criteria and learning is shared widely
- Workforce uses guidelines and participates in training about collaborative commissioning

Outcomes

- | | | | | | |
|------------|--|---|---|---|---|
| Short-Term | Increased effective collaboration between primary, community and acute health care organisations | Increased number of enduring joint planning and funding initiatives to define and agree on local outcomes in alignment with the Quadruple aim | Increase in patients reporting positive health care experiences, using appropriate care settings and accessing integrated care pathways | Increased provider satisfaction and engagement, and increased participation in training to improve commissioning capability | Trials demonstrate reduction in service duplication, improved efficiency |
| | Local health organisations collaborate when planning health services and making investment decisions | Patients have equitable access to high quality integrated, person and community centred health services | Health outcomes improve for targeted populations | Clinician experience of the health care system improves | Sustainable system funding – Funding supports health system to be efficient and effective |

Reform stream	Empowering people through health literacy
Vision	Australians will be empowered to manage their own health, avoid illness, make informed health choices, engage effectively with health services, and achieve better health outcomes.
Aim	Service providers and policy makers will better support people's health literacy needs, including through strategic leadership for the health sector. The whole health system will be more responsive to individuals' health literacy needs, delivering person-centred health information, support and services to all Australians.
Case for change	The Commonwealth, states and territories recognise all Australians have a right to safe, high quality care. This is enhanced when people are informed about services, treatment options and costs in a clear and open way and are active participants in decisions and choices about their care. Health literacy is crucial to effective self-care. People with poor health literacy are less able to understand the consequences of poor health, take action to prevent or manage disease, navigate the health system or participate in their own health care decision-making. Poor health literacy can lead to higher rates of overweight and obesity, chronic conditions, hospitalisation, emergency care and adverse outcomes and disproportionately affects people from disadvantaged backgrounds.
Links to other reforms	<p>The <i>Enhanced health data</i> reform will develop quality information for consumers on health system performance, including the development and implementation of Patient Reported Measures.</p> <p>This reform will support Closing the Gap in disadvantage for Aboriginal and Torres Strait Islander people, and other vulnerable groups.</p> <p>Work to align government-funded information resources and digital platforms will align with My Health Record and Healthdirect initiatives.</p>
Intended outcomes	<p>During the term of this Addendum, all parties will strive to:</p> <ul style="list-style-type: none"> • embed health literacy standards and requirements into health care training and qualifications • increase innovation and cooperation on health literacy initiatives between governments, the health workforce, researchers, and the community • ensure people can easily access reliable, user-friendly, culturally and linguistically appropriate information and support • support patients and families to partner with their health care teams to make joint decisions about care options • promote the use of Patient Reported Measures to understand what patients value and improve patient experiences and outcomes
Key concepts	The <i>Empowering people through health literacy</i> reform is focused on creating a health system that promotes health literacy, including cultural change at the organisational and individual levels. It will take a universal approach to promoting health literacy responsiveness by recognising everyone benefits from clear, understandable, motivational (including non-stigmatising) and actionable information and that health workers are not expected to identify who has low levels of health literacy.
COVID-19 related developments	Relevant COVID developments include improved communications campaigns and the increased profile of government information resources and advice services, particularly in quality language materials and accessible formats.

Key components						
National health reform agreement commitments	NHRA clause	Deliverable	Timeframes			
			21-22	22-23	23-24	24-25
Better align government-funded information resources and digital platforms, ensuring they are culturally and linguistically appropriate, accessible, credible and evidence-based	C.33	Reviewed health digital platforms and information resources	■	■	■	■
Systematically measure patient reported health outcomes and care experiences	C.32	Patient reported measures framework (linked to <i>Enhanced health data</i>)	■	■	■	■
Build workforce capability to meet health literacy needs	C.32	Workforce engagement strategy	■	■	■	■
Make information on the performance of the health system and services more accessible	C.33	Accessible performance data	■	■	■	■
Share evidence of the effectiveness of health literacy initiatives across governments, the health workforce, researchers and the community	C.34	Information sharing strategies and mechanisms utilised/developed	■	■	■	■

Empowering people through health literacy – Outcomes Map

Rationale: People with poor health literacy are less able to prevent or manage disease, navigate the health system or participate in their own health care decision-making. People who are health literate are better equipped and empowered to manage their own health, engage effectively with health services, and achieve better health outcomes. Creating systems and organisations that are responsive to health literacy needs will support people to be active participants in their own health care. The health system will be more responsive to every individual's health literacy needs and deliver person-centred health information, support and services.

Inputs

- Infrastructure (including existing websites)
- Australian Health Performance Framework (AHPF)
- My Health Record infrastructure
- ACSQHC work on health literacy, standards and performance measures
- OECD Patient Reported Indicators Survey (PaRIS)
- Agency for Healthcare Research and Quality: Ten Attributes of Health Literate Health Care Organisations

Activities

- Provide strategic leadership for the sector to raise awareness of health literacy needs
- Build workforce capability to meet health literacy needs
- Better align government-funded information resources and digital platforms, ensuring they are culturally appropriate, accessible and evidence-based
- Make information on the performance of the health system and services more accessible
- Systematically measure patient reported health outcomes and care experiences
- Share evidence of the effectiveness of health literacy initiatives across governments, the health workforce, researchers and the community

Outputs

- Partnerships established with training providers to enhance education and training programs
- Government-funded resources are aligned and publicly promoted as sources of high quality, appropriate and credible information
- Indicators and measures of system and service performance are developed and clearly communicated
- Data collections include a nationally consistent approach to Patient Reported Measures (PRMs)
- Mechanisms to share evidence established

Outcomes

Short-Term

- Health literacy initiatives are nationally cohesive and include national standards for health literate organisations
- Health literacy is embedded in health workforce training and in health service design, policies and practices
- People can easily access reliable, user-friendly and culturally appropriate information and support
- Patients and families partner with their health care teams to make joint decisions about care options
- Nationally consistent approach to using PRMs informs service design and delivery
- Increased innovation and cooperation between researchers, health providers and people

Long-Term

- The health system is responsive to and works in partnership with consumers to deliver person-centred care
- Improved patient experience and outcomes, including increased uptake of health promoting behaviours, particularly among population groups at high risk of ill health
- Empowered people are informed and active participants in their own health care

Reform stream	Prevention and wellbeing
Vision	Australians will live healthier lives. This reform will promote and maintain good physical and mental health and wellbeing and reduce the proportion of people living with preventable chronic conditions and delay the onset of these conditions. It will address the underlying drivers of preventable ill health – including social, economic and environmental factors – and will focus on those with greatest need. This reform will make our health system more equitable and more sustainable.
Aim	Primary prevention investment will be increased and invested in scalable, high-value, evidence-based innovations so Australia’s health system can promote good health and wellbeing and better address preventable chronic disease.
Case for change	<p>Australia is a world leader in many areas of prevention, such as reducing levels of smoking, but despite ongoing action in other areas like tackling obesity, rates of chronic disease have not reduced.</p> <p>Almost 40 per cent of the total burden of disease could be prevented by reducing exposure to the top five risk factors – tobacco use, overweight and obesity, dietary risks, high blood pressure and high blood sugar. And approximately 40 per cent of preventable hospitalisations are due to chronic disease, placing a significant burden on the health system.</p> <p>Funding for preventive health is low and varies across jurisdictions, with public health in Australia accounting for just 1.5 per cent of total health expenditure. There are ongoing difficulties in measuring impacts, outcomes, and returns on investment for preventive health activities. There are limited mechanisms to generate investment or support cross sector collaboration.</p> <p>The Commonwealth, states and territories recognise that effective prevention requires cross-portfolio action and engagement to complement existing activities. Through the NHRA, all governments have committed to increase investment in primary prevention over time in evidence-based initiatives.</p>
Links to other reforms	This reform will build on the National Strategic Framework on Chronic Conditions, as well as the full range of evidence-based primary prevention activities undertaken nationally and within jurisdictions. It will support the implementation of existing commitments in development – such as the National Obesity Strategy, the National Preventive Health Strategy and the National Mental Health and Suicide Prevention Agreement.
Intended outcomes	<p>During the term of this Addendum, all parties will strive to achieve:</p> <ul style="list-style-type: none"> • a shared approach to the prevention of chronic conditions, their risk factors, and their underlying drivers • removal of barriers and disincentives for prevention activities across the healthcare system to promote a better balance between prevention and treatment within the health system • increased investment (by all sources) in prevention activities, and a sustainable national prevention funding mechanism with appropriate incentives • a strengthened evidence base for primary prevention initiatives, including improved collection, linkage, analysis, access, use of prevention related data and evaluation of initiatives
Key concepts	<p>The Commonwealth, states and territories will work together to explore innovative ways to finance evidence-based primary prevention activities, including through cross sector and non-government sources. This reform will lay the foundations for increased, sustained investment in preventing disease and promoting wellbeing, including addressing the wider determinants of health.</p> <p>Cohort-specific and risk-based approaches to planning and prioritisation will be explored.</p> <p>A national prevention and monitoring performance framework will include outcomes measures and indicators to show progress. It will develop targets and outcomes specifically relating to the health and wellbeing of Aboriginal and Torres Strait Islander populations. It will also develop a consistent way to measure the cost-effectiveness of prevention investment.</p>
COVID-19 related developments	<p>Key risk factors for illness and fatalities from COVID-19 included obesity and chronic disease, highlighting the risk to our population and the urgent need for action on non-communicable disease.</p> <p>The COVID-19 response included a number of preventive approaches, including: pro-active outreach programs to support people at high risk for COVID-19, including people with disabilities; mental health and wellbeing support programs; increased support for infectious disease emergency response research; and increased telephone and online access to support and</p>

Reform stream Prevention and wellbeing

information.

This reform will explore the potential benefits and risks of embedding initiatives such as these in ongoing programs.

Key components

National health reform agreement commitments	NHRA clause	Deliverable	Timeframes			
			21-22	22-23	23-24	24-25
Review health system barriers to prevention	C.40.e	Action plan				
Agree a national monitoring and reporting framework, including outcomes and progress measures to inform priorities for prevention investment	C.40.a	Framework				
Develop innovative fit-for-purpose financing mechanisms for scaling primary prevention initiatives	C.40.c C.40.b	Bilateral trials				
Explore evidence-based regulatory prevention measures	C.40.d	Recommendations				

Prevention and wellbeing – Outcomes Map

Rationale: Australia is a world leader in many areas of prevention but, despite ongoing action, rates of chronic disease have not reduced. Effective prevention requires cross-portfolio action and engagement to complement existing activities. Reform will explore innovative ways of financing primary prevention activities. Governments will consider sustainable, innovative mechanisms for financing preventive health activities, including the adoption of cohort-specific and risk-based approaches to planning and prioritisation.

Inputs

- National Strategic Framework for Chronic Conditions and other key policies relevant to primary prevention
- AIHW's health expenditure data
- National Preventive Health Strategy
- National Obesity Strategy
- National Tobacco Strategy
- Existing initiatives and investments at a national and jurisdictional level
- Head of Treasury's report on health financing
- Australian Social Impact Investing Taskforce final report

Activities

- Develop a national prevention monitoring and reporting framework, with a focus on shared priorities
- Increase investment in primary prevention over time
- Develop innovative, fit-for-purpose financing mechanisms for scaling primary prevention initiatives
- Explore evidence-based regulatory prevention measures
- Review and address health system barriers to prevention

Outputs

- Data is consistent nationally
- Return on investment for primary prevention is measured
- Shared priorities are identified
- Current prevention investment are analysed
- Prevention investment is accurately measured
- Long-term target for national prevention investment is agreed
- Prevention investment is sustained and increased over the long term
- Innovative investment mechanisms for primary prevention are identified
- Investment by non-government and private sectors increases
- A review of literature and evidence, including local and international experience
- Analysis of current barriers to prevention

Outcomes

- Australia has a national agenda to address preventable chronic disease and associated risk factors
- There is an increased focus on outcomes and accountability for prevention efforts
- Investment in prevention is increasing, including investment from non-government sources
- The evidence base is strengthened for prevention measures delivered at a whole of population scale, including regulatory prevention measures
- There are increased incentives and reduced disincentives for primary prevention within the health care system
- The underlying drivers of chronic ill health – including social, economic and environmental determinants – are being addressed
- The proportion of Australians living with preventable chronic conditions or associated risk factors is reduced
- Australians with chronic conditions, or associated risk factors, develop them later in life
- Priority populations, including Aboriginal and Torres Strait Islander people, have reduced risk of developing chronic conditions
- The sustainability of the health system is improving

Reform stream	Enhanced health data
Vision	Integrated data supports better decisions which improve health outcomes and save lives. Governments, clinicians, consumers and researchers will be able to access and link richer sources of information to help deliver better care which is more targeted, person-centred and value-based.
Aim	This reform aims to ensure the data generated by Australia’s health system drives better health outcomes and delivers effective, safe and efficient health care for all Australians.
Case for change	<p>Australia’s data resources represent substantial investments, but there are technical and other barriers which limit realisation of the full benefits of this resource.</p> <p>The Commonwealth, states and territories recognise that integrating data across patient journeys by using various health data sets will support better planning and decision-making by governments, health services, clinicians, consumers, researchers and communities. Data linked at the person-level helps policymakers and program designers provide more consumer-focused care to drive system improvements and break down siloes. Robust health data is also essential to understanding the wider determinants of health and wellbeing.</p>
Links to other reforms	<p>The <i>Enhanced health data</i> reform is key to fully realise other long-term health reforms, including <i>Paying for value and outcomes</i>, <i>Joint planning and funding at a local level</i>, <i>Interfaces between health, disability and aged care systems</i>, and support trials of innovative models of care under the Addendum Schedule A.</p> <p>Initiatives developed under this reform will be mindful of the need for better data to accurately measure outcomes for Aboriginal and Torres Strait Islander peoples and progress toward Closing the Gap.</p>
Intended outcomes	<p>During the term of this Addendum, all parties will strive to:</p> <ul style="list-style-type: none"> • establish a national standard and risk-based approach to govern the creation, access and sharing of data across all Australian governments • remove legislative and regulatory barriers to health data linkage, access and use, while maintaining appropriate privacy standards • increase access to regularly updated linked data, including multilateral linked data, across health care settings and patient journeys • increase use of best practice health data and analytics, including linked data and patient reported measures, to better understand health service use and inform planning and service delivery • increase health workforce capability to use health data and analytics effectively • ensure appropriate data is captured and used meaningfully to support other NHRA reform activities
Key concepts	The Parties are committed to achieving comprehensive health data access, usage and sharing, while at the same time maintaining data security and preserving individuals’ privacy.
COVID-19 related developments	This reform may be able to leverage COVID-19 responses to support rapid data collection for up-to-date monitoring and response, including the Australian Data and Digital Council (ADDC) Data Sharing to Support COVID-19 Recovery, the Critical Health Resource Information System (CHRIS), and changes to legislation during the pandemic to allow data sharing between agencies.

Key components						
National health reform agreement commitments	NHRA clause	Deliverable	Timeframes			
			21-22	22-23	23-24	24-25
Review data linkage and privacy legislation and regulations across Australia	C.46.f	Report				
Share information about current data systems, processes and guidelines to help inform solutions for data sharing	C.47.a					
Pilot projects for local implementation and feedback to all participants	C.47.b					
Scale up a national approach to data governance arrangements, structures and processes	C.46.a	Approach document and implementation plan	Dependent on C.46.f			
Develop a risk-based framework and standards for collection, sharing, and security of data	C.46.d	Framework and standards	Dependent on C.46.f			
Establish Commonwealth-state patient-level primary and community health care datasets	C.46.b	Datasets				
Develop and implement a consistent approach to the collection and use of Patient Reported Measures	C.46.e	Approach document and implementation plan				
Develop a health data workforce capability framework to define roles and standards, and identify necessary skills and capabilities	C.46.c	Framework and implementation plan				

Enhanced health data – Outcomes Map

Rationale: This reform supports Australia’s governments in their commitment to realise the value of public health data through greater data sharing and information access to transform healthcare, drive efficiency and safety, create productivity gains and allow better decision making. It will ensure that relevant, robust and timely data is available to the appropriate people, to support shared patient-clinician decision-making, improved service delivery, evidence-informed policy development, research and analytics, and system planning. Maintaining data security and preserving individuals’ privacy will be central to the reforms.

Inputs

- Existing governance committee structures, data sharing legislation, accredited integrating authority arrangements, and bilateral data sharing agreements
- Existing data analytics hosting environments, enduring cross-jurisdictional linked datasets, and enduring cross-domain linked datasets
- Existing sharing of public hospital data, MBS and PBS data, and other national minimum datasets
- My Health Record
- Existing collaborative analytics projects and analytics training opportunities

Activities

- Share information about current data systems, processes and guidelines
- Pilot projects for local implementation and feedback to all participants
- Review relevant legislation and regulations across Australia
- Scale up a consistent national approach to data governance arrangements, structures and processes
- Develop a risk-based framework and standards for collection, sharing and security of data
- Establish Commonwealth-state patient-level primary and community health care datasets
- Develop and implement a consistent approach to the collection and use of Patient Reported Measures
- Develop a health data workforce capability framework

Outputs

- Information is shared to help inform solutions for data collection, sharing, governance and use
- Recommendations on ways to support better data linkage, access, use and ensure appropriate protections for patient privacy
- A framework for developing and sharing data between all Australian governments
- A Commonwealth-state, risk-based framework to support information security
- A framework to build health data workforce capability to undertake high quality analytics
- A Commonwealth-state patient-level primary care National Minimum Data Set and a community care National Minimum Data Set
- A framework for collection of PRMs to build national level evidence

Outcomes

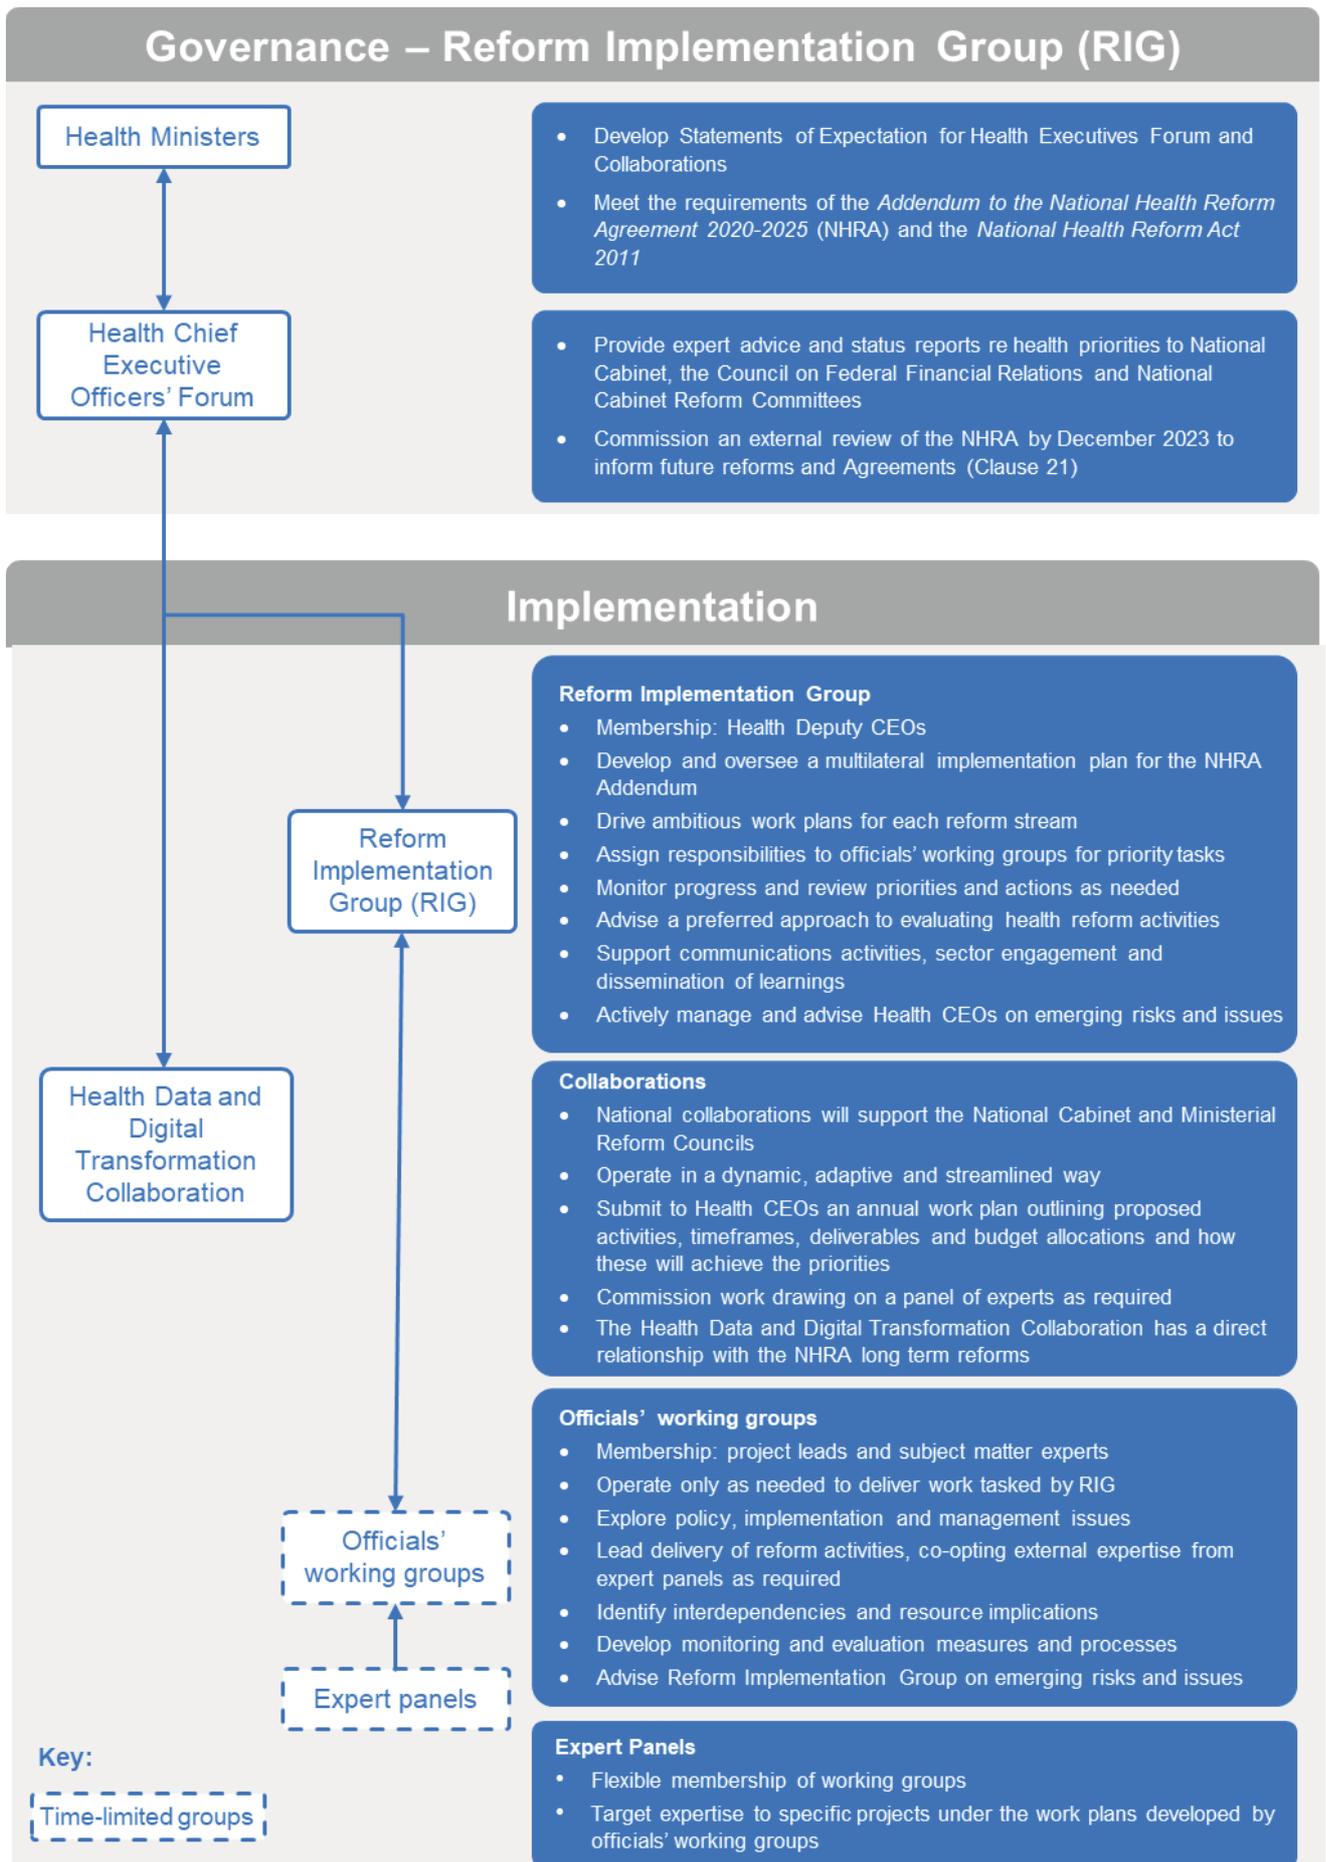

- | | | | | |
|-------------------|---|---|---|--|
| Short-Term | Legislative and regulatory barriers to health data linkage, access and use are removed, while maintaining appropriate privacy standards | A national standard and risk-based approach governs the creation, access and sharing of data across all Australian governments | Commonwealth-State minimum data sets for primary care and community health are established and maintained | Appropriate data is captured and used meaningfully to support other NHRA reform activities |
| Long-Term | Access to regularly updated linked data, including multilateral linked data, across health care settings and patient journeys increases | Use of best practice health data and analytics, including linked data and patient reported measures, to better understand health service use and inform health care planning and service delivery increases | Health workforce capability to use health data and analytics effectively increases | |

Reform stream	Interfaces between health, disability and aged care systems
Vision	Better coordination between the health, primary care, aged care and disability systems will ensure people can access the services they need, when they need them and improve care outcomes for people.
Aim	People's experiences of transferring and navigating between health and social service systems will be timely, well-coordinated and streamlined, particularly for people with complex and chronic conditions and disabilities.
Case for change	The care needs of many Australians are becoming increasingly complex. Many people access multiple services across the health, primary care, disability and aged care systems. The Commonwealth, states and territories recognise they have a shared responsibility to better coordinate their services, particularly for people with chronic conditions and disability.
Links to other reforms	This reform supports the success of other NHRA long-term reforms, aligning with and expanding data projects underway by jurisdictions and the Commonwealth.
Intended Outcomes	<p>During the term of this Addendum, all parties will strive to:</p> <ul style="list-style-type: none"> • resolve interface issues quickly, consistently and sustainably • identify and address service gaps within agreed timeframes • ensure better coordination between the health, primary care, disability and aged care systems with improved consumer access and care outcomes • provide better access to the clinical and social care older people and people with disability need from the appropriate system at the appropriate time • make it easier for consumers, carers and their families to navigate the health, primary care, aged care and disability support systems to receive optimal care and support • reduce avoidable hospital presentations, time spent in hospital and discharge delays
Key concepts	The parties are committed to reducing barriers, inefficiencies and issues that impact patients who use both health and social service systems. The parties will address legislative, funding and policy issues that impede interface performance.
COVID-19 related developments	This reform will build on COVID developments, including: National Disability Insurance Agency/state data sharing Memorandums of Understanding; continuing telehealth services; in-reach support services, accessible communications and improved engagement and collaboration with disability and aged care sectors.

Key components

National health reform agreement commitments	NHRA clause	Deliverable	Timeframes			
			21-22	22-23	23-24	24-25
Establish health, primary care, aged care and disability interface performance indicators and associated data collection and reporting	F.12	New indicators and data collection				
Monitor and analyse interface performance and effectiveness of system and interface improvement strategies	F.13.e	Framework and regular reporting				
Monitor, report on and address services gaps and the effect of policy or service changes across systems	F.13.a-d	Regular reporting Action plan				
Clarify joint governance arrangements for monitoring and resolving issues between health, aged care and disability systems	F.14	Paper				
Explore the impact of housing security, provision and assistance on people's health outcomes	F.15	Report				
Work towards consistent application/interpretation of data across systems to assist understanding of linkages between data sets, establish sharing practices, explore viability of disability identifier in health data	F.16.c	Framework and regular reporting				
Improve data sharing for serious incident/missed care across systems to provide early warning flags for all regulators	F.16.d	Framework and regular reporting				
Work towards sustainability and improved coordination of health, primary health, aged care and disability services particularly in regional, rural and remote communities	F.16.e	Regular reporting

PRELIMINARIES, SYSTEM WIDE OBJECTIVES AND ROLES AND RESPONSIBILITIES

Preliminaries

1. This Addendum:
 - a. sets out the shared intention of the Commonwealth, State and Territory governments (the States) to work in partnership to improve health outcomes for all Australians and ensure the sustainability of the Australian health system;
 - b. re-affirms that all governments:
 - i. agree that the healthcare system will strive to eliminate differences in health status of those groups currently experiencing poor health outcomes relative to the wider community; and
 - ii. acknowledge that private providers and community organisations play a significant role in delivering health services to the community and will continue to be partners with government in meeting the objectives of this Addendum.
 - c. recognises that responsibility for health is shared between the Commonwealth and the States, and that all governments have a responsibility to ensure that systems work together effectively and efficiently to produce the best outcomes for people, including interfaces between health, aged care and disability services, regardless of their geographic location;
 - d. amends the National Health Reform Agreement (NHRA) for the period 1 July 2020 to 30 June 2025;
 - e. implements and supersedes the Heads of Agreement on public hospital funding and health reform as agreed by the Council of Australian Governments (COAG) in 2018;
 - f. re-affirms the Medicare Principles, as set out in clause 8;
 - g. builds on and re-affirms the high-level service delivery principles and objectives for the health system in the National Healthcare Agreement (agreed by COAG in 2008 and amended in July 2011) for the period of this Addendum;
 - h. continues the financial arrangements for Australian public hospital services, including Activity Based Funding (ABF) and block funding, as set out in in Schedule A of this Addendum;
 - i. acknowledges the shared commitment of the Commonwealth and States to work in partnership with Aboriginal and Torres Strait Islander communities in closing the gap through the COAG-agreed agenda;
 - j. recognises the responsibility for improving the mental health outcomes of Australians and preventing suicides is shared and that all governments are committed to reforming the provision of mental health care across the key areas of prevention, diagnosis, treatment and recovery, with the aim of:
 - i. promoting the mental health and wellbeing of the Australian community and,

where possible, prevent the development of mental health problems and mental illness;

- ii. reducing the impact of mental health problems and mental illness, including the effects of stigma on individuals, families and the community;
- iii. promoting recovery from mental health problems and mental illness; and
- iv. assuring the rights of people with mental health problems and mental illness, and enable them to participate meaningfully in society; and

k. is subject to the Intergovernmental Agreement on Federal Financial Relations (IGA FFR) and should be read in conjunction with that Agreement and subsidiary schedules.

2. The Commonwealth and the States agree the following four strategic priorities will guide further reform of our health system between 2020 and 2025:

- a. Improving efficiency and ensuring financial sustainability (Schedule A);
- b. Delivering safe, high-quality care in the right place at the right time, including long-term reforms in:
 - i. Nationally cohesive health technology assessment;
 - ii. Paying for value and outcomes; and
 - iii. Joint planning and funding at a local level.
- c. Prioritising prevention and helping people manage their health across their lifetime, including long-term reforms in:
 - i. Empowering people through health literacy; and
 - ii. Prevention and wellbeing; and
- d. Driving best practice and performance using data and research, including long-term reforms in:
 - i. Enhanced health data.

3. High level principles outlining the focus of reforms in clause 2 (b)-(d) are included in Schedule C, and implementation plans will be attached to this Addendum when agreed.

4. Included at Appendix A is a list of definitions for words and phrases used in this Addendum.

Objectives

5. The Commonwealth and the States recognise that this Addendum provides an opportunity to work together to ensure the best possible outcomes for the Australian people through the collective investments governments make in health. The Parties recognise that improving value in our health system means developing and implementing

reforms that:

- a. deliver improvements in outcomes that matter most to people and communities;
 - b. improve outcomes, experiences, quality, safety and efficiency of care through public reporting, such as promoting the uptake of Patient Reported Measures;
 - c. create stronger incentives for providers and funders to work together to better integrate care and drive efficiency across the system; and
 - d. ensure equitable access to care regardless of geographic location.
6. As part of the shared commitment to improving mental health outcomes, the Parties agree to work together informed by the Productivity Commission’s final report into mental health, the National Suicide Prevention Adviser’s final report and other inquiries, including the Victorian Royal Commission into Mental Health Services.
7. The Commonwealth and the States will work in partnership to implement arrangements for a nationally unified and locally controlled health system which will:
- a. improve patient outcomes, patient experience and access to services, including by focussing on what matters most to patients, supporting innovative models of care and trialling new funding arrangements (Schedule C);
 - b. improve the provision of GP and primary health care services, including Aboriginal and Torres Strait Islander community controlled health organisations, and the effective integration of health services at a local and national level (Schedule C);
 - c. improve care coordination for people with chronic and complex needs, building on the activities set out in the 2017 Bilateral Agreements on Coordinated Care and incorporating them into relevant long-term health reforms (Schedule C);
 - d. improve the safety and quality of health services through continuation of hospital pricing reforms agreed by COAG in 2017 (Schedule A);
 - e. improve standards of clinical care, including through guidance from the Australian Commission on Safety and Quality in Health Care (ACSQHC) (Schedule B);
 - f. improve accountability and performance reporting on the health system through the Australian Health Performance Framework and supporting national performance indicators (Schedule D);
 - g. improve local accountability and responsiveness to the needs of communities through continued operation and collaboration between Local Hospital Networks (LHNs) and Primary Health Networks (PHNs) (Schedule E);
 - h. work effectively with the aged care and disability support systems to deliver better outcomes (Schedule F);
 - i. improve access to and use of data to support service delivery and improved patient outcomes (Schedule C);
 - j. improve public hospital efficiency through the use of ABF based on a national efficient price (Schedule A);

- k. ensure the sustainability of funding for public hospitals by increasing the Commonwealth's share of public hospital funding through a 45 per cent contribution to the costs of growth, subject to the operation of the National Funding Cap (Schedule A); and
- l. maintain transparency of public hospital funding through the National Health Funding Pool (Schedule A).

Roles and responsibilities

- 8. Under this Addendum, States will provide health and emergency services through the public hospital system, based on the following Medicare Principles:
 - a. eligible persons must be given the choice to receive public hospital services free of charge as public patients;¹
 - b. access to public hospital services is to be on the basis of clinical need and within a clinically appropriate period; and
 - c. arrangements are to be in place to ensure equitable access to such services for all eligible persons, regardless of their geographic location.
- 9. Under this Addendum, the Commonwealth and the States will be jointly responsible for:
 - a. funding public hospital services, using ABF where appropriate and block funding in other cases;
 - b. funding growth in public hospital services and the increasing cost of public hospital services;
 - c. determining funding policy and exploring innovative models of care in the national funding model;
 - d. establishing and maintaining nationally consistent standards for healthcare and reporting to the community on the performance of health services;
 - e. collecting and providing patient-level data to support the objectives of this Addendum;
 - f. working together on policy decisions or areas of the system that impact on each other's responsibilities;
 - g. ensuring that the commitments outlined in this Addendum contribute to closing the gap in Aboriginal and Torres Strait Islander disadvantage and life expectancy. This will be given effect by:
 - i. working with Aboriginal and Torres Strait Islander communities to design approaches tailored to their needs, recognising and enabling Aboriginal and Torres Strait Islander leadership and local decision making processes;
 - ii. working to achieve cultural safety in the health system with Aboriginal and

¹ This Addendum recognises that clinical practice and technology changes over time and that this will impact on modes of service and methods of delivery. These principles should be considered in conjunction with the definition of public hospital services set out in Schedule A.

Torres Strait Islander people by co-developing and co-delivering culturally safe and secure health services;

- iii. developing a National Aboriginal and Torres Strait Islander Health Workforce Strategy; and
- iv. monitoring the impact of reforms through Aboriginal and Torres Strait Islander-led evaluation, including assessing the differential impact prior to implementation and during implementation, and making appropriate changes in partnership with Aboriginal and Torres Strait Islander organisations and communities;

h. identifying rural and remote areas where there is limited access to health and related services with a view to developing new models of care to address equity of access and improve outcomes; and

i. maintaining and improving population health.

10. Under this Addendum, the States will be responsible for:

a. system management of public hospitals, including:

- i. ensuring the legislative basis and governance arrangements for Local Hospital Networks are consistent with the objectives of this Addendum;
- ii. system-wide public hospital service planning and performance;
- iii. purchasing of public hospital services and monitoring delivery of services purchased;
- iv. planning, funding and delivering capital;
- v. planning, funding (with the Commonwealth) and delivering teaching, training and research;
- vi. managing Local Hospital Network performance; and
- vii. State-wide public hospital industrial relations functions, including negotiation of enterprise bargaining agreements and establishment of remuneration and employment terms and conditions to be adopted by Local Hospital Networks;

b. taking a lead role in managing public health activities; and

c. sole management of the relationship with Local Hospital Networks to ensure a single point of accountability in each State for public hospital performance, performance management and planning.

11. States affirm their commitment to the following:

a. providing public patients with access to all services provided to private patients in public hospitals;

b. ensuring that eligible persons who have elected to be treated as private patients have done so on the basis of informed financial consent;

c. providing and funding pharmaceuticals for public and private admitted patients, and for public non-admitted patients in public hospitals (except where Pharmaceutical Reform Arrangements are in place); and

- d. maintaining a Public Patients Hospital Charter and an independent complaints body and ensuring that people are aware of how to access these provisions.
12. In providing these services States will adhere to the Business Rules and other requirements set out in Schedule G.
13. Under this Addendum the Commonwealth will be responsible for:
 - a. maintaining the legislative basis and governance arrangements for the key independent national bodies (“national bodies”), comprising the Australian Commission on Safety and Quality in Health Care, Australian Institute of Health and Welfare, Independent Hospital Pricing Authority and Administrator of the National Health Funding Pool;
 - b. system management and support, policy and funding for GP and primary health care services including lead responsibility for Aboriginal and Torres Strait Islander Community Controlled Health Services (noting contributions of the States);
 - c. maintaining Primary Health Networks to promote coordinated GP and primary health care service delivery, and service integration over time;
 - d. working with each State and with PHNs on system-wide policy and State-wide planning for GP and primary health care;
 - e. supporting and regulating private health insurance to enable an effective private health sector and patient choice;
 - f. planning, funding, policy, management and delivery of the national aged care system;
 - g. continuing to focus on reforms in primary care that are designed to improve patient outcomes and reduce avoidable hospital admissions; and
 - h. functions transferred from Health Workforce Australia and the National Health Performance Authority when these organisations ceased operations on 6 August 2014 and 30 June 2016 respectively.
14. The Commonwealth affirms its commitment to the following:
 - a. funding the Medicare Benefits Schedule to ensure equitable and timely access to affordable primary health care and specialist medical services;
 - b. funding the Pharmaceutical Benefits Scheme to ensure timely and affordable access to safe, cost-effective and high quality medicines; and
 - c. affordable aged care services so that people needing this care can access it when required, regardless of geographic location.
15. The roles and responsibilities of the following national bodies and organisations under this Addendum are outlined in Schedule B:
 - a. Australian Commission on Safety and Quality in Health Care (ACSQHC);
 - b. Australian Institute for Health and Welfare (AIHW);
 - c. Independent Hospital Pricing Authority (IHPA); and

- d. Administrator of the National Health Funding Pool.
16. The Commonwealth, States and relevant national bodies will comply with applicable privacy legislation and principles during the implementation of this Addendum.

Implementation

17. This Addendum will be implemented through the following mechanisms:
- a. COAG will provide overall leadership, supported by COAG Councils (Health and Federal Financial Relations);
 - b. the COAG Health Council (CHC) will take responsibility for implementing this Addendum and further developing the six long-term reforms outlined in Schedule C, which will guide further reform of our national health system between 2020 and 2025;
 - c. the long-term reforms will need to take into account each State's particular circumstances. Implementation will allow individual States the flexibility to identify priority reforms and determine the scope and timing of activities that best suit local needs and support local health system diversity, readiness, and funder and provider capabilities;
 - d. CHC will be responsible for jointly developing multilateral implementation plans that will provide a broad framework and allow individual States the flexibility to identify priority reforms and determine the scope and timing of activities. Multilateral implementation plans will be considered by CHC as per clause 25 and, once approved, appended to this Addendum;
 - i. where appropriate, CHC will monitor multilateral implementation against the commitments in this Addendum and will escalate implementation issues to COAG when required; and
 - e. bilateral implementation plans for the long-term reforms will be developed where required by the relevant Commonwealth and State Ministers for Health and will take into account each States' particular circumstances:
 - i. relevant Ministers will monitor implementation against the commitments in the implementation plans.
18. In addition to the Medicare Principles outlined at clause 8, this Addendum affirms that the following implementation principles will underpin reform:
- a. all Australians should have equitable access to high quality health care, including those living in regional and remote areas;
 - b. all Australians should be able to access transparent, timely, meaningful and nationally comparable performance data and information on the hospital, GP and primary health care, aged care, disability and other health services systems; and
 - c. better coordination between the hospital, GP and primary health care, disability services and aged care systems is needed to ensure the health system meets the needs of communities.

19. Reforms will also:
- a. support and encourage integrated person-centred care;
 - b. incentivise local diversity and innovation in the health system as a crucial mechanism to achieve better outcomes;
 - c. promote positive health and wellbeing outcomes, social equity and the reduction of disadvantage, especially for Aboriginal and Torres Strait Islander people;
 - d. be evidence-based;
 - e. be evaluated to assess their impact on sustainability and patient outcomes;
 - f. consider the impacts of health workforce matters; and
 - g. engage providers, clinicians and patients when new approaches to care are developed.
20. To support implementation of the reforms, the Commonwealth provided \$100 million for a Health Innovation Fund for trials that support health prevention and the better use of health data. This funding is managed separately through a Project Agreement under the *Intergovernmental Agreement on Federal Financial Relations*.

Review

21. An external review of the Addendum commissioned by CHC will be undertaken at the midpoint of this Addendum, completed by December 2023. The review will assess if the Addendum is meeting its stated objectives and will consider the following matters:
- a. implementation of the long-term reforms and other governance and funding arrangements, and whether practice and policy in place delivers on the objectives of the Addendum;
 - b. the impact of external factors on the demand for hospital services and the flow-on effects on Addendum parameters;
 - c. for small rural and small regional hospitals, whether they continue to meet the block funding criteria determined by the IHPA;
 - d. whether any unintended consequences such as cost-shifting, perverse incentives or other inefficiencies that impact on patient outcomes have arisen, and the capacity of Parties to adopt and deliver innovative models, as a result of financial and other arrangements in this Addendum;
 - e. the performance of the national bodies against their functions, roles and responsibilities;
 - f. arrangements for approval and funding of high cost therapies offered in public hospitals, as outlined in Schedule C (clauses C11 and C12) and Appendix B; and
 - g. other matters as agreed by CHC or COAG.
22. Outcomes and learnings from the long-term health system reforms will be provided to CHC to inform future reforms and agreements.

23. The reviewer(s) and the terms of reference for the reviews are to be agreed by CHC. The review will be completed by December 2023, or at another time as agreed by CHC.

Process for amending the Agreement

24. Subject to clause 25, the NHRA may be amended at any time in writing with the agreement of all parties and with terms and conditions as agreed by all the parties.
25. The schedules to the NHRA may be amended or revoked, and new schedules added at any time, with the written agreement of the relevant portfolio Commonwealth Minister and all State and Territory Ministers for Health. Where an amendment has material funding implications for more than one State or Territory, agreement will be sought from First Ministers.

Dispute resolution

26. Any party may give notice to other parties of a dispute under the NHRA.
27. The Officials of relevant parties will attempt to resolve any dispute in the first instance. If a dispute cannot be resolved by Officials it may be escalated to the relevant Ministers, and if necessary, the relevant COAG Council.
28. If a dispute cannot be resolved by the relevant Ministers, it may be referred to COAG for consideration.

SCHEDULE A – SUSTAINABILITY OF FUNDING FOR PUBLIC HOSPITAL SERVICES

Preliminaries

- A1. This Schedule details public hospital funding arrangements between the Parties from 1 July 2020 to 30 June 2025. Arrangements for 1 July 2025 and beyond will be subject to negotiations between the Commonwealth and all jurisdictions.
- A2. The Parties agree the Commonwealth's contribution to health services in respect of this agreement will comprise funding relating to:
- a. hospital services provided to public patients in a range of settings and funded on an activity basis;
 - b. hospital services provided to eligible private patients in public hospitals;
 - c. hospital services provided to patients in public hospitals better funded through block grants, including relevant services in rural and regional communities;
 - d. teaching and training functions funded by States undertaken in public hospitals or other organisations (such as universities and training providers);
 - e. research funded by States undertaken in public hospitals; and
 - f. public health activities as determined by clause A15.
- A3. Commonwealth funding will be provided on the basis of activity through Activity Based Funding (ABF) except where it is neither practicable nor appropriate.
- A4. To provide financial predictability and sustainability as the national funding model evolves over time, funding arrangements will be implemented in accordance with the following principles:
- a. Information will be shared between jurisdictions and the national bodies on a timely and transparent basis to support development of the national funding model each year, implementation of services under the model, and final reconciliation of payments.
 - b. Data reporting and calculations of activity and funding should be accurate, transparent, accountable, and in accordance with the national funding model;
 - c. Activity and cost data will progressively be incorporated into the development of the national funding model;
 - d. Data reporting from jurisdictions and advice from national bodies should be provided as early as feasible to facilitate timely payments to local hospital networks and the determination of funding entitlements;
 - e. Where an error or unexpected outcome in activity or cost data has been identified, national bodies must consult with jurisdictions before taking any further action;
 - f. funding entitlements should be determined in a timely manner; and

- g. Parties, the Administrator and the IHPA will seek to resolve any disputes in a timely and transparent manner.
- A5. Growth in the Commonwealth’s total annual funding contribution to health services nationally under this Addendum as outlined at clauses A6 and A7 will not exceed 6.5 per cent a year (the national funding cap). Details on the operation of the national funding cap are outlined in clauses A56 to A58.
- A6. The Commonwealth will fund 45 per cent of efficient growth of ABF service delivery, subject to the operation of the national funding cap. Efficient growth consists of:
- a. the national efficient price for any changes in the volume of services provided; and
 - b. the growth in the national efficient price of providing the existing volume of services.
- A7. Where services or functions are more appropriately funded through block grants, the Commonwealth will fund 45 per cent of growth in the efficient cost of providing the services or performing the functions. The efficient cost will be determined annually by the IHPA, taking account of changes in utilisation, the scope of services provided and the cost of those services, to ensure the Local Hospital Network has the appropriate capacity to deliver the relevant block funded services and functions.
- A8. Commonwealth funding for public hospital services and functions under this Addendum is dependent on the provision of data requested by the national bodies outlined in this Addendum, including in relation to services to patients, information identifying the patient to whom the services were provided, the public or private status of the patient, the nature of the service and the facility providing the service.
- A9. The Commonwealth will also continue to support private health services through the Medicare Benefits Schedule (MBS), the Pharmaceutical Benefits Scheme (PBS) and Private Health Insurance Rebate. Subject to any exceptions specifically made in this Addendum or through variation to the Addendum, the Commonwealth will not fund patient services through this Addendum if the same service, or any part of the same service, is funded through any of these benefit programs or any other Commonwealth program.
- A10. The Parties agree that the following Commonwealth benefits constitute exceptions to the principle outlined at clause A9:
- a. MBS payments covered by a determination made by the Commonwealth Health Minister, or a delegate of the Minister, under s19(2) of the *Health Insurance Act 1973*;
 - b. MBS payments relating to services provided to eligible admitted private patients in public hospitals;
 - c. PBS benefits dispensed under Pharmaceutical Reform Arrangements agreed between the Commonwealth and the relevant State; and
 - d. the default bed day rate (or equivalent payment) supported through the private health insurance rebate.
- A11. Parties agree that from 1 July 2020, the Administrator should identify instances not covered by the exceptions outlined at clause A10 where services appear to have been paid under this Addendum and other Commonwealth programs, such as through the MBS

and PBS, and should refer these matters to the relevant Commonwealth officer in the first instance to support Commonwealth compliance activities through mechanisms outside this Addendum.

- a. The Administrator will determine the data matching business rules, with consultation of the Parties, to identify services funded by the Commonwealth through both this Addendum and other Commonwealth programs. Rationale for new business rules will be provided to Parties in the financial year preceding the introduction of the business rules.
- b. Data matching business rules will be reviewed as required by the Administrator. Upon the request of a party, the Administrator is to initiate a review of data matching business rules where material false positives or false negatives in matched data are demonstrated through Commonwealth compliance activities.
- c. Any data provided by the Administrator to the Commonwealth or a State or Territory for compliance activities will be de-identified matched data only and will include the relevant Medicare PIN. The relevant State or Territory will receive a copy of any matched data provided by the Administrator for verification purposes. Data provision will comply with applicable Commonwealth and State legislation including privacy legislation and principles.
- d. The relevant Commonwealth officer responsible for compliance will notify, consult and validate with the States and Territories and have regard to timely advice provided by affected States or Territories prior to undertaking any compliance activity relating to duplicate payments. State health departments will raise any validation or verification issues with the relevant Commonwealth officer responsible for compliance. This consultation will include providing relevant data back to the State or Territory.
- e. The Commonwealth will provide an annual report to the Administrator on the outcomes of compliance activities taken in relation to instances of duplicate payments.
- f. Commonwealth compliance activities, where possible, will be undertaken in a timely manner.

A12. Where instances of matched payments are identified and referred by the Commonwealth through compliance activities as outlined in clause A11, this will not impact Commonwealth national health reform funding, except when:

- a. amounts are identified where the services or any part of the service is funding through any Commonwealth program, that is not excepted through clause A10, and evidence is provided that reasonably demonstrates the amount is unable to be recovered through the process outlined in clause A11; and
- b. The relevant jurisdiction has been offered the opportunity outside of this agreement to address over-payments unable to be recovered through Commonwealth compliance activities. In this case, the Administrator will:
 - i. work with the relevant jurisdictions to identify additional mechanisms to prevent payment for patient services through this Addendum; and
 - ii. adjust Commonwealth NHR funding by the amount of the over-payment.

- c. the Administrator identifies that a matched payment is a false positive – for instance, a privately-funded hospital service has incorrectly been coded as a publicly-funded hospital service – the Administrator will not be required to directly adjust national health reform funding, but instead work with the relevant jurisdiction to correct the source data coding and reprocess the necessary calculations.

A13. The Parties agree to the principle that both the Commonwealth and States' funding models will be financially neutral with respect to all patients, regardless of whether patients elect to be private or public under the Addendum.

Public health activity funding

A14. The Commonwealth's commitment to public health will continue to grow by the former National Healthcare Specific Purpose Payment (SPP) growth factor.

- a. Payments for public health activities will be equal to the previous year's payment indexed by the former National Healthcare SPP growth factor.

A15. States will have full discretion over the application of public health funding to the outcomes set out in the National Healthcare Agreement 2012.

Public hospital funding arrangements

Scope of 'public hospital services'

A16. States will provide health and emergency services through the public hospital system, based on the Medicare principles set out at clause 8 and interpreted consistently with this section (clauses A17 to A32).

A17. Unless a State chooses to reach bilateral agreement with the Commonwealth under clauses A25 to A28 on this matter, the scope of public hospital services funded on an activity or block grant basis that are eligible for a Commonwealth funding contribution will include:

- a. all admitted services, including hospital in the home programs;
- b. all emergency department services provided by a recognised emergency department service; and
- c. other outpatient, mental health, subacute services and other services that could reasonably be considered a public hospital service in accordance with clauses A18 to A24.

A18. States will provide the IHPA with recommendations for other services that could reasonably be considered to be a public hospital service and which are not captured by clauses A17(a) and A17(b) that they consider should be eligible for a Commonwealth funding contribution.

A19. The IHPA will maintain and publish criteria for assessing services for inclusion on a general list of hospital services eligible for Commonwealth growth funding. The IHPA will consider each State's recommendations against the published criteria. If the IHPA considers the service should continue to be included or excluded, it will publicly release its determination and its rationale. In doing so, the IHPA will establish a general list of other services eligible for a Commonwealth funding contribution.

- A20. The COAG Health Council (CHC) may then request the IHPA to revise its determination of services included on or excluded from the general list. If the IHPA considers the service should continue to be included or excluded from the general list, the IHPA will publicly release its determination and the basis of that determination.
- A21. The IHPA may update the criteria and will update the general list based on any updated criteria, or as required to reflect innovations in clinical pathways. States may request the IHPA to update the list or to assess specific services against the criteria for inclusion on the general list.
- A22. In publishing criteria a primary consideration will be whether the service could reasonably be considered to be a public hospital service during 2010.
- A23. Services named on the general list will attract a Commonwealth funding contribution if provided by any Local Hospital Network as agreed between the State and that Local Hospital Network.
- A24. In addition to services on the general list (clause A17 of this Addendum) and services covered under a bilateral agreement (clause A25), grandfathered services in specific hospitals will also be eligible for Commonwealth funding. Grandfathered services in specific hospitals were made eligible under clause A17 of the 2011 National Health Reform Agreement (NHRA). In 2011, these services were agreed as eligible for Commonwealth funding for specific hospitals as they were purchased or provided by that hospital during 2010 (i.e. prior to the 2011 NHRA being agreed).
- A25. A State Health Minister and State Treasurer and the Commonwealth Health Minister and Commonwealth Treasurer may enter into a bilateral agreement to determine the scope of public hospital services funded on an activity or block grant basis that are eligible for a Commonwealth funding contribution.
- A26. The scope of public hospital services under a bilateral agreement will include:
- a. all admitted services, including hospital in the home programs;
 - b. all emergency department services provided by a recognised emergency department service;
 - c. all other services agreed between Ministers as being provided or purchased by a public hospital within the State during 2010; and
 - d. any other services, agreed between Ministers, provided or purchased by public hospitals in Australia.
- A27. Unless otherwise agreed by Ministers, the bilateral agreement will include lists of services which will be funded by the Commonwealth if provided by individual hospitals, and lists of services which will be funded by the Commonwealth if provided at any hospital in the State, or by types of hospital in the State.
- A28. A bilateral agreement will be reviewed every two years to reflect changing patterns of service delivery, and may be varied at any other time by mutual consent.
- A29. Public hospital services which attract a Commonwealth funding contribution will continue to be eligible for Commonwealth funding, even if they are subsequently provided outside a hospital in response to changes in clinical pathways.

- A30. States agree they will not change the management, delivery and funding of health and related services for the dominant purpose of making that service eligible for Commonwealth funding.
- A31. Should the IHPA identify anomalies in service volumes or other data which suggest that services have been transferred from the community to public hospitals, the IHPA will analyse those services and provide a report to the CHC. In performing the analysis the IHPA will consult with the relevant State, LHNs, PHN, and other stakeholders. Following an appropriate consultation period, the IHPA may determine that those particular services provided by that hospital have been transferred for the dominant purpose of making that service eligible for Commonwealth funding and those particular services provided by that hospital will not be eligible for Commonwealth funding.
- A32. The Commonwealth agrees that it will not change the management, delivery and funding of health and related services for the dominant purpose of directing services from the community into the hospital setting.

Activity based funding calculation

- A33. The Commonwealth will fund 45 per cent of the efficient growth of ABF Service delivery, subject to the operation of the national funding cap.
- A34. The Commonwealth's funding for all ABF Service Categories will be calculated individually for each State by summing:
- a. *previous year amount*— the Commonwealth's contribution rate for the relevant State in the previous year, multiplied by the volume of weighted ABF Services provided in the previous year, multiplied by the national efficient price in the previous year;
 - b. *price adjustment*—the volume of weighted services provided in the previous year, multiplied by the change in the national efficient price relative to the previous year, multiplied by 45 per cent; and
 - c. *volume adjustment*—the net change in volume of weighted services provided in the relevant State (relative to the volume of weighted ABF Services provided in the previous year), multiplied by the national efficient price, multiplied by 45 per cent.
- A35. Commonwealth funding will be distributed across all ABF Service Categories in each State at a single Commonwealth contribution rate:
- a. The single Commonwealth contribution rate in each State for all ABF service categories will be calculated by dividing the sum of clause A34 by the relevant year's total volume of weighted services multiplied by the national efficient price.
 - b. On implementation of the single Commonwealth contribution rate there will be an initial re-distribution of Commonwealth funding at the LHN level within each State but no aggregate change in the amount of Commonwealth funding that a State receives as a result of the introduction of the single Commonwealth contribution rate.
 - c. States will manage their funding levels such that there will be no impact on service level delivered at individual LHNs as a result of the introduction of a single Commonwealth contribution rate. Adjustments in service levels at individual LHNs and hospitals may still be made by the system managers for reasons other than the

introduction of the single Commonwealth contribution rate.

- A36. The Commonwealth’s contribution to funding public hospital services on an ABF basis (including efficient growth) will be calculated at the start of each financial year, and may be updated or revised during a year based on updated activity estimates, finalised reconciliation processes for prior years, and final activity data from jurisdictions and advice from the Administrator, including a final reconciliation of public hospital services.
- A37. All parties will participate in the development of parameters of the national funding model each year, through the IHPA process outlined in clauses B21 to B40, including efficient price, classifications and cost weights. This process will rely on transparent sharing of analysis, commissioned costing data, and shadow pricing and reporting (where appropriate) to support robust decision making.
- A38. The Administrator will provide the Commonwealth and States with a formal forecast of the Commonwealth’s funding contribution for each ABF service category before the start of each financial year. The formal forecast will be provided within 14 calendar days of receipt of both:
- a. service volume information for all Local Hospital Networks within a State, as provided in Service Agreements; and
 - b. the published national efficient price from the IHPA.
- A39. The Administrator will also provide informal estimates of the Commonwealth’s funding contribution to jurisdictions where requested.
- A40. The methodologies set out in clauses A34 to A35 relate to the calculation of preliminary payment entitlements. Final payment entitlements will be made after the reconciliation adjustments, as specified in clauses A63 to A76 have been completed.
- A41. The national activity based funding model will improve every year, informed by previous years’ cost and activity data. If the IHPA makes significant changes to the ABF classification systems or costing methodologies, the effect of such changes must be back-cast to the year prior to their implementation for the purpose of the calculations set out in clauses A34 and A35.
- A42. The IHPA will use transitional arrangements when developing new ABF classification systems or costing methodologies, including shadow pricing classification system changes and pricing based on a costing study, for two years or a period agreed with the Commonwealth and a majority of States to ensure robust data collection and reporting to accurately model the financial and counting impact of changes on the National Funding Model.
- a. Where a jurisdiction participates fully in the shadow pricing, including the provision of the best available data over the shadow period to support the implementation of the new ABF classification systems or costing methodologies, the Parties agree there will be no retrospective adjustments to the National Funding Model, excluding adjustments to Commonwealth contributions as a result of service volume reconciliations as set out in clauses A63, A65 and A73.
 - b. Business rules will be developed by the national bodies in consultation with Parties, addressing significance of changes, process and consultation around retrospective adjustments where appropriate.

- i. If the national bodies consider there is a potential need for a retrospective adjustment to the national funding model, national bodies will communicate, consult and collaborate with Parties. The national bodies will hold a consultation period of 45 days to allow Parties an opportunity to provide submissions on the matter.
- ii. Within 45 days following the jurisdiction 45-day consultation period, national bodies will prepare a report to the CHC, advising them of the national bodies' decision and the nature and circumstances of the recommended adjustment to the national funding model.
- iii. Once the report is provided to the CHC, the national bodies will incorporate the decision regarding the retrospective adjustment into the national funding model and provide parties with an updated report on funding entitlements from the national model.
- iv. When providing payment advice to the Commonwealth Treasurer following the six-month or annual reconciliation, the Administrator will include a section that notes any matters or concerns raised by State Ministers in the 45-day consultation period in the formation of that advice.

A43. ABF payments for eligible private patients must utilise the same ABF classification system as for public patients with the cost weights for private patients being calculated by excluding or reducing, as appropriate, the components of the service for that patient which are covered by:

- a. Commonwealth funding sources other than ABF;
- b. patient charges including:
 - v. prostheses; and
 - vi. accommodation and nursing related components/charge equivalent to the private health insurance default bed day rate (or other equivalent payment).

A44. To give effect to the principle agreed at clause A13, the IHPA will, in determining cost-weight price for private patients in any year, further adjust the price to the extent required to achieve overall payment parity between public and private patients in the relevant jurisdiction. These adjustments will take into account all hospital revenues, be subject to back-casting, and will apply from 1 July 2021, to ensure there are no funding incentives for hospitals to treat public or private patients differently.

Principles for determining the national efficient price

A45. The role of the national efficient price is to:

- a. form the basis for the calculation of the Commonwealth funding contribution; and
- b. provide a relevant price signal to States and Local Hospital Networks that will improve patient access to services, public hospital efficiency and funding effectiveness.

- A46. In determining the national efficient price, the IHPA must:
- a. have regard to ensuring reasonable access to public hospital services, clinical safety and quality, efficiency and effectiveness and financial sustainability of the public hospital system;
 - b. consider the actual cost of delivery of public hospital services in as wide a range of hospitals as practicable;
 - c. consider the expected changes in costs from year to year when making projections;
 - d. have regard to the need for continuity and predictability in prices;
 - e. have regard to any input costs funded through other Commonwealth programs, such as pharmaceuticals supplied under arrangements pursuant to section 100 of the *National Health Act 1953* and magnetic resonance imaging services funded through MBS bulk-billing arrangements; and
 - f. develop methods which allow consideration of reasonable and likely growth in cost inputs, so that the national efficient price can be projected into the future in a predictable and transparent manner.
- A47. In determining adjustments to the national efficient price, the IHPA must have regard to legitimate and unavoidable variations in wage costs and other inputs which affect the costs of service delivery, including:
- a. hospital type and size;
 - b. hospital location, including regional and remote status; and
 - c. patient complexity, including Indigenous status.
- A48. While these adjustments to the national efficient price should provide a relevant price signal to States and Local Hospital Networks, the IHPA should not seek to duplicate the work of the Commonwealth Grants Commission in determining relativities.

Block funded services funding

- A49. The Commonwealth will continue to provide funding to States for public hospital services or functions that are more appropriately funded through block funding, and will fund 45 per cent of the growth in the efficient cost of providing these services or performing these functions.
- A50. Payments will consist of the previous year's payment plus 45 per cent of the growth in the efficient cost of providing the services, adjusted for the addition or removal of block services as provided in clauses A52 to A55 (calculated in accordance with clause A7).
- A51. The IHPA, in consultation with jurisdictions, maintains block funding criteria and identifies whether hospital services and functions are eligible for block funding only or mixed ABF and block funding.
- A52. From 2013-14, the process for determining the discrete amounts for block funding is set out below:
- a. the IHPA, in consultation with jurisdictions, develops Block Funding Criteria and

identifies whether hospital services and functions are eligible for block funding only or mixed ABF and block funding

- b. States, during the consultation period, assess their hospital functions and services against the block funding criteria and, if necessary, provide advice to the IHPA on the potential impact of the criteria;
- c. the IHPA provides the block funding criteria to CHC for endorsement; and
- d. CHC considers the block funding criteria proposed by the IHPA and either:
 - vii. endorse the recommendation; or
 - viii. request the IHPA to refine the block funding criteria and bring it back to CHC.

A53. States provide advice to the IHPA on how their hospital services and functions meet the block funding criteria on an annual basis.

A54. On the basis of this advice, the IHPA will determine which hospital services and functions are eligible for Commonwealth funding on a block grant basis.

A55. Using the IHPA's determination the Administrator will then calculate the Commonwealth's funding contribution for block funded services and functions.

Funding cap

A56. Overall growth in Commonwealth funding will be capped at 6.5 per cent a year (the national funding cap). In doing so:

- a. A soft cap will be applied to the Commonwealth funding entitlement of each State throughout the relevant financial year;
- b. Any funding remaining under the national funding cap will be subject to proportionate redistribution as part of the annual reconciliation under clause A77;
- c. while the national funding cap applies to Commonwealth contributions to public hospital services in aggregate, any adjustments to funding as a result of the national funding cap will be applied to the Commonwealth funding contribution for ABF Services only;
- d. should the growth in Commonwealth funding under this Addendum not exceed 6.5 per cent at a national level, each State will receive its uncapped Commonwealth funding entitlement for that State; and
- e. no State will receive more than its uncapped Commonwealth funding entitlement for public hospital services delivered in a relevant financial year.

Interaction of pricing and funding for safety and quality reforms with the funding cap

A57. Adjustments to Commonwealth funding for an individual State resulting from sentinel events, hospital acquired complications (HACs) and avoidable hospital readmissions will be incorporated in the calculation and determination of the State's Commonwealth funding entitlement. The Commonwealth funding entitlement for a given year,

incorporating these adjustments, will form the base for the calculation of the State's soft cap in the following year.

- A58. Any downward adjustment to an individual State for sentinel events, HACs and avoidable hospital readmissions will not be deducted from the total available pool of Commonwealth funding under the national funding cap and will be available for redistribution under clause A56(b).

Calculating Commonwealth funding

Determining preliminary Commonwealth funding

- A59. Prior to the commencement of a relevant financial year covered by this Addendum, the Administrator will calculate a State's estimated Commonwealth funding entitlement as the lower of:
- a. 106.5 per cent of the State's most recent estimated Commonwealth funding entitlement for the State for the previous financial year, excluding any adjustments relating to prior year activities; or
 - b. That State's estimated uncapped Commonwealth funding entitlement for the relevant financial year.
- A60. Estimated Commonwealth funding entitlements can be updated during the course of the year as outlined in clause A143. Adjustments to payments remain subject to the soft cap.
- A61. The Administrator will provide information to jurisdictions about progress against the caps when the estimated Commonwealth funding is calculated or when the Commonwealth's funding contribution is adjusted.
- A62. For the avoidance of doubt, a State will not receive any Commonwealth funding in excess of the soft cap until the annual adjustment, at which time it may be entitled to payment of a redistribution amount.

Adjustments to the Commonwealth's contribution

- A63. There will be two levels of adjustments to the Commonwealth's funding contribution to Local Hospital Networks:
- a. a six-monthly adjustment, and
 - b. an annual adjustment.
- A64. Having regard to technological and operational improvements, States will consider moving to more frequent reconciliation and adjustment arrangements. Jurisdictions may agree to increase the frequency of reconciliation and adjustments through correspondence between health ministers.

Six-monthly adjustment

- A65. The six-monthly adjustment will be conducted in arrears and will arise from the reconciliation conducted to determine the actual volume for services provided by the Local Hospital Networks for Commonwealth payment purposes. Any State may request that the reconciliation be conducted more frequently.

- A66. States will provide to the Administrator, within three months (with a preference to reducing the period over time) of the end of December, gross volume and patient identified data regarding actual services delivered for those public hospital functions funded by the Commonwealth on an activity basis to enable the six monthly adjustment to be undertaken in accordance with clause A65.
- A67. Any variation to Commonwealth payments arising from the six-monthly adjustments will be spread equally across payments for a subsequent quarter, or an appropriate period as determined by the Administrator.
- A68. Variation to the Commonwealth payments arising from the six-monthly adjustments may be deferred until the annual adjustment if the relevant State/Territory health minister and the Commonwealth Minister for Health agree.
- A69. The Administrator will provide timely advice to the Commonwealth Treasurer, contingent on the data, preliminary and revised calculations, reports and advice being provided in a timely manner and on jurisdictions being able to resolve issues in trilateral discussions.
- A70. At the point of six-month reconciliation, and based on the data submitted by States, national bodies will inform Parties if there is any indication of an unexpected outcome from a change to the national funding model where transitional arrangements were not used.

Annual Adjustment

- A71. The Parties agree to seek to finalise the annual adjustment activities ahead of the Commonwealth Budget. To support this commitment, all parties agree to the principles outlined in clause A4.
- A72. The Administrator will undertake annual reconciliation for each State following the receipt of required data from all States. The Administrator will not finalise an annual reconciliation for individual States that have provided the required data until all other States have provided required data.
- A73. The annual adjustment will be conducted in arrears once actual volumes have been validated by the service volume reconciliations to ensure the Commonwealth meets its agreed contribution to the funding of efficient growth.
- A74. In order to attract a Commonwealth funding contribution for each public hospital service provided on an activity basis, States must ensure that all data relevant to the funding of that service has been provided.
- A75. In undertaking the annual reconciliation the Administrator will calculate any sentinel event or safety and quality adjustment that applies to a State in a relevant financial year.
- A76. The issues the Administrator should have regard to as part of the annual reconciliation process will include, but not be limited to, the reconciliation of general transcription errors, including the incorrect coding of services provided and duplicate entries, and the exclusion of services paid for by the Commonwealth via other funding streams, the exclusion of services for which data has not been provided (in either the year being reconciled or the prior year), and the exclusion of services with incomplete data (in either the year being reconciled or the prior year).

Annual Adjustment – Application of the Caps

- A77. Following the completion of the annual reconciliation, the Administrator will calculate the final Commonwealth funding entitlements for a State for that year as follows:
- a. Where a State has an uncapped Commonwealth funding entitlement less than or equal to the soft cap, then the State’s Commonwealth funding entitlement will equal its uncapped Commonwealth funding entitlement.
 - b. Where a State has an uncapped Commonwealth funding entitlement that is more than its soft cap and the sum of all of the States uncapped Commonwealth funding entitlements is less than or equal to the national funding cap, then the State’s Commonwealth funding entitlement will equal its uncapped Commonwealth funding entitlement.
 - c. Where a State has an uncapped Commonwealth funding entitlement that is more than its soft cap, and the sum of all of the States’ uncapped Commonwealth funding entitlements is more than the national funding cap, then the State’s Commonwealth funding entitlement is its soft cap, plus a redistribution amount, calculated by the following formula:

National funding available for redistribution	X	$\frac{\text{Individual State's funding shortfall}}{\text{National funding shortfall}}$
Where:		
<ol style="list-style-type: none"> i. The ‘national funding available for redistribution’ is the sum of the difference of each State’s uncapped Commonwealth funding entitlement and the soft cap where the State’s uncapped Commonwealth funding entitlement is less than the soft cap. ii. The ‘individual State’s funding shortfall’ is the amount by which its uncapped Commonwealth funding entitlement exceeds the soft cap. iii. The ‘national funding shortfall’ is the sum of all the ‘individual State’s funding shortfall’. 		

Annual Adjustment – Certainty of reconciliation

- A78. The Parties agree that the final Commonwealth funding entitlement of a State for a year, once decided by the Commonwealth Treasurer’s determination, will not be adjusted under the national funding model.
- a. This does not restrict the Administrator’s ability to make adjustments at any time if Auditors General or other relevant bodies find fraud or other illegal or dishonest activity.
 - b. Notification of fraud or other illegal or dishonest activity for the purpose of clause A78(a) must be issued in writing by a senior officer of the relevant health department and provide full particulars of the nature and extent of the issue and the likely impact on the Commonwealth funding. A Statement of Assurance must accompany any further submission of data by a State to remedy an identified issue.

- c. If an issue is identified or raised with the Administrator through clause A78(a), the Administrator will notify the Commonwealth and States of the issue and how the Administrator plans to resolve the issue.
- d. The Administrator will calculate the impact on the Commonwealth funding entitlement of each State, including any applicable redistribution amounts, following the assessment of an A78(a) issue by the Administrator.
- e. The Administrator will assess and advise whether adjustments to the Commonwealth funding entitlement of the States should be made. Following resolution of an A78(a) issue, the Administrator will notify the Commonwealth and States of the outcome.

Annual Adjustment – process and timeframes for advice

- A79. States will provide to the Administrator, within at least three months (with a preference to reducing the period over time) of the end of each reconciliation period, gross volume and patient identified data regarding annual actual services delivered for those public hospital functions funded by the Commonwealth on an activity basis to enable reconciliations to be undertaken in accordance with clause A73.
- A80. The Administrator will provide all Parties with a preliminary report on funding entitlements and reconciliation adjustments no later than 30 November following the end of the reconciliation period financial year.
- A81. The Administrator will facilitate a discussion between each of the States and the Commonwealth to resolve any issues or disputes with the application of the national funding model to the calculation of funding entitlements and reconciliation adjustments up to 28 February following the end of the reconciliation period financial year. The Administrator may release revised reconciliation advice following this consultation.
- A82. If the Administrator is not able to resolve the issue within the remit of the Administrator's functions, the issue may be dealt with under the resolution clauses B16 to B20.
- A83. The Administrator will provide advice on the annual entitlements and adjustments to the Commonwealth Treasurer by the end of March, contingent on the data, reports and advice being provided in a timely manner. Jurisdictions will be provided a copy of that advice contemporaneously.

Annual Adjustment – determination and payment

- A84. The Commonwealth Treasurer will aim to finalise the determination on funding within one month, or as soon as practicable after receiving the Administrator's final advice.
- A85. Where the Commonwealth Treasurer's Determination of funding differs from the Administrator's final advice on funding entitlements for a reconciliation period the Commonwealth will publish a Statement of Difference at the time of the Determination outlining the new final entitlement amounts and the reason for the dissimilarity between the Determination and the Administrator's final advice.
- A86. In addition to the Commonwealth's statement above, the Administrator will provide parties with detail on the funding and National Weighted Activity Units related to the Commonwealth Treasurer's Determination, by detailed classification at the local hospital network. The Administrator will also publish this information on its website.

- A87. The determination by the Commonwealth Treasurer will be reflected in Commonwealth payments into the National Health Funding Pool in the next practicable monthly payment run.
- A88. Any variation to Commonwealth payments arising from the adjustment will be spread equally across payments for a subsequent quarter, or appropriate period where the Administrator deems necessary.

State and Territory funding arrangements

Determining the State Funding Contribution

- A89. The State contribution to the funding of public hospital services and functions will be calculated on an activity basis or provided as block funding in accordance with the process outlined above in the eligibility clauses A17 to A24.
- A90. States will determine the amount they pay for public hospital services and functions and the mix of those services and functions, and will meet the balance of the cost of delivering public hospital services and functions over and above the Commonwealth contribution.
- A91. Variations in the State funding contribution in respect of individual Local Hospital Networks for services and functions funded under this Addendum may be required to enable States to play their role of system managers of the public hospital system. States may use their own proportion of public hospital funding, or Commonwealth block funding paid to the States (other than funding for teaching, training or research), to retain some funding from Local Hospital Networks and use it to adjust service levels across the State, and to respond to unforeseen events and other contingencies as set out at clause A141.
- A92. State funding paid on an activity basis to Local Hospital Networks will be based for each service category on:
- a. the price set by that State (which will be reported in Service Agreements); and
 - b. the volume of weighted services as set out in Service Agreements.
- A93. It is expected that these arrangements will create incentives for Local Hospital Network efficiency. If a Local Hospital Network is able to operate more efficiently than the level of funding set by the State under the Local Hospital Network Service Agreement, the Local Hospital Network will be able to retain and reinvest the benefits accruing from efficiency in service delivery and in accordance with State policy and practice, as guided by the Service Agreement.
- A94. There will be no requirement for Local Hospital Networks to be paid the full national efficient price if the State considers that a lower payment is appropriate, having regard to the actual cost of service delivery and the Local Hospital Network's capacity to generate revenue from other sources.
- A95. To improve transparency and national comparability, States will provide to the Administrator and the IHPA:
- a. the price per weighted service they determine;
 - b. the volume of weighted services as set out by the national ABF classification scheme; and

- c. any variations to service loadings from the national ABF classification schemes.

Innovative Models of Care

- A96. It is the intention of the Parties that this Addendum facilitate exploration and trial of new and innovative approaches to public hospital funding, to improve efficiency and health outcomes.
- A97. The Commonwealth and a State(s) may agree to trial an innovative model of care for a fixed period of time through a bilateral agreement in accordance with Schedule C.
- A98. During a trial, a State would need to continue to acquit and report Commonwealth funding on an ABF or a block funded basis as appropriate, as provided for in this Addendum.
- A99. A Party can seek to trial innovative models of care, either:
 - a. as an activity based funded service with shadow pricing, reporting, and appropriate interim block funding arrangements for the trial period; or
 - b. as a block funded service, with reporting against the national model and program outcomes for the innovative funding model.
- A100. The outcomes of any trials of an innovative model of care would be provided to IHPA and the CHC. If Commonwealth and the relevant State(s) agree through the CHC, the IHPA will be advised of any decision to continue an innovative funding model. The IHPA will work with jurisdictions to facilitate the continuation of the model for a further period of trial or translation as a permanent model of care.
- A101. To support the trialling of innovative models of care the IHPA will:
 - a. develop a funding methodology for CHC approval by April 2021 that does not penalise States undertaking trials, or other parties to the Addendum. Application of this methodology in individual instances would be agreed by the relevant State(s) and the Commonwealth.
 - b. advise the Commonwealth and State(s) on the application of the methodology at (a) above and on any issues it foresees with the proposed trial, with regard to the national funding model.
 - c. provide advice to CHC on any proposal to translate an innovative funding model to the national funding model. This advice would inform CHC consideration on the matter.

Maintenance of effort

- A102. Parties agree to, at a minimum for the period of 2020-21 to 2024-25, maintain 2018-19 levels of funding for Public Hospital Services through the National Health Funding Pool, while having regard to new, appropriate models of care that may change the setting in which care is delivered.
- A103. The Administrator and AIHW will work with all Parties towards consistency and transparency of reporting to enable the Administrator to provide an annual report on maintenance of effort.

Provision of service level data and Service Agreements to the Administrator

- A104. Parties agree to improve the accuracy of NWAU estimates by allowing States to provide non-binding advice to the Commonwealth and the Administrator on expected services to be delivered, without the need to vary Service Agreements. The provision of this advice will not affect Commonwealth payments or cash flows to Local Hospital Networks (LHNs).
- A105. States will provide the Administrator with an estimate of weighted service volumes for a financial year as an aggregated total, which the Administrator will share with the Commonwealth, by the end of March in the preceding financial year.
- A106. States will provide the Administrator with confirmed aggregate weighted service volumes for a financial year, and estimated service volumes for each Local Hospital Network, by the end of May in the preceding financial year. The estimated weighted service volumes provided are to incorporate the level of disaggregation required by the Administrator in order to calculate the Commonwealth's funding contribution.
- A107. States will provide the Administrator with a copy of the Service Agreement for each Local Hospital Network once agreed between the State and the Local Hospital Network.
- A108. States will provide to the Administrator all State-reported in-scope expenditure at the Local Hospital Network level, including distribution of block funding from State managed funds.
- A109. To improve transparency, the reporting of the distribution of block funding from State managed funds at the Local Hospital Network level will separately detail the distribution of all Commonwealth block funding received by the State.

Cross-border arrangements

- A110. The treatment of cross-border hospital activities will be governed by the following principles:
- a. the State where a patient would normally reside should meet the cost of services (exclusive of the Commonwealth contribution arrangements discussed below) where its resident receives hospital treatment in another jurisdiction;
 - b. in instances where quality and safety penalties have been applied the State funding contributions will not increase to offset the reduced Commonwealth contribution for those services;
 - c. where a patient is transferred from their resident State to another jurisdiction for treatment the referring hospital is to meet the costs of medical transfers;
 - d. where a patient is transferred from another jurisdiction to their resident State for treatment the resident State is to meet the costs of medical transfers;
 - e. patient out-of-pocket costs related to discharge home from the provider State will be met through the patient's resident State travel assistance scheme where appropriate;
 - f. payment flows (both Commonwealth and State) associated with cross-border services should be administratively simple, and where possible consistent with the broader arrangements of this Addendum;
 - g. the cross-border payment arrangements should not result in any unintended GST

distribution effects;

- h. States recognise their commitment under the Medicare principles which require medical treatment to be prioritised on the basis of clinical need;
- i. both States should have the opportunity to engage in the setting of cross-border activity estimates and variations, in the context that this would not involve shifting of risk; and
- j. there should be transparency of cross-border flows.

Funding Flows

- A111. Commonwealth funding contributions will flow to the provider jurisdiction through the National Health Funding Pool. Steps will be taken to prevent Commonwealth payments made in accordance with these arrangements being subject to equalisation by the Commonwealth Grants Commission to avoid financially disadvantaging one State.
- A112. The Administrator will release actual cross-border activity data and Commonwealth contribution advice to the States within one month of finalising reconciliation to support bilateral cross-border reconciliations.
 - a. Administrator cross-border data made available to States and Territories will include Commonwealth percentage funding rates, Commonwealth funding contributions, and activity flows for activity-based funded and block funded hospitals.
- A113. Funding contributions by the resident State will be made to the provider State through the National Health Funding Pool, either:
 - a. on a regular basis throughout the year, reflecting activity estimates between the parties as scheduled through a Cross-border Agreement with subsequent reconciliation for activity; or
 - b. within six-months of receiving activity data from the Administrator finalising reconciliation and releasing activity data and Commonwealth contribution advice to the States (subject to arrangements between jurisdictions outlined in cross-border agreements).

Agreement around Activity

- A114. Cross-border Agreements will be developed between jurisdictions which experience significant cross-border flows, where one of the parties requests a Cross-border Agreement be in place.
- A115. States and Territories will review the national cross-border agreement template for endorsement by the Australian Health Ministers' Advisory Council (AHMAC) before April 2021 (noting that final cross-border agreements will be adjusted to take into account bilateral arrangements).
- A116. States and Territories will share estimated cross-border activity levels by 31 May for the coming financial year, to provide capacity for both parties to contribute to service delivery planning.
- A117. Cross-border Agreement disputes will be dealt with as part of the IHPA dispute resolution process.

A118. States and Territories will endeavour to finalise cross-border agreements by 31 May for the coming financial year.

Pricing

A119. Prices will be set at the national efficient price, as determined by the IHPA including adjustments for any loadings for the provider Local Hospital Network, unless otherwise agreed by the parties to the cross-border Agreement.

A120. Outlier patients requiring Highly-Specialised Services, not appropriately defined within the existing classification system, and where costs are not reasonably funded by the pricing of the next closest Diagnosis-Related Group, should be flagged in advance by the provider State to the resident State when possible to simplify reimbursement through cross-border arrangements.

- a. Highly-Specialised Services are defined by procedures that do not appropriately fit within a Diagnosis-Related Group classification, are provided at limited sites nationally, have low volume (generally less than 200 separations nationally), and cost significantly more than the funding provided based on pricing in the relevant year's National Efficient Price Determination
- b. Parties recognise that referrals are often made and agreed to at the clinician level at short notice in the interests of patient well-being. Where it is not possible for States to notify the resident State prior to treatment commencing, the treating State will endeavour to communicate and notify as soon as possible thereafter.
- c. Highly-Specialised Services will be excluded from cross-border reconciliations and subject to separate reimbursement by agreement between jurisdictions. Payments will not be made directly to the treating hospital by the resident State.
- d. States and Territories will designate a point of contact to action this clause. If a point of contact is no longer reachable or appropriate the default point of contact will be the jurisdiction's representative for the Administrator's Jurisdictional Advisory Committee.

A121. Capital will not be explicitly priced by the IHPA, however cross-border dispute resolution can include disputes in relation to the resident State's contribution to capital funding.

A122. The Commonwealth and States agree that they will accept and implement any recommendations made by the IHPA in relation to cross-border disputes under clause B24(k), and will provide additional funding to the other party in a dispute if this is required.

A123. If, three months after the IHPA has made a recommendation under clause B24(k), a State has not complied with any element of the recommendation requiring it to make payments to another State, the IHPA may at the request of the second State, advise the Commonwealth Treasurer of any adjustments to Commonwealth payments to the National Health Funding Pool required to give effect to the recommendation. States agree to fund from their own resources any reduction in Commonwealth payments to Local Hospital Networks.

Cost-shifting

A124. Jurisdictions may make submissions to the IHPA requesting it advise whether a party to

this Addendum has shifted costs onto another jurisdiction in a manner which is contrary to the intent of this Addendum.

- A125. The IHPA will provide the other party a copy of the submission and request a responding submission to be provided within 60 days. The IHPA will provide this response to the initiating jurisdiction.
- A126. The IHPA will then assess the submissions, consult further with affected jurisdictions and publicly release its assessment should it consider that cost-shifting has occurred.

Funding Pool payments

- A127. A single National Health Funding Pool will be maintained, comprising a Reserve Bank of Australia account for each State, for the purposes of receiving all Commonwealth and activity-based State public hospital funding.
- A128. The existence and operation of the Pool in relation to a particular State owes its authority to the enabling legislation passed by both the Commonwealth Parliament and the Parliament of that State.
- A129. Pool accounts will be audited, have complete transparency in reporting and accounting, and will meet all other transparency requirements established by COAG and relevant legislation.
- A130. There will be complete transparency and line-of-sight of respective contributions into and out of Pool accounts to Local Hospital Networks, discrete State managed funds, or to State health departments in relation to public health funding and any top-up funding, and of the basis on which the contributions are calculated. There will also be complete transparency and line-of-sight of respective contributions out of State managed funds to Local Hospital Networks.
- A131. Additional streams of funding may be incorporated into the National Health Funding Pool, once agreed by COAG, with the aim of optimising transparency and efficiency of all public hospital funding flows.
- A132. Commonwealth payments into the pool will be made monthly, calculated as 1/12th of the estimated annual payment. Commonwealth payments will be made into the National Health Funding Pool in accordance with Schedule D of the IGA FFR.
- A133. States will determine when State payments are made into the Pool and State managed funds.

Payments from the National Health Funding Pool and State Managed Funds

- A134. Payments will be made from the Pool accounts to Local Hospital Networks and State managed funds in accordance with Service Agreements to be agreed between the States and Local Hospital Networks.
- A135. Payments may be made out of the Pool accounts directly to other parties on the behalf of Local Hospital Networks for the provision of shared services, as detailed in a Service Agreement between a Local Hospital Network and a State. Any subsequent reference to payments made to Local Hospital Networks in this Addendum includes a reference to payments made to other parties for the provision of shared services.
- A136. States and Local Hospital Networks can agree amendments to Service Agreements in

order to adjust service volumes or pricing to take account of such matters as changing health needs, variations in actual service delivery and hospital performance.

- A137. States, as the system manager of public hospitals, can determine the frequency of alterations to Service Agreements. States will notify the Administrator, within 28 calendar days, of agreed variations to a Service Agreement.
- A138. The payment arrangements for Commonwealth funding are as follows:
- a. ABF will flow directly to Local Hospital Networks through Pool accounts;
 - b. funding for block grants will flow through Pool accounts to State managed funds and from there to Local Hospital Networks;
 - c. funding for teaching, training and research will flow through Pool accounts to State managed funds and from there to Local Hospital Networks or other organisations (such as universities and training providers) depending upon the specific funding arrangements established in each State for the provision of those services; and
 - d. public health funding and any top-up funding will flow through Pool accounts to State health departments.
- A139. The payment arrangements for States' funding are as follows:
- a. ABF will flow directly through Pool accounts to Local Hospital Networks;
 - b. funding for block grants will flow through State managed funds to Local Hospital Networks; and
 - c. funding for teaching, training and research will flow through State managed funds to Local Hospital Networks or other organisations (such as universities and training providers) depending upon the specific funding arrangements established in each State for the provision of those services.
- A140. States will direct the disbursement of State funding from Pool accounts and State managed funds to Local Hospital Networks. The frequency of State payments to Local Hospital Networks will be in accordance with Service Agreements, agreed between the State and Local Hospital Network.
- A141. States are able to make exceptional payments through a Pool account or a State managed fund to Local Hospital Networks at any time.
- A142. States will direct the timing of Commonwealth payments from Pool accounts and State managed funds to Local Hospital Networks. However, States will not redirect Commonwealth payments:
- a. between Local Hospital Networks;
 - b. between funding streams (for example from ABF to block funding); or
 - c. to adjust the payment calculations underpinning the Commonwealth's funding.
- A143. States can cause Commonwealth payments to be modified by changing the relevant Service Agreements, if they wish, and by notifying the Administrator of an agreed

variation, in accordance with clause A137. These changes to Commonwealth funding will take effect in the next payment period.

- A144. To ensure that payments flowing out of the National Health Funding Pool are correct, no payment will flow from the Pool until the respective State has validated the schedule of payment and instructed the Administrator to make payment on the State's behalf.

Administrator of the National Health Funding Pool

- A145. The Administrator will calculate and advise the Commonwealth Treasurer of the monthly Commonwealth payments into the National Health Funding Pool. The States, in consultation with the National Health Funding Body, will continue to determine when State payments are made into the National Health Funding Pool and State managed funds.

- A146. The Administrator will apply the national funding cap and soft cap in calculating and delivering advice to the Commonwealth Treasurer in respect of the Commonwealth contribution to the National Health Funding Pool under the Addendum.

Reporting by the Administrator

- A147. The Administrator will provide a monthly report to the Commonwealth and States detailing the following at the Local Hospital Network level:
- a. the basis for the amount of Commonwealth funding flowing into Pool accounts;
 - b. the basis for the amount of State funding flowing into Pool accounts and State managed funds;
 - c. the number of public hospital services funded and provided as a running yearly total, in accordance with the national system of ABF; and
 - d. the delivery of other public hospital functions funded by the National Health Funding Pool and State managed funds as a running yearly total.
- A148. The same transparency arrangements that apply to the National Health Funding Pool will also apply to the State managed funds. States will provide data to the Administrator in accordance with the timeframe and format specified in the Administrator's data plan on the:
- a. flow of Commonwealth and State funds into and out of State managed funds; and
 - b. provision of public hospital services by Local Hospital Networks.
- A149. All reports produced by the Administrator will be publicly available.
- A150. Reporting undertaken by the Administrator will be structured to avoid duplication and overlap with the reporting undertaken by other bodies detailed in this Addendum.
- A151. Financial audits will be undertaken at least annually, at the completion of each financial year. Performance audits may be undertaken at any time.

- A152. Further to clause B81, in publishing information on compliance with data requirements, the Administrator will publish additional information including:
- a. dates on which each State provided data under clauses A66, A79, A105 and A106;
 - b. dates on which resubmissions of data were provided; and
 - c. dates on which Reconciliation was completed.

A153. The Administrator will ensure that determinations, and final activity and entitlements at the Local Hospital Network level, are publicly available for all years that the Addendum has been in operation.

Data quality and integrity

A154. Consistent with clause B76, jurisdictions will work together and with the national bodies to share and work towards best practice approaches to data quality and integrity.

Data Conditional Payment

A155. The Parties agree to continue the operation of a Data Conditional Payment (DCP) to encourage the prompt provision of the required data in order to facilitate timely Reconciliation and payment of any Redistribution Amounts due to States. The DCP will be a variation to the timing of payments under clause A132.

A156. If a State has not provided the Required Data for annual Reconciliation within three months of the end of the Reconciliation period the Administrator will, in calculating the Commonwealth contribution to the National Health Funding Pool for that State, advise the Commonwealth Treasurer to defer payment of 10 per cent of the amount payable to the State in November of the current year, until the Required Data is provided.

A157. If a State has not provided the Required Data for the annual Reconciliation within four months of the end of the Reconciliation period, the Administrator will, in calculating the Commonwealth contribution to the National Health Funding Pool for that State, advise the Commonwealth Treasurer to defer a further 15 per cent of the amount payable to the States in December of the current year, until the Required Data is provided.

A158. If an amount is deferred under clauses A156 or A157:

- a. the Administrator will advise the affected State of that fact; and
- b. any funds deferred will be paid in the next available monthly payment once the Required Data is provided.

A159. The Administrator will be responsible for applying the DCP and providing advice to jurisdictions as to its operation.

Reforms to decrease avoidable demand for public hospital services

A160. All Parties commit to implement reforms to improve outcomes for patients and decrease potentially avoidable demand for Public Hospital Services. This Part does not preclude pursuing other reforms to improve health outcomes and the efficiency of public hospitals in the future.

Incorporating quality and safety into hospital pricing and funding

- A161. Australia’s public hospitals deliver safe, high quality care but there remain opportunities for improvement. Reducing Sentinel Events, Hospital Acquired Complications (HACs) and Avoidable Readmissions will deliver better health outcomes, improve patient safety and support greater efficiency in the health system.
- A162. The Parties agree to continue reforms integrating safety and quality into the pricing and funding of Public Hospital Services in a way that:
- a. Improves patient outcomes;
 - b. Provides an incentive in the system to provide the right care, in the right place, at the right time;
 - c. Decreases avoidable demand for public hospital services; and
 - d. Signals to the health system the need to reduce instances of preventable poor quality patient care, while supporting improvements in data quality and information available to inform clinicians’ practice.
- A163. The Parties agree that pricing and funding adjustments for Sentinel Events, HACs and Avoidable Readmissions are part of a multifaceted, system-wide approach to safety and quality, which includes national standards, accreditation, and workforce development.
- a. The Parties recognise that safety and quality reforms are connected to wider health system reforms, particularly better coordinated care.
 - b. Together, these reforms will establish better system capability and culture to support the reduction of ineffective interventions and procedures known to be harmful in the longer term, beyond the immediate focus on Sentinel Events, HACs and Avoidable Readmissions.
- A164. For the avoidance of doubt, the Parties agree that Sentinel Events and Safety and Quality adjustments will be subject to back-casting under clause A41.

Sentinel events

- A165. The Parties agree that any episode of care that gives rise to a Sentinel Event will not be funded by the Commonwealth. The episode will be assigned a NWAU of zero.
- A166. States agree to apply a digital flag to any episode that includes a Sentinel Event and report this information to IHPA as part of data submissions under clauses A8 and B72 of this Addendum.

Hospital Acquired Complications

- A167. The Parties agree to continue to develop, in consultation with the ACSQHC, IHPA and the Administrator, a comprehensive pricing and funding model, that:
- a. Is rigorous, fair and transparent;
 - b. Does not incentivise under reporting, or adversely affect service delivery; and
 - c. Is significant enough to be an effective overall price signal from the Commonwealth

through to hospitals.

A168. To confirm the suitability of the complications on the HAC List in a pricing and funding model, the Parties will use the following four criteria:

a. Preventability:

- i. Clinical evidence is available to demonstrate that the HAC can be prevented with 'best clinical practice';
- ii. Evidence supports that individual LHNs (including single campus and specialist hospitals) are able to prevent the HAC and that the causes of such condition are within the control of the hospital;
- iii. The strength of external influences (e.g. patient factors) does not unduly impact the LHN's ability to avoid the HAC;
- iv. There is sufficient evidence to inform / instruct health services on how to avoid the HAC; and
- v. The development of the HAC measure has been subjected to valid construction. The inferences used to test the HAC have been made on the basis of appropriate measurements and occurrences can be easily defined, identified and adequately measured.

b. Impact:

- i. The introduction of the financial adjustments related to specific HAC will result in a significant enough change to funding at the hospital level to drive the intended clinical practice outcome, impact appropriately on patients and improve patient outcomes;
- ii. Unintended consequences as a result of practice or reporting changes are not likely to be to the detriment of individual and hospital-wide patient care; and
- iii. The rate of HAC by LHN (giving consideration to size and type of hospital) is sufficient to warrant introduction of a financial mechanism.

c. Feasibility:

- iv. Reporting mechanisms are sufficiently robust to ensure that any benefit obtained through under reporting is minimised;
- v. Sufficient information is available to other bodies, such as the National Health Funding Body, to monitor the impact of the financial mechanism on the prevalence of the HAC across the system;
- vi. Sufficient processes, systems, policies, feedback mechanisms and data collections are in place to support the reduction of the HAC across each LHN; and
- vii. The introduction of the HAC is prioritised to obtain maximum benefit.

d. Equity:

- i. The application of pricing and funding adjustment does not unfairly impact any one, or group, of providers as a result of characteristics beyond their control (e.g. size, location and type of hospital).

Avoidable Hospital Readmissions

- A169. The Parties recognise that there is variation in the way States currently define Avoidable Hospital Readmissions, presenting challenges to the immediate development of a pricing and funding model.
- A170. The ACSQHC will develop and maintain a list of clinical conditions, subject to AHMAC approval, that arise from complications of the management of the original condition, which can be considered Avoidable Hospital Readmissions, including identifying suitable condition-specific timeframes for each of the identified conditions.
- A171. The Parties agree that the IHPA will consult with and have regard to the advice of the ACSQHC and Parties in the development of a pricing model for Avoidable Hospital Readmissions, for implementation by 1 July 2021, following approval from the CHC.

Evaluation

- A172. The Parties agree that IHPA will provide advice to CHC by April 2021 evaluating these reforms against the principles outlined at clause A168, to support COAG consideration of new or additional reforms from 1 July 2021.
- A173. In addition, IHPA, the ACSQHC and the Administrator will provide advice to CHC by April 2021 providing options for the further development of safety and quality-related reforms, including examining ways that avoidable and preventable hospitalisations can be reduced through changes to the Addendum.
- A174. IHPA will work with the Parties, national bodies and other related stakeholders to establish a framework to evaluate the reforms against the following principles:
- a. Reforms are evidence based and prioritise patient outcomes:
 - i. Better patient health outcomes underpin the design and implementation of reform;
 - ii. The design and implementation of pricing and funding models for safety and quality, and reducing avoidable readmissions, are based on robust evidence;
 - iii. Adjustments are based on evidence of a causal link to the condition or complication, and are commensurate with the additional care required as a result of the complication;
 - iv. Adjustments relate to conditions or complications which clinicians and other health professionals are reasonably able to take action to reduce their incidence or impact; and
 - v. Pricing and funding models add to the evidence base for strategies to address safety and quality, with robust monitoring of the effectiveness of implementation and ultimately, their impact on patient outcomes.

- b. Reforms are consistent with whole-of-system efforts to deliver improved patient health outcomes:
 - i. Adjustments complement existing national and State measures to improve patient health outcomes and reduce avoidable hospital demand, including but not limited to the ACSQHC’s goals, national benchmarking, data reporting, and accreditation;
 - ii. The design and implementation of pricing and funding models acknowledge that mechanisms other than pricing and funding have a role in achieving the reform intention and that complementarity of all mechanisms is desirable; and
 - iii. The design and implementation of pricing and funding models should not compromise State system financial sustainability and quality and should therefore be focused on system level performance improvement.
- c. Reforms are transparent and comparable:
 - i. As far as practicable, the financial levers are designed to ensure there is transparency between the approach and the intended outcome; and
 - ii. Pricing and funding models use an appropriate risk adjustment methodology to consider different patient complexity levels or specialisation across jurisdictions and hospitals.
- d. Reforms provide budget certainty:
 - i. Any downward adjustment to an individual State is not deducted from the available pool of funding under the overall cap of 6.5 per cent.

Transparency

- A175. States agree to implement a pricing approach for Sentinel Events and safety and quality adjustments, to give effect to the model developed by the IHPA, within their funding and purchasing arrangements (including in Service Level Agreements and Purchasing Agreements) for public hospital services at the episode of care level.
- A176. States agree to each provide an annual report to AHMAC, within nine months from the end of each financial year, on the outcomes of the implementation of the pricing approach for safety and quality. These reports will include information on:
- a. the financial impacts at the LHN level; and
 - b. any relevant safety and quality programs.

Roles and responsibilities

- A177. CHC will oversee the continuing development, implementation and the ongoing refinement of reforms to integrate safety and quality into the pricing and funding of public hospital services, including:
- a. advising national bodies on pricing and funding approaches, including shadow approaches, for HACs and avoidable readmissions; and
 - b. final approval of the Sentinel Events, HACs and avoidable readmissions lists for

funding and pricing purposes.

- A178. States will seek to refine and improve public hospital activity monitoring and reporting capability to support the system in making safety and quality improvements.
- A179. The Commonwealth will work collaboratively with States and national bodies to support pricing and funding reforms for public hospital services, and advise on how these reforms intersect with private hospital services and primary health care services.

Private or not-for-profit provision of public hospital services

- A180. Where a State contracts with a private or not-for-profit provider to operate a public hospital, that hospital will be treated as a public hospital for the purposes of this Addendum, and may be, or form part of, a Local Hospital Network. This arrangement will apply to existing contracts and contracts entered into after the Addendum commences.
- A181. Hospitals owned by charitable organisations which are recognised as public hospitals, whether by legislation or by other arrangements, will be treated as a public hospital for the purposes of this Addendum, and may be, or form part of, a Local Hospital Network.
- A182. Other public hospital services provided by the private or not-for-profit sector can be contracted for in the following ways:
- a. the State may contract centrally and establish a notional ‘contracted services Local Hospital Network’ which is not required to meet usual Local Hospital Network governance arrangements; or
 - b. Local Hospital Networks may enter into individual contracts with the private or not-for-profit sectors.
- A183. For any notional contracted services Local Hospital Network, the State will provide information on forecast and actual contracted activity to the Administrator, and this will include the same type, level and specificity of data on the contracted activity as required of other Local Hospital Networks under this Addendum.
- A184. The Commonwealth will provide funding in respect of the contracted activity through the National Health Funding Pool to the State. IHPA determined loadings will apply in respect of patient characteristics, and service location.
- A185. Public hospital services provided under contract by the State with the private sector or not-for-profit sector will be treated as being provided by public hospitals and will be treated consistently with the approach in clauses A17 to A24 to determine eligibility for a Commonwealth funding contribution.

Veteran Entitlements

- A186. Arrangements for funding and provision of health care for entitled veterans are the subject of a separate Commonwealth-State agreement. Nothing in any separate agreement will interfere with the rights of entitled veterans to access public hospital services as public patients.

Nationally Funded Centres

- A187. These arrangements may have an impact on Nationally Funded Centres. This will be considered further by the CHC.

SCHEDULE B – NATIONAL BODIES

Introduction

- B1. The national bodies are:
- a. The Independent Hospital Pricing Authority (the IHPA);
 - b. The Administrator of the National Health Funding Pool (the Administrator) and the National Health Funding Body (the NHFB);
 - c. The Australian Commission on Safety and Quality in Health Care (the ACSQHC); and
 - d. The Australian Institute of Health and Welfare (the AIHW).
- B2. The national bodies are established by relevant Commonwealth and State legislation to undertake specific functions including under this Addendum.
- B3. For avoidance of doubt, any jurisdiction that enacts or amends legislation that is inconsistent with the provisions of this Addendum relating to the new National Health Reform funding arrangements, including the establishment, appointment, powers and functions of the Administrator, will be in breach of this Addendum.
- B4. The Commonwealth and States will consult with COAG on any proposed amendments to legislation establishing the position and functions of the national bodies and the operation of the National Health Funding Pool.
- B5. Parties recognise that the national bodies are independent and expect these bodies to carry out their functions in a timely manner that advances the objectives of this Addendum and regularly consult with each other, Parties to this Addendum and other relevant stakeholders. The consultation requirements and processes set out in this Addendum are not intended to be exhaustive.
- B6. The functions and roles of national bodies relating to this Addendum may overlap from time-to-time. Where the work of one national body affects the work of another, relevant bodies are expected to work collaboratively together and keep Parties informed of their work through their relevant advisory committees.
- B7. Commonwealth and State departments of health will be the primary contact for the national bodies, and will be responsible for engaging with other government agencies in their jurisdictions (noting the Administrator's statutory role in providing advice to the Commonwealth Treasurer).

National funding bodies

Consultation and transparency

- B8. For the purposes of this Schedule, the national funding bodies are the IHPA, the Administrator and the NHFB.
- B9. The Commonwealth established the national funding bodies under the *National Health*

Reform Act 2011 on behalf of all parties to facilitate and administer the public hospital funding arrangements under the Act and this Addendum. The Commonwealth Minister must consult and have regard to the views of COAG Health Council (CHC) on any direction to the IHPA.

- B10. Given the significance to all Parties of the functions discharged by the national funding bodies, the bodies will consult with CHC on changes that materially impact the application of the national funding model. Such consultation will be in addition to specific consultation requirements and processes with Parties set out in this Addendum.
- B11. The national funding bodies must consult with affected Parties and provide relevant analysis and documentation on decisions that could materially impact Parties before releasing draft or final advice on the matter.
- B12. When a Party has raised a matter formally in writing with a national funding body through a consultation process under this Addendum or otherwise, the relevant body is to provide a written statement explaining how the matter has been considered and addressed on request from a Party. The request and statement must be timely in relation to the matter raised.
- B13. The Commonwealth or two or more States may request that the national funding bodies present for Health Ministers' consideration a final or draft business rule, decision or determination that affects the national funding model or the calculation of the Commonwealth funding contribution. Such consultation will be in addition to specific consultation requirements and processes set out in the Addendum, and provide no less than 45 days for response by Health Ministers.
- B14. As per clause A42, National Bodies will develop business rules related to process and consultation related to retrospective adjustments, for consideration and unanimous agreement by CHC, by April 2021.
- B15. National Bodies will formally consult with Parties on the development of business rules and policies as per clause A42.

Resolving national funding body matters

- B16. Consistent with the principles articulated in this Addendum and prior to raising a matter under this section:
 - a. Parties should follow the consultation requirements and processes under this Addendum and work together with the relevant national funding bodies to understand the different perspectives and attempt to resolve the matter;
 - b. National funding bodies should work collaboratively and with Parties as appropriate, and have regard to advice provided by Parties; and
 - c. Parties and national funding bodies should use existing governance mechanisms including Jurisdictional Advisory Committees productively and transparently.
- B17. The Commonwealth, or a State (with the support of another party) or national funding

body can raise a dispute under this section through CHC.

- B18. Once a dispute is raised, the appropriate national body will conduct a 45 day ministerial consultation period seeking submissions from the Parties and other national bodies. Within 45 days of the close of the consultation period, the national body will provide a statement on the dispute to CHC ahead of the Administrator providing any advice to the Commonwealth Treasurer.
- a. The statement is to address submissions received during the consultation period and make recommendations on how the matter can be resolved in the context of the Addendum and on the basis of the submissions from Parties.
- B19. After the consultation period closes, a parallel report from the Australian Health Ministers' Advisory Council (AHMAC) is to be provided to CHC within 45 days. The report is to address submissions received within the consultation period and make recommendations on how the matter can be resolved in the context of the Addendum.
- B20. The process under this section is intended to be an intermediary step prior to a matter being formally referred to COAG under the dispute resolutions under clauses 26 to 28.

Independent Hospital Pricing Authority

Functions

- B21. The Independent Hospital Pricing Authority is an independent Commonwealth statutory authority established under the *National Health Reform Act 2011* (the Act) to promote improved efficiency in and access to Australian public hospital services.
- B22. In performing its functions, the IHPA must:
- a. have regard to this Addendum;
- b. follow the process and meet the conditions or requirements set out in this Addendum; and
- c. have regard to submissions made at any time by the Commonwealth, a State or a Territory.
- B23. The main functions of the IHPA are to:
- a. determine the national efficient price for health care services provided by public hospitals where the services are funded on an activity basis;
- b. determine the national efficient cost for health care services provided by public hospitals where the services are block funded; and
- c. publish this, and other information, for the purpose of informing decision makers in relation to the funding of public hospitals.

- B24. The IHPA has the following determinative functions:
- a. developing and specifying the national classifications to be used to classify activity in public hospitals for the purposes of ABF;
 - b. subject to clause B67, determining the supporting data requirements and data standards to apply to data to be provided by States, including:
 - i. data and coding standards to support uniform provision of data; and
 - ii. patient demographic characteristics and other information that is relevant to classifying, costing and paying for public hospital functions;
 - c. subject to clause B67, specifying costing data, methods and standards to be used in studies of the costs of delivering public hospital services, and to collect such data from Local Hospital Networks, through the States, to enable it to calculate the national efficient price and loadings;
 - d. determining the national efficient price for services provided on an activity basis in public hospitals through empirical analysis of data on actual activity and costs in public hospitals, taking account of any time lag and the cost weights to be applied to specific types of services;
 - e. determining the national efficient cost of services provided on a block funded basis in public hospitals through empirical analysis of data on actual activity and costs in Australian public hospitals, taking account of any time lag;
 - f. developing, refining and maintaining such systems as are necessary to calculate the national efficient price, including determining classifications, costing, data elements and data collections;
 - g. determining adjustments ('loadings') to the national efficient price required to take account of legitimate and unavoidable variations in the costs of service delivery, including those driven by hospital size, type and location;
 - h. developing projections of the national efficient price for a four year period, updated on an annual basis and providing confidential reports on these projections to the Commonwealth and States;
 - i. determining what other services provided by public hospitals are eligible for a Commonwealth funding contribution (Schedule A – Scope of 'Public Hospital Services' refers);
 - j. determining the Block Funded Criteria to be applied to agreed hospitals, functions and services that would be better funded in that way every three years from 2013-14. Before this determination can be made the Block Funding Criteria must have been endorsed by COAG (clause A53 refers);
 - k. resolving disputes on cross-border issues, where parties are unable to reach bilateral

agreement and either party seeks a determination from the IHPA; and

- I. determining the national efficient price that will apply to eligible private patients receiving public hospital services.

B25. The CHC may direct the IHPA to refine the determination of public hospital services eligible for a Commonwealth funding contribution (clause B24(i) refers).

B26. The IHPA has the following advisory functions:

- a. advising COAG on a nationally consistent definition and typology of public hospitals eligible for:
 - i. block funding only (including small rural and regional hospitals better funded in that way); and
 - ii. mixed ABF and block funding;
- b. making recommendations to the Treasurer to adjust Commonwealth contributions to implement cross-border recommendations under clause A123;
- c. making an assessment in relation to cost-shifting in line with clauses A124 to A126.

B27. In relation to the safety and quality reforms described in this Addendum the IHPA will:

- a. implement an approach whereby any episode of care that includes a Sentinel Event, across all care settings, will not be funded in its entirety;
- b. implement an approach whereby all HACs across every public hospital will have a reduced funding level to reflect the extra cost of a hospital admission with a HAC and will be risk adjusted; and
- c. develop a pricing and funding approach for avoidable hospital readmissions related to a prior HAC, based on a set of definitions developed by the ACSQHC.

B28. Parties may request the IHPA provide monitoring and support for the development of innovative models of care and funding for inclusion into the national funding model under clauses A96 to A101.

B29. The IHPA will improve transparency by publicly reporting on:

- a. ABF, including release of nationally consistent classifications, costing methods and data and efficient prices;
- b. its advice in respect of block funding and the basis of that advice; and
- c. its findings and supporting analysis on cost-shifting and cross-border issues raised by parties to the Addendum, following consultation with the relevant jurisdictions.

B30. The IHPA will provide all governments with draft copies of its reports before they are

released publicly. All governments will have 45 calendar days in which to comment on the reports.

- B31. The IHPA may undertake data collection and research, including by commissioning others to undertake specified studies and research.
- B32. In carrying out its functions, the IHPA will:
- a. publicly call for submissions from interested parties annually;
 - b. have regard to any submissions from governments regardless of when they are made; and
 - c. draw on relevant expertise and best practice within Australia and internationally.
- B33. Should the IHPA, in carrying out its functions, identify significant anomalies in service provision or pricing which potentially suggest activity contrary to the intent of this Addendum, the IHPA may consult with the relevant jurisdiction. If the matter is unresolved following consultation with the relevant jurisdiction, the IHPA may confidentially provide information to all jurisdictions about the matter. Should a jurisdiction consider this information evidence of cost-shifting, they can make a submission to the IHPA (as set out in clause A125).
- B34. Any information provided as a result of consultation under clause B33 by a jurisdiction to IHPA can only be used to resolve the matter in relation to which the information was provided for.

Governance

- B35. The IHPA comprises an independent board and chief executive officer, supported by officials from the Commonwealth Department of Health operating at the direction of the IHPA CEO. The ongoing costs of the IHPA will continue to be met by the Commonwealth.
- B36. In seeking to make an appointment to the position of the IHPA CEO, the IHPA Board will consult with the Parties.

Consultation

- B37. The IHPA must seek guidance from Parties, through the IHPA Jurisdictional Advisory Committee, when implementing changes to the national funding model that will impact the way services are delivered. Parties may escalate a funding policy issue to the HSPC, AHMAC or CHC for consideration.
- B38. The IHPA must provide a Statement of Impact to Parties when material changes or significant transitions are proposed to the national funding model, including changes that will have a major impact on any one party or materially redistribute activity between service streams.
- B39. The Statement of Impact must be timely in relation to the matter raised and:

- a. include a risk assessment of the proposed changes or adjustments;
- b. outline appropriate transition arrangements;
- c. be informed by consultation with the Parties; and
- d. have input from the Administrator.

B40. The IHPA will provide AHMAC with a clear understanding of IHPA's processes, governance arrangements and its committees on national funding model matters.

Administrator of the National Health Funding Pool

Functions

B41. The Administrator of the National Health Funding Pool (the Administrator) is an independent statutory office holder, distinct from Commonwealth and State and Territory governments and established by the *National Health Reform Act 2011*.

B42. The functions of the Administrator are to:

- a. calculate and advise the Commonwealth Treasurer of the Commonwealth contribution to the National Health Funding Pool under this Addendum;
- b. reconcile estimated and actual volume of service delivery, informed by the results of data checking activities conducted by other bodies on behalf of the Administrator, and incorporate the result of this reconciliation into the calculation of the Commonwealth contribution to the National Health Funding Pool;
- c. maintain accounts (established by each State) with the Reserve Bank of Australia in the name of each State, collectively known as the National Health Funding Pool;
- d. oversee payment of Commonwealth funding determined under this Addendum into State accounts established at the Reserve Bank of Australia under State legislation;
- e. oversee payments into Pool accounts of State funding provided under this Addendum;
- f. pay State funding from Pool accounts to Local Hospital Networks and other recipients in accordance with the direction of the relevant State Health Minister; and
- g. publicly report on:
 - i. funding received into the National Health Funding Pool from the Commonwealth;
 - ii. funding received into the National Health Funding Pool from the States;
 - iii. payments made from the National Health Funding Pool to Local Hospital Networks and State managed funds, and the basis on which these payments are made;

- iv. payments made, and the basis on which these payments are made, from the State managed funds to Local Hospital Networks and other providers, based on information provided by States;
 - v. payments made by the Commonwealth through the National Health Funding Pool to the States for the provision of public health services;
 - vi. top-up payments made by the Commonwealth through the National Health Funding Pool to the States;
 - vii. the volume of public hospital services provided by Local Hospital Networks; and
 - viii. the delivery of other public hospital functions funded by the National Health Funding Pool and State managed funds.
- h. calculate Commonwealth Funding Entitlement of States with reported Sentinel Events;
 - i. calculate Safety and Quality Adjustments to be made using the pricing and funding models nominated for this purpose by the Parties; and
 - j. advise the Commonwealth Treasurer of h) and i) during annual Reconciliation and a) during six monthly assessment reporting.

Governance

- B43. As per the *National Health Reform Act 2011*, the Chief Executive Officer of the National Health Funding Body is appointed by the Commonwealth Minister.
- B44. In seeking to make an appointment to the position of the NHFB CEO, the Commonwealth Minister will consult with the States.

Consultation

- B45. The Administrator must have regard to intent and objectives of the Addendum and avoid unnecessary administrative burden for Parties when considering implementation of the Addendum.
- B46. The Administrator will provide AHMAC with a clear understanding of the Administrator's processes, governance arrangements, its committees on national health funding matters and changes to these arrangements.

Australian Commission on Safety and Quality in Health Care

Functions

- B47. The Australian Commission on Safety and Quality in Health Care is a Commonwealth statutory authority established under the *National Health Reform Act 2011*. The ACSQHC is a body corporate subject to the *Public Governance, Performance and Accountability Act 2013* (PGPA Act).

- B48. The role of the ACSQHC is to:
- a. lead and coordinate improvements in safety and quality in health care in Australia by identifying issues and policy directions, and recommending priorities for action;
 - b. disseminate knowledge and advocate for safety and quality;
 - c. report publicly on the state of safety and quality including performance against national standards;
 - d. recommend national data sets for safety and quality, working within current multilateral governmental arrangements for data development, standards, collection and reporting;
 - e. provide strategic advice to CHC on best practice thinking to drive quality improvement, including implementation strategies; and
 - f. recommend nationally agreed standards for safety and quality improvement.
- B49. The ACSQHC will expand its role of developing national clinical standards and strengthened clinical governance. These arrangements will be further developed in consultation with Parties to this Addendum via AHMAC.
- B50. The ACSQHC will:
- a. formulate and monitor safety and quality standards and work with clinicians to identify best practice clinical care, to ensure the appropriateness of services being delivered in a particular health care setting; and
 - b. provide advice to CHC about which of the standards are suitable for implementation as national clinical standards.
- B51. The ACSQHC does not have regulatory functions.
- B52. In relation to the safety and quality reforms described in this Addendum, the ACSQHC will:
- a. curate the Sentinel Events and HAC lists for the purposes of ensuring they remain robust and relevant for clinical improvement purposes, within its existing governance arrangements and in conjunction with IHPA Technical Advisory Committee advice;
 - b. maintain a HAC Curation Clinical Advisory Group (HCCAG) to advise on new and existing complications on the HAC list. The HCCAG will have regard to the recommendations of specialty Clinical Panels established by the ACSQHC where necessary;
 - c. assess rates of preventability for each HAC to inform a risk adjustment methodology developed by IHPA;
 - d. maintain a nationally consistent definition for avoidable hospital readmissions

associated with a HAC;

- e. consult with ACSQHC committees to ensure proposals forwarded to AHMAC and CHC best represent matters that are supported by the relevant committees; and
- f. advise on clinician engagement.

Consultation

- B53. The Parties expect that, in performing its functions, the ACSQHC will provide advice to the CHC on best practice thinking to drive quality improvement, including implementation strategies.
- B54. The Parties expect that, in performing its functions, the ACSQHC will collaborate with Parties via AHMAC.
- B55. The ACSQHC is expected to liaise with AHMAC to provide a clear understanding of the ACSQHC's processes, governance arrangements, its committees on national safety and quality matters and any changes to these arrangements.

Australian Institute of Health and Welfare

Functions

- B56. The Australian Institute of Health and Welfare is a Commonwealth statutory authority established under the *Australian Institute of Health and Welfare Act 1987* (the Institute Act). The AIHW is a body corporate subject to the *Public Governance, Performance and Accountability Act 2013* (PGPA Act).
- B57. The AIHW is an independent agency that provides reliable, regular and relevant information on Australia's health and welfare. The AIHW's broad health-related functions are set out in section 6 of the Institute Act and include:
 - a. collecting and producing health-related information and statistics; coordinating and assisting the collection and production of such information by other bodies;
 - b. developing methods and undertaking studies designed to assess the provision, use, cost and effectiveness of health services and health technologies;
 - c. conducting and promoting research into health and health services; developing statistical standards and classifications; and
 - d. subject to confidentiality requirements in the Institute Act, providing access to health information and statistics.
- B58. The AIHW, in accordance with the Australian Health Performance Framework, will:
 - a. provide clear and transparent annual public reporting of the performance of every Local Hospital Network, the hospitals within it, every private hospital and every Primary Health Network;

- b. develop additional performance indicators, when asked by the Commonwealth Health Minister at the request of CHC; and
- c. maintain the MyHospitals website and MyHealthyCommunities website.

- B59. In undertaking its work, the AIHW will provide comparative analysis across Local Hospital Networks and Primary Health Networks.
- B60. The AIHW will carry out work designed to facilitate jurisdictions' understanding of service performance in line with implementation of the Australian Health Performance Framework, as agreed from time to time by CHC.
- B61. The AIHW will develop specifications for performance indicators to be reported under the Australian Health Performance Framework that align with AHMAC's intentions for health sector performance reporting (see Schedule D).
- B62. The AIHW will continue to develop the National Integrated Health Services Information Analysis Asset which will comprise linked health services data to inform contemporary health policy development and the planning and monitoring of health and residential aged care service delivery (see clause C44(d) in Schedule C). The AIHW will do this in consultation with key stakeholders, including jurisdictions, clinicians and consumer representatives, and through established committee processes.
- B63. The AIHW will establish a 'national front door' as a reporting platform for performance information, to assist Australians to make informed decisions about the performance of the health system.

Consultation

- B64. The Parties expect that, in performing its functions, the AIHW will collaborate with Parties via AHMAC.
- B65. The AIHW will provide AHMAC with a clear understanding of the AIHW's processes, governance arrangements and its committees on national health information matters and changes to these arrangements.

Data requirements for the national bodies

- B66. The national bodies will develop rolling three year data plans indicating their future data needs, in line with the following process:
- a. each national body will develop a data plan that takes into account the objectives of this Addendum and the requirements in clause B67;
 - b. each national body will provide its data plan to the CHC; and
 - c. the plan will be considered final and complete 30 calendar days after release, unless the process referred to in clause B70 is invoked.

- B67. In determining data requirements, each body must:
- a. seek to meet its data requirements through existing national data collections, where practical;
 - b. conform with national data development principles and wherever practical use existing data development governance processes and structures, except where to do so would compromise the performance of its statutory functions;
 - c. allow for a reasonable, clearly defined, timeframe to incorporate standardised data collection methods across all jurisdictions;
 - d. support the concept of ‘single provision, multiple use’ of information to maximise efficiency of data provision and validation where practical, in accordance with privacy requirements;
 - e. balance the national benefits of access to the requested data against the impact on jurisdictions providing that data; and
 - f. consult with the Commonwealth and States when determining its requirements.
- B68. AHMAC will periodically review the three-year data plans of the national bodies for the effectiveness and appropriateness of data requested from jurisdictions. The review will consider the administrative burden of non-essential data requests:
- a. The review will check the three-year data plans conform with the data requirements of clause B67; and
 - b. The review of three-year data plans will be conducted at least once every three years.
- B69. Privacy of individual healthcare users is paramount and will be protected at all times. The national bodies will collect, secure and use information in accordance with relevant legislation and Australian Privacy Principles, ethical guidelines and practices in order to protect the privacy of individuals. To give effect to this commitment, the Commonwealth will consult with relevant privacy stakeholders on Commonwealth-related data aspects of this Addendum.
- B70. The CHC may direct the national bodies in respect of specific elements of their data plans or interim data plans:
- a. if it determines that a plan does not meet the requirements set out at clause B67; and
 - b. provided that such a direction would not diminish the achievement of transparency, comparability or other objectives of this Addendum or materially delay implementation.
- B71. If a jurisdiction intends to request CHC to consider changes to the data plan under clause B70, the following procedure will be used:

- a. within 45 calendar days of the release of the plan, the jurisdiction must lodge a submission with CHC, setting out its reasons for seeking the direction;
 - b. the jurisdiction must provide the body that developed the data plan with a copy of the submission; and
 - c. within 21 calendar days of receiving the submission, CHC will consider the matter out of session and agree its response.
- B72. Subject to clauses B67 and B69, the Commonwealth and States will provide the national bodies outlined above with the data the national bodies determine is required to carry out their functions in accordance with their data plans. This data will be provided to each agency as required, with the exception of patient identified data which will be provided to the Services Australia (formerly the Commonwealth Department of Human Services) for the purpose of de-identifying the data (as set out in clause B74). This de-identified data will then be used by the IHPA and NHFB in the calculation of the national efficient price and ensure appropriate Commonwealth payments for public hospital services.
- B73. Data requested by a national body from a jurisdiction, additional to the requirements of the published three year data plan, can only be used to resolve the matter in relation to the which the information and/or data was provided, or other purposes agreed by the Parties.
- B74. Where patient identified data is required, States will provide that data with patients identified by a Medicare Card Number to Services Australia. Services Australia will then de-identify that data and provide it to the relevant national body. Where patient identified data is required it will be subject to relevant Commonwealth and State statutory protections of individuals' privacy.
- B75. The Commonwealth Department of Health will be able to access relevant matched data to allow it to perform Medicare compliance activities and State health departments will be able to access a copy of the matched data relevant to their jurisdiction for verification purposes.
- B76. The Commonwealth and the States will take responsibility for the data integrity within their systems and agree to establish appropriate independent oversight mechanisms for data integrity, to provide certainty to the Australian public about the actual performance of hospitals and other parts of the health system.
- B77. As set out in clause B67(d), data provided to the national bodies may be shared between agencies as set out by the following principles:
- a. the national bodies will be able to access data to allow them to meet their functions as set out by this Addendum;
 - b. the Australian Bureau of Statistics will be able to access relevant data required to meet its legislative and contractual reporting requirements;
 - c. the Australian Institute of Health and Welfare (AIHW) will be able to access relevant

data to allow the AIHW to meet its statutory and contractual reporting requirements;

- d. Services Australia will be able to access data to perform its role of de-identifying patient level data to allow the Administrator to perform their functions; and
- e. the Commonwealth Department of Health, the Commonwealth Department of Veterans' Affairs, the Commonwealth Treasury, State health departments and State treasuries will be able to access all de-identified data for the purposes of policy analysis and planning.

- B78. To ensure that States are able to effectively fulfil their responsibilities in public hospital management and health planning, the Commonwealth will provide reasonable access to Local Hospital Network level and PHN level health and ageing data about Commonwealth programs in accordance with arrangements under Schedule C (see Enhanced health data). CHC will agree appropriate protocols and procedures to govern the operation of this arrangement, including compliance with Commonwealth legislative obligations.
- B79. With regard to clause B77(e), those agencies will not publish, or use in any way publicly, or provide data to a third party without the express written approval of the originating jurisdiction in writing, except where there is a legislative basis to do so.
- B80. In using the data available, agencies listed in clause B77 will have regard to the caveats and limitations of the collected data.
- B81. Each body will publish details of Commonwealth and State compliance with the data requirements of the national bodies on a quarterly basis.

Statement of Assurance

- B82. States will provide the IHPA with a Statement of Assurance from a senior health department official on the completeness and accuracy of approved data submissions provided under clauses A66, A79, B76 and B77 of this Addendum:
- a. consistent with clause B77, the IHPA will provide statements of assurance to the Administrator;
 - b. jurisdictions will use the Statement of Assurance template agreed by AHMAC; and
 - c. the provision of the Statement of Assurance does not prevent a State from resubmitting data to improve previous submissions, subject to the requirements in clause A78. Each approved submission or resubmission of data will be accompanied by a Statement of Assurance.
- B83. Data provided to the Administrator by the Commonwealth under clauses A8 and A9 will also require a statement of assurance on completeness and accuracy of data submitted by the relevant Divisional Data Steward.

SCHEDULE C – LONG-TERM HEALTH REFORM PRINCIPLES

- C1. Shared action on long-term health system reform is essential to achieve the agreed critical priorities of:
- a. Improving efficiency and ensuring financial sustainability
 - b. Delivering safe, high-quality care in the right place at the right time; through
 - i. Nationally cohesive health technology assessment
 - ii. Paying for value and outcomes
 - iii. Joint planning and funding at a local level
 - c. Prioritising prevention and helping people manage their health across their lifetime; through
 - i. Empowering people through health literacy
 - ii. Prevention and wellbeing
 - d. Driving best practice and performance using data and research; through
 - i. Enhanced health data
- C2. The Parties acknowledge that a genuine commitment to shared action on long term health system reform with clearly identified approaches will contribute to improved patient outcomes, reducing emergency department demand, avoidable hospital admissions and extended stays. Actions to improve the interfaces with the health system will also be essential in addressing this demand (see Schedule F).
- C3. Facilitation of innovative approaches will be critical. The Parties agree funding pools and models must have sufficient flexibility to enable the testing and trialling of these approaches. The Parties will also work collaboratively on the fundamental enablers of the reform such as strengthened governance arrangements, including for sharing and developing data simplifying processes to support long term health system reform objectives.
- C4. The Parties agree to jointly develop detailed implementation plans for each of the six long-term reforms outlined above, to be considered by COAG Health Council (CHC). Once approved, the implementation plans will be appended to this Addendum. The implementation plans will include steps and timelines for delivery of activities, objectives, expected outcomes and evaluation.
- C5. The Parties agree that activities included as part of this schedule and in the implementation plans will be delivered within existing resources and programs, unless specific budget authority or agreement by jurisdictions has been sought and granted.
- C6. The Parties also:
- a. Commit to regular progress reports to CHC on implementation of reforms and progress against key outcomes, including reducing emergency demand, avoidable hospital admissions and extended stays in public hospitals;

- b. Agree that a common approach to evaluation is required to assess reform outcomes and inform CHC considerations to refine, further scale or apply reforms nationally; and
- c. Recognise that reforms should be tested in a range of circumstances to ensure they meet the needs of all Australians, including rural and remote areas, as well as vulnerable populations.

Nationally cohesive health technology assessment

- C7. Australia requires a strategic, systematic, cohesive, efficient and responsive national framework for health technology assessments (HTA). The current approach to the use of HTA to inform investment and disinvestment decisions in Australia is fragmented and does not facilitate coordinated and timely responses to rapidly changing technologies.
- C8. Separate processes exist across all levels of the health system, which has the potential to duplicate effort, create inefficiencies and inconsistent advice, and delay access to innovative and emerging technologies. Proactive planning will optimise financial and organisational access to innovative and emerging technologies.
- C9. The Parties agree that:
- a. HTA is an important means of delivering value to patients and the broader health system;
 - b. the Commonwealth and States must determine how to prioritise spending on health technologies within the constraints of limited budgets, and do so in a way that is consistent, equitable and efficient; and
 - c. the development and implementation of a nationally cohesive approach to HTA is an opportunity for governments to make informed decisions to deliver safe, effective and efficient care that is financially viable and improves population health.
- C10. The Parties further agree to jointly develop a federated approach to health technology assessment, with a view to towards a unified framework in the longer term. The goal is to increase the impact of HTA on policy, funding (investment and disinvestment) and service delivery decision making at all levels of the health system. The Parties acknowledge that a unified framework is ambitious and commit to testing and trialling this strategy within an initial narrow and defined scope.
- C11. The Parties agree that funding arrangements for new high cost, highly specialised therapies (HSTs), recommended for delivery in a public hospital setting by the Medical Services Advisory Committee, will be determined on the basis of hospital funding contributions specified in Schedule A with the following exceptions for the term of this Addendum:
- a. the Commonwealth, for these types of therapies, will provide a contribution of 50 per cent of the growth in the efficient price or cost (including ancillary services), instead of 45 per cent; and
 - b. they will be exempt from the funding cap at clause A56 for a period of two years from the commencement of service delivery of the new treatment.
 - c. Upon commencement of service delivery of the new treatment in a State, the State

may request advice from the Administrator on the operation of the cap exemption for that treatment in that State.

- C12. The Parties agree that there will be joint decision making by Chairs of MSAC and PBAC and a nominated representative of CHC, on the referral for HTA of applications for a new HST likely to be offered within public hospitals. This decision will consider potential impact on other public hospital clinical services, as well relevant legislation guiding the HTA process. This decision will occur within 30 days of the application so that HTA is not unreasonably delayed by early consideration of implementation. The governance process for these arrangements is outlined at Appendix B.
- C13. The reform will also include the following components:
- a. establishment of a process to facilitate a consistent approach to HTA nationally, identify and prioritise technologies that would benefit from national level HTA;
 - b. development of a national HTA framework, including processes for HTA to inform advice on implementation, investment and disinvestment opportunities at Commonwealth and State levels;
 - c. establishment of an information sharing platform to enable collaboration between relevant jurisdictional and national bodies;
 - d. Production of public and stakeholder guidance; and
 - e. Review and support of HTA workforce.
- C14. The Parties agree that the Australian Health Ministers' Advisory Council (AHMAC) and its relevant authorised committees will oversee the design and delivery of the HTA federated approach.
- C15. The Parties jointly agree to ensure that other relevant agencies and committees directly or partially engaged in HTA remain informed of and consulted on the progress of this long term health reform.
- C16. The Parties agree to continue to work together to improve the engagement with, and transparency of, HTA processes where the item under assessment is likely to be delivered in a public hospital setting.

Paying for value and outcomes

- C17. While Australia's health system performs comparatively well, current models for commissioning and funding health care are fragmented and do not reward providers for planning, coordination, and integration of care across a treatment journey. Policies and programs are designed in isolation from one another, even though patients access services across boundaries between programs. This has widespread impacts on people, providers and funders, and jeopardises the sustainability of the health system.
- C18. Responding to the challenges the Australian health system will face in the future demands a financing system that is proactive, value-based and focused on individual and community needs. The current system does not afford the necessary funding flexibility and governance arrangements to address these challenges, provide best patient care and support contemporary models of care.

- C19. The Parties agree that the Paying for Value and Outcomes reform will explore funding and payment mechanisms to create stronger incentives for providers to:
- a. focus on the outcomes that matter to patients, including through the utilisation of Patient Reported Measures;
 - b. improve patient equity, namely inequities in health care provision, access to health care, and health outcomes;
 - c. improve clinical outcomes, including the outcomes that matter to patients, and experiences of health care;
 - d. deliver best-practice clinical care; and
 - e. focus on the entire patient journey, not just individual parts of it.
- C20. The Parties agree that reform to funding and payment mechanisms should be sustainable and holistic, and aim to improve the extent to which funding is:
- a. needs based, with funding distributed to patient and population need; and
 - b. flexible with funding conditions giving providers the necessary discretion to provide care in the right place, at the right time, by the right workforce.
- C21. Further, the Parties agree the reform plan for Paying for Value and Outcomes may include, but not be limited to, the following activities and commitments:
- a. develop a National Health Funding and Payments Framework to guide and evaluate trials and inform future implementation of health system reform across all levels of government;
 - b. identify and support removal of legislative, regulatory and technical barriers to the implementation of innovative funding and payment approaches, at the national and State and Territory levels;
 - c. develop and progress trials of funding and payment reforms at a:
 - i. program level – options may include bundled payments, refinements to ABF, capitation models, and outcomes-based payments, among others; and
 - ii. system level – options may include blended funding models and pooling of payment streams across programs and providers; and
 - d. A common approach to evaluation of trials and knowledge sharing, to inform further decisions about scaling of trials and future reform directions.
- C22. Successful delivery of reform objectives will be supported by the exploration and trial of new and innovative approaches to public hospital funding under this Addendum, as outlined in clauses A96 to A101.

Joint planning and funding at a local level

- C23. The current health system in Australia is fragmented, making it difficult for people to get well-coordinated care. There is a complex split between the Commonwealth and State governments, and the not-for-profit and private sectors, regarding who is responsible for planning, funding and delivering different services.
- C24. While these mixed funding and accountability arrangements have benefits, they do not create strong incentives for providers to plan, work together and co-ordinate care for patients. Current models of commissioning and funding health care do not compensate or reward providers for planning, coordination, and integration of care across a treatment journey. Patients with chronic and complex conditions are particularly at risk of receiving fragmented and variable quality of care because they often use a wide range of health services.
- C25. The Parties recognise that they need to work together to better plan and co-ordinate health services at the local level, and that this will benefit them both as population outcomes improve. This can only be achieved if there is greater collaboration across care settings, clinicians are engaged and supported to adopt new practices, accountabilities are clear, and there is a joint commitment across all agencies and governments that span the continuum of care.
- C26. As part of this shared commitment, the Parties will:
- a. encourage local health organisations, such as Primary Health Networks, Local Hospital Networks, as well as primary and community health services, to collaborate when planning health services and making investment decisions;
 - b. develop commissioning arrangements that provide stronger incentives for local health organisations to co-ordinate care, pool funding and integrate health services; and
 - c. establish shared reporting and accountability arrangements to effectively measure the impact on population health outcomes, quality of health services and value at the local level.
- C27. Further, the Parties agree the reforms aim to:
- a. reorient the health system around individuals and communities and improve patient outcomes and experiences while considering the impacts on patients, carers and their families;
 - b. achieve better integrated patient-centred care that is evidence-based and incentivises innovation;
 - c. emphasise patient empowerment, particularly through co-design of services, collaboration with providers and expanded use of new and existing technologies; and
 - d. promote equitable access to high quality health care and reduce disadvantage for all Australians, including for Aboriginal and Torres Strait Islander people and those living in regional and remote areas.

- C28. The reform plan for Joint Planning and Funding at a Local Level will include, but not be limited to, the following activities and commitments:
- a. nationally agreed principles for local-level commissioning;
 - b. identifying and supporting removal of barriers to joint governance, needs assessment, service integration, evaluation and funding, at a national and State and Territory level;
 - c. progressively trialling, evaluating, refining and scaling up joint planning and funding arrangements of increasing levels of ambition;
 - d. addressing workforce matters, including capability gaps for effective health services commissioning, and exploration of innovative workforce models and potential new roles to support better care coordination; and
 - e. ongoing monitoring and evaluation of joint planning and funding arrangements, including the development of shared outcome measures to determine the effectiveness of jointly planned and funded services.

Empowering people through health literacy

- C29. Health literacy is a system issue. It involves interactions between individual consumers, communities, healthcare professionals, and healthcare organisations. Creating health literacy-friendly systems and organisations through a co-design approach will better equip and empower people to manage their own health, engage effectively with health services, and achieve better health outcomes. People with low health literacy are less well equipped to take appropriate action to prevent and manage disease and ill health. As a result, they may have higher rates of hospitalisation, emergency care and adverse outcomes.
- C30. The Parties recognise that a significant proportion of adult Australians have low health literacy and that supporting health literacy can help to address the social determinants of health. Low health literacy compounds the disadvantage already experienced by marginalised groups. As a result, the Parties recognise the need to prioritise disadvantaged groups in the design of health literacy interventions because this will help to reduce inequity in access to care and health outcomes.
- C31. The Parties agree the reforms will aim to:
- a. improve population health outcomes;
 - b. make the health system and organisations more health literacy-friendly, so it is easier for people to get appropriate health information, support and services;
 - c. empower people to become informed and active participants in their own health care;
 - d. increase the uptake of health promoting behaviours, particularly among population groups at high risk of ill health;
 - e. develop providers' capacity to engage consumers in co-designing health services around patients' needs; and
 - f. improve the efficiency, effectiveness and equity of health service delivery.

- C32. The Parties will provide strategic leadership for the health sector to raise awareness of health literacy needs and build capacity within the workforce to meet these needs. Patient reports of their health outcomes and care experiences will be measured systematically to drive a transition towards more person-centred care.
- C33. Government-funded information resources and digital platforms will be better aligned, culturally appropriate and evidence-based. Information on the performance of the health system and services will be more accessible. These resources will support people to manage their own health and actively engage with their health service providers in making decisions about their care.
- C34. Evidence of the effectiveness of health literacy initiatives will be shared between governments and with the health workforce, researchers and the community.

Prevention and wellbeing

- C35. The Parties recognise the benefits of supporting Australians to live healthier lives by reducing the proportion of people living with preventable chronic conditions and delaying the onset of these conditions. Reducing the burden of chronic disease and addressing the underlying drivers to ill health will significantly reduce avoidable hospital admissions and make our health system more sustainable.
- C36. The risk of a person developing a preventable illness or condition is affected by social, economic and environmental factors, as well as their lifestyle. Prevention needs to work at several levels, beginning with a healthy start to life and targeting approaches at critical stages throughout a person's life, as well as impacting on the broader environment to create healthier places where people spend their time. It should include a focus on population groups and areas with the greatest need.
- C37. Despite consensus on the need to intervene earlier to prevent the onset of poor health and wellbeing, investment has historically been targeted towards treating ill health. Currently, there are few incentives for the health workforce to build prevention into practice, and there are ongoing difficulties measuring impacts, outcomes, and returns on investment for preventive health activities.
- C38. The Parties acknowledge that all governments currently invest in primary prevention of disease in various ways, and that the Prevention and wellbeing reform will complement existing activities.
- C39. The Parties agree that the key objectives of the reform is to:
 - a. increase investment in primary prevention;
 - b. reduce the prevalence of chronic disease;
 - c. support coordinated, cross-sector investment including from non-government sectors;
 - d. address the underlying drivers of ill-health, including social, economic and environmental determinants;
 - e. develop sustainable, innovative mechanisms for financing preventive health activities, including the adoption of cohort-specific and risk-based approaches to planning and prioritisation; and

f. improve the sustainability of the health system.

C40. The Parties agree to the following actions:

- a. a national prevention monitoring and reporting framework, with a focus on shared priorities;
- b. a commitment to increase investment in primary prevention over time;
- c. developing innovative, fit-for-purpose financing mechanisms for scaling primary prevention initiatives;
- d. exploring evidence-based regulatory prevention measures; and
- e. reviewing and addressing health system barriers to prevention.

Enhanced health data

C41. The Parties recognise that timely access to data is critical to support shared patient-clinician decision making, improved service delivery, policy development and system planning.

C42. Parties acknowledge that enhanced health data is a critical enabler for all the long-term health reforms and commit to working together to harness data and analytics to drive meaningful improvements in the health system.

C43. The Parties are committed to achieving comprehensive health data access, usage and sharing, while at the same time maintaining data security and preserving individuals' privacy.

C44. The Parties agree the key objectives of the reforms are to achieve better patient outcomes and incentivise and support integrated patient centred care by:

- a. establishing a national standard approach to govern the creation, access and sharing of data from all Australian governments;
- b. providing data access to support shared patient-clinician decision making, improved service delivery and system planning;
- c. working together to better harness data, analytics and evidence in order to drive meaningful improvements in the health system; and
- d. progressing mechanisms and interoperable systems for secure and comprehensive integration of data across patient journeys, such as the National Integrated Health Services Information Analysis Asset, and a dynamic cyber security framework to ensure security and ethical management of personal health information.

C45. Further, in achieving comprehensive health data access, usage and sharing it will:

- a. facilitate bona fide research;
- b. protect individual privacy in line with relevant legislation, community expectations and values;

- c. make data available in a timely manner based on the purpose for which the data is intended to be used;
- d. collect data once for multiple uses;
- e. build capacity, capability and innovation in collecting and applying data; and
- f. allow all jurisdictions to identify priority reforms and timing of trials that best suit local needs and readiness.

C46. The Parties agree to the following national actions:

- a. scale up a national approach to data governance arrangements, structures and processes, to facilitate clear and efficient mechanisms for sharing and developing data in a sustainable, purpose-based and safe way;
- b. establish Commonwealth-State patient-level primary and community health care datasets to inform the development of quality indicators that support shared decision making and service planning across the primary, community and acute sectors;
- c. develop a health data workforce capability framework that defines roles and standards, identifies necessary skills, competencies and mechanisms to build capacity;
- d. develop a risk-based framework and standards to provide the capacity for the effective collection, sharing and security of data;
- e. develop and implement a consistent approach to the collection and use of Patient Reported Measures, to build national-level evidence and improve care across the health system; and
- f. review relevant legislation and regulations across Australia to provide recommendations on ways to support better data linkage while ensuring appropriate protections for patient privacy.

C47. The Parties agree to the following bilateral activities:

- a. share information about current data systems, processes and guidelines to help inform solutions for data sharing; and
- b. pilot projects for local implementation and feedback to all participants.

SCHEDULE D – TRANSPARENCY AND PERFORMANCE

- D1. While the Australian health system performs well, access to timely, fit-for-purpose information, which is needed to make informed decisions about health care is not consistently available. Expanding public reporting on quality, safety and value of health services will drive improvements in the health system and make providers more accountable for outcomes.
- D2. Health Ministers have agreed to the Australian Health Performance Framework (AHPF) which will provide a single framework to support system-wide reporting on Australia's health and health care performance, support research for policy and planning purposes, and inform the identification of priorities for improvement and development.
- D3. Past agreements have committed to improving public reporting on performance and outcomes and this Addendum will build on them.
- D4. All Parties will be accountable to the community for their progress towards achieving the outcomes outlined in the AHPF and articulated in this Addendum, as well as any prior commitments to performance indicators, public reporting and data provision.
- D5. The Parties agree that the following will be provided to COAG Health Council (CHC) for approval including:
- a. A consolidated set of whole of system performance indicators that are drawn from the AHPF (with priority given to reporting already agreed indicators). This will include:
 - i. A review of the performance indicators outlined in the National Healthcare Agreement 2012 (NHA) and other relevant health performance frameworks;
 - ii. A detailed plan for developing new performance indicators to measure progress and impact against the whole AHPF, including the impact on the health of other sectors that intersect with the health system; and
 - iii. Timeframes for regular public reporting and updating indicators ensuring information is current and relevant;
 - b. Revised performance benchmarks to demonstrate improvement in performance over time. This will replace the performance benchmarks in the NHA;
 - c. A mechanism of governance for the:
 - i. review and revision of indicator set utility and relevance to the AHPF;
 - ii. rationalisation of reporting by data providers, including moving over time to single provision, multiple use; and
 - iii. accurate analysis and interpretation of shared data; and
 - d. A proposed approach to measuring value in the health system that encompasses Commonwealth, State, private sector and individual funding sources and aligns with the definition in this Addendum.

- D6. Progress on work outlined in clause D5 will be reported to the Health Services Principal Committee in consultation with the Australian Institute of Health and Welfare (AIHW), the Australian Commission on Safety and Quality in Health Care (ACSQHC), the Independent Hospital Pricing Authority (IHPA), the Productivity Commission (PC), the Australian Digital Health Agency (ADHA), the National Aboriginal and Torres Strait Islander Health Standing Committee (NATSIHSC) and other bodies as required.
- D7. The Parties will work to harmonise reporting arrangements on health system performance information and data and rationalise where appropriate. This includes Parties agreeing to:
- a. a list of reports for inclusion as part of the reporting arrangements under the AHPF; and
 - b. ongoing monitoring of the list of AHPF reports.
- D8. Further to clause D5, the Parties agree to work collaboratively with relevant national agencies in accordance with their roles and responsibilities outlined in Schedule B to:
- a. Review and revise the National Health Information Agreement (consistent with the principles outlined in this Addendum) by April 2021;
 - b. Manage a central repository for the AHPF performance information and national reporting, leveraging the existing infrastructure and platforms;
 - c. Ensure fit for purpose public reporting of performance information is accessible, understandable and timely for stakeholders, based on the data provided by all sources in accordance with this Addendum; and
 - d. Develop and provide, in collaboration with relevant stakeholders, tiered, fit for purpose reporting at the lowest meaningful level of granularity, in line with best practice and subject to any applicable privacy legislation. This could include:
 - i. Individual providers and facilities, local (PHN, LHN), State/Territory, national and international;
 - ii. Priority population groups including Aboriginal and Torres Strait Islander populations;
 - iii. Comparisons across local (PHN, LHN), State/Territory regions and population groups;
 - iv. Funding sources;
 - v. Different health conditions;
 - vi. Demographic and socio-economic groups; and
 - vii. Public and private health care providers and funders.

- D9. The Parties agree that transparent performance reporting should be based on the following:
- a. flexibility to evolve over time to support the long term objectives of this Addendum;
 - b. ability to progressively expand to cover the AHPF domains focused on health system performance;
 - c. apply measures across the range of private sector and primary care settings;
 - d. providing timely and regular information to the public on the performance, safety and quality of the health system and health facilities;
 - e. provide data once through a single source with multiple use by national agencies and Commonwealth departments;
 - f. use agreed data supply pathways;
 - g. strong governance protocols which limit unauthorised access and protect privacy;
 - h. prioritise additional data sources for development and expansion over time; and
 - i. States and Territories remain responsible for jurisdictional reporting of performance information outside the scope of national reporting.
- D10. Whole of system reporting will include all facets of the health system including primary, secondary and tertiary services in the public, private and community settings:
- a. The Parties agree to align their individual performance frameworks with the AHPF to the greatest extent;
 - b. The Parties agree to develop and implement enhanced performance reporting across the whole care pathway including:
 - i. Health system outcomes including: health outcomes, clinical outcomes, safety and quality, workforce outcomes and health system sustainability;
 - ii. Patient-centred outcomes by embedding Patient Reported Measures and moving towards linkage with other data sets;
 - iii. Increased coverage and reporting of primary care activity;
 - iv. Specific consideration of the representation of Aboriginal and Torres Strait Islander peoples' experience including: the choice of outcomes; patient centred outcomes; the presentation and interpretation of reporting; and any other factors;
 - v. Increased coverage and reporting of private hospital sector activity and performance; and
 - vi. The interface between health and other sectors, such as the disability or aged

care sectors.

- D11. The Productivity Commission will continue its role of reporting the progress towards the COAG’s key commitments, including reviewing progress against a set of agreed national performance indicators defined through the AHPF.

SCHEDULE E – LOCAL GOVERNANCE

Local Hospital Networks

- E1. The Commonwealth and the States agree that the role of Local Hospital Networks is to decentralise public hospital management and increase local accountability to drive improvements in performance. Local Hospital Networks are accountable for treatment outcomes and responsive to patients' needs and make active decisions about the management of their own budget. They have the flexibility to shape local service delivery according to local needs.
- E2. Local Hospital Networks are required to engage with the local community and local clinicians, incorporating their views into the day-to-day operational planning of hospitals, particularly in the areas of safety and quality of patient care.
- E3. Local Hospital Networks are required to directly manage public hospital services and functions and may at the discretion of States also have responsibility for delivery of other health services. Local Hospital Networks are required to work with Primary Health Networks to integrate services and improve the health of local communities.
- E4. Local Hospital Networks are responsible for:
- a. managing their own budget, in accordance with State financial and audit requirements;
 - b. managing performance of functions and activities specified in Service Agreements;
 - c. receiving Commonwealth and State funding contributions for delivery of services as agreed under the Service Agreement entered into with the State government;
 - d. local implementation of national clinical standards to be agreed between the Commonwealth and States on the advice of the Australian Commission on Safety and Quality in Health Care (ACSQHC);
 - e. local clinical governance arrangements;
 - f. providing information to States at their request, for the purpose of enabling the relevant State to provide information and data to the national bodies and the Commonwealth;
 - g. maintaining accountability under, and subject to, State financial accountability and audit frameworks; and
 - h. collaborating with Primary Health Networks and private providers to meet the health needs of the community and minimise service duplication and fragmentation.
- E5. Local Hospital Networks are required to assist States through:
- a. contributing expertise, local knowledge and other relevant information to State-managed capital and service planning arrangements; and
 - b. the implementation and local planning of capital infrastructure.
- E6. Local Hospital Networks are required to engage with the following stakeholders to enable

their views to be considered when making decisions on service delivery at the local level, or service and capital planning at the State level:

- a. other Local Hospital Networks to collaborate on matters of mutual interest;
- b. local primary health care providers, Primary Health Networks and aged care services; and
- c. the local community and local clinicians, particularly in the area of safety and quality of patient care.

E7. The Local Hospital Network Service Agreement are required to include at a minimum:

- a. the number and broad mix of services to be provided by the Local Hospital Network, so as to inform the community of the expected outputs from the Local Hospital Network and allow the Administrator to calculate the Commonwealth's funding contribution (clause B42(a) refers);
- b. the quality and service standards that apply to services delivered by the Local Hospital Network, including the Performance and Accountability Framework (2011 NHRA) and Australian Health Performance Framework (Schedule D);
- c. the level of funding to be provided to the Local Hospital Networks under the Service Agreement, through ABF, reported on the basis of the national efficient price, and block funding; and
- d. the teaching, training and research functions to be undertaken at the Local Hospital Network level.

E8. Service Agreements are required to be publicly released by States within fourteen calendar days of finalisation or amendment and are required to then also be made available through relevant national bodies. States may agree additional matters with Local Hospital Networks (such as the delivery of additional programs).

E9. The Commonwealth is not a party to Local Hospital Network Service Agreements and has no role, directly or indirectly, in the negotiation or implementation of Local Hospital Network Service Agreements.

E10. States are accountable for financial management and audit of Local Hospital Networks and are required to ensure that stringent independent oversight and financial accountability is put in place.

E11. Local Hospital Networks are required to have separate bank accounts able to receive funding from the National Health Funding Pool independent of State treasuries or health departments and are required to be audited as separate entities.

E12. Local Hospital Networks are required to have a professional Governing Council and Chief Executive Officer, unless otherwise agreed by the Health Ministers of the Commonwealth and an individual jurisdiction. The professional Governing Council and Chief Executive Officer are responsible for:

- a. delivering agreed services and performance standards within an agreed budget, based on annual strategic and operating plans, to give effect to the Local Hospital Network Service Agreement;

- b. ensuring accountable and efficient provision of services and producing annual reports, subject to State financial accountability and audit frameworks;
- c. monitoring Local Hospital Network performance against the agreed performance monitoring measures in the Local Hospital Network Service Agreement, including the Performance and Accountability Framework (2011 NHRA) and Australian Health Performance Framework (Schedule D);
- d. improving local patient outcomes and responding to system-wide issues; and
- e. maintaining effective communication with the State and relevant local stakeholders, including clinicians and the community.

E13. Local Hospital Network Governing Councils are responsible for:

- a. negotiating and agreeing with the relevant State government a Local Hospital Network Service Agreement and any necessary adjustments; and
- b. developing a strategic plan for the Local Hospital Network, and implementing an operational plan to guide the delivery of the services, within the budget agreed under the Local Hospital Network Service Agreement.

E14. Local Hospital Network Governing Councils are required to comprise members with an appropriate mix of skills and expertise to oversee and provide guidance to large and complex organisations, including:

- a. health management, business management and financial management;
- b. clinical expertise, including expertise external to the Local Hospital Network wherever practicable;
- c. cross-membership with Primary Health Networks wherever possible;
- d. where appropriate, people from universities, clinical schools and research centres; and
- e. where appropriate, people with other skills and experience.

E15. The overall makeup of Local Hospital Network Governing Councils are required to be determined taking into account the need to ensure local community knowledge and understanding.

E16. Local Hospital Network Governing Councils are required to be recruited through a process conducted publicly, transparently and in accordance with due process principles, and are required to be remunerated at rates determined by the relevant State.

E17. Local Hospital Network Governing Council members are required to be appointed under State legislation by State Health Ministers. Each Local Hospital Network's Chief Executive Officer (CEO) is required to be appointed by the Governing Council, with the approval of the State Health Minister or their delegate, and are required to be accountable to the Governing Council.

E18. Local Hospital Network Governing Councils are required to establish a formal engagement protocol with local Primary Health Networks.

Local Hospital Network Structure

- E19. Local Hospital Networks are required to comprise single or small groups of public hospitals with a geographic or functional connection, large enough to operate efficiently and to provide a reasonable range of hospital services and small enough to enable the Local Hospital Networks to be effectively managed to deliver high quality services.
- E20. Types of Local Hospital Networks include:
- a. metropolitan Local Hospital Networks, which are required to comprise at least one hospital, but could comprise a small group of hospitals, and should be built around principal referral hospitals or specialist hospitals;
 - b. specialist Local Hospital Networks, which are required to have a functional focus without any particular geographic focus and are required to operate with whole-of-State coverage, for example specialist hospitals or the largest most complex tertiary hospitals; and
 - c. other Local Hospital Networks, bringing together an individual or groups of hospitals operated by third parties as public hospitals, including those operated by religious orders.
- E21. In regional Australia, a flexible approach is required to be adopted to determine the regional, rural and remote Local Hospital Network structure that best meets the needs of these communities and best takes into account the challenges of managing multiple small hospitals.
- E22. If over time States identify that significant changes are needed to roles and structures for Local Hospital Networks, they are required to work with Local Hospital Networks to deliver the adjustments necessary to respond to these changes, including the number and location of staff.
- E23. States are required to work cooperatively with the Commonwealth to ensure, wherever possible, common geographic boundaries with Primary Health Network boundaries, including where States introduce arrangements for cross-border Local Hospital Networks.
- E24. In respect of performance assessment, reporting and management of Local Hospital Networks:
- a. States, as system managers of the public hospital system, are required to agree and adopt the Performance and Accountability Framework (2011 NHRA) and Australian Health Performance Framework (Schedule D), and are required to be responsible for ensuring Local Hospital Network performance in accordance with this framework; and
 - b. States, as system managers of the public hospital system, are required to decide on the nature and timing of actions to remediate ongoing poor performance.

Primary Health Networks

- E25. Primary Health Networks will be the GP and primary health care partners of Local Hospital Networks, responsible for supporting and enabling better integrated and responsive local GP and primary health care services to meet the needs and priorities of patients and communities.

- E26. Primary Health Networks and State-funded health and community services will cooperate to achieve these objectives.
- E27. The strategic objectives for Primary Health Networks are:
- a. identifying the health needs of their local areas and development of relevant focused and responsive services;
 - b. commissioning health services to meet health needs in their region;
 - c. improving the patient journey through developing integrated and coordinated services;
 - d. providing support to clinicians and service providers to improve patient care;
 - e. facilitating the implementation of primary health care initiatives and programs; and
 - f. being efficient and accountable with strong governance and effective management.
- E28. Primary Health Networks have, among other functions, responsibility for assessing the health needs of the population in their region, for identifying gaps in GP and primary health care services and working with other funders and key stakeholders to put in place strategies to address these gaps.
- E29. Primary Health Networks are independent legal entities (not government bodies) with strong links to local communities, health professionals and service providers, including GPs, allied health professionals and Aboriginal and Torres Strait Islander Community Controlled Health Services. Primary Health Networks will reflect their local communities and health care services in their governance arrangements.
- E30. The Commonwealth and States will work together on system-wide policy and State-wide planning for GP and primary health care. The Commonwealth will consult with States and Primary Health Networks to ensure that:
- a. Primary Health Networks are taken into account in system-wide policy and State-wide planning for primary health care; and
 - b. plans required to be developed by Primary Health Networks take account of State-wide plans.
- E31. Primary Health Networks and Local Hospital Networks will be expected to share some common membership of governance bodies where possible. Primary Health Networks will be expected to work closely, and establish a formal engagement protocols, with Local Hospital Networks.
- E32. The Commonwealth will monitor performance for Primary Health Networks.
- E33. States will not establish duplicate GP or primary health care planning and integration organisations. To the extent that such organisations already exist, the Commonwealth and the relevant State will work together to agree a transition plan, including timing, for the organisation then to become part of Primary Health Network arrangements.
- E34. The Commonwealth and States will work together to create linkages and coordination mechanisms, where appropriate, between Primary Health Networks and other State

services that interact with the health system, for example services for children at risk, people with serious mental illness and homeless Australians.

- E35. The Commonwealth will work co-operatively with States to ensure, wherever possible, Primary Health Networks have common geographic boundaries with Local Hospital Networks. These boundaries may be reviewed over time by the Commonwealth in consultation with States.
- E36. Primary Health Networks will engage with the following stakeholders to enable their views to be considered when making decisions on service delivery at the local level, or service and capital planning at the State level:
- a. other Primary Health Networks to collaborate on matters of mutual interest;
 - b. Local Hospital Networks, particularly to improve planning and delivery of services to coordinate and integrate care for patients; and
 - c. the local community and local clinicians, particularly in the area of safety and quality of patient care.

Commonwealth and State engagement to support local care delivery

- E37. GP and primary health care services are integral to an effective and efficient Australian health system. The Commonwealth will renew its efforts to improve GP and primary health care services in the community to improve care for patients. The Commonwealth will take lead responsibility for the system management, funding and policy development of GP and primary health care with the objective of delivering a GP and primary health care system that meets the health care needs of Australians, keeps people healthy, prevents disease and reduces demand for hospital services.
- E38. The Commonwealth and the States will work together on system-wide policy and local, regional and State level planning and funding for GP and primary health care given the impact on the efficient use of hospitals and other State funded services, and because of the need for effective integration across Commonwealth and State-funded health care services at the local level to improve patients' outcomes through early intervention and better coordination of care.
- E39. Commonwealth and States will work together to trial and test better approaches to accountability and funding that supports more integrated service delivery for communities. States will work cooperatively with the Commonwealth in the implementation and ongoing operation of the Commonwealth's primary health care initiatives.

Reforms to primary care to reduce potentially avoidable hospital admissions

- E40. The Commonwealth will continue to invest in programs designed to minimise the impact of potentially preventable hospital admissions arising from shortcomings in areas within its own direct policy control including:
- a. integrating the planning, co-ordination and commissioning of services at a regional level through Primary Health Networks, with a specific focus on the interface between primary health care, and hospital services;
 - b. investments in national implementation of co-ordination of care models for persons

with complex, chronic conditions, and flexible funding models to better support persons with severe mental health conditions, consistent with the November 2015 response to the National Mental Health Commission Report - Contributing Lives, Thriving Communities;

- c. continued national rollout of My Health Records with legislative change to enable opt out provisions, with ongoing patient safety and efficiency benefits;
- d. implementation of the Community Pharmacy Agreement to enhance primary health care management of medications and avoidance of errors; and
- e. partnering with jurisdictions, where appropriate, in relation to primary health care, for example in remote and Aboriginal and Torres Strait Islander communities.

SCHEDULE F – INTERFACES BETWEEN HEALTH, DISABILITY AND AGED CARE SYSTEMS

- F1. Many Australians have increasingly complex care needs that require services from across the health, primary care, disability and aged care systems. This growing complexity requires better coordination between these systems to ensure positive outcomes for people through access to appropriate services, and reductions in avoidable hospital admissions, time spent in hospital and premature residential care admissions. Parties will develop meaningful and transparent mechanisms to monitor and report on system interface performance, and agree appropriate escalation pathways to ensure issues are identified and addressed proactively in a timely manner, to optimise consumer access and care outcomes.
- F2. The Parties recognise:
- a. that the disability, aged care, acute care, primary care and community health systems, including the Aboriginal and Torres Strait Islander Community Controlled Health sector, are part of a whole care and support system and are a collective responsibility;
 - b. all governments have a shared responsibility to improve people’s health outcomes, by supporting consumers, carers and their families to better navigate the health, primary care, aged care, and disability support systems, with the aim of optimising care and support and reducing avoidable hospital admissions;
 - c. the interoperability of the health, primary care, aged care and disability systems, their interfaces, and that policy changes in one system can have an impact on other systems particularly in resource constrained environments.
 - d. that people who regularly move between and interact with the health, aged care and/or disability systems may be more vulnerable, so it is important to have clear and effective mechanisms in place to effectively co-ordinate care across systems;
 - e. that the outcomes of people living with a disability can be improved by supporting their continued access to mainstream health services and the National Disability Insurance Scheme (NDIS), where eligible; and
 - f. that the outcomes for older people can be improved by continued co-ordination between hospital, aged care and mainstream health services, including primary care services.

Roles and responsibilities

- F3. The roles and responsibilities of the Parties where they relate to the interface between health, primary care, aged care and disability support systems, including community and residential aged care, and the NDIS should be read together with the NDIS Bilateral Agreements, the National Psychosocial Supports Measure, relevant legislation and supporting documents including the:
- a. *Aged Care Act 1997*;
 - b. *the Aged Care Safety and Quality Commission Act 2018*;
 - c. *the National Disability Insurance Scheme Act 2013*;

- d. the National Disability Agreement;
 - e. the National Disability Strategy;
 - f. the NDIS Rules; and
 - g. the 'Principles to Determine the Responsibilities of the NDIS and other Service Systems - Applied Principles and Tables of Support (APTOS)' agreed by COAG.
- F4. In addition to the role and functions of the Australian Commission on Safety and Quality in Health Care (ACSQHC) (see Schedule B), the roles and functions of other relevant bodies including the Aged Care Quality and Safety Commission and the NDIS Quality and Safeguards Commission should also be considered.
- F5. The Parties acknowledge the need to build on the activities set out in the 2017 Bilateral Agreements on Coordinated Care, which were designed to improve people's health outcomes and reduce avoidable demand for health services.
- F6. The Commonwealth is responsible for:
- a. policy and regulation of community and residential aged care delivered under Commonwealth-funded aged care programs for all people;
 - b. funding of community and residential aged care delivered under Commonwealth-funded aged care programs for people aged 65 years and over (50 years and over for Aboriginal and Torres Strait Islander people);
 - c. providing continuity of support, where required, for clients of Commonwealth programs that support people who are aged under 65 years with a disability but are not eligible for the NDIS;
 - d. regulating the provision of services under the NDIS via the NDIS Quality and Safeguards Commission, once established in each State; and
 - e. policy and funding to support timely and appropriate access to general practitioners regardless of where people live, through benefits paid for services listed on the Medicare Benefits Schedule (MBS).
- F7. States are responsible for:
- a. policy, funding and regulation of relevant disability supports and services for people aged under 65 years (and Aboriginal and Torres Strait Islander people aged under 50 years) with a disability who are not eligible for the NDIS;
 - b. continuing to fund and provide access to mainstream public hospital and State owned and run community health services, regardless of a person's NDIS participation;
 - c. funding of Commonwealth residential aged care or Home Care Packages for people aged under 65 years, except Indigenous Australians aged 50 years and over, who are not eligible for the NDIS; and
 - d. providing continuity of support, where required, for clients of State specialist disability programs who are found to be ineligible for the NDIS, to assist them to achieve similar outcomes.

- F8. The Parties will share responsibility for:
- a. providing continuity of care across the health, primary care, aged care, and disability systems to ensure smooth client transitions and reduce avoidable hospital admissions, and avoidable disability and aged care admissions; and
 - b. providing direction and strategic guidance through the Disability Reform Council on the NDIS, that funds disability supports and services for people who are eligible.
- F9. Where applicable, the Parties will share program responsibility for their respective community care and residential care services for Aboriginal and Torres Strait Islander clients aged 50 to 64 years, who will be eligible to receive services from an appropriate provider under programs of either level of government. There will be no 'wrong door' for Aboriginal and Torres Strait Islander people in this age group seeking community or residential care services. Where care services are provided under a State funded program to an Aboriginal or Torres Strait Islander person aged 50 years or older the Commonwealth will meet the cost of the service.

Interface between systems

- F10. This work builds on activities agreed in the Bilateral Agreements on Co-ordinated Care that aim to improve care coordination, particularly for people with chronic conditions and a disability, and transitions between residential aged care and primary and acute settings.
- F11. The Parties are committed to working across service systems to ensure legislative and regulatory changes, changes to service types, eligibility, and methods and mechanisms of service delivery avoid a negative impact on the interoperability of health, primary care, aged care and disability systems and people's wellbeing and outcomes, by:
- a. ensuring that changes with anticipated impacts on interfacing systems are managed in a timely and collaborative manner;
 - b. using a range of clearly defined, existing governance mechanisms (including relevant Ministers' forums) to manage, escalate and report on significant interface issues in a timely and sustainable way.
- F12. The Parties agree that the AIHW, in consultation with States, Territories and the Commonwealth, will develop health, primary care, aged care and disability interface performance indicators and an associated data collection and reporting for COAG Health Council (CHC) consideration by June 2021. The indicators will monitor the impact of interface performance on client outcomes (with a focus on priority population groups), in domains including, but not limited to:
- a. responsiveness of assessment and decision making processes;
 - b. equity of access to primary care, aged care, and disability care systems;
 - c. public hospital efficiency, including access to public hospital services, avoidable admissions, and appropriate discharge.
- F13. The Parties recognise that issues may arise at the interface between the health, primary care, aged care and disability systems from time to time. To appropriately identify and understand such issues, Parties agree to:

- a. monitor and report on the effect of any policy or significant service change in one system, on services in other systems;
- b. support the health, primary care, aged care and disability systems to operate together effectively;
- c. monitor and analyse interface performance using performance indicators and data developed and collected under clause F12 to identify new issues and manage known issues;
- d. proactively address identified service gaps in a timely manner that minimises risk to individuals; and
- e. measure effectiveness of system and interface improvement strategies.

F14. The following governance arrangements will apply for resolving system interface issues:

- a. The Australian Health Ministers' Advisory Council (AHMAC) will monitor interface issues that arise between the health system, and primary care or aged care systems, and make recommendations to CHC to resolve those issues. AHMAC will report to CHC on issues and resolution strategies and seek endorsement for any action that requires Ministerial approval. Aged Care Ministers will be included in any decisions relating to the aged care system.
- b. AHMAC and the NDIS Senior Officials Working Group will monitor interface issues that may arise between the health system and the NDIS. Either party can raise an issue to be resolved with outcomes or recommendations to be provided to the Disability Reform Council and/or CHC, as appropriate.
- c. Ministerial Councils will update COAG on any consequential decisions or activity.
- d. COAG will determine appropriate governance arrangements which are not addressed by the above arrangements.

F15. Parties agree to explore the impact of housing security, provision and assistance on people's health outcomes, and report to CHC by December 2021.

F16. The Parties will jointly:

- a. recognise that the principles agreed by COAG in the APTOS will be used to determine the funding and delivery responsibilities of the NDIS and that the interactions of the NDIS with other service systems will reinforce the obligations of other service delivery systems to improve the lives of people with disability, in line with the National Disability Strategy, noting the APTOS does not intend to place additional obligations on other systems;
- b. work together with the NDIA to improve outcomes for people with a disability;
- c. work towards the consistent application and interpretation of data across the systems to assist understanding of the linkages between data sets, establish sharing practices, and explore the viability of a disability identifier in health data;
- d. improve data sharing for serious incident/missed care across systems to provide early warning flags for all regulators; and

- e. work towards sustainability and improved coordination of health, primary health, aged care and disability services particularly in regional, rural and remote communities with progress to be reported to CHC and the Disability Reform Council.

SCHEDULE G – BUSINESS RULES

The following Business Rules are for service providers required to operate under the National Health Reform Agreement. These rules may be amended at any time with agreement in writing by all the parties or on behalf of the parties by the Commonwealth, State and Territory Health Ministers.

Public patient charges

- G1. Where an eligible person receives public hospital services as a public patient no charges will be raised, except for the following services provided to non-admitted patients and, in relation to (f) only, to admitted patients upon separation:
- a. dental services;
 - b. spectacles and hearing aids;
 - c. surgical supplies;
 - d. prostheses – however, this does not include the following classes of prostheses, which must be provided free of charge:
 - i. artificial limbs; and
 - ii. prostheses which are surgically implanted, either permanently or temporarily or are directly related to a clinically necessary surgical procedure;
 - e. external breast prostheses funded by the National External Breast Prostheses Reimbursement Program;
 - f. pharmaceuticals at a level consistent with the Pharmaceutical Benefits Scheme (PBS) statutory co-payments;
 - g. aids, appliances and home modifications; and
 - h. other services as agreed between the Commonwealth and States.
- G2. States can charge public patients requiring nursing care and accommodation as an end in itself after the 35th day of stay in hospital providing they no longer need hospital level treatment, with the total daily amount charged being no more than 87.5 per cent of the current daily rate of the single aged pension and the maximum daily rate of rental assistance.

Charges for patients other than public patients

- G3. Private patients, compensable patients and ineligible persons may be charged an amount for public hospital services as determined by the State.
- G4. Notwithstanding clause G3, pharmaceutical services to private patients, while they receive services as admitted patients, will be provided free of charge and cannot be claimed against the PBS.

Pharmaceutical Reform Arrangements

- G5. States which have signed bilateral agreements for Pharmaceutical Reform Arrangements may charge the PBS for pharmaceuticals for specific categories of patients as provided for

in the Arrangements.

Public health services

- G6. States and the Commonwealth will deliver public health services in accordance with the objectives, principles, roles and responsibilities, and any applicable standards, agreed in relevant national strategies, programs or initiatives.

Public patients' charter and complaints body

- G7. States agree to:
- a. continue the commitment under the previous health care agreements to preparing and distributing a Public Patients' Hospital Charter (the Charter), in appropriate community languages to users of public hospital services; and
 - b. maintaining complaints bodies independent of the public hospital system to resolve complaints made by eligible persons about the provision of public hospital services received by them.

Public Patients' Hospital Charter

- G8. States agree to:
- a. review and update the existing Charter to ensure its relevance to public hospital services. The review should be conducted with the Australian Commission on Safety and Quality in Health Care (ACSQHC);
 - b. develop the Charter in appropriate community languages and forms to ensure it is accessible to people with disabilities and from non-English speaking backgrounds;
 - c. develop and implement strategies for distributing the Charter to public hospital service users and carers; and
 - d. adhere to the Charter.
- G9. States agree to the following minimum standards:
- a. the Charter will be promoted and made publicly available whenever public hospital services are provided; and
 - b. the Charter will set out:
 - i. how the principles included in this Addendum are to apply to the provision of public hospital services in States;
 - ii. the process by which eligible persons can lodge complaints about the provision of public hospital services to them;
 - iii. that complaints may be referred to an independent complaints body;
 - iv. a statement of the rights and responsibilities of consumers and public hospitals in the provision of public hospital services in States and the mechanisms available for user participation in public hospital services; and

- v. a statement of consumers’ rights to elect to be treated as either public or private patients within States’ public hospitals, regardless of their private health insurance status.

Independent Complaints Body

- G10. States agree to maintain an independent complaints body to resolve complaints made by eligible persons about the provision of public hospital services to them.
- G11. States agree to the following minimum standards:
- a. the complaints body must be independent of bodies providing public hospital services and State health departments;
 - b. the complaints body must be given powers to investigate, conciliate and/or adjudicate on complaints received by it; and
 - c. the complaints body must be given the power to recommend systemic and specific improvements to the delivery of public hospital services.
- G12. The Commonwealth and the States agree that the powers of the complaints body will not interfere with or override the operation of registration boards or disciplinary bodies in States and that the exercise of powers by the complaints body will not affect the rights that a person may have under common law or statute law.
- G13. To assist in making recommendations and taking action to improve the quality of public hospital services, States agree to implement a consistent national approach, agreed with the ACSQHC or any successor, to collecting and reporting health complaints data to improve services for patients.

Patient arrangements

- G14. Election by eligible patients to receive admitted public hospital services as a public or private patient will be exercised in writing before, at the time of, or as soon as possible after admission and must be made in accordance with the minimum standards set out in this Addendum.
- G15. In particular, private patients have a choice of doctor and all patients will make an election based on informed financial consent.
- G16. Where care is directly related to an episode of admitted patient care, it should be provided free of charge as a public hospital service where the patient chooses to be treated as a public patient, regardless of whether it is provided at the hospital or in private rooms.
- G17. Services provided to public patients should not generate charges against the Commonwealth MBS:
- a. except where there is a third party payment arrangement with the hospital or the State, emergency department patients cannot be referred to an outpatient department to receive services from a medical specialist exercising a right of private practice under the terms of employment or a contract with a hospital which provides public hospital services;
 - b. referral pathways must not be controlled so as to deny access to free public hospital

services; and

- c. referral pathways must not be controlled so that a referral to a named specialist is a prerequisite for access to outpatient services.

G18. An eligible patient presenting at a public hospital emergency department will be treated as a public patient, before any clinical decision to admit. On admission, the patient will be given the choice to elect to be a public or private patient in accordance with the National Standards for Public Hospital Admitted Patient Election processes (unless a third party has entered into an arrangement with the hospital or the State to pay for such services). If it is clinically appropriate, the hospital may provide information about alternative service providers, but must provide free treatment if the patient chooses to be treated at the hospital as a public patient. However:

- a. a choice to receive services from an alternative service provider will not be made until the patient or legal guardian is fully informed of the consequences of that choice; and
- b. hospital employees will not direct patients or their legal guardians towards a particular choice.

G19. An eligible patient presenting at a public hospital outpatient department will be treated free of charge as a public patient unless:

- a. there is a third party payment arrangement with the hospital or the State or Territory to pay for such services; or
- b. the patient has been referred to a named medical specialist who is exercising a right of private practice and the patient chooses to be treated as a private patient.

G20. Where a patient chooses to be treated as a public patient, components of the public hospital service (such as pathology and diagnostic imaging) will be regarded as a part of the patient's treatment and will be provided free of charge.

G21. In those hospitals that rely on GPs for the provision of medical services (normally small rural hospitals), eligible patients may obtain non-admitted patient services as private patients where they request treatment by their own GP, either as part of continuing care or by prior arrangement with the doctor.

G22. States which have signed a Memorandum of Understanding with the Commonwealth for the COAG initiative "Improving Access to Primary Care Services in Rural and Remote Areas" may bulk bill the MBS for eligible persons requiring primary health care services who present to approved facilities.

G23. In accordance with this Addendum, public hospital admitted patient election processes for eligible persons should conform to the national standards set out in this schedule.

Data provision to private health insurers

G24. Hospitals will continue to provide data on privately insured patients treated in a public hospital to insurers, consistent with the agreed private patients claim form (clause G30).

G25. Consistent with the principle of single provision, multiple use, Local Hospital Networks and the AIHW will work towards providing data on privately insured patients treated in a public hospital to insurers as required under the Private Health Insurance (Health

Insurance Business) Rules made under the *Private Health Insurance Act 2007*.

- G26. The Commonwealth will consult with States on any changes to the Private Health Insurance (Health Insurance Business) Rules made under the *Private Health Insurance Act 2007* that impact on the practices of public hospitals. Any changes to data provision requirements to private health insurers should avoid creating undue additional administrative burden on public hospitals.

Certification documentation

- G27. Consistent with the Private Health Insurance (Health Insurance Business) Rules, private health insurers are not to:
- a. request certification documentation from public hospitals beyond those requirements prescribed in the National Private Patient Hospital Claim Form; or
 - b. delay or refuse payments of claims for eligible hospital treatments.
- G28. Where there is insufficient or incorrect information in certification documentation, private health insurers should, in the first instance, work with the public hospital providing the certification documentation and seek further information.
- G29. As regulators of private health insurers, the Commonwealth will review compliance with the minimum standards set out in this Addendum, the Private Health Insurance (Health Insurance Business) Rules and the *Private Health Insurance Act 2007* annually, report any relevant findings to the COAG Health Council (CHC), and publish the review.

Public hospital admitted patient election forms

- G30. States agree that while admitted patient election forms can be tailored to meet individual State or public hospital needs, as a minimum, all forms will include:
- a. a statement that all eligible persons have the choice to be treated as either public or private patients. A private patient is a person who elects to be treated as a private patient and elects to be responsible for paying fees of the type referred to in clause G1 of this Addendum;
 - b. a private patient may be treated by a doctor of his or her choice and may elect to occupy a bed in a single room. A person may make a valid private patient election in circumstances where only one doctor has private practice rights at the hospital. Further, single rooms are only available in some public hospitals, and cannot be made available if required by other patients for clinical reasons. Any patient who requests and receives single room accommodation must be admitted as a private patient (note: eligible veterans are subject to a separate agreement);
 - c. a statement that a patient with private health insurance can elect to be treated as a public patient;
 - d. a clear and unambiguous explanation of the consequences of public patient election. This explanation should include advice that admitted public patients (except for care and accommodation type patients as referred to in clause G2):
 - i. will not be charged for hospital accommodation, medical and diagnostic services, prostheses and most other relevant services; and

- ii. are treated by the doctor(s) nominated by the hospital;
- e. a clear and unambiguous explanation of the consequences of private patient election. This explanation should include advice that private patients:
 - i. will be charged at the prevailing hospital rates for hospital accommodation (whether a shared ward or a single room), medical and diagnostic services, prostheses and any other relevant services;
 - ii. may not be fully covered by their private health insurance for the fees charged for their treatment and that they should seek advice from their doctor(s), the hospital and their health fund regarding likely medical, accommodation and other costs and the extent to which these costs are covered; and
 - iii. are able to choose their doctor(s), providing the doctor(s) has private practice rights with the hospital;
- f. evidence that the form was completed by the patient or legally authorised representative before, at the time of, or as soon as practicable after, admission. This could be achieved by the witnessing and dating of the properly completed election form by a health employee;
- g. a statement that patient election status after admission can only be changed in the event of unforeseen circumstances. Examples of unforeseen circumstances include, but are not limited to, the following:
 - i. patients who are admitted for a particular procedure but are found to have complications requiring additional procedures;
 - ii. patients whose length of stay has been extended beyond those originally and reasonably planned by an appropriate health care professional; and
 - iii. patients whose social circumstances change while in hospital (for example, loss of job);
- h. in situations where a valid election is made, then changed at some later point in time because of unforeseen circumstances, the change in patient status is effective from the date of the change onwards, and should not be retrospectively backdated to the date of admission;
- i. it will not normally be sufficient for patients to change their status from private to public, merely because they have inadequate private health insurance cover, unless unforeseen circumstances such as those set out in this Schedule apply;
- j. a statement signed by the admitted patient or their legally authorised representative acknowledging that they have been fully informed of the consequences of their election, understand those consequences and have not been directed by a hospital employee to a particular decision;
- k. a statement signed by admitted patients or their legally authorised representatives who elect to be private, authorising the hospital to release a copy of their admitted patient election form to their private health insurance fund, if so requested by the fund. Patients should be advised that failure to sign such a statement may result in the refusal of their health fund to provide benefits; and

- i. where admitted patients or their legally authorised representatives, for whatever reason, do not make a valid election, or actual election, these patients will be treated as public patients and the hospital will choose the doctor until such time as a valid election is made. When a valid election is made, that election can be considered to be for the whole episode of care, commencing from admission.

Multiple and frequent admissions election forms

- G31. A State or hospital may develop a form suitable for individuals who require multiple or frequent admissions. The form should be for a specified period, not exceeding six months, and nominate the unit where the treatment will be provided. Further, the form should be consistent with the national standards and provide patients with the same information and choices as a single admission election form.

Other written material provided to patients

- G32. Any other written material provided to patients that refers to the admitted patient election process must be consistent with the information included in the admitted patient election form. It may be useful to include a cross reference to the admitted patient election form in any such written material.
- G33. All parties agree that written material provided to patients by public hospitals or private health insurers on the choice to elect to be treated privately will:
- a. be appropriate, robust and best support the consumer to make an informed choice; and
 - b. refrain from directing the patient to a particular choice.

Verbal advice provided to patients

- G34. Any verbal advice provided to admitted patients or their legally authorised representatives that refers to the admitted patient election process must be consistent with the information provided in the admitted patient election form.
- G35. Admitted patients or their legally authorised representatives should be referred to the admitted patient election form for a written explanation of the consequences of election.
- G36. To the maximum extent practicable, appropriately trained staff should be on hand at the time of election, to answer any questions admitted patients or their legally authorised representatives may have.
- G37. Verbal advice provided to patients by public hospitals or private health insurers on the choice to elect to be treated privately will:
- a. be appropriate, robust and best support the consumer to make an informed choice; and
 - b. refrain from directing the patient to a particular choice.
- G38. Through the provision of translation/interpreting services, hospitals should ensure, where appropriate, that admitted patients, or their legally authorised representatives, from non-English speaking backgrounds are not disadvantaged in the election process.

APPENDIX A – DEFINITIONS

- A. A reference in this Addendum to the *Health Insurance Act 1973* or the *National Health Act 1953* is a reference to the Acts as at 1 July 2020 or as amended thereafter.
- B. Words and phrases which are not defined in this Addendum or defined in the *Health Insurance Act 1973* are to be given their natural meaning.
- C. In this Addendum, unless otherwise specified, words and phrases are to be interpreted as follows.

Activity Based Funding (ABF)	Refers to a system for funding public hospital services provided to individual patients using national classifications, cost weights and nationally efficient prices developed by the Independent Hospital Pricing Authority.
ABF Service	Means a Public Hospital Service funded under ABF.
Administrator	Means the Administrator of the National Health Funding Pool, who is appointed in accordance with section 232 of the <i>National Health Reform Act 2011</i> , and performs the functions set out in Schedule B.
Admitted patient	Means “Admitted patient” as defined in the National Health Data Dictionary.
Australian Commission on Safety and Quality in Health Care	Means the authority performing the functions set out in Schedule B.
Australian Health Performance Framework	Means the framework established in accordance with Schedule D.
Avoidable Hospital Readmission	Means a clinical condition identified by the Australian Commission on Safety and Quality in Health Care for the purpose of clause A170 of Schedule A.
Block Funding	Means funding provided to support: <ul style="list-style-type: none"> • Public hospital functions other than patient services; and • Public patient services provided by facilities that are not appropriately funded through ABF.
Blended funding models	Means payments that use multiple mechanisms e.g. fee-for-service and pay-for-performance.
Bundled payment	Means a single payment for multiple services.
COAG	Refers to the Council of Australian Governments, being the peak intergovernmental forum in Australia, comprising the Prime Minister, State Premiers, Territory Chief Ministers and the President of the Australian Local Government Association (ALGA).

COAG Health Council	Means the forum established to facilitate provision of advice by Health Ministers to COAG.
Compensable patient	Means an eligible person who is: <ul style="list-style-type: none"> • receiving public hospital services for an injury, illness or disease; and • entitled to receive or has received a compensation payment in respect of an injury, illness or disease; or if the individual has died.
Commissioning	Means a continual and iterative cycle involving the development and implementation of services based on needs assessment, planning, co-design, funding, monitoring and evaluation. <p>Operational commissioning (or service commissioning) involves applying the design and governance principles of commissioning to a service, group of services or activities to create better service integration and community outcomes.</p> <p>Commissioning is undertaken at the regional level by organisations such as Local Hospital Networks, Primary Health Networks and the community health sector. A range of approaches can be used in commissioning of health care services. In the context of the National Health Reform Agreement, these could include co-commissioning arrangements between health agencies and agencies and organisations from other service sectors such as Human Services, Education, Justice), to develop joined-up and co-ordinated service responses to complex service needs. Joint commissioning arrangements, which often involve the use of a pooled or aligned budget, may also be used.</p>
Commonwealth Funding Entitlement	Means, in respect of a State, its Uncapped Commonwealth Funding Entitlement, adjusted for the imposition of the Soft Cap and any Redistribution Amount that may be payable. It may be expressed on an estimated basis prior to annual Reconciliation or a final basis after annual Reconciliation and Redistribution.
Complaints body	Means an independent entity established or commissioned to investigate complaints and/or grievances against providers of States' public hospital services.
Cultural safety	Means that health consumers are safest when health professionals have considered power relations, cultural differences and patients' rights. Part of this process

requires health professionals to examine their own realities, beliefs and attitudes.

Cultural safety is not defined by the health professional, but is defined by the health consumer’s experience—the individual’s experience of care they are given, ability to access services and to raise concerns.

The essential features of cultural safety are:

- a. An understanding of one’s culture
- b. An acknowledgment of difference, and a requirement that caregivers are actively mindful and respectful of difference(s)
- c. It is informed by the theory of power relations; any attempt to depoliticise cultural safety is to miss the point
- d. An appreciation of the historical context of colonisation, the practices of racism at individual and institutional levels, and their impact on First Nations people’s living and wellbeing, both in the present and past
- e. Its presence or absence is determined by the experience of the recipient of care and not defined by the caregiver.

[definition sourced from AHMAC’s *Cultural Respect Framework 2016-2026*]

Data Conditional Payment (DCP)	Means the mechanism described at clause A155 in Schedule A to provide an incentive for the prompt provision of hospital activity data to enable timely Reconciliation.
Default bed day rate	Means the rate set by the Commonwealth Minister under the <i>Private Health Insurance Act 2007</i> .
Eligible admitted private patient	Means an eligible patient who is admitted and chooses to be treated as a private patient, and excludes compensable patients and other patients funded by third parties.
Eligible person	Means, as defined in subsection 3(1) (6) (6A) and (7) of the <i>Health Insurance Act 1973</i> , excluding compensable patients.
Emergency department	Means admission level three or above emergency service under the Australian College for Emergency Medicine guidelines, or as otherwise recommended by the IHPA and agreed by the COAG Health Council.
Entitled veteran	Means a Department of Veterans’ Affairs patient referred to in the <i>Veterans’ Entitlements Act 1986</i> .

Federated approach (related to Health Technology Assessment)	Means an overarching centralised framework, within which the Commonwealth and each State and Territory keeps some internal autonomy.
HAC List	Means the Hospital Acquired Complication List maintained by the Australian Commission on Safety and Quality in Health Care, as amended from time to time.
Health Technology Assessment (HTA)	Means the systematic evaluation of the properties and effects of a health technology, addressing direct and intended effects, as well as its indirect and unintended consequences, and aimed mainly at informing decision making. Health technologies include tests, devices, medicines, vaccines, procedures, programs and systems.
High cost, highly specialised therapies	Means TGA approved medicines and biologicals delivered in public hospitals where the therapy and its conditions of use are recommended by MSAC or PBAC; and the average annual treatment cost at the commencement of funding exceeds \$200,000 per patient (including ancillary services) as determined by the MSAC or PBAC with input from the IHPA; and where the therapy is not otherwise funded through a Commonwealth program or the costs of the therapy would be appropriately funded through a component of an existing pricing classification.
Highly-specialised services	Means high cost, low volume services that require a highly skilled and specialised workforce and require a national population catchment to ensure quality and safety is maintained.
Hospital Acquired Complication (HAC)	Means a condition set out on the HAC List and approved by the COAG Health Council.
Implementation principles	Means the principles that should underpin National Health Reform as set out in clauses 17 to 19.
Independent Hospital Pricing Authority (IHPA)	Means the authority established under the <i>National Health Reform Act 2011</i> to perform the functions set out in Schedule B.
Individual health literacy	Means the skills, knowledge, motivation and capacity of a person to access, understand, appraise and apply information to make effective decisions about health and health care and take appropriate action.
Ineligible person	Means any person who is not an eligible person.
Informed financial consent	Means the provision of cost information to patients, (including any likely out-of-pocket expenses), by a doctor or other health service provider, preferably in writing, about a proposed treatment or admission to hospital.

Local Hospital Network	Means an organisation established in accordance with Schedule E and providing public hospital services.
Medicare Benefits Schedule (MBS)	Means the Commonwealth government’s scheme to provide medical benefits to Australians established under part II, IIA, IIB and IIC of the <i>Health Insurance Act 1973</i> together with relevant Regulations made under the Act.
Medicare Principles	Means the principles set out in clause 8 of this Addendum.
National efficient cost	Means the model that underpins funding for services that are not suitable for activity based funding, such as small rural hospitals. The national efficient cost determines the Commonwealth Government contribution to block funded hospitals.
National efficient price	Means the base price(s) which will be determined by the IHPA and applied to those services funded on the basis of activity for the purpose of determining the amount of Commonwealth funding to be provided to Local Hospital Networks. The IHPA may determine that there are different base prices for discrete categories of treatment, for example admitted care, sub-acute care, non-admitted emergency department care and outpatient care. In the event that there are multiple national efficient prices, the IHPA will determine which national efficient price applies.
National bodies	Means the functions and bodies established and existing from time to time for the purposes of the Addendum, including, without limitation, the Administrator, the National Health Funding Body, the Independent Hospital Pricing Authority and the Australian Commission on Safety and Quality in Health Care.
National Funding Cap	Means the limit in growth in Commonwealth funding for Public Hospital Services for all States of 6.5 per cent per annum and where the context so requires includes the operation of the Funding Cap as provided in this Addendum.
National Funding Model	Means the calculation, payment and reconciliation of Commonwealth national health reform funding entitlements for health services, by the Administrator of the National Health Funding Pool (Administrator) applying the agreed methodology, business rules and policies. This is calculated from activity based funding based on National Weighted Activity Units and the Independent Hospital Pricing Authority’s (IHPA) National

	Efficient Price determination, and block funding calculated from the IHPA's National Efficient Cost determination.
	The agreed methodology, business rules and policies include the activity based funding formula, the Administrator's Calculation of Commonwealth National Health Reform Funding and associated operational documents, IHPA's Pricing Framework and National Pricing Model specifications, classification systems, counting rules, data, coding and costing standards.
National Health Data Dictionary	Means the publication (in hard copy and/or the internet) containing the Australian National Standard of Data Definitions recommended for use in Australian health data collections; and the National Minimum Data Sets agreed for mandatory collection and reporting at a national level.
National Health Funding Body	Means the body established under the <i>National Health Reform Act 2011</i> to assist the Administrator in carrying out his or her functions under Commonwealth and State legislation, in accordance with Schedule B of this Addendum.
National Health Funding Pool	Means the pool established by enabling Commonwealth and State legislation in accordance with Schedule B of this Addendum.
Non-admitted patient services	Means services of the kind defined in the National Health Data Dictionary, under the data element "Non-Admitted Patient Service Type".
Outpatient department	Means any part of a hospital (excluding the emergency department) that provides non-admitted patient care.
Parties	Means the signatories to this Addendum, being the Commonwealth and each State and Territory.
Patient election status	Means the status of patients according to the National Standards for Public Hospital Admitted Patient Election Processes in Schedule G.
Patient Reported Measures	Means information collected about the experience of health services, and the outcomes of health services, as described by patients. <ul style="list-style-type: none"> • Patient-reported experience measures (PREMs) include patients' views and observations on matters such as the accessibility and physical environment of services and aspects of the patient–clinician interaction. • Patient-reported outcome measures (PROMs) are used to obtain information from patients on their

	health status such as overall health and wellbeing, the severity of symptoms such as pain, measures of daily functioning and psychological symptoms.
Pharmaceutical Benefits Scheme (PBS)	Means the Commonwealth government’s scheme to provide subsidised pharmaceuticals to Australians established under part VII of the <i>National Health Act 1953</i> (the Act) together with the National Health (Pharmaceutical Benefits) Regulation 1960 made under the Act.
Pharmaceutical Reform Arrangements	Means arrangements which provide for public hospitals that are Approved Hospital Authorities under Section 94 of the <i>National Health Act 1953</i> to supply pharmaceuticals funded by the PBS for specific categories of patients including: <ul style="list-style-type: none"> • admitted patients on separation; • non-admitted patients; and • same day admitted patients for a range of drugs made available by specific delivery arrangements under Section 100 of the <i>National Health Act 1953</i>.
Population health	Means activities aimed at benefiting a population, with an emphasis on prevention, protection and health promotion as distinct from treatment tailored to individuals with symptoms. Examples include the conduct of anti-smoking education campaigns, and initiatives to increase accessibility and promotion of healthier food and drink. Can also refer to the health of particular sub-populations, and comparisons of the health of different populations.
Private Health Insurance Rebate	Means the Commonwealth Government’s scheme to provide private health insurance rebates established under the <i>Private Health Insurance Act 2007</i> together with relevant Regulations and rules made under that Act.
Public Hospital Services	Means the services, functions and activities funded by the Commonwealth under this Addendum, including service subject to Activity Based Funding, Block Funding or public health activities.
Public patient	Means an eligible person who receives or elects to receive a public hospital service free of charge.
Public patients’ hospital charter	Means the document outlining how the principles of this Addendum are to be applied; the process by which eligible persons might lodge complaints about the provision of public hospital services; a statement of rights and responsibilities of consumers and public hospitals; and a statement of consumers’ rights to elect

	to be treated as either public or private patients.
Reconciliation	Means the Reconciliation of actual ABF Service delivery volume undertaken within a State to the estimate of ABF Service delivery volumes provided by a State in accordance with clauses A63 to A76 of Schedule A of this Addendum.
Redistribution	Means the allocation of remaining funding under the National Funding Cap to States whose Uncapped Commonwealth Funding Entitlement exceeded their respective Soft Funding Cap in accordance with clause A77 of Schedule A of this Addendum.
Redistribution Amount	Means an amount paid by the Commonwealth to a State that is entitled to additional funds as a result of the Redistribution.
Relevant financial year	Means a specific financial year for which data is submitted by the Parties so that the Administrator can calculate the Commonwealth funding and payments for that financial year.
Required Data	Means each of: <ul style="list-style-type: none"> a. the data specified as being required for Reconciliation in the data plan issued by the Administrator for the relevant financial year; b. data necessary to enable the Administrator to operate the pricing and funding models agreed by the Parties to calculate Safety and Quality Adjustments; c. data necessary to identify Sentinel Events; and d. the duly completed Statement of Assurance.
Risk/reward share payment	Means payments where the provider/s share in the financial risk and reward.
Safety and Quality Adjustment	Means a reduction in funding payable to a State by the Commonwealth for Public Hospital Services, funded either under ABF or Block Funding, following the occurrence of a HAC or an Avoidable Hospital Readmission in accordance with the pricing and funding models to be developed by the Parties for this purpose.
Sentinel Event	Means an event set out on the Sentinel Events List.
Sentinel Events List	Means events set out on the Australian Sentinel Events List maintained by the Australian Commission on Safety and Quality in Health Care and approved by the COAG Health Council.
Service Agreement	Means an agreement between a State and a Local Hospital Network consistent with this Addendum.

Soft Cap	Means the limit in growth in Commonwealth funding for Public Hospital Services in a State of 6.5 per cent per annum.
Statement of Assurance	Means the statement as to the completeness and accuracy of data submitted, issued in accordance with clauses B82 and B83 in Schedule B of this Addendum.
State managed fund(s)	Means a fund(s) or account(s) established by State legislation for the purpose of receiving funding for block grants, teaching, training and research.
States	Means States and Territories.
Uncapped Commonwealth Funding Entitlement	Means in respect of a State in a relevant financial year, its entitlement to Commonwealth funding for Public Hospital Services in that State under the Addendum, excluding the impact of the National Funding Cap or any relevant Soft Cap.
Value	Means maximising patient experience and outcomes, improving population health and high quality, evidence-based clinical care, relative to the cost of delivery. This definition of value-based health care involves the alignment of incentives for all stakeholders (including patients, families, providers and governments) in order to obtain the best possible health outcomes for all Australians.
Weighted services	Means services of a particular ABF category where each service may count as more or less than one service as determined by the cost weight determined by the IHPA to be applicable to that service.

APPENDIX B – GOVERNANCE PROCESS FOR HIGHLY SPECIALISED THERAPIES

- A. The Medical Services Advisory Committee (MSAC) and Pharmaceutical Benefits Advisory Committee (PBAC) Chairs, together with a COAG Health Council (CHC) representative will jointly decide on which committee should assess the application for a new drug or therapy, where the HCT is likely to be delivered in a public facility.
 - I. The rules for PBAC assessment are set out in the National Health Act 1953. Where the matter does not fall within the definition for consideration by PBAC it is assessed by MSAC.
 - II. The Chair of CHC will nominate one representative on behalf of all states and territories to participate in this meeting. This representative is to have the same clinical expertise as the MSAC and PBAC Chairs.
- B. For therapies that will be assessed by MSAC and delivered in a public hospital, the Commonwealth will write to states and territories advising them that an application has been received and invite them to make a submission to MSAC for consideration, noting that the states and territories will need to abide by the same confidentiality requirements as MSAC members.
 - I. The terms of reference of MSAC will be amended to ensure that MSAC is obliged to consider any submission from a state or territory where it is relevant to comparative safety, clinical effectiveness and/or cost-effectiveness of the therapy.
- C. For therapies that will be assessed by MSAC and delivered in a public hospital, states and territories will be invited to send a representative to observe the meeting where the application will be considered.
 - I. This will enable states and territories to ensure all submissions are considered and to have an early heads up that the MSAC has recommended a therapy for public funding.
- D. States and territories will be notified on the same day that the company agrees to the recommendations of MSAC.
 - I. This is usually 6-8 weeks after the MSAC recommendation, depending on the approach of the company.
- E. Once the company agrees to the recommendations of MSAC, the decision of MSAC is published on the public website.
 - I. States and territories will be notified before this occurs.
- F. States and territories decide when and where the therapy will be provided.

NSW Health

Commissioning for Better Value Strategy 2021-24

Shifting our focus from outputs to outcomes

“NSW Health is committed to a strategic response to the challenges of our health system.

The needs of our patients, clinicians and communities are changing, and impacted by rising healthcare costs and new technologies. A value based healthcare approach strives to improve health outcomes that matter most to patients, patient and clinician experience, and service efficiency and effectiveness.

Value is defined by outcomes and experiences that matter most to the people receiving and delivering care, relative to the costs of achieving those outcomes.

Commissioning for Better Value (CBV) is one of the statewide programs accelerating NSW Health’s move to value based healthcare. The approach puts the patient at the centre of service design, with a focus on measuring and achieving outcomes. It relies on us working with our internal and external stakeholders to prioritise outcomes and collaborating to deliver these.

The lessons learnt from applying a commissioning approach over the past few years have informed the Commissioning for Better Value Strategy. The strategy outlines the direction for implementing Commissioning for Better Value across services that support patient care over the next three years.

Embedding Commissioning for Better Value in the health system will help deliver high-quality and equitable healthcare, ensure our resources are allocated optimally, and support innovation to deliver outcomes that matter to patients. This is an important part of building a health system for the future.

Thank you to all who contributed their time and input to the development of the strategy.”

**Dr Nigel Lyons, Deputy Secretary,
Health System Strategy and Planning,
NSW Health**

Commissioning for Better Value (CBV)

Strategy at a glance

NSW Health vision

A sustainable health system that delivers outcomes that matter to patients and the community, is personalised, invests in wellness and is digitally enabled.

Goal

To enhance NSW Health services that support patient care by shifting our focus from outputs to outcomes.

Objectives

Drive awareness and understanding of CBV in alignment with value based health care

Support partnerships and networks to build CBV capability

Embed value based healthcare in CBV across the system

Monitor implementation and evaluate the impact of CBV

by June 2023

by June 2024

Implementation plan

Embed

Established 'business as usual' norms, culture and partnerships in NSW health services.

2021-23

- Build capability in districts, pillars, networks and our external partners to apply CBV.
- Influence policy to embed CBV in NSW Health strategies, service statements and agreements, contracts, grants, business cases and reform initiatives.

Sustain

Best practice sustained that reinforces an outcomes focus in NSW health services.

2023-24

- Explore new funding models that support a commissioning approach.
- Review and renew CBV strategy.

Outcomes focus on improving

Health outcomes that matter to patients

Services define, implement and measure outcomes that matter to patients. This contributes to the delivery of high quality, timely and safe patient care.

Experience of receiving care

Patient experience is improved by service delivery which is accessible, high-quality, appropriate, timely and safe.

Experience of providing care

Clinician engagement in CBV is strengthened to optimise the experience of providing care. This contributes to improved patient outcomes.

Effectiveness and efficiency of care

Drawing on evidence-based data, service managers and clinicians are equipped to use CBV to empower innovation and improve services.

CBV is accelerating our move to value based healthcare

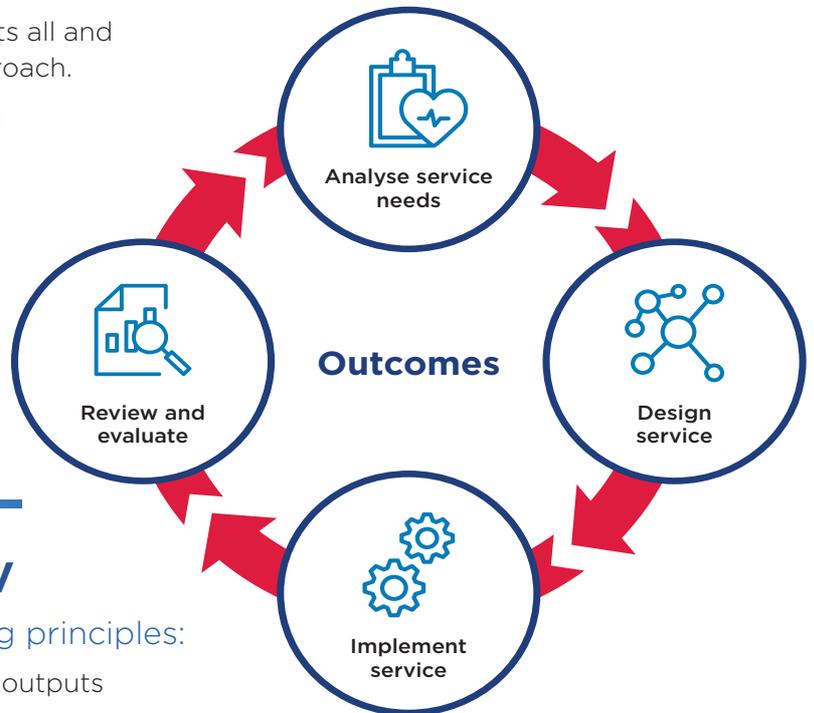

CBV provides a structure that puts the patient at the centre of service design, with a focus on measuring and achieving outcomes. Services that deliver improved outcomes for patients, better experiences for patients, clinicians and other end-users drive value within the health system.

Commissioning is about analysing service need and performance, developing models of care and delivering services based on this analysis. CBV helps shift the focus from outputs to outcomes designed around the person receiving care.

A commissioning approach is not a one-size fits all and not all projects may suit a commissioning approach.

A commissioning approach is commonly used:

- to develop and review service delivery policies, proposals and contracts
- as part of strategic planning and organisational redesign
- when the service contract or industry is affected by innovation or change.

Principles underpinning CBV

This strategy is guided by the following principles:

- services focus on outcomes rather than outputs
- patients are at the centre of service design
- service and outcomes are defined in collaboration with patients, their families and carers, communities, clinicians, service providers and other key stakeholders
- evidence and data is used to plan, implement, evaluate and continuously improve services
- service delivery models reflect local patient demographics, needs and preferences, as well as environmental sustainability and market capacity and capability
- robust governance and executive sponsorship guide the strategic direction.

Commissioning for Better Value is an outcomes-based approach that helps design, implement and manage services that support patient care.

Actions supporting implementation

We will collaborate with patients, clinicians, service managers and our external partners to implement the strategy.

Strategic Reform and Planning Branch at the NSW Ministry of Health sponsors this strategy. Governance and oversight lies with the Commissioning for Better Value Working Group which comprises members from local health districts, Ministry branches and other NSW Health organisations. An implementation plan accompanies the strategy to support delivery, mapping actions to identified responsibilities, time frames and evaluation.

Drive awareness and understanding of CBV in alignment with value based healthcare (VBHC)

- develop CBV information, resources and tools that support decision making
- use a variety of channels and leverage existing opportunities to promote CBV
- promote benefits of outcomes based commissioning

Support partnerships and networks to build CBV capability

- increase collaboration to facilitate partnerships
- promote knowledge sharing to enhance access to information and data
- strengthen commissioning capability through training and workshops
- provide strategic advice and support to assist NSW Health staff apply CBV in practice
- engage external partners such as service providers, markets and funders in outcomes-focused service delivery

Embed value based healthcare in commissioning across the system

- apply learnings from past and current projects
- support services to develop outcomes and measures for planning, design and review
- explore new commissioning projects and funding models to support innovation
- embed accountability for CBV into service statements and agreements
- maintain strong governance to provide strategic direction and executive sponsorship for CBV projects

Monitor implementation and evaluate the impact of CBV

- align CBV measurement with the broader VBHC evaluation
- track progress in achieving CBV outcomes
- complete an annual review of the CBV strategy with a focus on continuous improvement
- monitor CBV enquiries and developments in commissioning policy and practice

Monitoring and evaluation

A monitoring and evaluation plan will be developed to support this strategy. It will identify measures to monitor progress of the strategy and achievement of the CBV outcomes. The plan will be refined with advice from the Value Based Healthcare (VBHC) Monitoring and Evaluation Working Group which has been established to align and coordinate monitoring and evaluation activity across the statewide programs.

Some examples of intermediate measures of success may include:

- increased number and types of projects that use a CBV approach
- increased number of tenders and contracts that apply outcome measures
- increased adoption of co-design consultation processes
- increased CBV capability for districts, networks and pillars
- CBV is formalised in procurement policy and performance frameworks.

An annual review will be conducted to track performance, with a final review at the end of the strategy term.

We will apply a value based healthcare lens to commissioning, embed CBV practice and support change through a range of system-wide enablers.

CBV in practice

CBV helped Northern NSW Local Health District (NNSWLHD) shift the focus from outputs to outcomes for their medical imaging services. The district analysed service needs to design a medical imaging service that delivers the right services to the right places and focuses on the outcomes that matter most to patients. They used extensive consultation and co-design processes to ensure the feedback and perspectives of their stakeholders informed the design of medical imaging services for the district.

Transition to the new service began in October 2020. The district will monitor the service goals using key performance indicators (KPIs) informed by measurable outcomes. This will include annual patient and clinician experience surveys to identify continuous improvement opportunities.

"This opportunity was a true collaboration with genuine engagement of medical, nursing and technical staff throughout. We are now a few months into the transition to the new district-wide services, and our medical officers are providing positive feedback about the high quality of the services."

Wayne Jones
Chief Executive, NNSWLHD

Links to policies, strategies and initiatives

Several developments have occurred across NSW in recent years that drive the delivery of outcomes for the people of NSW.

Outcome budgeting facilitates the allocation of public resources with a focus on achieving outcomes.

NSW Human Services Outcomes Framework is a cross-agency approach to achieve better outcomes for the NSW population. The framework outlines seven wellbeing outcomes: safety, home, economic, health, education and skills, social and community, and empowerment.

Commissioning Policy provides a platform for NSW Government agencies to explore ways to create better service outcomes. It is a whole-of-government approach that sets out governing principles for commissioning.

NSW State Health Plan Toward 2021 provides the strategic framework that underpins plans, programs and policies across NSW Health to deliver the right care, in the right place, at the right time. Strategic direction for the next decade of care will progress NSW Health's vision for 'a sustainable health system that delivers outcomes that matter to patients, is personalised, invests in wellness and is digitally enabled'.

Elevating the Human Experience is a statewide strategy informed by patients, families, carers, volunteers and NSW Health staff. It focuses on what we can do together to create positive, personalised experiences.

The CBV Strategy supports value based healthcare together with other initiatives.

Value Based Healthcare (VBHC) is NSW Health's approach to delivering outcomes and experiences that matter to patients and the community. Programs accelerating our move to VBHC include:

Commissioning for Better Value
(CBV)

Applying an outcomes-based approach to help design, implement and manage services that support patient care.

Leading Better Value Care (LBVC)

Delivering effective clinical models of care with patient centred outcomes.

Collaborative Commissioning

Co-commissioning services in partnership with districts and external organisations, such as primary health networks, for services delivered in the community.

Integrated Care

Leading partnerships to deliver seamless care anywhere that coordinates services around a patient to improve their experiences of care and health outcomes.

Predictors of inpatient rehabilitation after total knee replacement: an analysis of private hospital claims data

Chris Schilling¹, Catherine Keating², Anna Barker², Stephen F Wilson³, Dennis Petrie⁴

The known A variety of options for rehabilitation are available to patients who have undergone total knee replacements (TKRs).

The new The inpatient rehabilitation rate after TKRs in private hospitals increased between 2009 and 2016. Interhospital variation in rates persisted after adjusting for patient-related factors, suggesting that some inpatient rehabilitation is low value care. Provider-related factors were three times as important as patient factors for predicting inpatient rehabilitation.

The implications The use of inpatient rehabilitation after TKR can be substantially reduced to improve health care efficiency without any detriment to health outcomes.

The rate of total knee replacement (TKR) in Australia is among the highest in the world.¹ More than 50 000 TKRs were performed in Australia during 2016;² about 70% were delivered in private hospitals.³ Post-surgery rehabilitation is a core component of the care pathway for facilitating functional recovery after a TKR,⁴ including inpatient, home-based, community-based, and outpatient rehabilitation. It was recently reported that 43% of patients who underwent a TKR funded by Medibank Private (a large private health insurer in Australia) during 2014–16 were referred for inpatient rehabilitation.⁵ However, functional improvements in patients who received inpatient rehabilitation after TKR have not generally been superior in randomised controlled trials to those achieved with home- or community-based rehabilitation.^{6,7} In North America, rates of inpatient rehabilitation declined during the 2000s.^{8,9}

Inpatient rehabilitation referral rates in Australia during 2014–16 varied between surgeons from 0 to 100%,⁵ but the relevant data were not adjusted for patient characteristics that predict inpatient rehabilitation, such as age, comorbid conditions, living alone, and surgical complications.¹⁰ In Australia, routinely collected outcomes data that could be analysed to evaluate the benefits of rehabilitation are limited. The Australasian Rehabilitation Outcomes Centre (<https://ahsri.uow.edu.au/aroc/index.html>) records data for a functional measure after inpatient rehabilitation, but corresponding data for patients who undergo other forms of rehabilitation are not routinely collected. As an alternative approach, Duckett and colleagues¹¹ have promoted analysis of variation for similar patients at the hospital level; variation at this level that persists after adjusting for patient factors may indicate low value care.

Our study had three aims. The first was to investigate changes since 2009 in the rate of inpatient rehabilitation after TKR in Australia, and to quantify the degree to which any change might be explained by patient-related factors (demography, comorbid conditions,

Abstract

Objective: To investigate inpatient rehabilitation rates after private total knee replacements (TKRs) in Australia since 2009; to quantify the contributions of hospital-, surgeon- and patient-related factors to predicting inpatient rehabilitation.

Design: Retrospective cohort study; multivariate linear regression analysis of linked, de-identified Medibank administrative claims data and hospital casemix protocol data, adjusted for patient-related characteristics.

Setting, participants: 35 389 patients undergoing Medibank-funded TKRs in 170 private hospitals in Australia, 2009–2016.

Main outcome measures: Hospital inpatient rehabilitation rate; relative contributions of patient- and provider-related characteristics to variation in inpatient rehabilitation rates.

Results: The overall inpatient rehabilitation rate increased from 31% in 2009 to 45% in 2016, but varied between hospitals (range, 0–100%). The reduction in mean acute length of stay during this period explained about 15% of this increase, and about 30% was explained by patient-related factors; more than half of the increase was explained by neither reduced length of stay or patient-related factors. Patient-related characteristics explained little of the variation in rates between hospitals. Rates at 27% of hospitals lay above the 95% confidence limit for the mean inpatient rehabilitation rate in private hospitals (38%), both before and after adjusting for patient-related factors. Provider characteristics explained three times as much of the variation as patient characteristics (75% v 25%); hospital-related factors made the largest contribution to variation (47%).

Conclusion: Inpatient rehabilitation after TKR has increased in private health care during the past 8 years. Substantial variation in inpatient rehabilitation rates is not explained by patient-related factors, suggesting that some inpatient rehabilitation is low value care.

complications of surgery) or reducing the average acute length of stay in hospital (LOS). The second was to identify potentially low value care by quantifying hospital inpatient rehabilitation rates, adjusted for patient characteristics. Third, we quantified the relative contributions of hospital- and surgeon-related factors and of patient-related characteristics to variation in inpatient rehabilitation rates.

Methods

Dataset

We analysed de-identified Medibank administrative claims data and hospital casemix protocol data for 35 389 patients aged 40–89 years who had not previously undergone hip or knee replacement, who had received an acute primary, unilateral TKR during January

Podcast with Chris Schilling available at <https://www.mja.com.au/podcasts>

2009 – December 2016. Patient information included age, sex, socio-economic status (Index of Relative Socio-economic Advantage and Disadvantage, IRSAD¹²), living alone, smoking, comorbid conditions (as evaluated with the Charlson comorbidity index¹³), and hospital claims during the 12 months preceding surgery. LOS data for the acute TKR procedure and the associated inpatient rehabilitation admission were also included. Provider information included unique identifiers for each of the 170 hospitals in which the surgery was performed and the 1254 surgeons who performed the TKRs (further details in the online Appendix, table 1). All patient-, surgeon-, and hospital-related data were de-identified prior to analysis.

Statistical analysis

All analyses were conducted in Stata 14.2 (StataCorp). Five linear probability regression models were generated (Box 1; online Appendix, table 2). The proportion of patients who underwent inpatient rehabilitation was the dependent variable in all models. Data were adjusted for patient and surgical complexity using the socio-demographic and surgical factors listed above. All adjusted rates were computed relative to the covariate means with the *margins, atmeans* Stata command.

Funnel plots of the outcome rate (hospital inpatient rehabilitation rate) against the sample volume or population (hospital TKR volume) highlighted variation between hospitals in inpatient rehabilitation rates. Two sets of hospital data were included in each funnel plot. The first set depicted the inpatient rehabilitation rate and TKR volume for each hospital during the study period. As the rate would be higher for hospitals that received relatively large proportions of patients more likely to require inpatient rehabilitation (eg, older patients; people with comorbid conditions), we also plotted hospital rates adjusted for patient-related factors by econometric modelling; that is, the estimated rate for each hospital had they received an average mix of patient types.

In each plot, 95% confidence intervals (CIs) around the mean inpatient rehabilitation rate were calculated, forming a funnel that narrows as TKR volume increases. At higher TKR volumes, it is less likely that variations are due to chance. As the overall mean inpatient rehabilitation rate for our private hospital dataset was not necessarily clinically optimal, CIs were also calculated for the post-TKR inpatient rehabilitation rate of 17% reported for a sample of public hospitals.¹⁴

The upper outlier count metric was defined as the number of hospitals with inpatient variation that placed them above the mean and beyond the 95% CI. Shapley decomposition of model 5 (Box 1) was computed with the REGO Stata module (<http://research.uni-leipzig.de/rego/>) to investigate the relative contribution of patient-, surgeon- and hospital-related factors to variation in rehabilitation destination. Multicollinearity between factors is discussed in the online Appendix.

Ethics approval

Ethics approval was granted by the Monash University Human Research Ethics Committee (project number, 9729).

Results

During 2009–2016, 35 389 people underwent Medibank-funded TKRs. Their mean age was 68.7 years (standard deviation [SD], 8.7 years); 20 721 (58.6%) were women; 20 667 (58.4%) were from metropolitan areas. The mean age of patients who underwent inpatient rehabilitation was higher than for those who did not (71.0 years [SD, 8.7] v 67.3 years [SD, 8.4]), the distribution of Charlson comorbidity scores was shifted to higher values, and larger proportions had had surgical complications (1.6% v 1.1%) or lived alone (7.6% v 1.1%) (Box 2).

Inpatient rehabilitation rate over time (models 1 and 2)

The inpatient rehabilitation rate increased from 31% in 2009 to 45% in 2016 (mean increase, 14 percentage points; 95% CI, 12–16 percentage points). Over the same period, the proportions of patients who were aged 70 or more, lived alone, or had comorbid conditions also increased. These latter changes accounted for almost one-third of the total increase in inpatient rehabilitation rate (Box 3).

Mean LOS for the acute surgery episode declined from 7.1 days (SD, 1.4 days) in 2009 to 5.4 days (SD, 1.0 days) in 2016 (mean decrease, 1.7 days; 95% CI, 1.5–1.8 days) (Box 2). The reduction in acute LOS during the study period accounted for almost 15% of the increase in inpatient rehabilitation rate (Box 3). The changes in patient-related factors and LOS together explained about half of the increase in inpatient rehabilitation rate. The association between LOS and inpatient rehabilitation is further discussed in the online Appendix.

Variation in rehabilitation practices (models 3–5)

The funnel plot of inpatient rehabilitation rates by hospital during 2009–2016 indicated there was significant variation between hospitals (Box 4, Box 5). An association between TKR volume and inpatient rehabilitation rate was not apparent; the five hospitals with the greatest volumes included two sites with inpatient rehabilitation rates below 20% and two with rates exceeding 60%. A few hospitals had zero inpatient rehabilitation rates, suggesting that they did not have rehabilitation facilities. Excluding these hospitals from supplementary analyses did not substantially change the overall results (data not shown).

Marked variation in hospital inpatient rehabilitation rates persisted after adjusting for patient-related factors; the average magnitude of the effect of adjustment on inpatient rehabilitation rates was 4 percentage points (Box 4, Box 5), suggesting that these patient-related factors did not explain a large proportion of inter-hospital variation.

Procedures per surgeon, median (IQR)	—	—	7 (1–36)	—	—

IQR = interquartile range; IRSAD = Index of Relative Socio-economic Advantage and Disadvantage; LOS = length of stay; NA = not applicable; SD = standard deviation. ♦

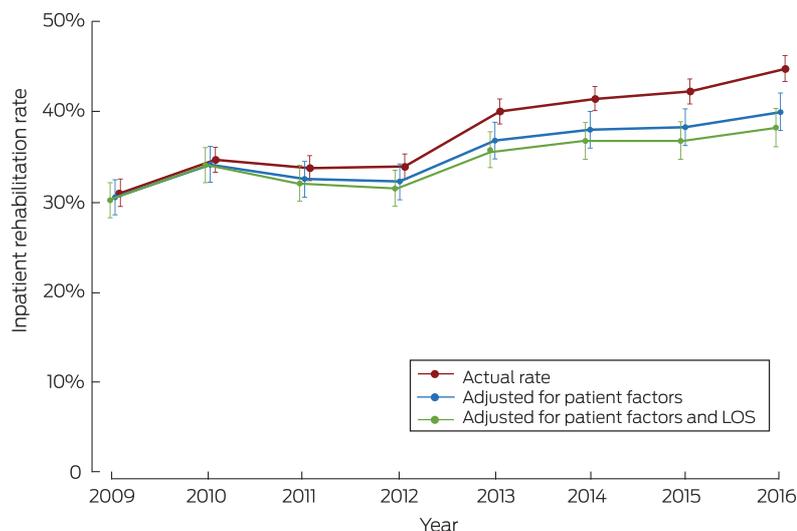

Actual inpatient rehabilitation rates for 46 of 170 hospitals (27%) were above the 95% CI for the mean private inpatient rehabilitation rate of 38%; after adjusting for patient-related factors, 44 hospitals remained outliers and two other hospitals became outliers (Box 4, Box 6). After adjusting for patient-related factors, inpatient rehabilitation rates for 79 of 170 hospitals (46%) were above the 95% CI for the mean public hospital inpatient rate of 17% (Box 5, Box 6). The adjusted R^2 (goodness-of-fit) values increased with the addition of patient- and surgeon-related factors, indicating that each explains some of the variation in inpatient rehabilitation rate;

however, more than half the variation was not explained by these factors.

Contributions to variation (model 5)

The Shapley decomposition results suggested that hospital-related factors (46.9%) made the largest contribution of the factors included to variation in inpatient rehabilitation rates; together with surgeon-related factors (28.5%), provider-related factors explained three times as much of the variation as patient-related factors (24.6%).

3 Inpatient rehabilitation rates for 35 389 people who received Medibank-funded total knee replacements, 2009–2016*

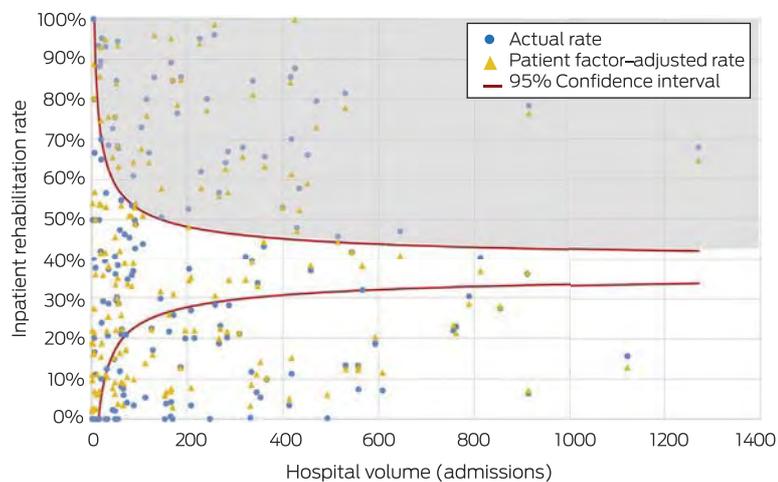

LOS = length of stay in hospital (acute admission). * Depicted are the actual rates, together with rates adjusted for patient-related factors or for patient-related factors and reduced LOS during the study period. ◆

Discussion

A recent *MJA* editorial noted that simply identifying variation in health is not enough to facilitate change without further careful analysis.¹⁵ In response, we analysed more than 35 000 admissions to private hospitals for TKRs in Australia during 2009–2016. We made three key findings. Firstly, inpatient rehabilitation rates increased from 31% to 45% during the study period, while mean acute surgery admission LOS declined and the complexity of the patients (aged 70 years or more, lived alone, or had comorbid conditions) increased. However, these changes explained only about half the increase in inpatient rehabilitation rate. Secondly, marked variation between private hospitals in inpatient rehabilitation rates persisted after adjusting for patient-related factors; the

4 Funnel plot of hospital inpatient rehabilitation rates after total knee replacement, Australia, 2009–2016, with 95% confidence interval around the mean private hospital rate (38%)

Each circle represents one hospital; each triangle indicates the inpatient rehabilitation rate after adjusting for patient-related factors. The shaded area indicates hospitals with inpatient rehabilitation rates above the upper 95% confidence limit. ◆

rates at more than one-quarter of hospitals significantly exceeded the mean private inpatient rehabilitation rate, and almost half the hospitals significantly exceeded the mean public hospital rate. Finally, provider-related factors (hospital- and surgeon-related) explained three times as much of the variation between hospitals as did patient characteristics (demographic, clinical and surgical attributes); hospital-related factors constituted the major driver category.

Comparison with previous reports

Patients require some form of rehabilitation after complex surgery such as TKR, but clinical evidence does not support the need for in-hospital rehabilitation. A recent analysis of 258 privately insured patients in 12 Australian hospitals found that care pathways incorporating inpatient rehabilitation were significantly more expensive for uncomplicated patients than those that did not (mean difference, \$9500; interquartile range, \$7000–\$11 497) but were not associated with improved patient-reported outcomes.¹⁶ Randomised controlled trials that evaluated inpatient rehabilitation^{6,7} and a systematic review by the Royal Australasian College of Surgeons¹⁷ also concluded that outcomes for patients who had outpatient or

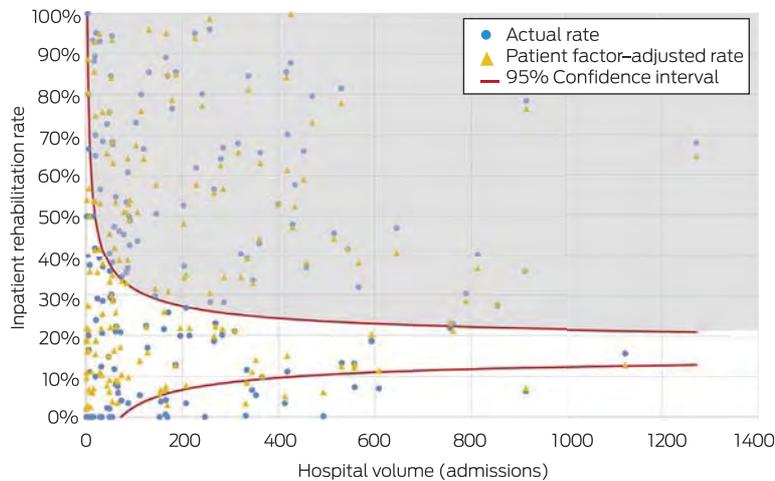

home-based care after TKR were comparable with those of patients who attended inpatient rehabilitation.¹⁸ Our study extends the evidence base for examining this question by analysing a large administrative dataset and investigating the drivers of inpatient rehabilitation in the private health care sector.

We found that the inpatient rehabilitation rate in Australian private hospitals increased by almost 50% between 2009 and 2016, contrasting with the reported substantial declines in inpatient rehabilitation rates overseas during the 2000s. Inpatient rehabilitation rates in the United States decreased from a peak of 35% in 2003 to 11% in 2009,⁸ with a mean rate during 2009–2014 of 15%;¹⁷ in Ontario, Canada, rates dropped from 25% in 2009–10 to less than 10% in 2012–13.⁹ Our analysis suggests that less than half of the increase in Australia can be explained by a higher proportion of complex patients and reduced acute surgery admission LOS; 50% of the increase was therefore unexplained. Improved techniques for TKR, including computer-assisted navigation¹⁹ and perioperative analgesia,²⁰ would be expected to reduce rather than increase the need for inpatient rehabilitation.

We found substantial variation between private hospitals in inpatient rehabilitation rates that was not explained by patient-related factors. Patients in hospitals with high rates of inpatient rehabilitation were similar to those in hospitals with low rates, eliminating patient complexity as the reason. When combined with clinical findings that inpatient rehabilitation provides no more clinical benefit for uncomplicated patients than home or community rehabilitation, our results provide compelling evidence that at least some of inpatient rehabilitation in hospitals with high rates is low value care.

We found that the most important determinant of whether a patient is admitted to inpatient rehabilitation was the hospital where the TKR procedure was undertaken. This factor was substantially more important than the clinical profile of the patient; that is,

5 Funnel plot of hospital inpatient rehabilitation rates after total knee replacement, Australia, 2009–2016, with 95% confidence interval around the mean public hospital rate (17%)

Each circle represents one hospital; each triangle indicates the inpatient rehabilitation rate after adjusting for patient-related factors. The shaded area indicates hospitals with inpatient rehabilitation rates above the upper 95% confidence limit. ◆

the same patient may enter different rehabilitation pathways according to the hospital in which they were operated. Potential systematic reasons for some private hospitals encouraging inpatient rehabilitation include the fact that it is often funded on a per diem basis, whereby the hospital receives an additional payment per rehabilitation day in addition to the initial TKR surgery payment. From a hospital perspective, offering a service that delivers benefits to patients for which it is well remunerated is consequently attractive. However, it is less so from the health system perspective: home- and community-based rehabilitation deliver similar outcomes at much lower cost. As noted in another recent *MJA* editorial,¹⁸ inpatient rehabilitation has become an industry, with hospitals offering new and undoubtedly excellent facilities, but at a cost that, for many patients, is not justified by better outcomes.

Implications for clinical practice

Our findings indicate that the proportion of patients who receive inpatient rehabilitation after a TKR can be reduced, improving

health care efficiency without harming health outcomes. There is no consensus regarding the ideal rate of inpatient rehabilitation, but the public health system rate in Australia of 17%, rates under 11% in the United States and Canada, and the clinical evidence discussed above suggest that the private inpatient rehabilitation rate in Australia of 45% is too high. Were it returned to the 2009 level (31%)—still higher than the cited comparison rates—net annual rehabilitation costs could be reduced by \$50 million (according to the incremental cost differences reported by Naylor and colleagues¹⁶) and almost 60 000 hospital bed-days made available for other patients.

Improving system performance

Clear clinical guidelines are an evidence-based means for improving system performance, but there are no relevant guidelines in Australia regarding best practice for rehabilitation after TKR.¹⁷ Adoption of a clinical protocol by one hospital improved the odds of rehabilitation in the home rather than inpatient rehabilitation by 45%.²⁰ Financial incentives and linking payments to outcomes are also widely promoted as methods for improving the cost-effectiveness of service delivery.²¹

Linking funding to patient outcomes, or at least to compliance with guidelines based on patient need, could help improve the use of inpatient rehabilitation. We also support recommendations that the Australian Commission on Safety and Quality in Health Care publish variation data at the hospital rather than the area level, and that outlier hospitals should be made aware of and encouraged to improve their relative performance.¹¹

Limitations of our study

Data for some patient-related factors that influence rehabilitation decisions were not available, including obesity, pre-operative physical and mental health (although comorbid conditions were analysed when data were available), functional performance, physical gait aid, and home environment. Nonetheless, the dataset included a wide variety of socio-economic and health factors that are typically correlated with these factors; for example, obesity is related to comorbid conditions such as diabetes and cardiovascular disease²² and socio-economic status.²³ It is therefore unlikely that the omitted patient factors would explain a substantial proportion of the interhospital variation in inpatient rehabilitation.

Large variations in inpatient rehabilitation rates after adjusting for patient-related factors suggest low value care. However, while the Australasian Rehabilitation Outcomes Centre collects data on a functional independence measure for some patients after inpatient rehabilitation, data on post-surgery outcomes for private TKR recipients that could provide more robust evidence of low value care are not routinely collected. We recommend that such information be collected, as it is in the United Kingdom.²⁴

Finally, as a large proportion of the variation in inpatient rehabilitation rates was not explained by the hospital-, surgeon- or patient-related factors we examined, investigation of further elements is required.

Conclusion

Rates of inpatient rehabilitation after TKR are increasing in Australia at a time when they are declining overseas. Clinical outcomes evidence has consistently indicated that inpatient rehabilitation is not superior to community- and home-based

6 Hospital inpatient rehabilitation rates after total knee replacement: upper outlier counts and adjusted R² values for models 3–5

	Model 3	Model 4	Model 5
	Unadjusted rates	Adjusted for patient-related factors	Adjusted for patient- and surgeon-related factors
Adjusted R ²	0.31	0.38	0.42
Upper outlier count*			
Private hospital mean (38%)	46 (27%)	46 (27%)	38 (22%)
Public hospital mean (17%)	80 (47%)	79 (46%)	83 (49%)

* Number of hospitals with an inpatient rehabilitation rate above the 95% confidence interval. ◆

rehabilitation, suggesting that health care system costs can be reduced without harming patient outcomes. Reducing low value care will require system-level changes to guidelines and incentives for hospitals, as hospital-related factors are the major driver of variation in inpatient rehabilitation practices.

1. Overview

1.1 Independent Hospital Pricing Authority

The Independent Hospital Pricing Authority (IHPA) was established under the *National Health Reform Act 2011* (Cwlth) (the Act), and by virtue of section 131(1) of the Act is invested with the following functions relevant to this National Efficient Price Determination 2021–22 (Determination):

- (a) to determine the national efficient price for healthcare services provided by public hospitals where the services are funded on an activity basis
- (b) to determine the national efficient cost for healthcare services provided by public hospitals where the services are block-funded
- (c) to develop and specify classification systems for health care and other services provided by public hospitals
- (d) to determine adjustments to the national efficient price to reflect legitimate and unavoidable variations in the costs of delivering healthcare services
- (e) except where otherwise agreed between the Commonwealth and a state or territory – to determine the public hospital functions that are to be funded in the state or territory by the Commonwealth
- (f) to publish a report setting out the national efficient price for the coming year and any other information that would support the efficient funding of public hospitals.

This Determination is an output of the performance of those functions by the Pricing Authority.

In this document, ‘Pricing Authority’ refers to the governing members and ‘IHPA’ refers to the agency.

1.2 Data quality

In making this Determination, the Pricing Authority has relied on a number of different data sources.

Costing information used to determine the national efficient price (NEP) has been drawn from the National Hospital Cost Data Collection Round 23 (2018–19), as provided by states and territories.

Activity information used to determine the NEP has been drawn from a number of National Minimum Data Sets (NMDS) and National Best Endeavours Data Sets (NBEDS), including:

- Admitted patient care NMDS
- Admitted subacute and non-acute hospital care NBEDS
- Activity based funding: Mental health care NBEDS
- Non-admitted patient emergency department care NMDS
- Emergency service care NBEDS
- Non-admitted patient NBEDS
- Non-admitted patient care aggregate NBEDS.

IHPA continues to review and refine the classification systems used in the national pricing model.

The Hospital Casemix Protocol collection and Commonwealth pharmaceutical program payments data has also informed the removal of the costs of other Commonwealth programs that are not in-scope of the National Health Reform Agreement (NHRA).

1.3 Determination development

In performing the functions outlined above and preparing this Determination, the Pricing Authority has had regard, as required pursuant to sections 131(3) and 132 of the Act, to:

- (a) relevant expertise and best practice within Australia and internationally
- (b) submissions made at any time by the Commonwealth or a state or territory
- (c) the need to ensure:
 - (i) reasonable access to healthcare services
 - (ii) safety and quality in the provision of healthcare services
 - (iii) continuity and predictability in the cost of healthcare services
 - (iv) the effectiveness, efficiency and financial sustainability of the public hospital system
- (d) the range of public hospitals and the variables affecting the actual cost of providing healthcare services in each of those hospitals
- (e) relevant intergovernmental agreements (including the NHRA and the Addendum to the NHRA 2020–25 (the Addendum)).

In May 2020, all Australian governments signed the Addendum which amends the public hospital financing arrangements in the NHRA for the period from 1 July 2020 to 30 June 2025.

1.4 Terminology

Although the Pricing Authority aims to use plain English to make its documents accessible to a wide audience, the subject matter of this Determination requires the use of some specialist terms. For ease of reference, the meaning of those terms is set out in a [glossary](#) available on the IHPA website.

2. National Efficient Price 2021–22

2.1 The national efficient price

The national efficient price (NEP) is \$5,597 per national weighted activity unit 2021–22 (NWAU(21)).

2.2 Calculation of the NEP

The NEP is based on the average cost of public hospital activity in the 2018–19 financial year of \$5,167 per NWAU(21), indexed at a rate of 2.7 per cent per annum.

Consistent with clause A46(e) of the Addendum to the National Health Reform Agreement 2020–25, in calculating the NEP, the following Commonwealth funded programs have been removed prior to determining the underlying cost data of the 2018–19 reference cost:

- highly specialised drugs – section 100 funding (\$1,298.6 million in the 2018–19 financial year)
- pharmaceutical reform agreements – efficient funding of chemotherapy (section 100 funding) (\$452.9 million in the 2018–19 financial year)
- pharmaceutical reform agreements – Pharmaceutical Benefits Scheme (PBS) Access Program (\$292.3 million in the 2018–19 financial year).

Where blood expenditure has been reported in the National Hospital Cost Data Collection by states and territories this has also been removed, as Commonwealth funding for this program is provided directly to the National Blood Authority. In 2018–19 this amounted to \$294.0 million.

2.3 Price of an activity based funding activity

The price of an activity based funding (ABF) activity is calculated using the following formula, with adjustments applied as applicable:

Price of an admitted acute ABF activity =

$$\{[PW \times A_{Paed} \times (1 + A_{SPA} + A_{Ind} + A_{Res} + A_{RT} + A_{Dia}) \times (1 + A_{Treat}) + (A_{ICU} \times ICU \text{ hours})] - [(PW + A_{ICU} \times ICU \text{ hours}) \times A_{PPS} + LOS \times A_{Acc}] - PW \times A_{HAC} - PW_{AHR} \times R_{AHR}\} \times NEP$$

Price of an admitted subacute ABF activity =

$$\{[PW \times (1 + A_{Ind} + A_{Res} + A_{RT} + A_{Dia}) \times (1 + A_{Treat})] - [PW \times A_{PPS} + LOS \times A_{Acc}]\} \times NEP$$

Price of a non-admitted ABF activity =

$$\{PW \times A_{Paed} \times (1 + A_{Ind} + A_{Res} + A_{NMC}) \times (1 + A_{Treat})\} \times NEP$$

Price of an emergency department ABF activity =

$$\{PW \times (1 + A_{Ind} + A_{Res}) \times (1 + A_{Treat})\} \times NEP$$

Price of an emergency service ABF activity =

$$\{PW \times (1 + A_{Treat})\} \times NEP$$

Where:

A_{Paed}	means the paediatric adjustment
A_{SPA}	means the specialist psychiatric age adjustment
A_{Res}	means each or any patient residential remoteness area adjustment
A_{Ind}	means the Indigenous adjustment
A_{RT}	means the radiotherapy adjustment
A_{Dia}	means the dialysis adjustment
A_{Treat}	means each or any patient treatment remoteness area adjustment
A_{ICU}	means the intensive care unit adjustment
A_{PPS}	means the private patient service adjustment
A_{Acc}	means the private patient accommodation adjustment applicable to the state of hospitalisation and length of stay
A_{NMC}	means the multidisciplinary clinic adjustment
A_{HAC}	means the hospital acquired complications adjustment
R_{AHR}	means the avoidable hospital readmission risk adjustment factor
ICU hours	means the number of hours spent by a person within a specified intensive care unit
LOS	means the length of stay in hospital (in days)
NEP	means the National Efficient Price 2021–22
PW	means the price weight for an ABF activity as set out in Appendix H (for admitted acute), Appendix I (for admitted subacute and non-acute), Appendix J (for non-admitted), Appendix K (for emergency department) or Appendix L (for emergency services)
PW_{AHR}	means the price weight for an ABF activity of a linked avoidable hospital readmission

In the event that the application of the adjustments relating to private patients, hospital acquired complications, or avoidable hospital readmissions returns a negative NWAU(21) value for a particular episode, the NWAU(21) value is held to be zero – that is, negative NWAU(21) values are not permitted for any episodes under the national pricing model.

3. In-scope public hospital services

3.1 Overall scope

In accordance with section 131(f) of the *National Health Reform Act 2011* (Cwlth) and clauses A16–A24 of the Addendum to the National Health Reform Agreement 2020–25 (the Addendum), the scope of public hospital services eligible for Commonwealth funding under the agreement are:

- all admitted programs, including hospital-in-the-home programs and forensic mental health inpatient services
- all emergency department services
- non-admitted services as defined below.

3.2 Non-admitted services

The listing of in-scope non-admitted services is independent of the service setting in which they are provided (for example, at a hospital, in the community, in a person's home). This means that in-scope services can be provided on an outreach basis.

To be included as an in-scope non-admitted service, the service must meet the definition of a service event, which is:

‘an interaction between one or more healthcare provider(s) with one non-admitted patient, which must contain therapeutic/clinical content and result in a dated entry in the patient’s medical record.’

Consistent with clause A31 of the Addendum, the Pricing Authority will conduct analysis to determine if services are transferred from the community to public hospitals for the dominant purpose of making services eligible for Commonwealth funding.

There are two broad categories of in-scope, public hospital non-admitted services:

- A. specialist outpatient clinic services
- B. other non-admitted patient services.

Category A: Specialist outpatient clinic services – Tier 2 Non-Admitted Services Classification classes 10, 20 and 30

This comprises all clinics in the Tier 2 Non-Admitted Services Classification, classes 10, 20 and 30. However, the general practice and primary care (20.06) clinic is considered by the Pricing Authority as not eligible for Commonwealth funding as a public hospital service.

Category B: Other non-admitted patient services and non-medical specialist outpatient clinics – Tier 2 Non-Admitted Services Classification class 40

To be eligible for Commonwealth funding as an ‘other non-admitted patient service’ or a class 40 Tier 2 non-admitted service, a service must be:

- (a) directly related to an inpatient admission or an emergency department attendance; or
- (b) intended to substitute directly for an inpatient admission or emergency department attendance; or
- (c) expected to improve the health or better manage the symptoms of persons with physical or mental health conditions who have a history of frequent hospital attendance or admission.

Prior to preparing this Determination (2021–22), jurisdictions were invited to submit evidence for additional services to be included or excluded from the list based on the criteria above. Decisions by the Pricing Authority to include or exclude services from the list have been incorporated into the Determination.

The following clinics are considered by the Pricing Authority as not eligible for Commonwealth funding as a public hospital service under this category:

- Aged care assessment (40.02)
- Family planning (40.27)
- General counselling (40.33)
- Primary health care (40.08).

Interpretive guidelines for use

In line with the criteria for Category B, community mental health, physical chronic disease management and community based allied health programs considered in-scope will have all or most of the following attributes:

- be closely linked to the clinical services and clinical governance structures of a public hospital (for example integrated area mental health services, step-up/step-down mental health services and crisis assessment teams)
- target patients with severe disease profiles
- demonstrate regular and intensive contact with the target group (an average of eight or more service events per patient per annum)
- demonstrate the operation of formal discharge protocols within the program
- demonstrate either regular enrolled patient admission to hospital or regular active interventions which have the primary purpose to prevent hospital admission.

4. Price weights

4.1 Price weights

Price weights expressed as national weighted activity unit 2021–22 (NWAU(21)) are set out in **Appendices H to L** by classification.

4.2 Classification systems

The classification systems used are:

- Australian Refined Diagnosis Related Groups Classification Version 10.0
- Australian National Subacute and Non-Acute Patient Classification Version 4.0
- Tier 2 Non-Admitted Services Classification Version 7.0
- Australian Emergency Care Classification Version 1.0
- Urgency Disposition Groups Classification Version 1.3.

4.3 Shadow pricing

Clause A42 of the Addendum to the National Health Reform Agreement 2020–25 (the Addendum) stipulates that IHPA will use transitional arrangements when developing new activity based funding (ABF) classification systems or costing methodologies, including shadow pricing classification system changes and pricing based on a costing study, for two years or a period agreed with the Commonwealth and a majority of States to ensure robust data collection and reporting to accurately model the financial and counting impact of changes on the national funding model.

In accordance with the Addendum, for this National Efficient Price Determination 2021–22 (Determination) IHPA will shadow price the classification changes detailed in **Table 1**.

Table 1: Classification changes being shadow priced for this Determination

System change	Shadow pricing arrangements
Australian Mental Health Care Classification Version 1.0 for admitted mental health care services	<ul style="list-style-type: none"> • Second year of shadow pricing in 2021–22
Australian Mental Health Care Classification Version 1.0 for community mental health care services	<ul style="list-style-type: none"> • First year of shadow pricing in 2021–22
The '40.62 Multidisciplinary case conference - patient not present' clinic under the Tier 2 Non-Admitted Services Classification Version 7.0	<ul style="list-style-type: none"> • First year of shadow pricing in 2021–22

Shadow price weights expressed as NWAU(21) for the above classification changes and further information is available on the [IHPA website](#).

5. Adjustments

5.1 Adjustments

Adjustments to price weights, expressed as national weighted activity unit 2021–22 (NWAU(21)) are to be applied in the manner and in the order indicated by the formula for determining the NWAU(21) value (price) of an activity based funding (ABF) activity (refer to Chapter 2).

5.2 Precedence of adjustments

Adjustments have the following order of precedence for application:

- (a) paediatric adjustment; then
- (b) specialist psychiatric age adjustment; then
- (c) patient residential remoteness area adjustment; then
- (d) Indigenous adjustment; then
- (e) radiotherapy adjustment; then
- (f) dialysis adjustment; then
- (g) patient treatment remoteness area adjustment; then
- (h) intensive care unit (ICU) adjustment; then
- (i) private patient service adjustment; then
- (j) private patient accommodation adjustment; then
- (k) multidisciplinary clinic adjustment; then
- (l) hospital acquired complication (HAC) adjustment; then
- (m) avoidable hospital readmission risk adjustment factor.

Circumstances in which adjustments are to be applied are described in **Table 2**.

Table 2: Adjustments

Name	Context	Amount to be applied
Paediatric adjustment	<p>is in respect of a person who:</p> <ul style="list-style-type: none"> • is aged up to and including 17 years • is treated by a specialised children's hospital (Appendix E) as an admitted acute or non-admitted patient. 	Refer to column headed paediatric adjustment in the tables of admitted acute price weights (Appendix H) and non-admitted price weights (Appendix J)
Specialist psychiatric age adjustment (≤ 17 years, in major diagnostic category (MDC) 19 or 20)	is in respect of a person who is aged 17 years or less at the time of admission, with a mental health-related principal diagnosis (MDC 19 or 20) and has one or more total psychiatric care days recorded.	Admitted acute patient: 39 per cent (except patients admitted to a specialised children's hospital who will receive 15 per cent)
Specialist psychiatric age adjustment (≤ 17 years, not in MDC 19 or 20)	Where an ABF activity:	Admitted acute patient: 69 per cent (except patients admitted to a specialised children's hospital who will receive 58 per cent)
Specialist psychiatric age adjustment (> 17 years, not in MDC 19 or 20)	is in respect of a person who is aged over 17 at the time of admission, with a principal diagnosis which is not mental health-related (not in MDC 19 or 20) and has one or more total psychiatric care days recorded.	Admitted acute patient: 36 per cent
Patient residential remoteness area adjustment – outer regional area	is in respect of a person whose residential address is within an area that is classified as being outer regional.	Admitted acute, admitted subacute or non-admitted patient: 8 per cent

Name	Context	Amount to be applied
Patient residential remoteness area adjustment – remote area	is in respect of a person whose residential address is within an area that is classified as being remote.	Admitted acute, admitted subacute or non-admitted patient: 27 per cent Emergency department patient: 29 per cent
Patient residential remoteness area adjustment – very remote area	is in respect of a person whose residential address is within an area that is classified as being very remote.	Admitted acute, admitted subacute or non-admitted patient: 31 per cent Emergency department patient: 29 per cent
Indigenous adjustment	Where an ABF activity:	Admitted acute, admitted subacute, emergency department or non-admitted patient: 4 per cent
Radiotherapy adjustment	is in respect of an admitted acute or admitted subacute patient with a specified Australian Classification of Health Interventions (ACHI) Eleventh Edition radiotherapy intervention code assigned. ¹	Admitted acute or admitted subacute patient: 40 per cent
Dialysis adjustment	is in respect of an admitted acute or admitted subacute patient with a specified ACHI Eleventh Edition renal dialysis code who is not assigned to the Australian Refined Diagnosis Related Groups (AR-DRG) L61Z Haemodialysis or AR-DRG L68Z Peritoneal Dialysis. ¹	Admitted acute or admitted subacute patient: 28 per cent

¹ Refer to **Appendices B and C** for valid ACHI Eleventh Edition codes.

Name	Context	Amount to be applied
Patient treatment remoteness area adjustment – remote area	is in respect of a person who receives care in a hospital which is within an area that is classified as being remote.	Admitted acute, admitted subacute or non-admitted patient: 7 per cent Emergency department or emergency service patient: 5 per cent
Patient treatment remoteness area adjustment – very remote area	is in respect of a person who receives care in a hospital which is within an area that is classified as being very remote.	Admitted acute, admitted subacute or non-admitted patient: 19 per cent Emergency department or emergency service patient: 5 per cent
ICU adjustment	Where an ABF activity: (a) is not represented by a newborn/neonate AR-DRG identified as ‘bundled ICU’ in the tables of price weights (Appendix H); but (b) is in respect of a person who has spent time within a specified ICU. ²	0.0445 NWAU(21) per hour spent by that admitted acute patient within the specified ICU
Private patient service adjustment	is in respect of an eligible admitted private patient.	Admitted acute, admitted subacute or non-acute patient: refer to Appendix F for applicable adjustment

² Refer to **Appendix D**.

Name	Context	Amount to be applied
Private patient accommodation adjustment	is in respect of an eligible admitted private patient.	Admitted acute, admitted subacute or non-acute patient: refer to Appendix F for applicable adjustment
Multidisciplinary clinic adjustment	is in respect of a non-admitted service event where three or more healthcare providers (each of a different speciality) are present, as identified using the non-admitted multiple healthcare provider indicator.	Non-admitted patient: 46 per cent
HAC adjustment	is in respect of an admitted acute episode where one or more HAC is present. If more than one HAC is present, the larger of the HAC adjustments applies. Where an ABF activity:	Admitted acute episode with one or more HAC: refer to Appendix M for applicable adjustments
Avoidable hospital readmission risk adjustment factor	is in respect of an admitted acute episode where the patient was discharged from hospital and admitted again within a certain time interval and the readmission is clinically related to the index admission and had the potential to be avoided through improved clinical management and/or appropriate discharge planning in the index admission. The risk adjustment factor is applied to the price of the readmission episode, and the result is used to adjust the index episode.	Admitted acute episode identified as an avoidable hospital readmission: refer to Appendix N for applicable risk adjustment factors

6. Safety and quality

6.1 Sentinel events

In accordance with a ministerial direction issued to IHPA on 16 February 2017 under section 226 of the *National Health Reform Act 2011* (Cwlth) and consistent with the Addendum to the National Health Reform Agreement 2020–25 (the Addendum) signed by First Ministers in May 2020, any public hospital episodes that include a sentinel event will not be funded.

Definition

Sentinel events are a subset of adverse events that result in death or serious harm to patients.

In 2017, the Australian Commission on Safety and Quality in Health Care (the Commission) undertook a review of the Australian sentinel events list on behalf of the states, territories and the Commonwealth. The updated Australian sentinel events list (Version 2.0) was endorsed by Australian health ministers in December 2018.

Version 2.0 of the Australian sentinel events list will be used for pricing in 2021–22. Version 2.0 of the Australian sentinel events list, including further information on its development and specifications is available on the [Commission's website](#).

States and territories will be required to report these events to IHPA and the Administrator of the National Health Funding Pool. These episodes will be assigned zero national weighted activity unit 2021–22 (NWAU(21)).

6.2 Hospital acquired complications

In accordance with the Addendum, the funding level for admitted acute episodes will be reduced where a hospital acquired complication (HAC) is present. Separate adjustments have been determined for each HAC. Where an episode contains multiple HACs, the HAC with the largest adjustment determines the funding adjustment.

Definition

A HAC refers to a complication which is acquired in hospital for which clinical risk mitigation strategies may reduce (but not necessarily eliminate) the risk of that complication occurring. The list of HACs was determined by a joint working group of the Commission and IHPA.

The HACs are:

- Pressure injury
- Falls resulting in fracture or intracranial injury
- Healthcare associated infection
- Surgical complications requiring unplanned return to theatre
- Unplanned intensive care unit admission³

³ No funding adjustment for 'Unplanned intensive care unit admission' will be applied in 2021–22 as it cannot be identified in current datasets.

- Respiratory complications
- Venous thromboembolism
- Renal failure
- Gastrointestinal bleeding
- Medication complications
- Delirium
- Incontinence
- Endocrine complications
- Cardiac complications
- Third and fourth degree perineal laceration during delivery⁴
- Neonatal birth trauma⁴

Version 3.0 of the HAC list will be used for pricing in 2021–22. Further information on the HAC list including diagnosis codes used to identify each HAC is available on the [Commission's website](#).

The funding adjustment for HACs has been risk adjusted to take account of the increased predisposition of some patients to experiencing a HAC during their hospital stay and adjusts the reduction in funding accordingly.

Further information on the risk adjustment model for HACs, including the risk factors for each HAC group is contained in the [National Pricing Model Technical Specifications 2021–22](#) on the IHPA website.

The funding adjustments for HACs are at **Appendix M**.

6.3 Avoidable hospital readmissions

Under the Addendum, IHPA is required to develop a pricing model for avoidable hospital readmissions, for implementation by 1 July 2021, following approval from the Council of Australian Governments Health Council.

Definition

Unplanned hospital readmissions are a measure of potential issues with the quality, continuity and integration of care provided to patients during or subsequent to their initial hospital admission (the index admission). Reducing the number of avoidable hospital readmissions improves patient health outcomes and decreases avoidable demand for public hospital services.

The Commission was tasked with developing and maintaining a nationally consistent definition of avoidable hospital readmissions. The list of clinical conditions considered to be avoidable hospital readmissions was approved by the Australian Health Ministers' Advisory Council in June 2017.

⁴ No funding adjustment for 'Third degree perineal laceration during delivery' and 'Neonatal birth trauma' will be applied in 2021–22 due to small patient cohorts or other issues that have prevented development of a robust risk adjustment approach at this time.

The avoidable hospital readmission conditions are as follows:

- Pressure injury
- Infections
- Surgical complications
- Respiratory complications
- Venous thromboembolism
- Renal failure
- Gastrointestinal bleeding
- Medication complications
- Delirium
- Cardiac complications
- Other (constipation, nausea and vomiting)

Version 1.0 of the avoidable hospital readmissions list will be used for pricing in 2021–22. Further information on the list, including diagnosis codes used to identify each readmission condition, is available on the [Commission's website](#).

The funding adjustment for avoidable hospital readmissions has been risk adjusted to account for the increased predisposition of some patients to experiencing an avoidable hospital readmission during their hospital stay and adjusts the reduction in funding accordingly with use of a risk adjustment factor.

Further information on the risk adjustment model for avoidable hospital readmissions, including the risk factors for each readmission condition, is contained in the [National Pricing Model Technical Specifications 2021–22](#) on IHPA's website.

The risk adjustment factors for avoidable hospital readmissions are at **Appendix N**.

7. Pricing for private patients in public hospitals

7.1 Clauses

In May 2020, the Commonwealth and state and territory governments signed the Addendum to the National Health Reform Agreement 2020–25, which includes clauses A13, A43 and A44 with the intent to neutralise revenue at the hospital level for public and private patients.

The Administrator of the National Health Funding Pool (the Administrator) may make a further adjustment to the price of an admitted activity to account for private insurance benefits paid for activity in public hospitals that has not been accounted for by the combined adjustments in the national efficient price (NEP) and state or territory funding models.

In making such an adjustment, the NEP will not be increased to a value above the price as defined by the formulas in this Determination.

7.2 Definition

IHPA has developed a definition of financial neutrality (clause A13) and payment parity (clause A44) in terms of revenue per national weighted activity unit 2021–22 (NWAU(21)) (excluding private patient adjustments).

That is, the sum of revenue a local hospital network (LHN) receives for public patient NWAU(21) (Commonwealth and state or territory activity based funding (ABF) payments) should be equal to payments made for a LHN service for private patient NWAU(21) (Commonwealth and state or territory ABF payments, insurer payments and Medicare Benefit Schedule payments).

7.3 Implementation

The definition of private patient neutrality is back-cast and is to be incorporated in the Administrator's annual growth calculation.

Private patient revenue is reported through the Hospital Casemix Protocol (HCP) data. Until such time that HCP data is available to inform the Administrator's annual reconciliation, private patient neutrality clauses will be implemented through:

- a) The application of state based service adjustments for private patients published within this Determination
- b) Confirmation by states and territories of:
 - payments made to each LHN for private patients (aggregate)
 - payments made to each LHN for public patients (aggregate)
 - LHN private patient revenue targets.

The private funding neutrality adjustment will be calculated as an adjustment to the NEP for the purposes of calculating Commonwealth growth funding pertaining to private patient NWAU(21) equal to the following:

Private funding neutrality adjustment =

$$(\mathbf{CC}_{Pu} + \mathbf{SC}_{Pu}) / \mathbf{NWAU}_{Pu} - [(\mathbf{CC}_{Pr} + \mathbf{SC}_{Pr} + \mathbf{P}_{Pr}) / (\mathbf{NWAU}_{Pr} + \mathbf{TA}_{PPS} + \mathbf{TA}_{Acc})]$$

Where:

CC_{Pu}	means growth in the aggregate Commonwealth contribution for public patient activity
SC_{Pu}	means growth in the aggregate state or territory contribution for public patient activity
NWAU_{Pu}	means growth in the aggregate national weighted activity units for public patient activity
CC_{Pr}	means growth in the aggregate Commonwealth contribution for private patient activity
SC_{Pr}	means growth in the aggregate state or territory contribution for private patient activity
P_{Pr}	means growth in the aggregate private patient revenue from private health insurers and Medicare Benefits Schedule payments related to private patient activity
NWAU_{Pr}	means growth in the aggregate national weighted activity units for private patient activity
TA_{PPS}	means growth in the aggregate national weighted activity unit value for private patient service adjustments
TA_{Acc}	means growth in the aggregate national weighted activity unit value for private patient accommodation adjustments

In the event that the private funding neutrality adjustment is greater than zero, then the private funding neutrality adjustment will be equal to zero. In other words, the private funding neutrality adjustment can only be negative, and act as a discount to the NEP.

8. National pricing model technical specifications

8.1 Technical specifications

The detailed [National Pricing Model Technical Specifications](#) are available on the IHPA website.

9. Standards

The following standards apply to the use of activity based funding in the 2021–22 financial year.

9.1 Coding and classification

9.1.1 Admitted acute patients

The International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification (ICD-10-AM), Australian Classification of Health Interventions (ACHI), Australian Coding Standards (ACS), collectively known as ICD-10-AM/ACHI/ACS Eleventh Edition.

Australian Refined Diagnosis Related Groups Classification Version 10.0.

9.1.2 Admitted subacute and non-acute patients

Australian National Subacute and Non-Acute Patient Classification Version 4.0.

9.1.3 Non-admitted patients

Tier 2 Non-Admitted Services Classification Version 7.0.

9.1.4 Emergency department patients

Australian Emergency Care Classification Version 1.0.

9.1.5 Emergency service patients

Urgency Disposition Groups Classification Version 1.3.

These reference standards are available on the [IHPA website](#).

9.2 Intensive care units

For the 2021–22 national efficient price, IHPA has determined which specified intensive care units (ICUs) are eligible to receive the ICU adjustment. This list is included at **Appendix D**.

9.3 Activity based funding dataset specifications

Full copies of these reference standards are available on the [IHPA website](#).

10. Back-casting

Clause A41 of the Addendum to the National Health Reform Agreement 2020–25 (the Addendum) outlines that where the Pricing Authority makes any significant changes to the activity based funding (ABF) classification systems or costing methodologies, the effect of such changes must be back-cast to the year prior to their implementation for the purpose of calculating Commonwealth funding estimates for each ABF service category.

In accordance with clauses A34(b) and A41 of the Addendum, the Pricing Authority has applied the methodological changes to the National Efficient Price (NEP) 2020–21 and determined the back-cast NEP 2020–21 for the purposes of determining Commonwealth growth funding estimated between 2020–21 and 2021–22 is \$5,450.

In accordance with clauses A34(c) and A41 of the Addendum, the Pricing Authority has applied the methodological changes to NEP 2020–21 and determined the back-casting volume multipliers for NEP 2020–21 as detailed in **Table 3**.

Table 3: Back-casting volume multipliers by service category and state and territory

State / territory	Admitted acute	Admitted subacute and non-acute	Emergency department	Non-admitted
NSW	0.9838	0.9939	1.0152	0.9615
Vic	0.9963	1.0025	1.0087	0.9973
Qld	1.0025	1.0026	1.0131	0.9908
SA	1.0036	1.0035	0.9970	0.9882
WA	1.0057	0.9910	1.0024	0.9925
Tas	0.9969	0.9986	1.0543	1.0053
NT	0.9983	1.0049	0.9996	0.9989
ACT	0.9963	1.0028	1.0035	0.9766

10.1 Need for further back-casting advice

The back-casting multipliers in **Table 3** are determined using the most recent activity data supplied by states and territories to IHPA. However, these back-casting multipliers may not be adequate where there are significant changes in the underlying data submitted by states and territories in 2021–22. Where this occurs, the Administrator of the National Health Funding Pool may request further back-casting advice from the Pricing Authority as part of the reconciliation process.

In 2021–22, the following changes may require additional back-casting measures:

- The introduction of the Australian Emergency Care Classification Version 1.0 from 1 July 2021
- The introduction of the Tier 2 Non-Admitted Services Classification Version 7.0 from 1 July 2021
- COVID-19 related activity that is not adequately captured in the NEP Determination for 2021–22.

Appendices

Appendix A – General List of In-Scope Public Hospital Services eligible for Commonwealth funding under the National Health Reform Agreement	26
Appendix B – List of radiotherapy codes	38
Appendix C – List of dialysis codes	40
Appendix D – Specified intensive care units	41
Appendix E – Specialised children’s hospitals	43
Appendix F – Private patient adjustments	44
Appendix G – Provisional weights for very long-stay patients	64
Appendix H – Price weights for admitted acute patients – AR-DRG V10.0	65
Appendix I – Price weights for admitted subacute and non-acute patients – AN-SNAP V4.0	84
Appendix J – Price weights for non-admitted patients – Tier 2 V7.0	87
Appendix K – Price weights for emergency department patients – AECC V1.0	90
Appendix L – Price weights for emergency service patients – UDG V1.3	93
Appendix M – Funding adjustments for hospital acquired complications	94
Appendix N – Risk adjustment factors for avoidable hospital readmissions	95

Appendix A – General List of In-Scope Public Hospital Services eligible for Commonwealth funding under the National Health Reform Agreement

In accordance with section 131(f) of the *National Health Reform Act 2011* (Cwth) and clauses A16–A24 of the Addendum to the National Health Reform Agreement (NHRA) 2020–25, the scope of public hospital services eligible for Commonwealth funding under the agreement are:

- all admitted programs, including hospital-in-the-home programs and forensic mental health inpatient services
- all emergency department services
- non-admitted services that meet the criteria for inclusion on the General List of In-Scope Public Hospital Services.

Category A: Specialist outpatient clinic services – Tier 2 Non-Admitted Services Classification classes 10, 20 and 30

The Pricing Authority has determined the following services as eligible for Commonwealth funding as a public hospital service under ‘Category A: Specialist outpatient clinic services’.

10. Procedure clinics

- 10.01 Hyperbaric medicine
- 10.02 Interventional imaging
- 10.03 Minor surgical
- 10.04 Dental
- 10.05 Angioplasty/angiography
- 10.06 Endoscopy - gastrointestinal
- 10.07 Endoscopy - urological/gynaecological
- 10.08 Endoscopy - orthopaedic
- 10.09 Endoscopy - respiratory/ear, nose and throat
- 10.10 Renal dialysis - hospital delivered
- 10.11 Chemotherapy treatment

- 40.63 COVID-19 response
- 40.64 Chronic pain management

Other non-admitted public hospital services for 2021–22 (excluding mental health services)

1. Home and community-based chemotherapy services.
2. Chronic disease management/hospital avoidance program targeting:
 - 2.1 Renal impairment
 - 2.2 Respiratory disease
 - 2.3 Cardiovascular disease
 - 2.4 Oncology
 - 2.5 Stroke
 - 2.6 Cystic fibrosis ambulatory care
 - 2.7 Hepatitis C services
3. Early discharge program services including:
 - 3.1 Postnatal care early discharge programs
 - 3.2 Anti-coagulant post-acute hospital event
4. Falls prevention services targeting patients at high risk of falls
5. Hospital admission risk screening services targeting patients at high-risk of hospital admission
6. Home and community-based lymphoedema services

7. Home dialysis
8. Home and community-based palliative care services including palliative care day hospices
9. Intense home and community-based nutrition support services including:
 - 9.1 Home parenteral nutrition services
 - 9.2 Home-based patients on nasogastric or percutaneous endoscopic gastrostomy tube feeding
10. Home and community peri and postnatal assessment services
11. Post-acute care services including:
 - 11.1 48-hour follow-up services targeting Aboriginal/Torres Strait Islander patients recently discharged from hospital
 - 11.2 Stroke post-acute care programs
12. Home and community-based rehabilitation services including:
 - 12.1 Trauma rehabilitation services
 - 12.2 Pulmonary rehabilitation services
 - 12.3 Cardiac rehabilitation services
 - 12.4 Stroke rehabilitation services
13. Sexual assault services
14. Speech pathology services targeting immediate post discharge patients
15. Stomal therapy

Other non-admitted community-based mental health services for 2021–22

- | | |
|------|--|
| MH1 | Adult integrated specialised community mental health services |
| MH2 | Mental health crisis assessment and treatment (including telephone-based services) |
| MH3 | Dual diagnosis services for patients with comorbid conditions |
| MH4 | Home and community-based eating disorders programs |
| MH5 | Mental health hospital avoidance programs |
| MH6 | Ambulatory mental health care services |
| MH7 | Perinatal and infant mental health services |
| MH8 | Mental health step-up/step-down services |
| MH9 | Mental health telephone triage services |
| MH10 | Older persons community mental health services |
| MH11 | Child and adolescent community mental health services |

A17 List

Under clause A17 of the NHRA, IHPA has also determined a list of services that would not normally be considered a public hospital service (the A17 List) as defined by the General List of In-Scope Public Hospital Services Eligibility Policy, but which IHPA is satisfied was provided by a particular hospital in 2010. The services on this list are eligible for Commonwealth funding only at the local hospital network (LHN) indicated in the list.

State/ territory	LHN	Service type

Other public hospital programs

The Pricing Authority has determined that the following program is eligible for Commonwealth funding as a public hospital service, subject to conditions:

State/ territory	LHN	Service type
Vic	Alfred Health Barwon Health Monash Health Northern Health Western Health	HealthLinks: Chronic Care

Conditions:

HealthLinks was conditionally approved for inclusion in 2018–19, which was then extended in 2020–21. IHPA has extended HealthLinks for a further 12 months (2021–22) subject to the following conditions for its continued inclusion:

- Specific patients are nominated
- IHPA is provided with an activity feed for the services received every three months in a data file
- The data is not in aggregate form
- The costs are either excluded from the National Hospital Cost Data Collection or provided separately
- The effectiveness of existing data is addressed, and the program methodology and evaluation is improved
- There is transparency in the patient's journey and funding flow
- The development of and move towards a funding model that is funded by means other than block funding.

Appendix B - List of radiotherapy codes

Table 4: Radiotherapy Australian Classification of Health Interventions Eleventh Edition codes

Intervention Codes	Description
15000-00	Radiation treatment, superficial, 1 field
15003-00	Radiation treatment, superficial, ≥ 2 fields
15100-00	Radiation treatment, orthovoltage, 1 field
15103-00	Radiation treatment, orthovoltage, ≥ 2 fields
15224-00	Radiation treatment, megavoltage, 1 field, single modality linear accelerator
15239-00	Radiation treatment, megavoltage, ≥ 2 fields, single modality linear accelerator
15254-00	Radiation treatment, megavoltage, 1 field, dual modality linear accelerator
15269-00	Radiation treatment, megavoltage, ≥ 2 fields, dual modality linear accelerator
15600-00	Stereotactic radiation treatment, single dose
15600-01	Stereotactic radiation treatment, fractionated
15600-02	Hemi body irradiation
15600-03	Total body irradiation
15600-04	Total skin irradiation
15303-00	Brachytherapy, intrauterine, low dose rate
15304-00	Brachytherapy, intrauterine, high dose rate
15311-00	Brachytherapy, intravaginal, low dose rate
15312-00	Brachytherapy, intravaginal, high dose rate
15319-00	Brachytherapy, combined intrauterine and intravaginal, low dose rate
15320-00	Brachytherapy, combined intrauterine and intravaginal, high dose rate
90764-00	Brachytherapy, intracavitary, low dose rate
90764-01	Brachytherapy, intracavitary, high dose rate
15327-00	Brachytherapy with implantation of removable single plane, low dose rate
15327-01	Brachytherapy with implantation of removable single plane, pulsed dose rate
15327-02	Brachytherapy with implantation of removable multiple planes or volume implant, low dose rate
15327-03	Brachytherapy with implantation of removable multiple planes or volume implant, pulsed dose rate
15327-04	Brachytherapy with implantation of permanent implant, < 10 sources
15327-05	Brachytherapy with implantation of permanent implant, ≥ 10 sources
15327-06	Brachytherapy with implantation of removable single plane, high dose rate
15327-07	Brachytherapy with implantation of removable multiple planes or volume implant, high dose rate
15338-00	Brachytherapy, prostate
15360-00	Brachytherapy, intravascular
15339-00	Removal of sealed radioactive source
15012-00	Brachytherapy, eye
90766-00	Brachytherapy using surface applicators, other sites
16003-00	Administration of a therapeutic dose of Yttrium 90
16009-00	Administration of a therapeutic dose of Iodine 131
16012-00	Administration of a therapeutic dose of Phosphorous 32
16015-00	Administration of a therapeutic dose of Strontium 89
16018-00	Administration of a therapeutic dose of 153 SM-Lexidronan
90960-00	Administration of a therapeutic dose of other unsealed radioisotope
15342-00	Construction and application of radioactive surface mould
15351-00	Construction and application of eye applicator
90765-00	Construction and fitting of immobilisation device, simple
90765-01	Construction and fitting of immobilisation device, intermediate
90765-02	Construction and fitting of immobilisation device, complex
90765-03	Construction and fitting of customised blocks
90765-04	Construction and fitting of treatment accessories
15500-00	Radiation field setting using simulator, simple
15503-00	Radiation field setting using simulator, intermediate
15506-00	Radiation field setting using simulator, complex
15506-01	Radiation field setting using dedicated CT scanner
15506-02	Radiation field setting for intensity modulated radiation therapy [IMRT]
15509-00	Radiation field setting using diagnostic x-ray unit
15550-00	Radiation field setting for three dimensional conformal radiation therapy [3DCRT]
15518-00	Dosimetry by CT interfacing computer, simple
15521-00	Dosimetry by CT interfacing computer, intermediate
15524-00	Dosimetry by CT interfacing computer, complex
15524-01	Dosimetry by CT interfacing computer for intensity modulated radiation therapy [IMRT]
15527-00	Dosimetry by non-CT interfacing computer, simple
15530-00	Dosimetry by non-CT interfacing computer, intermediate
15533-00	Dosimetry by non-CT interfacing computer, complex
15536-00	Brachytherapy planning, simple
15536-01	Brachytherapy planning, intermediate
15536-02	Brachytherapy planning, complex

Intervention Codes	Description
15539-00	Brachytherapy planning, prostate
15541-00	Brachytherapy planning, intravascular
15556-00	Dosimetry by CT interfacing computer for three dimensional conformal radiation therapy [3DCRT]
15556-01	Dosimetry by non-CT interfacing computer for three dimensional conformal radiation therapy [3DCRT]
37217-01	Implantation of fiducial markers
96256-00	Removal of brachytherapy applicator, prostate

Appendix C - List of dialysis codes

Table 5: Dialysis Australian Classification of Health Interventions Eleventh Edition codes

Intervention Codes	Description

Appendix G - Provisional weights for very long stay patients

These price weights are used to calculate national weighted activity unit (NWAU) for patients who are not discharged at 30 June 2022 and have a length of stay of 200 days or more.

The Administrator of the National Health Funding Pool will advise the business rules that will apply for reporting this activity.

Table 11: Price weights for very long stay patients

Care Type	NWAU/day
Admitted acute	0.2702
Admitted subacute and non-acute	0.2079

Appendix H - Price weights for admitted acute patients - AR-DRG V10.0

The admitted acute price weights are available as an Excel spreadsheet on the IHPA website.

Table 12: Admitted acute price weights - Australian Refined Diagnosis Related Groups (AR-DRG) Classification Version 10.0
