40.62 ⁹	Multidisciplinary case conference - patient not present	Not priced	N/A
40.63 ⁷	COVID-19 response	0.0506	87%
40.64	Chronic pain management	0.0595	100%

⁵ The price weight for clinics 10.15, 10.16, 10.17, and 10.18 are priced on a per calendar month basis - see the national efficient price and national efficient cost online glossary for further information.

⁶ COVID-19 vaccination is not priced by IHPA but funded under a separate agreement between the Commonwealth and the states and territories.

⁷ The price weights of COVID-19 response clinics are pegged to those of Infectious disease clinics pending the availability of further data.

⁸ These services are not priced as they are bundled to the originating service.

⁹ This service is shadow priced for the NEP21 Determination. The shadow price weight and paediatric adjustment for this service are available on IHPA's website.

Appendix K - Price weights for emergency department patients - AECC V1.0

The emergency department price weights are available as an Excel spreadsheet on the IHPA website.

Appendix M - Funding adjustments for hospital acquired complications

The adjustments for hospital acquired complications (HACs) are available as an Excel spreadsheet on the IHPA website.

Table 17: Funding adjustments for HACs

Complication	Complexity Group		
	Low	Moderate	High
1. Pressure injury	9.8%	1.2%	0.9%
2. Falls resulting in fracture or intracranial injury	3.7%	2.2%	1.1%
3. Healthcare-associated infection	7.4%	2.1%	1.7%
4. Surgical complications requiring unplanned return to theatre	10.3%	6.1%	4.9%
5. Unplanned intensive care unit admission ¹⁰	Nil	Nil	Nil
6. Respiratory complications	12.0%	7.3%	3.3%
7. Venous thromboembolism	8.5%	6.3%	4.6%
8. Renal failure	15.9%	4.2%	3.3%
9. Gastrointestinal bleeding	7.9%	6.7%	5.3%
10. Medication complications	8.3%	3.2%	0.9%
11. Delirium	8.5%	6.0%	4.4%
12. Incontinence	5.1%	3.9%	3.0%
13. Endocrine complications	7.4%	6.6%	5.2%
14. Cardiac complications	10.2%	7.7%	5.2%
15.1. Third degree perineal laceration during delivery ¹⁰	Nil	Nil	Nil
15.2. Fourth degree perineal laceration during delivery	31.6%	25.0%	25.0%
16. Neonatal birth trauma ¹⁰	Nil	Nil	Nil

¹⁰ No funding adjustment for 'Unplanned intensive care unit admission' (5), 'Third degree perineal laceration during delivery' (15.1) or 'Neonatal birth trauma' (16) will be applied in 2021–22 due to small patient cohorts or other issues which have prevented development of a robust risk adjustment approach at this time.

Appendix N - Risk adjustment factors for avoidable hospital readmissions

If an admitted acute patient experiences an avoidable hospital readmission in the same jurisdiction as their initial admission (index episode) then the efficient price of the index episode is reduced. The magnitude of the reduction is the product of the efficient price of the readmission episode and a risk adjustment factor.

To calculate the risk adjustment factor each patient is assigned to a 'Low', 'Moderate' or 'High' complexity group based on the presence of a prescribed set of risk factors for their readmission category. The risk adjustment factor for each complexity group and readmission category is shown in Table 18.

The risk adjustment factors for avoidable hospital readmissions by complexity group, as well as the list of risk factors for each readmission category, are available as Excel spreadsheets on the IHPA website.

Table 18: Risk adjustment factors for avoidable hospital readmissions within the same jurisdiction

Readmission Category	Complexity Group		
	Low	Moderate	High
1. Pressure injury	100%	44.0%	28.2%
2. Infections	100%	59.5%	50.0%
3. Surgical complications	100%	26.6%	25.5%
4. Respiratory complications	100%	51.9%	44.1%
5. Venous thromboembolism	100%	71.1%	65.6%
6. Renal failure	100%	48.0%	40.5%
7. Gastrointestinal bleeding	100%	37.3%	24.7%
8. Medication complications	100%	34.9%	26.1%
9. Delirium	100%	43.2%	37.2%
10. Cardiac complications	100%	48.2%	43.0%
11. Constipation	100%	45.5%	35.3%
12. Nausea and vomiting	100%	61.9%	45.9%

Private Health Insurance – expanding home and community based mental health and rehabilitation care

This Budget will make home and community-based care for rehabilitation services more accessible through private health insurance (PHI). Home and community care will be expanded, allowing patients to recover and rehabilitate in their own homes – if that is their preference and is clinically appropriate – with the support of their doctor.

A rehabilitation plan will be developed by an appropriate doctor, which explicitly considers home and community care options, in consultation with the patient.

This measure will also expand insurer options for funding of non-MBS mental health care services from general treatment and hospital treatment policies.

Why is this important?

Most patients prefer to recover and rehabilitate in their comfort of their own homes, if it is safe to do so. This is often a more cost-effective option than in-hospital care. Expanding community care will allow patients to recover at home and increase capacity in hospitals.

Consultations with the sector aim to ensure consumers with PHI can have access to greater range of mental health and rehabilitation services.

Who will benefit?

Australians with PHI will benefit from being able to recover – supported – in their own homes.

For mental health services, consumers will have access to a wider range of non-MBS and non-hospital services, including early intervention services.

How much will this cost?

The Department of Health will commence detailed consultation with the sector on these initiatives, with the goal of implementing these reforms from 1 April 2021.

BETTER AT HOME – MORE SUPPORT TO RECOVER AT HOME

The Andrews Labor Government will give more patients the opportunity to recover from illness or surgery at home in the comfort and familiarity of family and friends, as part of the new Better at Home initiative.

The Victorian Budget 2020/21 will spend \$120.9 million over three years on the program to meet growing demand for healthcare through increased delivery of hospital services in patients' homes.

This investment will include \$102.6 million to provide a range of different types of care at home, including clinic appointments, chemotherapy, post-surgical care and rehabilitation – making a real difference to people's lives.

Virtual care technology will be boosted through a \$12.5 million investment to sustain the high rates of telehealth we have achieved during the pandemic, and support the development of innovative new models of 21st century care.

A further \$5.8 million will help health services to engage the clinical workforce in this transformation of care in Victoria, through training, support, and clinical redesign which will provide more options to receive care at home.

Through Better at Home, up to 50,000 chemotherapy appointments could be delivered in living rooms across Victoria, or 50,000 days Victorians previously spent in hospital recovering or undertaking rehabilitation can be done from the comfort of home – freeing up around 160 hospital beds.

The initiative will also improve quality of care, enabling patients to choose to recover in a familiar environment, rather than in hospital if they prefer.

Clinical evidence shows patients achieve better outcomes at home, where they avoid the physical deterioration, sleep disruption and social isolation associated with hospital stays.

The growth of telehealth during the coronavirus pandemic will also benefit from the Better at Home initiative, with more consultations able to be done with recovering patients through electronic channels.

Through the initiative funding will be available for health services to design and implement shared service models for home-based and virtual care, enabling them to upscale and specialise quickly.

Quotes attributable to Minister for Health Martin Foley

"The coronavirus pandemic has been extremely hard on Victorians, but we've also seen it inspire some innovative, more effective ways of caring for people – we want to ensure these programs remain available to Victorians."

"Expanding the Better at Home program will mean many patients, particularly in regional Victoria will have better outcomes because they can recover or do their rehab in the comfort and familiar surroundings of their own home"

"Through this initiative Hospitals and health services will be equipped with even more telehealth facilities, allowing patients to receive the very best care from the comfort of their home and without having to travel."

Tuesday, 3 May 2022

DELIVERING WORLD CLASS CARE FOR VICTORIANS AT HOME

Thousands more Victorians will now get access to our best clinicians, allied health professionals and nurses from the comfort of their own homes thanks to a massive funding boost in the *Victorian Budget 2022/23*.

Premier Daniel Andrews and Minister for Health Martin Foley today joined some of Victoria's best nurses to announce a \$698 million package to expand the *Better at Home* program.

We saw how much difference it made to thousands of Victorians who were able to get treatment and support at home during the pandemic - that's why the program is going to become a permanent option for patients under the Andrews Labor Government.

The investment will expand the program to help more than 15,000 Victorians access home-based care each year, in addition to telehealth check-ups.

It allows Victorians to access experienced nurses, clinicians and allied health professionals at home, surrounded by their loved ones as part of a more convenient and tailored experience.

The package will extend the *Hospital in the Home* beds that were established throughout the pandemic, increasing capacity to 358 virtual beds - providing ongoing care at home for Victorians so they don't need to go to hospital for treatment.

This investment is the equivalent of running a major hospital like Footscray Hospital and will enable health services to perform more elective surgeries and reduce how long patients stay in hospital.

A further \$3.6 million will also be invested to continue the delivery of the *Transitional Care Program* – a program which helps patients with a disability safely transition out of a hospital bed and into community-based accommodation while they are awaiting their NDIS package to be approved.

Around \$2.1 million will be invested in a pilot Aboriginal virtual specialist clinic, giving Aboriginal Victorians access to culturally appropriate health care and clinicians in rural and regional areas.

Quotes attributable to Premier Daniel Andrews

"Ensuring more Victorians can access Better at Home not only means better outcomes and more comfortable health care for Victorians but it'll help take the pressure of our hardworking frontline nurses, paramedics and doctors."

"I know from my own experience just how helpful getting care at home can be. It makes treatment and recovery so much easier when you're able to get personalised care brought directly to you."

Quotes attributable to Minister for Health Martin Foley

"The pandemic has been extremely hard, but we've also seen it inspire some better ways of caring for people, including Better at Home – which is why embedding it in our health system so more Victorians can use it is so important."

"These initiatives will ensure the best care for Victorians from the comfort of their own home and will mean our hospitals can take care of more elective surgery patients and treat our sickest patients faster."

"I had no idea what I was in for with this operation, having not been in hospital for over 20 years. The Clinical Partners program was marvellous and made me feel very confident going into the procedure. I could not thank you enough for the support"

"Thanks HH and the girls in the clinical partners team for arranging everything for me when I was in hospital. Big thank you for the physiotherapist from Ethos, they were absolutely marvellous. I don't want to have any future surgeries, but if I do I will definitely be coming back to you girls. Appreciative of the phone calls that were made whilst I was in hospital, everything couldn't have worked out better. When Ethos went to my home, he was so kind and really gave me clear expectations of my recovery and his assistance was so helpful. I really couldn't ask for anything more."

"Lovely to talk with you too Billi and wonderful to know I have support people walking (pardon the pun!) this journey beside me."

"Thank you Billi so much for going through everything today with me and for your professionalism with what you do"

"I can't speak more highly of the care I have been given for my procedure. I have not been in hospital in 41 years and as a wife of a husband that has had health issues I am not used to being looked after. Everyone has been so wonderful. The last time I was in hospital I almost died so going into hospital brings back lots of bad memories, I know it will be okay this time because everyone is looking after me."

"I do not think I would be this far ahead without the Clinical Partners or the CSP programs. I have absolutely loved having my physio at home, who has been so encouraging. The clinical partners program is the way to go. The home physio has been very honest and let me know I was behind in my rehab, which is what I needed to hear. Suffering from social anxiety, and hating big crowds, meant that staying in hospital for 2 weeks was not an option for me. I wanted to return to my home (retirement village), where I feel I have recovered better than I ever would in hospital."

'I'm really pleased to have you by my side for my upcoming surgery. Thank you!'

'I have been an nib member for 48 years, and am so thankful for Aalia's call to check in and see how I was going 2 days after surgery. With the care and kindness shown to throughout her surgery and recovery, why would I ever go to another fund.'

'I was so worried that my husband had to have an anaesthetic, worried about costs, and concerned about his recovery. I am so relieved to know there would not be any out-of-pocket charges (other

than his hospital excess) and thrilled to know that you would be calling me again to support me and my husband.'

'It is very much appreciated and reassuring to know you are available if and when I have questions (am sure I will have a few in the coming weeks!).'

'Hey Aalia, just wanted to thank you once again for your call today. The information you provided and depth of support that is in place makes me feel very much encouraged about a positive outcome.'

'I was so anxious going into the procedure the support I was provided put me at ease. I appreciated being contacted along the way and not having any out of pocket charges, such a huge relief for me and his wife.'

I am very thankful to have been referred to CP.'

Foreword

In Australia, we are fortunate to have one of the best healthcare systems in the world. The response to the COVID-19 pandemic has highlighted the dedication and expertise of our health workers, along with leadership and cooperation among our institutions and governing bodies.

Although the pandemic has dominated the health news and placed extra demands on the system, the longstanding challenges we face in health have not gone away. It is more important than ever to be strategic about our approach to the issues raised in this *Fourth Australian Atlas of Healthcare Variation*.

We must focus our resources on those with clinical need, and investigate variation to identify and minimise low-value care. Where we see high rates of preventable hospitalisations, clearly we must do better. In many cases, such as heart failure and chronic obstructive pulmonary disease, there is good evidence about what works to improve the care for people with these conditions. It is time to implement evidence-based care.

I thank our partner in producing this Atlas, the Australian Institute of Health and Welfare. I also thank the many individuals and institutions that have provided invaluable feedback on the data and commentaries: state, territory and Commonwealth health departments; policy makers; clinicians; clinical colleges and societies; and consumer representative organisations.

The healthcare variation data in the Atlas series help us to see patterns that we can't see from our localised perspectives and alerts us to problem areas. Please make use of the wealth of information in this Atlas to improve healthcare delivery.

**Professor Villis Marshall ac
Chair**

Australian Commission on Safety
and Quality in Health Care

28 April 2021

Overview

The *Australian Atlas of Healthcare Variation* series explores the extent to which use of health care in Australia varies depending on where people live, how their care is funded and their level of socioeconomic disadvantage. Where possible, it looks at how use of health care by Aboriginal and Torres Strait Islander people compares with use by other Australians; how health care use in urban regions compares to rural and remote regions of Australia; and how health care use for private hospital procedures compares to health care use for public hospital procedures. It uses maps and graphs of variations in care, derived from information routinely gathered by the health system, to show how use of health care differs according to these factors.

The aim is to prompt further investigation into whether the observed variation reflects a response to differences in people's healthcare needs or in the informed choices they make about their treatment options. Variation for these reasons is desirable and a hallmark of a sophisticated healthcare system. But when variation in the use of health services is due to other factors – such as the provision of patient care that is not supported by evidence, uncertainty about the intervention's place in therapy, or differences in access to care or in appropriateness of care – it is unwarranted variation and represents an opportunity for the health system to improve.

Overview

Improvements to the health system involve increasing awareness of, and access to, treatment options that produce better outcomes for consumers, and reducing the use of investigations or treatments with little or uncertain benefit. They can take many forms, from policy reform through to a person-centred system that includes patients in shared decision making. Where improvements are imperative and/or there are obvious groups or sectors of the health system to lead them, the Commission makes recommendations.

In this Atlas

This *Fourth Australian Atlas of Healthcare Variation* (the Atlas) examines variation in 17 healthcare items according to where consumers live, and it tracks changes over time for nine of these items. Some items were selected for re-examination in this Atlas because there have been interventions that would be expected to affect the rates or patterns of use. In other cases, we have re-examined items that were shown to have less than optimal use in the first analysis, but little has been done to improve patient outcomes.

The interpretation of data in this Atlas, and discussions of what can be done to improve care, have benefited from thorough consultation by the Australian Commission on Safety and Quality in Health Care (the Commission). Clinicians, policy makers, medicines use experts, researchers and consumer representative organisations have helped us identify the likely drivers of variation and the changes that are needed to prevent unwarranted variation. The Commission is grateful for these insights.

This Atlas has been produced in partnership with the Australian Institute of Health and Welfare (AIHW), who have contributed enormous expertise in their analysis and understanding of the data and data sources. Commonwealth, state and territory health departments have also been pivotal partners in providing data, and in working with the Commission to interpret findings and find potential avenues for improvements in healthcare delivery.

What has the Atlas series taught us?

Where we see variation, it must be investigated and explained. Does it reflect differences in consumer needs or preferences, or is it unwarranted? The Atlas data assists us to identify potentially unwarranted variation and reveals signs that suggest healthcare delivery is not optimal:

1. High rates of healthcare interventions that have a risk of harm and uncertain or no benefit, suggesting a need for decisive action
2. High rates of admission for potentially preventable conditions or complications of chronic illness that may be due to a lack of integrated care and variable implementation of evidence-based care
3. Low rates of investigation or treatment in groups with the highest burden of disease, indicating that barriers to appropriate access should be investigated and dealt with
4. Markedly higher rates of interventions, or repeat interventions, in some areas, without an obvious reason, raising concern about the degree of benefit gained, potential harms, and opportunity costs to the health system.

What can we do?

Education and training are important, but not sufficient for reducing unwarranted variation in healthcare delivery. The implementation of shared decision making as routine practice to ensure informed consent, system and regulatory changes, and appropriate distribution of resources, are needed if we are to achieve meaningful change.

The current remuneration system for healthcare providers in Australia rewards quantity rather than quality. We need different and complementary payment approaches that better recognise and support high-quality care. And to underpin such change, we need to improve how we measure appropriateness of care; for example, with greater use of clinical quality registries.

What is appropriate care?

Appropriate care means offering patients care that optimises benefits and minimises harms, and is based on the best available evidence. At a health system level, it also needs to take into account whether the people with the greatest clinical need are getting care.

A lack of evidence contributes to variation in use of some health interventions, such as spinal fusion. Increasing the evidence base must be a priority in these situations by, for example, mandating contributions to a clinical quality registry.

The commentaries in this Atlas present a variety of specific strategies for reducing unwarranted variation in the patient care items examined, as shown in the examples below.

Cease payment for non-medically indicated early planned births

This fourth Atlas includes a report on gestational age at planned caesarean section or induction of labour without a medical or obstetric indication. This follows a report in the third Atlas about gestational age at planned caesarean section without a medical or obstetric indication. Short-term adverse effects from planned caesarean section before 39 weeks' gestation are well-established, and more recent research has suggested concerning long-term developmental effects for children born before 39 weeks, such as poorer educational outcomes.¹⁻⁶ For this reason, the Commission examined the topic in the third Atlas and again in this Atlas, despite data limitations that must be considered when interpreting the findings.

As reported in Chapter 1, in the seven reporting states and territories, 43–56% of the planned caesarean sections performed at less than 39 weeks' gestation, did not have a documented obstetric or medical indication. Despite the likely overestimation in these figures because of data limitations (see 'Important notes about the data...' on page 49), these high estimated rates are a call to action.

Given that the short-term adverse effects from planned caesarean section before 39 weeks' gestation are well-established, and despite multiple clinical policy responses the practice continues, a financial lever is needed in Australia to prevent unnecessary harm from early planned births. This should include ceasing MBS benefits and private insurance payments, as well as changes to state, territory and hospital admission policies, to prevent non-medically indicated planned births before 39 weeks and improve neonatal outcomes.

Integrated care to reduce potentially preventable hospitalisations

Potentially preventable hospitalisations include hospitalisations that may have been prevented by provision of disease-based, evidenced-based practice with appropriate intervention earlier in the disease. More than 330,000 potentially preventable hospitalisations in Australia in 2017–18 were due to the five conditions examined in Chapter 2: chronic obstructive pulmonary disease (COPD), kidney infections and urinary tract infections, heart failure, cellulitis, and diabetes complications.⁷ Substantial variation was observed between the highest and lowest local area rates for each condition: from about 18 times as high for COPD to about six times as high for heart failure.

The high hospitalisation rates and substantial variation reported in this chapter show that recommended care is not always provided for people with chronic conditions. Despite major efforts to coordinate care for people with chronic diseases, fragmented care remains the major contributor to suboptimal outcomes for many patients.

Overview

A fundamental shift of healthcare investment to a better integrated primary care system must be made to improve health outcomes. Critically, health systems also need to become better at applying evidence-based interventions to reduce the progression of chronic disease and improve consumers' quality of life.

Trials of integrated care models have shown that people with advanced chronic diseases are routinely receiving suboptimal care. For example, potentially preventable hospitalisations were reduced by 37% among people with chronic disease who were enrolled in or who had attended the rapid access and stabilisation service in an integrated care model in Western Sydney.⁸ The model focuses on people with type 2 diabetes, COPD, and coronary artery disease or congestive heart failure. The Western Sydney Primary Health Network and Western Sydney Local Health District shared governance of the project. However, the separate funding of hospital and general practice care means only partial integration of care can be achieved.⁸ A single funding system for the health district, incorporating community, primary and hospital care, may achieve the best outcomes for people with chronic conditions.⁸

The Commission is working with the Independent Hospital Pricing Authority to design funding models for reducing potentially preventable hospitalisations, consistent with the long-term health reforms set out in the National Health Reform Agreement Addendum 2020–25.⁹ These reforms will be evidence based and will prioritise consumer outcomes. This work will build on the activities set out in the 2017 Bilateral Agreements on Coordinated Care between the Commonwealth and states and territories.

Audit and review to improve use of spinal fusion

Most people with chronic low back pain related to degenerative disorders do not have nerve-related symptoms. The role of spinal fusion in these circumstances is very limited and controversial.¹⁰ The *Fourth Australian Atlas of Healthcare Variation* found marked differences in rates of lumbar spinal fusion.

In 2015–2018, the rate of hospitalisation for lumbar spinal fusion was 12.4 times as high in the area with the highest rate compared with the area with the lowest rate, raising concern that the procedure is being used outside the guidelines in the areas with higher rates. The substantial variation in rates of lumbar spinal fusion, a procedure recommended in few circumstances, suggests an urgent need for peer review of clinical variation at a local level, as well as high-quality evidence about who may benefit from this surgery and the degree of benefit.

Patients offered spinal fusion surgery for low back pain should be fully informed of the potential benefits and risks for them. They must be given clear information about the likely outcomes, the gaps in evidence and other treatment outcomes so they can give fully informed consent for the procedure.

Health services should include clinical audit as a credentialing requirement for surgeons who perform lumbar spinal surgery. Priority should be given to improving access to services that provide multidisciplinary review and non-surgical treatments for chronic low back pain.

Reducing supply-driven gastroscopy

Chapter 5 examines rates of repeat colonoscopy and repeat gastroscopy within a shorter time frame than recommended in most situations. Rates were higher in major cities compared with remote areas, and in areas of socioeconomic advantage. Given the few good reasons for performing these repeated procedures, and the lack of correlation with prevalence of disease, the findings suggests overuse of the procedures in these areas.

Access to clinicians may influence the likelihood of people seeking care and affect the rates of repeat colonoscopy and repeat gastroscopy. Open access units that do not require consultant assessment of the appropriateness of requests, as well as greater remuneration for providing a service rather than a consultation, may also lead to variation and over-servicing in some areas.

Where supplier-induced demand is found to be a contributor to unwarranted variation, regulatory approaches are needed. For example, limiting provider numbers in some cases could improve appropriateness of care. Relevant clinical craft groups should also provide leadership about best practice to reduce over-servicing.

Informed consent

In all health care, consumers should be informed of the benefits and risks to them, and of appropriate alternatives. This is crucial when the intervention involves uncertain or little benefit. Ensuring women and their partners are informed of the benefits and risks is a powerful strategy for reducing harm from early planned birth without a medical or obstetric indication.

Giving young adults with gastroesophageal reflux symptoms information about the natural course of the disease, and how lifestyle modifications can help, will reduce inappropriate referral for gastroscopy (see Chapter 5). Improved consumer awareness of the appropriate timing of proton pump inhibitor dosing will also improve the effectiveness of treatment and reduce the need for higher doses or long-term use. Tools such as the AIHW cancer summary data tool¹¹ can support data-driven discussions with consumers on the rates of cancer in various age groups. Discussing the very low rate of gastroesophageal cancer in younger adults may reduce inappropriate requests for gastroscopy and repeat gastroscopy in this group (see Chapter 5).

Supporting self-management

Consultations for procedures such as colonoscopy are an opportunity to arm the consumer with strategies to reduce their subsequent risk – for example, by reducing the lifestyle-related risk factors for bowel cancer. At a population level, the frequency of bowel cancer could be significantly reduced with successful modification of the key population-attributable risks – that is, addressing diet (21.8%), physical inactivity (16.5%), excess weight (12.5%), smoking (7.4%) and alcohol use (5.5%).¹²

In chronic illness, self-management has a major bearing on the prevention of complications. It is the patients themselves who need to take their diabetes medications every day, quit smoking or do the exercises to manage their back pain. Educating people with chronic illness about self-management, and supporting them to be active and effective partners in their health care, has the potential to greatly improve health outcomes.

Overview

Improving equity in health care

A concerning pattern of inequity has emerged from all four Atlases. For example, the much higher rates of otitis media in Aboriginal and Torres Strait Islander children than in other Australian children are not matched by appropriately higher rates of myringotomy (see Chapter 3).

Conversely, where the patterns in the Atlas do follow known differences in the burden of disease, they highlight the need to improve prevention of chronic disease by addressing risk factors, and the need to improve prevention of serious complications in people who have developed disease. People living in areas of socioeconomic disadvantage have higher rates of chronic conditions such as diabetes, heart disease and chronic COPD.¹³ The Atlas series has made many recommendations for improving health care for underserved groups with specific conditions, but models of care and prevention need to better target health inequities in a systematic way.

A lack of community-based health services and long distances to travel contribute to the high hospitalisation rates for patients from remote and some regional areas. Anecdotally, a greater availability of beds in some small rural hospitals may also lead to a lower threshold for admitting patients. Services must be redesigned to increase the availability of health care close to home for people living in non-metropolitan areas.

Socioeconomic disadvantage may contribute to hospitalisations through a variety of mediators, such as greater disease severity, multiple comorbidities and poor health literacy.¹⁴ Long-term strategies are needed to address the social determinants of health. Complex social determinants also underlie the disparities in health between Aboriginal and Torres Strait Islander people and other Australians.^{15,16} To reduce health inequities, improvements in social factors are required – for example, in education, employment and living conditions.¹⁵

Misalignment of mainstream health services with Aboriginal and Torres Strait Islander culture is a barrier to accessing health care.¹⁷ Increasing access

to culturally safe health care will involve continuing to develop partnerships with the Aboriginal Community Controlled Health Service sector, increasing the Aboriginal and Torres Strait Islander health workforce, and improving cultural awareness and competency of mainstream health services.

Following evidence-based practice

For many of the conditions discussed in this Atlas, we have evidence of what works to improve outcomes for consumers, and we have evidence-based best practice spelt out in guidelines. Despite having this information available, the implementation is lacking – this constitutes inappropriate care.

For example, results of a recent Australian study found only 13% of heart failure patients received excellent care according to guidelines.¹⁸ Another Australian study also showed shortfalls in rates of prescribing recommended medicines for patients admitted to hospital for heart failure.¹⁹ Pulmonary rehabilitation is another example – it can reduce COPD-related hospitalisations by 36–56%^{20,21} and is recommended by guidelines.²² However, estimates of the use of pulmonary rehabilitation have ranged from less than 5% to 10% of people in Australia with COPD.²³ In each example, multiple factors contribute to the problem, and multi-pronged approaches are needed to support best practice.

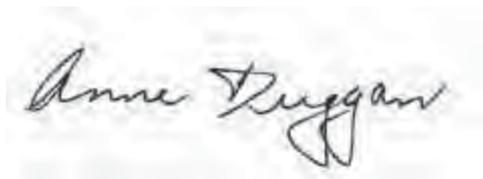

More effective prevention strategies

The need for many of the interventions analysed in the Atlas could be reduced by better prevention. For example, addressing lifestyle-related risk factors such as obesity and smoking could prevent a considerable proportion of chronic diseases and bowel cancers.¹³ A substantial reduction in risk factors could deliver significant benefits in terms of reduced burden of disease, as well as reduced expenditure on investigations and treatment for these diseases. Reducing unnecessary healthcare interventions has several further benefits, including reducing the associated carbon emissions, which will in turn benefit health at a societal level.

Conclusion

The Atlas series has highlighted many challenges and inequities in health care. It has also suggested reasons for variation, as well as realistic and specific recommendations for change. And it has shown how analysis and presentation of routinely collected data can promote action by organisations and clinical groups to investigate and improve appropriateness of care and the value Australians receive from their healthcare system. Many case studies in the Atlas show how innovative solutions, such as integrated care for people with chronic conditions, can improve health outcomes. Implementing successful interventions on a larger scale requires effective diffusion mechanisms, as well as funding reform.²⁴

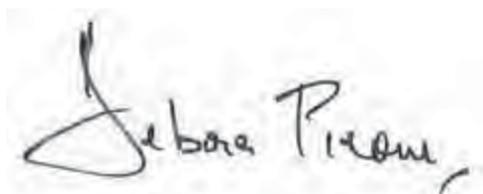

The maps and commentary in the four *Australian Atlases of Healthcare Variation* reveal many opportunities to deliver better health care in this country, by investigating and addressing both underuse and overuse of services, and by implementing targeted strategies to prevent chronic disease. Providing education and training is important, but not enough. We must make major system changes at all levels to achieve real progress.

Chief Executive Officer

28 April 2021

Why measure variation in healthcare use?

Getting the best outcomes for patients and reducing harm is the goal of the Atlas. Where we see substantial variation in use of a particular treatment, it is an alarm bell that should make us stop and investigate whether appropriate care is being delivered.

Variation in itself is not necessarily bad, and it can be good if it reflects health services responding to differences in patient preferences or underlying needs. When a difference in the use of health services does not reflect these factors, it is unwanted variation and represents an opportunity for the health system to improve.

Rates of an intervention that are substantially higher or lower in some areas can highlight:

- Clinical practice that is not supported by evidence-based guidelines
- Inequity of access to evidence-based care, and the need to deliver services more fairly
- Uncertainty about the intervention's place in therapy, and the need for better data on its benefits and harms
- Gaps in evidence accessible to clinicians, and the need for clinical care standards
- Inadequate system supports for appropriate care, and the need for changes in training or financial incentives.

Looking at how healthcare use varies between people living in different areas, between people with and without socioeconomic disadvantage, and between Aboriginal and Torres Strait Islander people and other Australians can show who in our community is missing out. Fundamental changes to address the underlying determinants of ill health, as well as better service delivery for those with existing disease, are needed where these inequities are found.

Overview

Responses to the Atlas series

The overall goal of the Atlas series is to improve the appropriateness of care. At a local level, the data can be used to make judgements and drive improvement in health care. At a national level, the Commission publishes recommendations for action using levers across the entire health system to effect change. Some of the most powerful levers recommended in the Atlas series have been aligning payments for health care with best-practice guidelines, developing clinical care standards, and incorporating the examination of healthcare variation into the National Safety and Quality Health Service Standards.

The Atlas series has prompted action across the health system to address variation in healthcare. Case studies highlighting responses to the Atlas reports on knee arthroscopy and psychotropic medicines are shown below. More example initiatives are described in the third Atlas, Chapter 6.

Case study: knee arthroscopy

Knee arthroscopy is a surgical procedure for examining the inside of the knee joint and, if necessary, repairing it. Arthroscopic procedures are not effective for treating knee osteoarthritis.²⁵ In older patients with knee pain caused by osteoarthritis or degenerative meniscal changes, arthroscopic procedures provide only minor pain relief, which is offset by an increased risk of harm.²⁶ In 2015, the first Atlas reported that there were more than 33,000 hospitalisations for knee arthroscopy in people aged 55 years and over in Australia in 2012–13.²⁸ The rate of hospitalisation was seven times higher in the area with the highest rate compared with the area with the lowest rate.²⁸

The Commission released the Osteoarthritis of the Knee Clinical Care Standard in light of the variation reported in the first Atlas and referred the findings to the MBS Review Taskforce, which subsequently recommended removal of funding for knee arthroscopy for degenerative changes.²⁸ The rate of knee arthroscopy in people over 55 years of age in Australia fell by 40% from 2015 to 2019.²⁹ Many drivers are likely to have contributed to this reduction, in addition to the Atlas.

Case study: state response to high rates of psychotropic medicine use

The first Atlas showed that several areas of Tasmania were among the highest users in Australia of anxiety and depression medicines.²⁷ Differences in rates of anxiety and depression in the population did not account for these high rates. Primary Health Tasmania undertook a comprehensive needs assessment to gain a deeper understanding of the Atlas findings, and to see how optimal treatment of anxiety and depression could best be supported.

Primary Health Tasmania, together with the Tasmanian Health Service and the Department of Health and Human Services, took a multi-pronged approach to improving the quality of clinical care. Quality improvement initiatives included auditing practice data, conversations with clinicians in target areas, providing peer support to improve practice, developing deprescribing resources and training clinicians in their use, and developing Tasmanian Health Pathways for mental health. The team assessed the availability of mental health services in different areas of Tasmania, and improved access where gaps were found. The team improved access to face-to-face social work and psychology supports, promoted consumer self-management tools for depression and anxiety, and increased the use of GP Mental Health Treatment Plans.

Key findings and recommendations

When variation in healthcare use reflects differences in the clinical needs or preferences of the people receiving care, it is warranted and means that the healthcare system is appropriately responding to population need. But some of the patterns of care in this Atlas, and the high rates of use of some treatments, suggest that greater attention needs to be paid to matching health care to people's needs to ensure appropriate care.

This Fourth Australian Atlas of Healthcare Variation shows that there is an opportunity to improve healthcare delivery to ensure that the best care is available to everybody, regardless of where they live. The Atlas also shows that we need to do better with data availability so that we can gain a comprehensive picture of the patterns of healthcare use in Australia and improve the value obtained from our healthcare system. This section presents the key findings from the Atlas, and the Australian Commission on Safety and Quality in Health Care (the Commission)'s recommendations for action. The Commission consulted widely, but is solely responsible for making the recommendations; as such, the recommendations may not reflect the views of all contributors to the Atlas.

Key findings and recommendations

1. Early planned births

Planned birth by caesarean section or induction (a medical treatment to start labour) is an important intervention in maternity care. However, the timing of birth should be carefully considered to ensure the best outcome for the mother and her baby.

When planning for birth by caesarean section or induction of labour, waiting until at least 39 weeks gestation results in better short- and long-term outcomes for the baby, unless there are medical or obstetric reasons for earlier birth. Short-term risks, such as respiratory problems and admission to neonatal intensive care, are higher for babies born at early term (by caesarean section or induction of labour) rather than full term.¹⁻⁴ There is also some evidence of longer-term risks in children born before 39 weeks gestation (either vaginally or by caesarean section) compared with those born at full term, such as cognitive deficits and a higher risk of attention deficit hyperactivity disorder (ADHD).⁵

Despite a number of data limitations (see page 49), the estimates presented in this chapter suggest that the percentage of caesarean sections performed before 39 weeks without a medical or obstetric indication may be substantial, and action is needed to reduce these rates.

Strategies to reduce rates of early planned birth without a medical or obstetric indication before 39 weeks gestation include:

- Changing policies of state and territory governments, hospitals and insurers to stop booking of early planned births without a medical or obstetric indication
- Giving parents information about the risks and benefits of early planned birth, and support for shared decision making
- Giving clinicians information about the risks and benefits of early planned birth
- Collecting data on the reason for early planned birth.

Gestational age	Range of state and territory rates* for caesarean sections without a medical or obstetric indication, as a percentage of all caesarean sections at these gestational ages, 2017
<37 weeks	13.3–19.3%
<38 weeks	24.8–32.7%
<39 weeks	42.8–56.1%

* Excludes Northern Territory

Gestational age	Range of state and territory rates* for induction of labour without a medical or obstetric indication, as a percentage of all inductions at this gestational age
<39 weeks	0.2–6.0%

* Excludes New South Wales and the Northern Territory

Recommendations

- 1a. It is recommended that pregnancies continue until at least 39 weeks gestation unless there is a medical or obstetric reason justifying earlier intervention.

- 1b. Health service organisations with maternity services, and clinicians, to implement systems to obtain informed patient consent that includes the provision of comparative information for prospective parents on the short- and long-term risks of early planned birth without a medical or obstetric indication.

- 1c. Health service organisations with maternity services to establish policies to cease booking planned births without a medical or obstetric indication before 39 weeks from July 2022 and to review adherence to these policies.

- 1d. Medicare Benefits Schedule payment for planned births before 39 weeks without a medical or obstetric indication to cease from July 2022.

- 1e. Health service organisations with maternity services, and clinicians, to ensure that care is consistent with The Whole Nine Months⁶ campaign.

- 1f. The Australian Institute of Health and Welfare (AIHW) to prioritise the development of the indicator on early caesarean section without a medical or obstetric indication in the National Core Maternity Indicators, including the need for a data element on the reason for early birth.

- 1g. All state and territory health departments to ensure consistent, routine collection and reporting of data on gestational age for planned births without a medical or obstetric indication to improve the quality of data collections. This should include reporting of gestational age in days to allow more in-depth understanding of the distribution of births occurring before 39 weeks.

- 1h. Health service organisations with maternity services to:

 - i. Report early planned births without a medical or obstetric indication as part of mandatory reporting of National Core Maternity Indicators

 - ii. Conduct audits of records documenting the communication of information to prospective parents about the risks of early planned births without a medical or obstetric indication, and provide the results back to clinicians to act upon, in line with Action 1.28 of the National Safety and Quality Health Service Standards

 - iii. Incorporate individual clinicians audit data as part of re-credentialing processes

 - iv. Report on agreed key performance indicators, trends and adverse events on early planned births without a medical or obstetric indication to the governing body.

- 1i. Short- and long-term risks arising from early planned birth without a medical or obstetric indication are avoidable. The Commission to include early caesarean section without a medical or obstetric indication in the national list of hospital-acquired complications.

Key findings and recommendations

2. Chronic disease and infection: potentially preventable hospitalisations

Potentially preventable hospitalisations are an indicator in the National Healthcare Agreement, and include hospitalisations that may have been prevented by appropriate management earlier in the disease. The rate of potentially preventable hospitalisations in a local area is likely to reflect sociodemographic factors as well as the quality of early disease management.⁷

More than 330,000 potentially preventable hospitalisations in Australia in 2017–18 were due to the five conditions examined in this chapter: chronic obstructive pulmonary disease (COPD), kidney infections and urinary tract infections (UTIs), heart failure, cellulitis, and diabetes complications.⁸ After standardising to remove age and sex differences between populations, substantial variation was observed between local areas (Statistical Area Level 3 – SA3) in the rates of hospitalisation for each condition. Variation was greatest for COPD (the highest rate was about 18 times higher than the lowest), cellulitis (about 16 times) and diabetes complications (about 12 times). For all the conditions examined, hospitalisation rates were higher among Aboriginal and Torres Strait Islander people, people living in areas of socioeconomic disadvantage, and those living in remote areas.

The high hospitalisation rates and substantial variation reported in this chapter show that recommended care is not always provided for people with chronic conditions. Even with the significant funding provided through Medicare to better coordinate primary care for people with chronic diseases, fragmented health care contributes to suboptimal management.

Likely contributors to variation include a higher proportion in some areas of patients with the most complex chronic disease, for whom hospitalisation may be inevitable. Poor access to health services in the community is also related to higher rates of potentially preventable hospitalisations. Ability to access health services is determined not only by clinician supply, but also by costs, transport and sufficient health literacy to know when to seek care.

Healthcare investment must be redirected to create a better-integrated primary care system to reduce potentially preventable hospitalisations. Critically, health systems also need to become better at reducing the progression of chronic disease and improving patients' quality of life.

Data item	Range across local areas* per 100,000	Times difference	Times difference excluding top and bottom 10%	Number during 2017–18
2.1 Chronic obstructive pulmonary disease (COPD)	56 – 1,013	18.1	3.3	77,754
2.2 Heart failure	91 – 531	5.8	2.0	62,554
2.3 Diabetes complications	64 – 782	12.2	2.9	50,273
2.4 Kidney infections and urinary tract infections	141 – 893	6.3	2.3	76,854
2.5 Cellulitis	90 – 1,393	15.5	2.9	68,663

* Statistical Area Level 3

Recommendations

2a. Consistent with the commitments made under the National Health Reform Agreement and building on the activities set out in the 2017 Bilateral Agreement on Coordinated Care, Local Hospital Networks, Primary Health Networks and the Aboriginal Community Controlled Health Service sector to implement the following principles in developing chronic disease management programs consistent with the National Strategic Framework for Chronic Conditions:

- i. Patients, families and carers as partners in care, where patients are activated to maximise their knowledge, skills and confidence to manage their health, aided by technology and with the support of a healthcare team
- ii. A risk stratification approach that supports identification of patients with high coordination and multiple provider needs, to ensure personalisation of service provision
- iii. Flexible service delivery and team-based care that supports integrated patient care across the continuum of the health system through shared information and care planning
- iv. A commitment to care that is of high quality and safe, including care planning and clinical decisions that are guided by evidence-based patient healthcare pathways, appropriate to the patient's needs
- v. Data collection and sharing by patients and their healthcare teams to measure patient health outcomes and improve performance.

2b. The Commission, the Independent Hospital Pricing Authority and the Administrator of the National Health Funding Pool to identify and develop alternative approaches to funding for chronic disease and infection that could be applied to the National Health Reform Agreement Pricing and Funding model so that pricing and funding are aligned with best-practice guidelines.

The alternative models could include bundled payments, capitation payments or regionally coordinated service responses.

COPD

2c. Local Hospital Networks, Primary Health Networks and the Aboriginal Community Controlled Health Service sector to implement appropriate care for the management of people with chronic obstructive pulmonary disease (COPD) using the *COPD-X Plan: Australian and New Zealand guidelines for the management of chronic obstructive pulmonary disease 2020*⁹ as the routine model of care.

Heart failure

2d. Local Hospital Networks, Primary Health Networks and the Aboriginal Community Controlled Health Service sector to implement process improvement for the effective management of people with heart failure, including:

- i. Multidisciplinary care across the acute and primary care sectors
- ii. A combination of strategies, including non-pharmacological approaches such as physical activity programs and fluid or dietary management, and pharmacotherapy.

Diabetes

2e. Local Hospital Networks, Primary Health Networks and the Aboriginal Community Controlled Health Service sector to promote appropriate care for the management of people with diabetes aligned with:

- i. *The Management of Type 2 Diabetes: A handbook for general practice (2020)*
- ii. The Australian National Diabetes Strategy 2016–2020.

Key findings and recommendations

3. Ear, nose and throat surgery for children and young people

Tonsillectomy

Tonsillectomy is used to treat recurrent throat infections (tonsillitis) and obstructive sleep apnoea (OSA), but there are uncertainties about its benefits. It is one of the most common surgical procedures performed in children in Australia – at a rate higher than in New Zealand or the United Kingdom.

After standardising to remove age and sex differences between populations, the Atlas found that, in 2017–18, the rate of hospitalisation for tonsillectomy in children and young people was six times higher in the local area with the highest rate than in the area with the lowest. It also found that the rate of tonsillectomy hospitalisations increased by 3% between 2012–13 and 2017–18.

There is a need for more information to ensure evidence-based care is provided to children with recurrent tonsillitis or OSA. Further developing the Australian Society of Otolaryngology Head and Neck Surgery Ear, Nose and Throat data registry could add to the knowledge base about outcomes for specific patient groups and provide information for effective peer review of tonsillectomy.

Myringotomy

Myringotomy is another common surgical procedure performed in young children. It is used to treat otitis media, an infection of the middle ear that can cause hearing loss.

Myringotomy (with insertion of grommets) is recommended for children who have otitis media with effusion (fluid) and documented hearing loss in both ears for more than three months.

Otitis media is the key cause of hearing loss in Aboriginal and Torres Strait Islander children, who are at risk of earlier, more severe and longer-lasting middle ear disease than other children. The Atlas examined rates in Aboriginal and Torres Strait Islander children for the first time.

The Atlas found that, in 2017–18, the rate of hospitalisation for myringotomy in children and young people was about eight times higher in the local area with the highest rate than in the area with the lowest. Although the rate for Aboriginal and Torres Strait Islander children was 6% higher than the rate for other children, it was lower than would be expected if surgery rates matched the prevalence of otitis media in Aboriginal and Torres Strait Islander children.

A comprehensive approach combining prevention, early treatment and coordinated management is urgently required to reduce rates of otitis media in Aboriginal and Torres Strait Islander children.

Data item	Range across local areas* per 100,000	Times difference	Times difference excluding top and bottom 10%	Number during 2017–18
3.1 Tonsillectomy hospitalisations, 17 years and under	305 – 1,836	6.0	2.2	42,509
3.2 Myringotomy hospitalisations, 17 years and under	198 – 1,607	8.1	2.3	34,755

* Statistical Area Level 3

Recommendations

Tonsillectomy

3a. The Australian and New Zealand Society of Paediatric Otorhinolaryngology to work with relevant clinical colleges to develop clinical guidelines on tonsillectomy in children, and subsequent to this the Commission to develop a clinical care standard with safety and quality indicators.

3b. Health service organisations to:

- i. Conduct audits of indications for tonsillectomy and tonsillectomy rates to monitor variation and provide the results back to clinicians to act upon in line with Action 1.28 of the National Safety and Quality Health Service (NSQHS) Standards

 - ii. Incorporate individual clinician's audit data as part of recredentialing processes.
-

Myringotomy

3c. State and territory health departments and health service organisations to set benchmarks for access to paediatric audiology services.

3d. The Australian Government Department of Health to develop and implement two national ear and hearing health performance indicators for Aboriginal and Torres Strait Islander children consistent with the recommendations of the National Aboriginal and Torres Strait Islander Hearing Health Advisory Panel:

- i. Measure the proportion of Aboriginal and Torres Strait Islander children who received an annual ear and hearing health check and the proportion of these who were found to have ear and/or hearing health conditions

 - ii. Measure the proportion of Aboriginal and Torres Strait Islander children who received audiology services and the proportion of those diagnosed with hearing loss.
-

3e. The Australian Government Department of Health, as part of the Roadmap for Hearing Health, to publish data on progress against the integrated national approach to undertaking ear health checks of children aged 0–6, with the goal of every Aboriginal and Torres Strait Islander child having regular ear health checks.

3f. Health service organisations to:

- i. Conduct audits of myringotomy and myringotomy rates to monitor variation and provide the results back to clinicians to act upon in line with Action 1.28 of the NSQHS Standards

 - ii. Incorporate individual clinician's audit data as part of recredentialing processes.
-

Key findings and recommendations

4. Lumbar spinal surgery

Lumbar spinal surgery refers to surgery in the lumbar spine or lower back. It is sometimes used to treat degenerative spinal disorders, which is the focus of this chapter. Two common lumbar spinal procedures are fusion and decompression. The Atlas excludes use of spinal surgery for treating infection, tumours or injury.

Degenerative spinal disorders are a diverse group of conditions that can cause chronic low back pain, leg pain and disability. Lumbar spinal surgery is generally only considered for certain degenerative spinal disorders if non-surgical options have not worked. There are limited data on patient outcomes, due in part to difficulties in conducting high-quality randomised controlled trials of these types of surgery.

Spinal fusion

Spinal fusion surgery involves joining two or more vertebrae using a bone graft. It has a role in treating a small minority of people who have degenerative spinal disorders that include nerve-related problems. Most people with chronic low back pain related to degenerative disorders do not have nerve-related symptoms. The role of spinal fusion in these circumstances is limited and controversial.

After standardising to remove age and sex differences between populations, the Atlas found that, in 2015–2018, the rate of hospitalisation for lumbar spinal fusion was about 12 times higher in the local area with the highest rate than in the area with the lowest. There was a 4% fall in the national rate of lumbar spinal fusion, and a 25% fall in the rate of lumbar spinal fusion excluding decompression, between 2012–2015 and 2015–2018.

Spinal decompression

Spinal decompression aims to increase the amount of the space in the spinal canal to relieve pressure on nerves and blood vessels. After standardising to remove age and sex differences between populations, the Atlas found that in, 2015–2018, the rate of hospitalisation for lumbar spinal decompression was about eight times higher in the local area with the highest rate than in the area with the lowest. The national rate of lumbar spinal decompression fell by 6% between 2012–2015 and 2015–2018.

Addressing variation

Priority should be given to examining and improving access to services that provide multidisciplinary review and non-surgical treatments for chronic low back pain. The Australian Spine Registry should be developed to support data collection on all patient outcomes. Surgeons should contribute data on all consenting patients, and regularly audit and review patient outcome data with their peers.

Data item	Range across local areas* per 100,000	Times difference	Times difference excluding top and bottom 10%	Number during 2015–18
4.1 Lumbar spinal fusion, 18 years and over	7 – 87	12.4	2.7	14,608
4.2 Lumbar spinal decompression excluding fusion, 18 years and over	27 – 209	7.7	2.1	43,185

* Statistical Area Level 3

Recommendations

4a. Health service organisations and Primary Health Networks to implement evidence-based pathways for the management of low back pain consistent with the care described in the Low Back Pain Clinical Care Standard (planned for publication in late 2021).

4b. Health service organisations where lumbar spinal surgery is conducted to implement evidence-based guidelines; for example, the National Institute for Health and Care Excellence guidelines: *Low Back Pain and Sciatica in Over 16s: Assessment and management*.

4c. The Royal Australasian College of Surgeons to require surgeons performing lumbar spinal surgery to participate in the Australian Spine Registry as part of mandatory continuing professional development requirements.

4d. The Commission to work with relevant specialist organisations to develop a list of key safety and quality indicators for the management of specified spinal conditions, which can be used by members for audit of their practice.

4e. Health service organisations to:

i. Develop and implement scope of clinical practice models for surgeons undertaking spinal surgery

ii. Audit spinal surgery and provide the results back to clinicians to act upon in line with Action 1.28 of the National Safety and Quality Health Service (NSQHS) Standards

iii. Incorporate individual spinal surgeons' audit data as part of re-credentialing processes

iv. Report key performance indicators, trends and adverse events in spinal surgery to their governing body, consistent with the NSQHS Standards.

4f. Primary Health Networks to implement a nationally agreed health pathway for management of low back pain, including imaging and referral indications, based on the Commission's Low Back Pain Clinical Care Standard (planned for publication in late 2021).

Key findings and recommendations

5. Gastrointestinal investigations

Gastroscopy 18-54 years

Gastroscopy is used to investigate, treat or monitor conditions of the upper part of the gastrointestinal (GI) tract. Most conditions that affect the upper GI tract and require gastroscopy are uncommon in people aged under 55 years.

After standardising to remove age and sex differences between populations, the Atlas found that, in 2018–19, the rate of Medicare Benefits Schedule (MBS)–subsidised services for gastroscopy for people aged 18–54 years was almost 11 times higher in the local area with the highest rate than in the area with the lowest. Rates were markedly higher in major cities than elsewhere. Almost two-thirds of gastroscopy services were performed on the same day as a colonoscopy for the same person.

Repeat gastroscopy, all ages

Few people who have an initial gastroscopy require another within three years. Repeat gastroscopy is used mainly to monitor conditions that can increase the risk of upper GI cancer or bleeding in high-risk groups.

The Atlas found that, in 2018–19, the rate of MBS-subsidised services for repeat gastroscopy performed within two years and 10 months of an earlier gastroscopy was almost 15 times higher in the local area with the highest rate than in the area with the lowest. Rates were markedly higher in major cities and also increased in with socioeconomic advantage.

Development and application of national guidance on the appropriate use of gastroscopy is needed. These should include guidance on when it is appropriate to repeat the procedure. Interventions to educate clinicians and consumers that the risk of upper GI cancer is low for most people, especially those aged under 55 years, are required.

Repeat colonoscopy, all ages

Repeat colonoscopy is used mainly to monitor for bowel cancer in people at increased risk of developing it. The timing of repeat colonoscopy is based on bowel cancer risk. A limited number of people who have an initial colonoscopy require another within three years.

After standardising to remove age and sex differences between populations, the Atlas found that, in 2018–19, the rate of MBS-subsidised services for repeat colonoscopy performed within two years and 10 months of an earlier colonoscopy was almost 20 times higher in the local area with the highest rate than in the area with the lowest. Rates were markedly higher in major cities and increased with socioeconomic advantage.

A concerted focus by clinicians, medical colleges and health service organisations to drive implementation of the national surveillance guidelines and the *Colonoscopy Clinical Care Standard* could reduce the frequency of inappropriate repeat colonoscopies.

Data item	Range across local areas* per 100,000	Times difference	Times difference excluding top and bottom 10%	Number during 2018–19
5.1 Gastroscopy MBS services, 18–54 years	218 – 2,348	10.8	2.9	154,338
5.2 Repeat colonoscopy MBS services, all ages	62 – 1,236	19.9	2.7	147,875
5.3 Repeat gastroscopy MBS services, all ages	61 – 908	14.9	3.1	87,933

* Statistical Area Level 3

Recommendations

- 5a. State and territory health departments to develop and implement evidence-based triage criteria for the prioritisation and allocation of patients to gastroscopy, colonoscopy, and gastroscopy performed with colonoscopy.
-
- 5b. Health service organisations to:
- i. Audit clinicians performing endoscopy services and provide the results back to clinicians to act upon, in line with Action 1.28 of the National Safety and Quality Health Service (NSQHS) Standards

 - ii. Incorporate individual clinicians' audit data as part of re-credentialing processes

 - iii. Report key performance indicators, trends and adverse events in endoscopy to the governing body, consistent with the NSQHS Standards.
-
- 5c. The Gastroenterological Society of Australia to develop a position statement on the appropriate use and timing of gastroscopy, and of gastroscopy performed with colonoscopy, for gastroenterologists and general practitioners.
-

Key findings and recommendations

6. Medicines use in older people

Polypharmacy, 75 years and over

Polypharmacy is the concurrent use of multiple medicines. It is common in older people, because they are more likely to have chronic diseases that require management with medicines. Although polypharmacy may be appropriate for some older people, it can increase the risk of harm from medicines.

After standardising to remove age and sex differences between populations, the Atlas found that, in 2018–19, the rate of people aged 75 years and over dispensed five or more medicines was about six times higher in the local area with the highest rate than in the area with the lowest. Almost 40% of people aged 75 years and over were dispensed five or more medicines. Rates of polypharmacy were higher in major cities than elsewhere, and rates increased with socioeconomic disadvantage, except in remote areas.

Medication management reviews, 75 years and over

Residential Medication Management Review (RMMR) and Home Medicines Review (HMR) are two types of medicine reviews available to people living in aged care facilities or at home. The reviews aim to help people to get the maximum benefit from their medicines and prevent medicines-related harm.

After standardising to remove age and sex differences between populations, the Atlas found that, in 2018–19, the rate of people aged 75 years and over who had at least one Medicare Benefits Schedule–subsidised service for an RMMR or HMR was almost 12 times higher in the local area with the highest rate than in the area with the lowest rate. About 5.4% of people had a review. Similar to the pattern with polypharmacy, rates were higher in major cities and increased with socioeconomic disadvantage.

Interventions for identifying people at risk of harm from polypharmacy, such as frail people and those with multiple morbidities, are needed. System changes are needed to improve access to RMMR and HMR services for these at-risk groups. Initiatives to improve uptake of pharmacist recommendations may improve the effectiveness of the review services.

Proton pump inhibitor medicine dispensing, 75 years and over

Proton pump inhibitor (PPI) medicines are effective in managing gastro-oesophageal reflux disease. They are commonly used in older people, often at higher doses or long term, without reassessment of need. Older people may be especially susceptible to harms from long-term use.

After standardising to remove age and sex differences between populations, the Atlas found that, in 2018–19, the rate of dispensing of PPI medicines to people aged 75 years and over was about six times higher in the local area with the highest rate than in the area with the lowest. Almost half people aged 75 years and over had at least one prescription dispensed for a PPI medicine.

Targeted interventions that prompt clinicians to regularly review the need for PPI medicines in older people are needed.

Data item	Range across local areas* per 100,000	Times difference	Times difference excluding top and bottom 10%	Number during 2018–19
6.1 Polypharmacy, 75 years and over	11,206 – 72,059	6.4	1.4	690,516
6.2 Medication management reviews, 75 years and over	1,618 – 19,006	11.7	2.0	96,533
6.3 Proton pump inhibitor medicines dispensing, 75 years and over	131,393 – 777,098	5.9	1.4	7,114,281

* Statistical Area Level 3

Recommendations

6a. The Commission, in collaboration with the Australian Government Department of Health, the Aged Care Quality and Safety Commission, NPS MedicineWise and relevant groups, to develop nationally consistent:

i. Guidance for people taking multiple medicines

ii. Guidance about the communication of reports to medical practitioners from Residential Medication Management Reviews and Home Medicines Reviews

iii. Measures for aged care homes to compare the percentage of residents who have received Residential Medication Management Reviews and the percentage of pharmacists' recommendations, in line with the Commonwealth's development of the National Aged Care Mandatory Quality Indicator Program

iv. Guidance for the establishment, governance, composition and operation of Medication Advisory Committees within aged care homes.

6b. The Australian Government Department of Health to investigate ways of collecting patient-level data on the supply of Pharmaceutical Benefits Scheme medicines through the S100 Remote Area Aboriginal Health Services Program to gather accurate information about the use of medicines in rural and remote Aboriginal communities.

General recommendations

Responsibilities of governing bodies

7a. Governing bodies to prioritise review of audit data, consistent with Action 1.28 of the National Safety and Quality Health Service (NSQHS) Standards for the following topics:

- i. Early birth
- ii. Tonsillectomy and myringotomy
- iii. Lumbar spinal surgery
- iv. Gastroscopy and colonoscopy.

Diagnosis and appropriateness of care

7b. Health service organisations to promote documentation in the healthcare record of a patient's diagnosis, or provisional diagnosis, in relation to their investigation and management. This can be used to improve the appropriateness of care, and should be communicated to the patient to increase their understanding of their care.

Clinical quality and appropriateness indicators

7c. The Commission to identify priority areas for development of nationally agreed, specialty-specific clinical quality and appropriateness indicators, and work with clinical colleges, professional societies and jurisdictions to develop these.

Clinical audit

7d. Clinical colleges and professional societies to mandate clinical audit, using agreed specialty-specific indicators where these exist, as a requirement of continuing professional development.

Registries

7e. Clinical quality registries:

- i. As part of their governance framework, all clinical quality registries to include sets of indicators for quality and appropriateness of care, to be used for clinical audits at a health service organisation and clinician level
- ii. To provide health service organisations and clinicians with regular reports showing their data for these indicators and how their data compares with data from other services
- iii. To develop and publish their indicator sets in METeOR (National Metadata Online Registry).

7f. Health service organisations to:

- i. Require clinicians to participate in data collection and quality improvement activities of relevant clinical quality registries, with the aim of improving patient outcomes
- ii. Ensure that data and analyses from clinical quality registries are used efficiently in clinical peer review meetings; that records are kept of these meetings, including the clinicians who have attended them and any actions that are being taken to improve care as a result of the discussions; and that the results are reported to and reviewed by the organisation's governing body as part of the clinical governance framework.

Health pathways

7g. The Australian Government Department of Health to develop guidance for Primary Health Networks about the development of nationally consistent Health Pathways, aligned with the Commission's clinical care standards.

Health workforce

7h. The Australian Government Department of Health's health workforce unit to:

- i. Map the specialist medical workforce by geographical area
- ii. Quantify the supply of newly trained specialists entering the workforce, by geographical area
- iii. Work with clinical colleges to understand projected specialty workforces
- iv. Map the current workforce by clinical specialty (including nursing, midwifery and allied health) relevant to priority clinical conditions to identify where there are areas of over and undersupply. Mapping the workforce for non-surgical management of back pain (e.g. physiotherapy, chronic pain management) should be a priority
- v. Develop strategies to prevent oversupply in particular geographical areas, with the objective of building capacity in rural and remote areas (rather than fly-in-fly-out arrangements) and reducing the personal and financial cost of population exposure to low value care driven by oversupply.

Patient Reported Outcome Measures

7i. The Commission to recommend validated Patient reported outcome measures (PROMs) for:

- i. Pregnancy and childbirth
- ii. Low back pain.

About the Atlas

Who has developed the Atlas?

The Australian Commission on Safety and Quality in Health Care (the Commission), in collaboration with the Australian Institute of Health and Welfare (AIHW), has led the development of the fourth Atlas.

Development has involved broad consultation with:

- The Australian Government Department of Health
- State and territory health departments and agencies
- Professional colleges and specialist societies
- Clinicians
- Healthcare organisations.

An oversight and advisory structure, including a state and territory advisory group (Jurisdictional Advisory Group) and a Primary Care Expert Advisory Group, has ensured wide-ranging input into the development of the fourth Atlas. For each chapter, a Topic Expert Group of lead clinicians and academic experts from across Australia was established. The Topic Expert Groups provided advice at key stages of development, including the interpretation of the Atlas findings. Members of the advisory groups were required to sign a confidentiality agreement and declare conflicts of interest before release of the preliminary data. The AIHW conducted the data extraction and analysis, produced the maps, graphs and tables, and provided expertise in interpreting the data.

How was it developed?

The Atlas examines a selection of procedures, investigations, treatments and hospitalisations in a range of clinical areas. A large number of clinical items were nominated and considered for inclusion, but many were not suitable because of poor data quality or small numbers, which limited the capacity to analyse and present the data. The final selection of clinical items reflects the following criteria:

- High levels of current or projected use
- Significant current or projected disease burden
- Significant potential for harm
- High use of health system resources
- Interest in the topic and clinical engagement to support review and action
- Availability of suitable data
- Important to monitor changes over time and compare with previous Atlas reports

The clinical items that met these criteria were reviewed by the Jurisdictional Advisory Group, the Primary Care Expert Advisory Group, and the Commission's executive. Following confirmation of clinical items for analysis, Topic Expert Groups were established around specific clinical themes. The Topic Expert Groups were consulted on prioritisation of the clinical items for analysis and on development of the data specifications, where possible. Following analysis of the data for each clinical item, the Jurisdictional Advisory Group, the Primary Care Expert Advisory Group and the Topic Expert Groups reviewed the results.

The expert groups also provided content for, and reviewed, the clinical commentaries. Their suggestions and the Commission's reviews of the literature were used as the basis for commentary on the possible reasons for healthcare variation and strategies for addressing variation. The clinical commentaries were also reviewed by:

- AIHW
- Medicine use experts

- The National Aboriginal and Torres Strait Islander Health Standing Committee
- Relevant clinical colleges.

More than 150 clinicians, researchers, policy experts and consumer representative organisations have examined and provided input on the clinical commentaries and data visualisations.

What does the Atlas measure?

The data in the Atlas show the rates for featured procedures, investigations, treatments or hospitalisations in each geographic area. To calculate rates, the number of interventions that occurred in an area is divided by the population of that area. Rates are age and sex standardised. Rates are based on the patient's place of usual residence and not the location of the hospital, clinic or pharmacy where the service was provided.

Why are the data age standardised and sex standardised?

The data in the Atlas have been age standardised (that is, controlled for age) so that fair comparisons can be made between areas that have different age structures. Without age standardisation, it would be difficult to know whether higher rates of an intervention in an area with a large number of retirees, for example, were due only to the older age of the local population. The data are also sex standardised, so that having a larger proportion of males or females in an area does not influence the findings. The early planned births (caesarean or induction) indicators are not age standardised because of small numbers.

Age standardisation involves calculating the rate in each area as if the area had a standard proportion of older and younger people. Sex standardisation involves calculating the rate in each area as if the area had a standard proportion of males and females. The resulting age- and sex-standardised rates can then be compared for all areas, knowing that differences in age and sex structure of the population have been accounted for.

About the Atlas

Magnitude of variation

The magnitude of variation (or ‘times difference’) shows how large the difference is between the lowest and highest rates of each intervention, and is expressed as a ratio of the highest to the lowest rates. For example, if the lowest rate was 10 per 100,000 people and the highest rate was 20 per 100,000 people, the magnitude of variation is two-fold.

Australian rate

Rates for an intervention may appear higher or lower than the Australian rate; in most cases, the most appropriate rate is difficult to define and not necessarily the Australian rate. Depending on the intervention, a higher or lower rate may be clinically appropriate. It is difficult to conclude what proportion of the variation is unwarranted or to comment on the relative performance of health services and clinicians in one area compared with another. An Australian rate is provided to encourage investigation into the reasons for any variation seen at local, regional, or state and territory levels.

About the data

The Atlas provides information on clinical items grouped into six clinical themes, covering procedures, investigations, treatments or hospitalisations.

The introduction to each chapter provides an overview of the clinical items; international comparisons, where possible; national and state or territory initiatives to improve care; and key findings and recommendations. Specific data limitations are also outlined. Clinical commentary is presented alongside each item, outlining the context, magnitude of variation, and possible reasons for the variation.

The fourth Atlas uses data sourced from four national health datasets:

- Medicare Benefits Schedule (MBS)
- National Hospital Morbidity Database (NHMD)
- National Perinatal Data Collection (NPDC)
- Pharmaceutical Benefits Scheme (PBS).

The years of data shown for each clinical item depend on the source and the most recently available data:

- MBS items are analysed for services provided in 2018–19
- NHMD items are analysed for hospitalisations in
 - 2014–15 to 2017–18 for potentially preventable hospitalisations
 - 2012–13 to 2014–15 and 2015–16 to 2017–18 for lumbar spinal surgery items, which are analysed for three combined years because of small numbers
 - 2012–13, 2015–16 and 2017–18 for ear, nose and throat surgery items
- The NPDC item is analysed for early planned births (caesarean or induction) in 2017
- PBS items are analysed for prescriptions dispensed in 2018–19.

Data were rerun for selected hospitalisation indicators from previous Atlases to allow robust comparison of rates over time through time-series analyses. Due to changes in data specifications and updates to NHMD datasets, some fourth Atlas results may differ from those reported in previous Atlases.

For MBS and PBS items, the Medicare enrolment postcode is used as a proxy for the patient residence because it corresponds to most people’s usual residence. For NHMD items, the rates are determined by the person’s usual place of residence as recorded at the time of hospital admission. For the NPDC item, the rates are based on the mother’s place of residence.

The Atlas presents age- and sex-standardised rates per 100,000 people for all items, except for the NPDC items, which are presented as a percentage. NPDC data are not standardised, as a result of small numbers.

Rates are age and sex standardised to the Australian population using the Australian Bureau of Statistics (ABS) Estimated Resident Populations (ERPs). The standard population is ERP at 30 June 2001. The denominator population estimates are based on ERPs, and are either at 30 June or 31 December, depending on data sources.

Population estimates as at 31 December in the relevant year were used as the denominator for indicators based on NHMD data for 2012–13 to 2017–18. For example, population estimates as at 31 December 2017 were used for 2017–18. Population estimates as at 31 December were calculated as the average of the 30 June population estimates before and after the relevant December.

Where three years of data were combined, the denominator was the sum of the population estimates as at 31 December for each year.

Population estimates as at 30 June 2018 were used as the denominator for indicators based on MBS and PBS data for 2018–19.

The geographic local areas used are ABS standard geographical regions known as the Statistical Areas Level 3 (SA3). SA3s provide a standardised regional breakdown to assist in analysing data at the local level. SA3s generally have populations between 30,000 and 130,000 people. To enable comparisons, local areas are also grouped by Primary Health Network, state and territory, and by remoteness and socioeconomic status.

Primary Health Networks connect health services across a specific geographic area so that patients, particularly those needing coordinated care, have access to a range of services.

Remoteness is calculated according to the ABS Australian Statistical Geography Standard (ASGS) 2016 using Statistical Area Level 1 (SA1) to remoteness concordance. SA1 population was concorded to SA3, and the remoteness category

with the highest percentage of SA3 population was allocated to the SA3. The remote and very remote categories were combined into one, giving a total of four remoteness categories (Major Cities, Inner Regional, Outer Regional, Remote).

The socioeconomic quintiles are based on the ABS 2016 Index of Relative Socio-Economic Disadvantage at the SA1 level. The quintile with the highest number of SA1s was allocated to the SA3. Some quintiles were combined within a remoteness category to ensure sufficient numbers of SA3s for comparison purposes.

Defined daily dose (DDD) is a measurement unit of assumed average maintenance dose per day for a medicine used for its main indication in adults, created by the World Health Organization. The DDD does not necessarily correspond to the recommended or average prescribed daily dose.

Use of DDDs allows comparisons of medicine dispensing independent of price, preparation and quantity per prescription. Expressing medicine dispensing in DDDs per thousand people per day (DDDs/1,000/day) allows the aggregation of data for medicines that have different daily doses.

The data specifications for each item can be accessed on the AIHW Metadata Online Registry (METeOR) at meteor.aihw.gov.au

Data limitations

The clinical items describe variation in health service provision. It is not currently possible to conclude what proportion of the variation is unwarranted, or to comment on the relative performance of health services and clinicians in one area compared with another. The data are provided to encourage and promote further analysis and discussion about variation at local, regional, and state and territory levels.

About the Atlas

Some data have been suppressed for the following reasons:

- To protect confidentiality of a patient – for example, when the number of prescriptions and the population are very small; this could potentially lead to identifying a patient
- To protect confidentiality of a service provider or a business entity in the MBS data – for example, when the services are predominantly provided by one or two providers
- To account for low numbers of events or very small populations – these rates are more susceptible to random fluctuations
- To preserve confidentiality – data suppressed in isolation may be calculable from the presented totals unless accompanied by other data suppressions to prevent back-calculation.

Suppressed SA3 data are included for larger area analysis.

Data for Aboriginal and Torres Strait Islander people

Data according to Aboriginal and Torres Strait Islander status have been provided for NHMD and NPDC items only. Analysis was not undertaken by Aboriginal and Torres Strait Islander status for the MBS and PBS data because this information is not available.

Analyses in this report have not been adjusted to account for the under-identification of Aboriginal and Torres Strait Islander people in NHMD and NPDC datasets. Data by Aboriginal and Torres Strait Islander status should be interpreted with caution because hospitalisations for Aboriginal and Torres Strait Islander patients are under-enumerated, and there is variation in the under-enumeration among states and territories.

Maps and graphs

Data for each of the items in the Atlas are displayed as maps and graphs to show variation in rates by geographic location of patient residence.

On the maps, age- and sex-standardised rates in each of the geographic areas are ranked from lowest to highest and then split into 10 categories (deciles). These are displayed with colour gradients, where darker colours represent higher rates and lighter colours represent lower rates. Separate maps show the greater capital city areas in more detail.

Standard figures are provided for NHMD, MBS and PBS items where data are available. Each figure presents a different analysis:

- Numbers and rates by local area, listing the areas with the lowest and highest rates
- Numbers and rates by state and territory
- Rates by remoteness and socioeconomic status
- Times difference and rates by local area across years (time series analysis), where applicable

NHMD items have two more standard figures where data are available:

- Rates by state and territory, by Aboriginal and Torres Strait Islander status
- Percentages and rates by state and territory, by patient funding status.

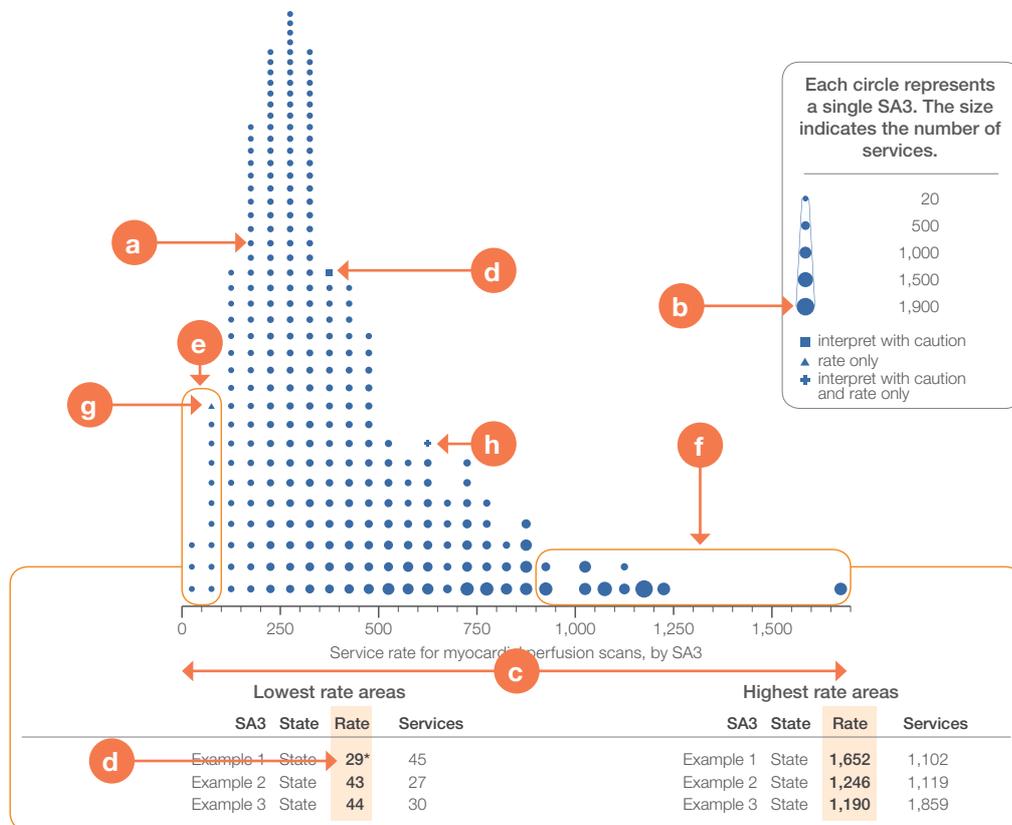

Standard figures for NPDC items are percentages by state and territory where data are available. Each figure presents a different analysis.

Further information on interpreting the figures for the print version of the fourth Atlas is provided on pages 33–36.

Additional figures are available for the online interactive Atlas at safetyandquality.gov.au/atlas

How to interpret our data visualisations

Histogram

a **What does the circle represent?**
Each circle represents an SA3. SA3s are geographical areas defined by the ABS that provide a standardised regional breakdown of Australia. SA3s generally have populations between 30,000 and 130,000 people.

b **Circle size**
The size of a circle indicates the number of events in that SA3. A large circle represents an SA3 with a greater number of events than SA3s with a smaller circle. Each histogram is accompanied by a legend to indicate scale.

c **Horizontal axis**
The horizontal axis shows the age- and sex-standardised rate. Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

d **Squares and asterisks**
Squares and asterisks indicate rates that are considered more volatile and should be interpreted with caution.

e **Lowest rates**
SA3s in the box are SA3s with the lowest age- and sex-standardised rates in Australia. The names, rates and numbers of events for these SA3s are listed in the table below the histogram.

f **Highest rates**
SA3s in the box are SA3s with the highest age- and sex-standardised rates in Australia. The names, rates and numbers of events for these SA3s are listed in the table below the histogram.

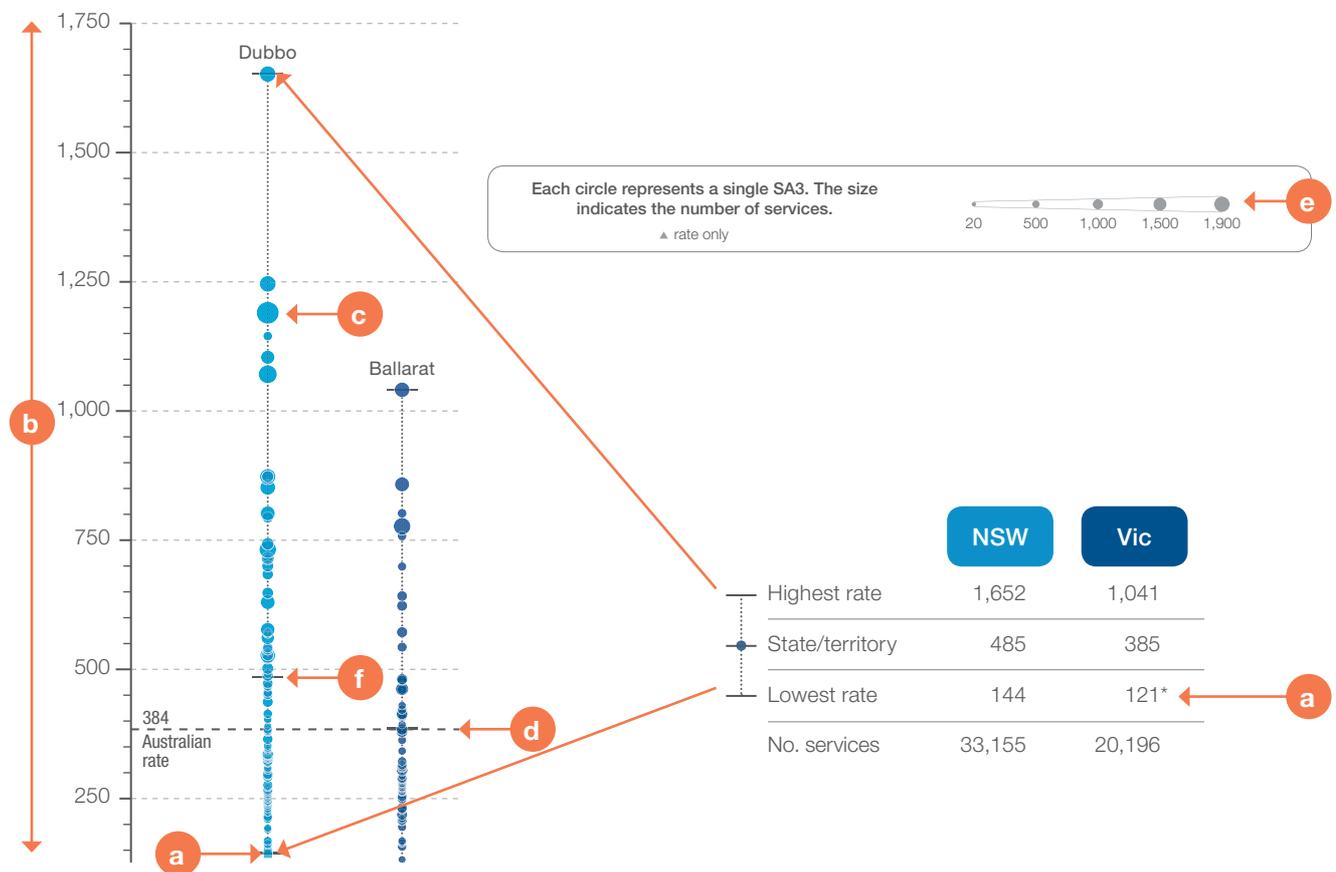

g **What does a triangle represent?**
Each triangle represents an SA3 where only the rate is published. The number of events is not published for confidentiality reasons.

h **What does a cross represent?**
Each cross represents an SA3 where the rate should be interpreted with caution, and the number of events is not published for confidentiality reasons.

About the Atlas

State and territory graphic

a Squares and asterisks
Squares and asterisks indicate rates that are considered more volatile and should be interpreted with caution.

b Vertical axis
The vertical axis shows the age- and sex-standardised rate. Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

c What does the circle represent?
Each circle represents an SA3. SA3s are geographical areas defined by the ABS that provide a standardised regional breakdown of Australia. SA3s generally have populations between 30,000 and 130,000 people.

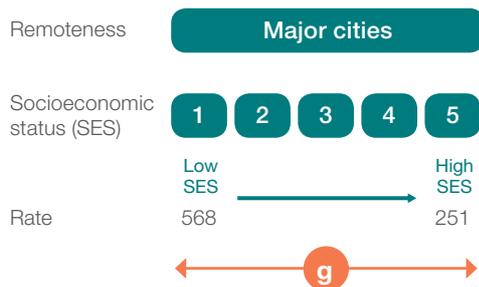

d Australian rate line
This line indicates the age- and sex-standardised rate for Australia.

e Circle size
The size of a circle indicates the number of events in that SA3. A large circle represents an SA3 with a greater number of events than SA3s with a smaller circle. Each graphic is accompanied by a legend to indicate scale.

f State and Territory rates
This line indicates the age- and sex-standardised rate for a state or territory.

How to interpret our data visualisations

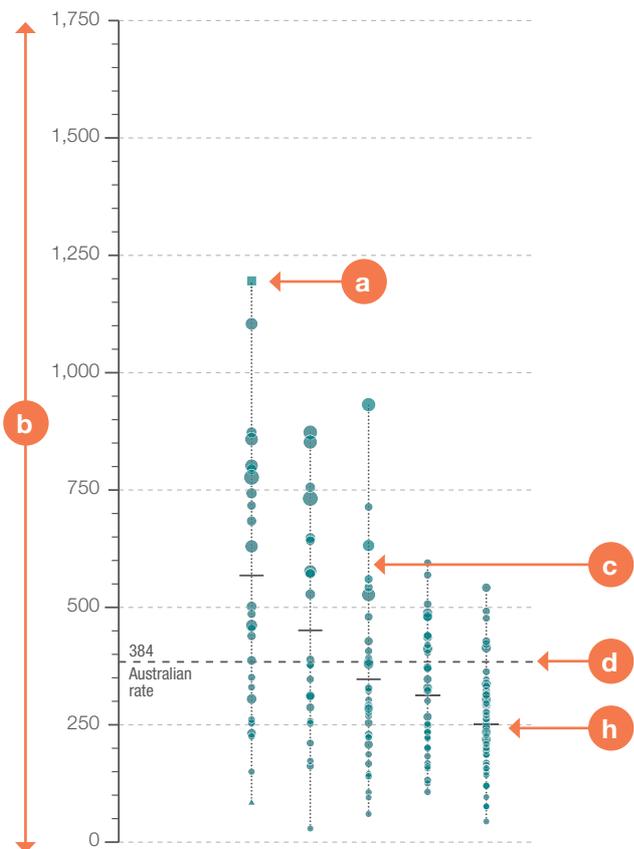

Remoteness and socioeconomic status graphic

g

Remoteness and socioeconomic status

Each SA3 is assigned a remoteness category and a socioeconomic status (SES) category, using remoteness and SES defined by the ABS. The lowest SES category has the most overall disadvantage, and the highest SES category has the least overall disadvantage. Some SES categories are combined in remoteness categories, except in major cities, to ensure sufficient numbers of SA3s for comparison. In this example, the remoteness and SES rate is higher with greater socioeconomic disadvantage.

h

Remoteness and SES

This line indicates the age- and sex-standardised rate for a combination of remoteness and SES.

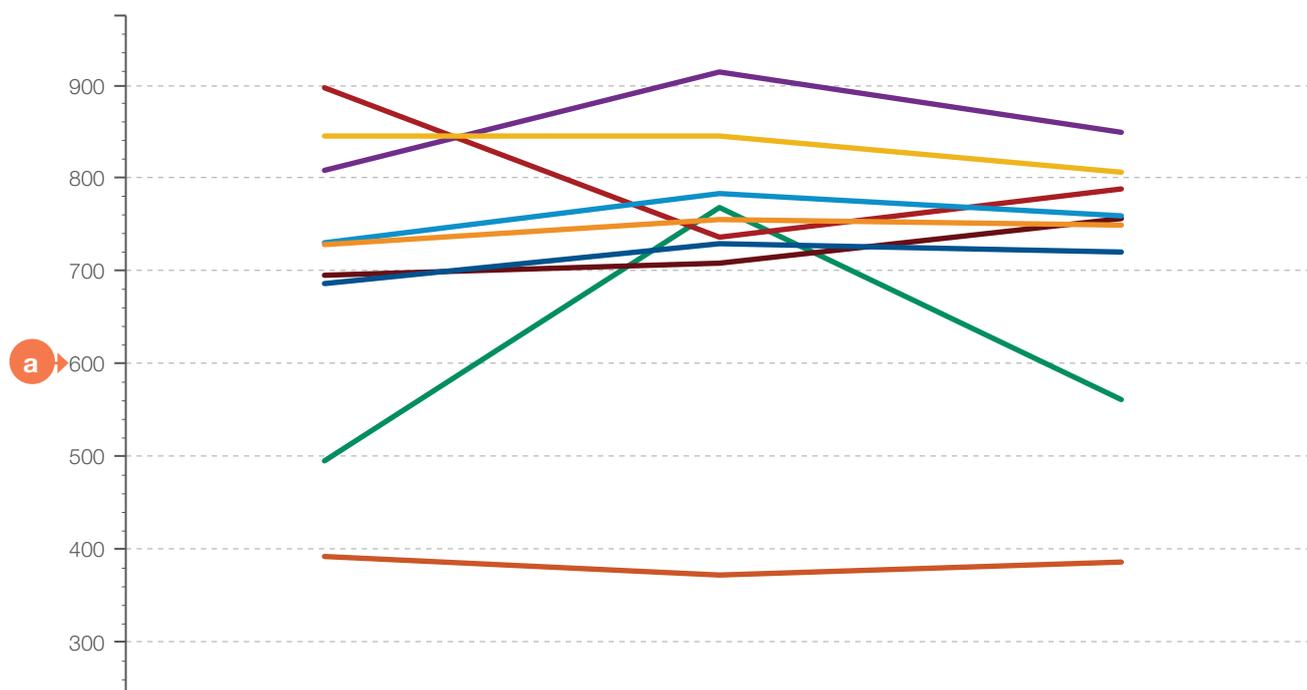

About the Atlas

How to interpret our data visualisations

Rates across years line graph

- a Vertical axis**
The vertical axis shows the age- and sex-standardised rate. Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.
- b Australian rate**
The Australian age- and sex-standardised rate.
- c Highest rate**
The highest rate is the highest age- and sex-standardised rate of all SA3 rates.
- d Lowest rate**
The lowest rate is the lowest age- and sex-standardised rate of all SA3 rates.
- e Magnitude of variation**
The magnitude of variation is the times difference between the highest and lowest SA3 rates in Australia. Rates published with caution are excluded from the calculation.
- f Magnitude of variation without top and bottom 10%**
The magnitude of variation is the times difference between the highest and lowest SA3 rates after excluding the highest and lowest 10% of SA3 rates.

	2012-13	2015-16	2017-18
Highest SA3 rate	2,414	1,753	1,836 c
Australian rate	729	756	750 b
Lowest SA3 rate	218	258	305 d
Magnitude of variation	11.1	6.8	6.0 e
Magnitude of variation without top & bottom 10% SA3	2.3	2.3	2.2 f

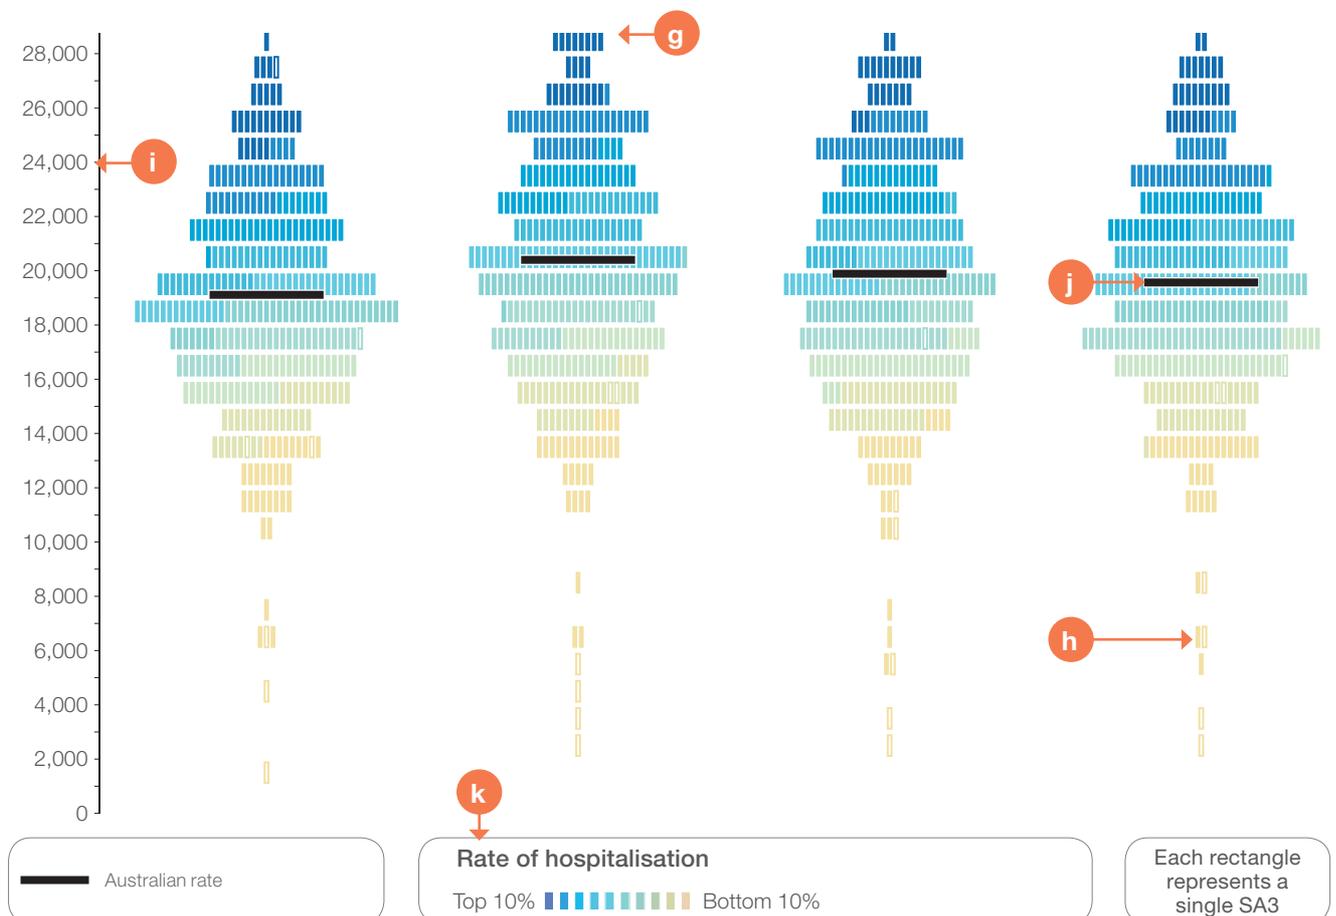

How to interpret our data visualisations

Rates across years graphic (interactive Atlas only)

This fully interactive graph is available at safetyandquality.gov.au/atlas

- g** **What does each diamond represent?**
Each diamond shows the rates for all SA3s in Australia for a given year.
 - h** **What does the rectangle represent?**
Each rectangle represents an SA3. SA3s are geographical areas defined by the ABS that provide a standardised regional breakdown of Australia. SA3s generally have populations between 30,000 and 130,000 people.
 - i** **Vertical axis**
The vertical axis shows the age- and sex-standardised rate. Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.
 - j** **Australian rate**
This line indicates the Australian age- and sex-standardised rate.
 - k** **Rate of hospitalisation**
SA3s are not presented for those suppressed due to a small number of hospitalisations and/or population in an area. Darker colour of a rectangle represents an SA3 with a higher rate, and light colour represents an SA3 with a lower rate.
- Notes are displayed for SA3 rates that are considered more volatile than other published rates and needs to be interpreted with caution.

Chapter 1

Early planned births

At a glance

Planned birth by caesarean section or induction (a medical treatment to start labour) is an important intervention in maternity care. However, the timing of birth should be carefully considered to ensure the best outcome for the mother and her baby.

When planning for birth by caesarean section or induction of labour, waiting until at least 39 weeks gestation results in better short- and long-term outcomes for the baby, unless there are medical or obstetric reasons for earlier birth. Short-term risks, such as respiratory problems and the need for intensive care, are higher for babies born at early term (by caesarean section or induction of labour) than at full term. Longer-term risks in children born before 39 weeks gestation (either vaginally or by caesarean section) compared with those born at full term include cognitive deficits and a higher risk of attention deficit hyperactivity disorder.

In 2017, the ranges of state and territory rates for caesarean sections without a medical or obstetric indication, as percentages of all caesarean sections at these gestational ages, were*:

- <37 weeks, 13.3–19.3%
- <38 weeks, 24.8–32.7%
- <39 weeks, 42.8–56.1%.

Despite a number of data limitations (see page 49),[†] the estimates presented in this chapter suggest that the percentage of caesarean sections performed before 39 weeks without a medical or obstetric indication may be substantial, and action is needed to reduce these rates.

Strategies to reduce rates of planned birth without a medical or obstetric indication before 39 weeks gestation include:

- Changing policies of state and territory governments, hospitals and insurers to block booking of early planned births without a medical or obstetric indication
- Giving parents information about the risks and benefits of early planned birth, and support for shared decision making
- Giving clinicians information about the risks and benefits of early planned birth
- Collecting data on the reasons for early planned birth.

* Excludes Northern Territory.

Recommendations

The Commission consulted widely, but is solely responsible for making the recommendations; as such, the recommendations may not reflect the views of all contributors to the Atlas.

- 1a. It is recommended that pregnancies continue until at least 39 weeks gestation unless there is a medical or obstetric reason justifying earlier intervention.

- 1b. Health service organisations with maternity services, and clinicians, to implement systems to obtain informed patient consent that includes the provision of comparative information for prospective parents on the short- and long-term risks of early planned birth without a medical or obstetric indication.

- 1c. Health service organisations with maternity services to establish policies to cease booking planned births without a medical or obstetric indication before 39 weeks from July 2022 and to review adherence to these policies.

- 1d. Medicare Benefits Schedule payment for planned births before 39 weeks without a medical or obstetric indication to cease from July 2022.

- 1e. Health service organisations with maternity services, and clinicians, to ensure that care is consistent with The Whole Nine Months campaign.

- 1f. The Australian Institute of Health and Welfare (AIHW) to prioritise the development of the indicator on early caesarean section without a medical or obstetric indication in the National Core Maternity Indicators, including the need for a data element on the reason for early birth.

- 1g. All state and territory health departments to ensure consistent, routine collection and reporting of data on gestational age for planned births without a medical or obstetric indication to improve the quality of data collections. This should include reporting of gestational age in days to allow more in-depth understanding of the distribution of births occurring before 39 weeks.

1h. Health service organisations with maternity services to:

- i. Report early planned births without a medical or obstetric indication as part of mandatory reporting of National Core Maternity Indicators

 - ii. Conduct audits of records documenting the communication of information to prospective parents about the risks of early planned births without a medical or obstetric indication, and provide the results back to clinicians to act upon, in line with Action 1.28 of the National Safety and Quality Health Service Standards

 - iii. Incorporate individual clinicians' audit data as part of re-credentialing processes

 - iv. Report on agreed key performance indicators, trends and adverse events on early planned births without a medical or obstetric indication to the governing body.

- 1i. Short- and long-term risks arising from early planned birth without a medical or obstetric indication are avoidable. The Commission to include early caesarean section without a medical or obstetric indication in the national list of hospital-acquired complications.

1.1 Early planned births without medical or obstetric indication

Why is this important?

When planning for birth by caesarean section or induction of labour, waiting until at least 39 weeks gestation results in better short- and long-term outcomes for the baby, unless there are medical or obstetric reasons for earlier birth. Short-term risks, such as respiratory problems and the need for neonatal intensive care, are higher for babies born at early term (by caesarean section or induction of labour) than at full term.¹⁻⁴ There is some evidence of longer-term risks in children born before 39 weeks gestation (either vaginally or by caesarean section) compared with those born at full term, including cognitive deficits and a higher risk of attention deficit hyperactivity disorder (ADHD).⁵

What did we find?

In 2017, the ranges of state and territory rates for caesarean sections without a medical or obstetric indication, as a percentage of all caesarean sections at these gestational ages, were*:

- <37 weeks, 13.3–19.3%
- <38 weeks, 24.8–32.7%
- <39 weeks, 42.8–56.1%.

Rates of induction of labour without a medical or obstetric indication at gestational age of <39 weeks were also examined: in contrast to caesarean section, these percentages were very low, ranging from 0.2% to 6% in 2017 in six reporting states and territories.

What can be done?

Strategies to reduce rates of early planned birth[†] without medical or obstetric indication before 39 weeks gestation include:

- Revision of the Medical Benefits Schedule (MBS) to cease payments for early term planned births without a medical or obstetric indication
- State and territory governments, hospitals and insurers to cease allowing early planned births without a medical or obstetric indication
- Giving parents information about the risks (and benefits, in some cases) of early planned birth, and support for shared decision making
- Giving clinicians information about the risks and benefits of early planned birth
- Improving data collection and monitoring to highlight where progress is being made and where more work is needed
- Reporting to the public at the hospital level to improve transparency and accountability.

* Excludes Northern Territory. Note: the reason for caesarean section and the reason for early birth are not necessarily related; data on medical or obstetric reasons for early birth are not collected.

† Birth without established labour is interpreted as planned birth in this report.

Early planned births without medical or obstetric indication

Context

Planned birth by caesarean section or induction (a medical treatment to start labour) can be an important intervention in maternity care. However, the timing of birth should be carefully considered to ensure the best outcome for the mother and her baby.

Where there are certain medical or obstetric complications, such as pre-eclampsia or fetal growth restriction, early planned birth may be necessary because the risks of waiting until 39 weeks gestation outweigh the benefits.⁶ But if there are no complications, waiting until at least 39 weeks is optimal for the baby because the last few weeks of pregnancy are important for the baby's development, including brain and lung maturation.^{4,5}

Parents may not be aware that waiting until at least 39 weeks is best for their baby if there are no medical or obstetric reasons for earlier birth.⁷ Educational campaigns on this issue have emphasised the effects of early birth on brain maturity and the need for admission to a special care nursery if the baby is born early (Figure 1.1).

Redefining 'full term'

Until recently, birth between 37 and 41 weeks gestation was considered full term, and neonatal outcomes were generally thought to be the same during this period.⁸ Evidence of poorer outcomes for babies born before 39 weeks prompted a re-evaluation of this definition. From 2010, the descriptor 'early term' began to be used for 37–38 weeks gestation, and 'full term' for 39–40 weeks gestation.⁸

Risks of early-term birth

Short-term risks

Observational studies have shown an increase in short-term risks, such as respiratory problems and the need for neonatal intensive care, for babies born at early term (37–38 weeks) rather than full term (39–41 weeks). These risks are higher following planned birth by either caesarean section or induction of labour.¹⁻⁴ Even after fetal lung maturity has been confirmed, babies born by early planned birth without a medical or obstetric indication have significantly worse respiratory outcomes, and poorer overall neonatal outcomes, than full-term babies.⁹

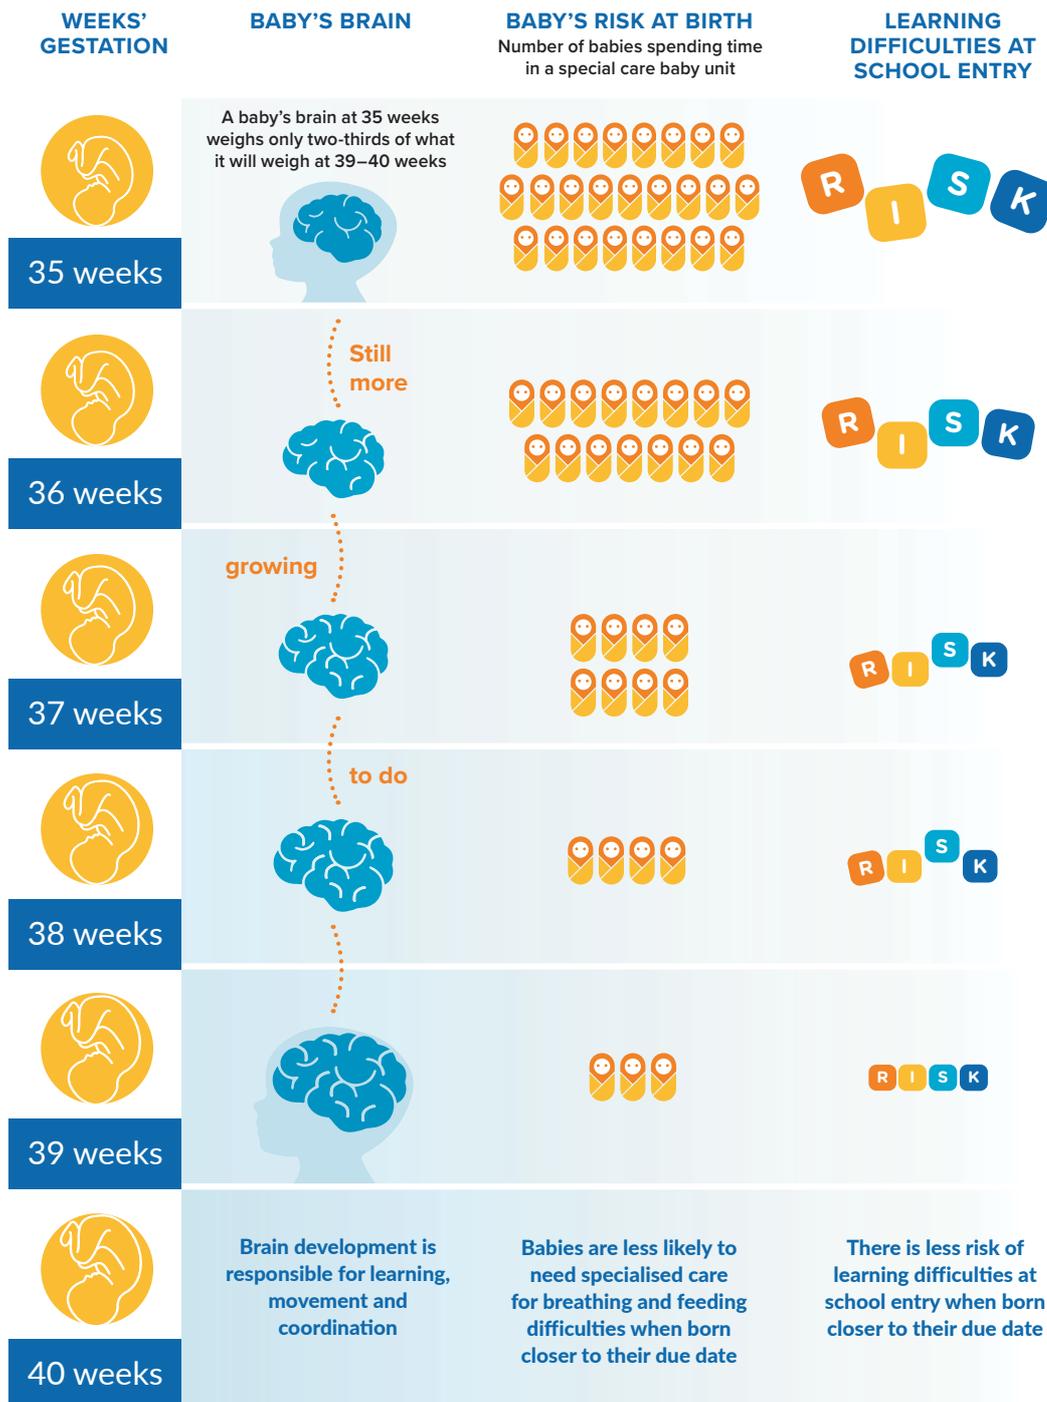

The risks of hypoglycaemia, jaundice and the need for neonatal intensive care unit for babies born by elective caesarean section decrease linearly from 37 weeks to 41 weeks gestation.⁴ That is, the earlier the planned birth in this period, the greater these risks.⁴ For example, among babies born by elective caesarean section, serious respiratory morbidity requiring neonatal intensive care occurred in 1.2% of those born at 37–38 weeks, compared with 0.5% of those born at 39–40 weeks, in an Australian study.¹⁰ Other potential consequences include negative psychological effects on parents from having their baby hospitalised in a neonatal intensive care unit.¹¹

The risk of neonatal death after elective caesarean section, although small, reaches the lowest point at 39 weeks, and then increases again.⁴ The risks of neonatal sepsis and of needing hospitalisation for five days or more also have a U-shaped course, with the lowest risk at 39 weeks.⁴

The risk of needing hospitalisation for infection in the first five years of life is higher among children born by planned caesarean section performed at 37–38 weeks gestation rather than at 39 weeks gestation.¹²

Early planned births without medical or obstetric indication

Long-term risks

More recently, evidence has grown of an increased risk of effects on brain development from early-term birth. Compared with children born at 39–40 weeks, those born at 37–38 weeks (either vaginally or by caesarean section) have up to a 30% higher risk of ADHD and a 10–40% higher risk of cognitive problems.⁵ This evidence is based on observational studies, and includes spontaneous early births.

In some cases, poorer developmental outcomes may be explained by the obstetric factors that prompted the earlier birth. Studies that accounted for these factors still found poorer outcomes with birth at early term rather than full term.^{13,14} This suggests that harm is associated with the earlier timing, rather than the factors that prompted it.^{13,14} For example, a United States study of 128,050 children in third grade at school found that those born at early term (either vaginally or by caesarean section) had significantly poorer performance in maths than those born at full term.¹³ This effect remained even after accounting for the effect of obstetric factors such as caesarean birth, birth weight and maternal age, as well as socioeconomic disadvantage.¹³

Although developmental risks are greater for babies born before 37 weeks gestation, the greater frequency of births at 37 or 38 weeks gestation means that these births have larger implications at a population level.^{15,16} For example, children born at 37–39 weeks (either vaginally or by caesarean section) accounted for 5.5% of cases of special educational needs, compared with children born preterm (less than 37 weeks gestation), who accounted for 3.6% of cases, in a study of Scottish schoolchildren.¹⁶

Aboriginal and Torres Strait Islander children born at early term have a higher risk of developmental vulnerability than other Australian children born at the same gestational age.¹⁷ This is largely accounted for by the socioeconomic disadvantage experienced by Aboriginal and Torres Strait Islander people.¹⁷

Risks of waiting until 39 weeks

Stillbirth

The benefits of waiting until 39 weeks for birth must be weighed against the risk of stillbirth (Figure 1.2).¹⁸ The risk of stillbirth in Australia is 0.5 per 1,000 babies in utero at 36–39 weeks, rising to 0.8 per 1,000 at 40–41 weeks, and then rising more steeply to 2.3 per 1,000 at 42 weeks or more.¹⁹

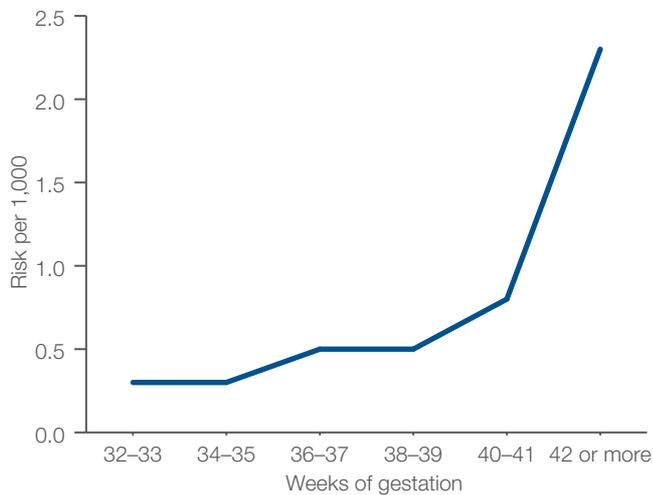

Identifying which babies are at risk and would benefit from earlier birth is challenging. Consequently, a large number of babies who would have benefited from longer gestation may need to be born early to prevent one stillbirth. The effects on neurodevelopmental outcomes from these early births are important and have been estimated.¹⁸ Although such estimates are complex and difficult to apply to decision-making for individuals, the risk of stillbirth and the risk of developmental problems appear to be at a minimum at 39–41 weeks for women and babies without known complications.

The assessment of risk versus benefit is likely to be different between ethnic groups. For example, the rate of stillbirth in south Asian- and African-born women is higher than in Australian-born women after 37 weeks gestation.²⁰

Risk of spontaneous labour

Another common concern about waiting until 39 weeks gestation for a planned caesarean section is the risk of the mother going into spontaneous labour beforehand, and possibly requiring an emergency caesarean section.²¹ This is a particular concern for women who live far from 24-hour emergency obstetric services. Emergency caesarean section is associated with higher risks of complications and higher costs.^{22,23} If caesarean section is planned for 39 weeks gestation, an estimated 13–25% of women will end up having a caesarean section after labour has started, compared with 8–11% if it is planned for 38 weeks gestation.²¹

Figure 1.2: Risk of stillbirth per 1,000 fetuses remaining in utero, by gestational age, Australia, 2015 and 2016

Source: *Stillbirths and Neonatal Deaths in Australia 2015 and 2016: In brief*.¹⁹

Guidelines for timing of planned birth

Several Australian states and territories have initiatives in place to reduce preterm and early-term births. These include guidance to avoid caesarean section and induction before 39 weeks gestation without a medical or obstetric indication – for example, The Whole Nine Months’ in Western Australia and Every Week Counts in New South Wales.^{24,25}

Guidelines for timing of planned caesarean section

Waiting until 39 weeks gestation for a planned caesarean section, if there are no medical or obstetric reasons for earlier birth, is now recommended by some Australian states and territories and several international organisations, including the American College of Obstetricians and Gynecologists, and the United Kingdom (UK) National Institute for Health and Care Excellence.²⁶⁻²⁸ A position statement from the Royal Australian and New Zealand College of

Obstetricians and Gynaecologists (RANZCOG) states: ‘On balance, weighing up the risk of respiratory morbidity following elective caesarean section and the risk of labouring prior to caesarean section, it is recommended that elective caesarean section in women without additional risks should be carried out at approximately 39 weeks gestation’.^{6,29}

Guidelines for timing of induction of labour without a medical or obstetric indication

Some international guidelines give recommendations on the timing of non-medically indicated induction of labour. For example, United States guidelines state that non-medically indicated inductions should not occur before 39 weeks gestation.²⁷ UK guidelines state that ‘Induction of labour should not routinely be offered on maternal request alone. However, under exceptional circumstances (for example, if the woman’s partner is soon to be posted abroad with the armed forces), induction may be considered at or after 40 weeks’.³⁰

No national Australian guidelines were found on the lower limit of gestational age for induction without a medical or obstetric indication.

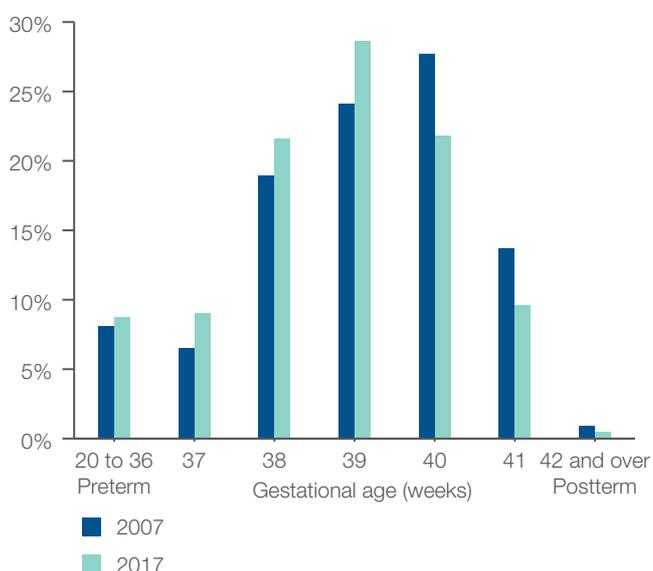

Early planned births without medical or obstetric indication

Trends in Australia

Gestational age at birth

Of all babies born each year in Australia, the proportion born at early term (37 or 38 weeks gestation) has increased in recent years. Between 2007 and 2017, the proportion of all babies born at 37, 38 or 39 weeks gestation increased, while the proportion born at 40 or 41 weeks gestation decreased (Figure 1.3).³¹

Figure 1.3: Percentage of babies, by gestational age in weeks, Australia, 2007 and 2017

Note: Pre-term births may include a small number of births of less than 20 weeks gestation.
Source: *Australia's Mothers and Babies 2017: In brief*.³¹

Caesarean section

Rates of caesarean section overall have risen steadily in Australia since the early 1990s. In 2017, 35% of births in Australia were by caesarean section, compared with 31% in 2007 and 18% in 1990.^{31,32} Australia's rate is higher than the average for countries in the Organisation for Economic Co-operation and Development (34 per 100 live births and 28 per 100 live births, respectively, in 2017).³³

Planned early-term caesarean section

Few Australian data are available on trends in the proportion of caesarean sections that are planned and occur at early term. In New South Wales, the proportion of all singleton births that were prelabour caesarean sections almost doubled between 1994 and 2009, increasing from 9.1% to 17.1%.³⁴ Another New South Wales study showed that, between 2001 and 2009, the rate of planned caesarean section at 38 weeks gestation increased from 4.3% to 5.4%, and at 39 weeks gestation from 4.2% to 7.1%.³⁵ The proportion of all caesarean sections or inductions reported with established medical or obstetric indications, such as maternal hypertension or fetal distress, decreased between 2001 and 2009, while the proportion increased for conditions in which evidence is equivocal (for example, diabetes mellitus).³⁵

Induction of labour

Rates of induction of labour have increased in Australia in recent years. Between 2007 and 2017, the percentage of mothers who had an induced labour increased from 25% to 33%.³¹ Diabetes and prolonged pregnancy are the most common reasons for induction.³¹

Patterns of gestational age at induction have also changed. In New South Wales, between 1994 and 2009, the rate of inductions at 40 weeks gestation decreased, and rates of induction at 37–39 weeks increased.³⁴

Rates of induction at early term (37–38 weeks) vary substantially between hospitals in New South Wales (3.3–13.9%). Early-term inductions are more common among women from the highest socioeconomic status areas than among those from the lowest socioeconomic status areas (24.1% compared with 15.2%).³⁶

Gestational diabetes

Gestational diabetes increases the risk of complications, including gestational hypertension, pre-eclampsia and having a baby that is large for gestational age.^{37–39} Among women who have a vaginal birth, the rate of shoulder dystocia and third- or fourth-degree perineal tears is higher for mothers with gestational diabetes than for those without diabetes.³⁸

The rate of gestational diabetes increased from 5.2% to 15.1% in Australia between 2000–01 and 2016–17.⁴⁰ A change in recommended diagnostic criteria in 2014 is likely to be responsible for part of this substantial rise.⁴¹ Other factors that are likely to have contributed to the increase in gestational diabetes include:

- Increased rates of obesity
- Increased age at child-bearing
- Immigration of women from ethnicities with higher rates of gestational diabetes, such as Asian, Indian, Torres Strait Islander, Pacific islander, Maori, Middle Eastern and non-white South African women.⁴²

Women diagnosed with gestational diabetes are more likely to have a planned birth than women without diabetes. They are also more likely to have a caesarean section than women without diabetes (40.4% and 33.0%, respectively, in Australia in 2014–15)⁴³ and more likely to have an induction than women without diabetes (44.4% and 27.2%, respectively, in 2014–15).⁴⁴

Planned birth by caesarean section or induction may be recommended as a result of conditions that develop because of gestational diabetes (for example, gestational hypertension) or conditions that are more common among mothers with gestational diabetes (for example, pre-existing hypertension).^{39,45} Caesarean section may be recommended to prevent shoulder dystocia and brachial plexus palsy, depending on the estimated weight of the baby.⁴⁶ Recommendations in Australian local guidelines for timing of birth for women with gestational diabetes vary.^{47,48}

Early planned births without medical or obstetric indication

Previous Atlas findings on early planned caesarean section

The *Third Australian Atlas of Healthcare Variation* included a special report on early planned caesarean section without a medical or obstetric indication. Although data collection by states and territories for this indicator was in its early stages, and was not yet complete enough to allow the usual maps and graphs presented for other Atlas topics, a combination of factors prompted the Australian Commission on Safety and Quality in Health Care to publish the available data:

- Growing evidence of long-term impacts on brain development in children who had a planned birth before 39 weeks gestation
- Increased risks of short-term adverse effects in babies born before 39 weeks, such as respiratory problems and the need for intensive care
- The large number of children affected in Australia and the potential to prevent substantial unnecessary adverse effects in the future.

What were the findings in the third Atlas?

The third Atlas reported that, in 2015, the percentage of planned caesarean sections performed at less than 39 weeks gestation without an obstetric or medical indication ranged from 42% to 60% in the four states and territories with data that could be presented.⁴⁹ The percentage of planned caesarean sections performed at less than 37 weeks gestation without an obstetric or medical indication ranged from 10% to 22% in the four states and territories with data that could be presented.

Rates were generally higher for patients with private accommodation status (private patients) than for patients with public accommodation status (public patients) for planned caesareans performed before 37 or 39 weeks. For example, in 2015, in the four states and territories with published data, the percentage of caesarean sections at less than 39 weeks gestation without an obstetric or medical indication was 51.6% for public patients, compared with 60.1% for private patients.⁴⁹

Why are we revisiting this topic?

This update includes an additional year of data (births in 2017) and provides a more complete picture of planned early births with the following additions:

- Publishable contributions from an additional three states and territories, allowing data from seven of the eight states and territories of Australia to be presented
- Data on planned caesarean section at less than 38 weeks, in addition to less than 37 and less than 39 weeks, as presented in the third Atlas; this shows the proportion of planned births that are carried out more than a week earlier than many guidelines recommend
- Data on inductions of labour without a medical or obstetric indication, as a proportion of all inductions for any reason, at less than 37, less than 38 and less than 39 weeks.

Important notes on the data used in this report

The draft National Core Maternity Indicator 18 – ‘Caesarean sections <39 completed weeks (273 days) without obstetric or medical indication’ used in this report was developed by the Expert Commentary Group responsible for the National Core Maternity Indicators to benchmark practice and to reduce neonatal respiratory morbidity by minimising early births. The indicator has not yet been endorsed by the National Health Data and Information Standards Committee and is not routinely reported. The potential to reduce avoidable harm prompted the Commission to publish data for this indicator.

A number of limitations with this indicator should be noted.

Birth without established labour is interpreted as planned birth in this report.

Data on the reason for early planned birth (by any method) are not available at the national level. Therefore, as a proxy measure, this indicator uses data collected on the main reason for caesarean section. The main reason for caesarean section may be unrelated to the reason for early birth. For example, there are a number of medical or obstetric reasons for early birth that will not appear as a reason for caesarean section, including pre-eclampsia and stillbirth. The induction indicator uses reason for induction as a proxy measure for early planned birth.

Differences exist between states and territories in definitions and methods used for collection of data on the main reasons for caesarean section and for induction. For this reason, data are not comparable across states and territories.

Some state and territory health departments found in their review of data that recording of the main reason for caesarean section was not always updated as the clinical situation evolved. For example, medical or obstetric indications for early birth, such as fetal compromise, were not always recorded as the main

indication for early caesarean section if a caesarean section had already been planned for other reasons. Similarly, clinical events such as pre-labour rupture of membranes may lead to an unplanned early caesarean section, but these were not always recorded if the caesarean section had already been planned for other reasons. This means that the count of planned caesarean sections performed before 39 weeks without medical or obstetric indication is an overestimate for some states. This may also apply to the recording of the reason for induction of labour. South Australia was unable to collect data for the main reason for caesarean section according to revised specifications introduced from 1 July 2015. Data were mapped by the Australian Institute of Health and Welfare (AIHW) to the revised specifications, where possible.

Data on the main indication for caesarean section are published at the state and territory level in the supplementary tables for the AIHW report *Australia's Mothers and Babies*.³¹ It is anticipated that, as clinicians start to use the data for quality improvement purposes, all states and territories will be able to report according to the specifications.

Caesarean section without medical or obstetric indication

The numerator for this indicator is caesarean sections ‘without medical or obstetric indication’ where the caesarean section occurred in the absence of labour and at less than 39 completed weeks for the following reasons:

- Maternal choice in the absence of any obstetric, medical, surgical or psychological indication
- Previous caesarean section
- Previous severe perineal trauma
- Previous shoulder dystocia.

Although these may be indications for planned caesarean section, they were not considered reasons for early planned caesarean section – that is, before 39 weeks.

Early planned births without medical or obstetric indication

The listed reasons included in the data element 'Main indication for caesarean section' in the perinatal data collection were used in the development of the indicator for this report. For the purposes of this report, all indications in the data element, except the four listed above, were considered medical or obstetric indications for early planned caesarean section.

The denominator is the total number of women who gave birth by caesarean section at less than 39 completed weeks gestation and where there was no established labour.

Induction of labour without medical or obstetric indication

The numerator for this indicator is induction of labour 'without medical or obstetric indication' at less than 39 completed weeks gestation for the following reasons:

- Administrative or geographical indication
- Maternal choice in the absence of any obstetric, medical, fetal, administrative or geographical indication.

The denominator is the total number of women who gave birth following induction of labour at less than 39 completed weeks gestation.

Data source and subanalyses

Data are sourced from the National Perinatal Data Collection, which includes births that occur in hospitals, birth centres and the community (such as home births), for patients with public or private elected accommodation status. Because of small numbers, data are reported only at the state and territory level. Reporting by smaller geographical area, remoteness and socioeconomic disadvantage is not possible.

Data availability

Data were available for publication for seven states and territories for the caesarean section indicator. Nationally, there were 37,709 caesarean sections before 39 weeks gestation without established labour (denominator of this indicator) in 2017. Of these, 37,182 caesarean sections (98.6%) were from the seven reporting states and territories; 527 (1.4%) were from the remaining territory and are not included in the analysis.

Data were available for publication for six states and territories for the induction of labour indicator. Nationally, there were 37,278 inductions before 39 weeks gestation without established labour (denominator for this indicator) in 2017. Of these, 26,992 inductions (72.4%) were from the six reporting states and territories; 10,286 (27.6%) were from other states and territories and are not included in the analysis.

What do the data show?

Early planned birth without a medical or obstetric indication

Caesarean section without a medical or obstetric indication

In 2017, the ranges of state and territory rates for caesarean sections without a medical or obstetric indication, as a percentage of all caesarean sections at these gestational ages, were (Figure 1.4)*:

- <37 weeks, 13.3–19.3%
- <38 weeks, 24.8–32.7%
- <39 weeks, 42.8–56.1%.

* Excludes the Northern Territory
Birth without established labour is interpreted as planned birth in this report.

Figure 1.4: Caesarean sections at <37, <38 or <39 weeks without a medical or obstetric indication, as a percentage of all caesarean sections at these gestational ages, by state and territory of usual residence, 2017^{a-g}

The data for Figure 1.4 are available at safetyandquality.gov.au/atlas

Notes:

- (a) Because of differences in definitions used and methods of data collection, these data are not comparable across states and territories.
- (b) Data include women who gave birth by caesarean section with no established labour only.
- (c) 'Without obstetric or medical indication' includes the following reasons for caesarean section: previous caesarean section; previous severe perineal trauma; previous shoulder dystocia; and maternal choice in the absence of any obstetric, medical, surgical or psychological indications. Although these may be indications for planned caesarean section, they were not considered reasons for planned caesarean section before 39 weeks. See page 49 for more information on obstetric and medical indications.
- (d) Clinical indications for early delivery, such as fetal compromise, were not always recorded as the main indication for caesarean section when the decision to deliver by caesarean section was pre-planned in the antenatal period.
- (e) South Australia was unable to collect data for this item according to revised specifications introduced from 1 July 2015. Data have been mapped to the new specifications, where possible.
- (f) Data for the Northern Territory were not published.
- (g) For Tasmania, the majority of private hospitals were unable to collect data for this item according to revised specifications introduced from 1 July 2015. Data have been mapped to the new specifications where possible. Care must be taken when interpreting these numbers.

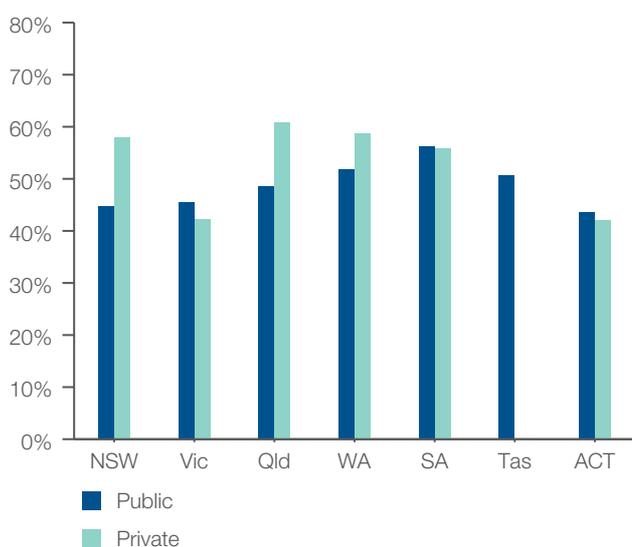

Source: AIHW analysis of National Perinatal Data Collection.

Early planned births without medical or obstetric indication

Analysis by funding status

Rates of caesarean section at less than 39 weeks without a medical or obstetric indication were higher for private patients than for public patients in New South Wales, Queensland and Western Australia (Figure 1.5). The rates for public and private patients were similar in both South Australia and the Australian Capital Territory.

Figure 1.5: Women who gave birth by caesarean section at less than 39 completed weeks gestation without medical or obstetric indication, by state and territory of usual residence and admitted patient elected accommodation status, 2017^{a-i}

The data for Figure 1.5 are available at safetyandquality.gov.au/atlas

Analysis by Aboriginal and Torres Strait Islander status

Data on rates of caesarean section at less than 39 weeks gestation without a medical or obstetric indication for Aboriginal and Torres Strait Islander women were available for publication from four states. Data were available from three other states and territories but could not be published for confidentiality reasons due to small numbers.

The percentages of caesarean sections performed at less than 39 weeks gestation without an obstetric or medical indication in the states with published data were lower among Aboriginal and Torres Strait Islander women than among other Australian women (Figure 1.6). The difference was 2 to 4 percentage points in each state.

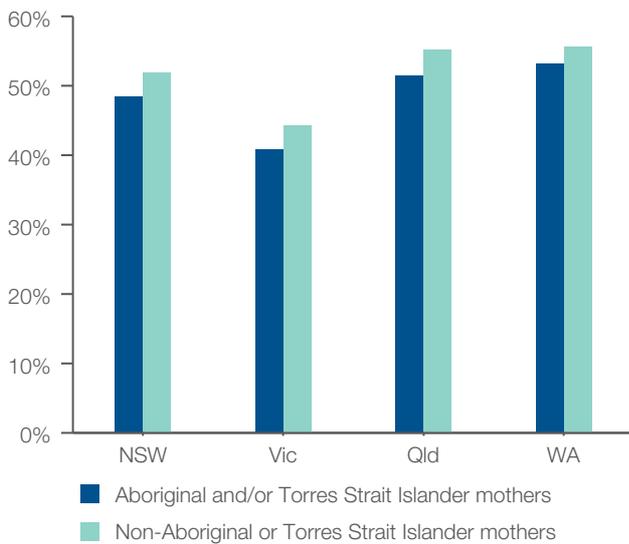

The denominators are low for this category (for example, for one state, the denominator is 110), so caution should be used in judging whether differences are significant.

Notes:

- Because of differences in definitions used and methods of data collection, these data are not comparable across states and territories.
- Data include women who gave birth by caesarean section with no established labour only.
- 'Without obstetric or medical indication' includes the following reasons for caesarean section: previous caesarean section; previous severe perineal trauma; previous shoulder dystocia; and maternal choice in the absence of any obstetric, medical, surgical or psychological indications. Although these may be indications for planned caesarean section, they were not considered reasons for planned caesarean section before 39 weeks. See page 49 for more information on obstetric and medical indications.
- Clinical indications for early delivery, such as fetal compromise, were not always recorded as the main indication for caesarean section when the decision to deliver by caesarean section was pre-planned in the antenatal period.
- For Western Australia, some private hospitals admit public women; hence, the number of women who elected private status might be lower than the number of women admitted to private hospitals. Care must be taken when interpreting these numbers.
- South Australia was unable to collect data for this item according to revised specifications introduced from 1 July 2015. Data have been mapped to the new specifications, where possible.
- For Tasmania, the majority of private hospitals were unable to collect data for this item according to revised specifications introduced from 1 July 2015; this may affect women with an admitted patient elected accommodation status of both public and private. Data have been mapped to the new specifications where possible. Data for public hospitals were collected according to the new specifications. Care must be taken when interpreting these numbers.
- Data for the Northern Territory were not published.
- Excludes women who gave birth in birth centres attached to hospitals.

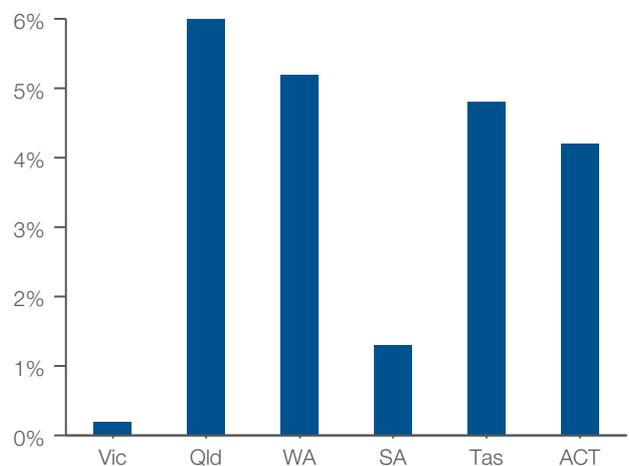

Figure 1.6: Women who gave birth by caesarean section at less than 39 weeks gestation without medical or obstetric indication, by state of usual residence and Aboriginal and Torres Strait Islander status, 2017^{a-g}

Induction of labour without a medical or obstetric indication

State and territory rates for induction of labour at less than 39 weeks gestation without a medical or obstetric indication ranged from 0.2% to 6.0% (excludes New South Wales and the Northern Territory; Figure 1.7).

Figure 1.7: Inductions at less than 39 weeks without a medical or obstetric indication, as a percentage of all inductions at less than 39 weeks, by state and territory of usual residence, 2017^{a-g}

The data for Figures 1.6 and 1.7 are available at safetyandquality.gov.au/atlas

Notes:

- Because of differences in definitions used and methods of data collection, these data are not comparable across jurisdictions.
- Data include women who gave birth by caesarean section with no established labour only.
- 'Without obstetric or medical indication' includes the following reasons for caesarean section: previous caesarean section; previous severe perineal trauma; previous shoulder dystocia; and maternal choice in the absence of any obstetric, medical, surgical or psychological indications. Although these may be indications for planned caesarean section, they were not considered reasons for planned caesarean section before 39 weeks. See page 49 for more information on obstetric and medical indications.
- Clinical indications for early delivery, such as fetal compromise, were not always recorded as the main indication for caesarean section when the decision to deliver by caesarean section was pre-planned in the antenatal period.
- Data for South Australia, Tasmania and the Australian Capital Territory are not published for confidentiality reasons due to small numbers (less than 5) of Aboriginal and Torres Strait Islander women.
- Data for the Northern Territory were not published.
- In 2017, 4.5% of women who gave birth in Australia identified as Aboriginal and/or Torres Strait Islander.³¹

Source: AIHW analysis of National Perinatal Data Collection.

Notes:

- Includes women who had induced labour and gave birth vaginally (including non-instrumental, forceps and vacuum extraction); or induced labour and gave birth by caesarean section.
- 'Without obstetric or medical indication' includes the following reasons for induction of labour: administrative or geographical indication; and maternal choice in the absence of any obstetric, medical, fetal, administrative or geographical indication.
- Because of differences in definitions used and methods of data collection, these data are not comparable across states and territories.
- Data not provided for New South Wales, because data for reason for induction of labour could not be collected according to revised specifications introduced from 1 July 2015.
- South Australia was unable to collect data for reason for induction of labour according to revised specifications introduced from 1 July 2015. Data have been mapped to the new specifications, where possible.
- Data for the Northern Territory were not published.
- For Tasmania, the majority of private hospitals were unable to collect data for this item according to revised specifications introduced from 1 July 2015. Data have been mapped to the new specifications where possible. Care must be taken when interpreting these numbers.

Early planned births without medical or obstetric indication

Analyses by remoteness and socioeconomic status

Small numbers made analyses by remoteness and socioeconomic status difficult to interpret. Data are available at safetyandquality.gov.au/atlas

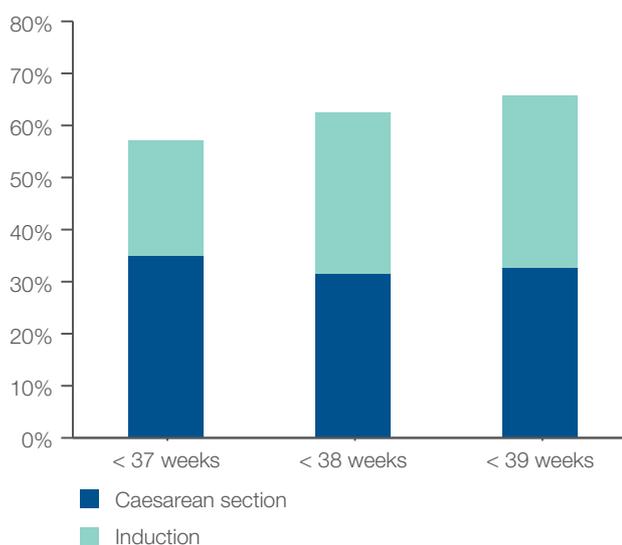

Early planned births, for any reason

Data presented in the previous section related to planned births without a medical or obstetric indication. The data in this section show planned births for any reason – that is, caesarean section or induction with or without a medical or obstetric indication.

The rates of women who gave birth by caesarean section (without labour) or following induction, as a percentage of all births at these gestational ages, for six states and territories were (Figure 1.8)*:

- <37 weeks, 57.1%
- <38 weeks, 62.7%
- <39 weeks, 65.7%.

Figure 1.8: Women who gave birth by caesarean section or who had labour induced, for any reason, as a percentage of all women giving birth at each gestational age, six states and territories, by gestational age, 2017^{a-d}

The data for Figure 1.8 are available at safetyandquality.gov.au/atlas

* Excludes New South Wales and the Northern Territory.

Notes:

- Excludes New South Wales and the Northern Territory. Data were not provided for New South Wales, because data for reason for induction of labour could not be collected according to revised specifications introduced from 1 July 2015. Data for the Northern Territory were not published.
- Caesarean section data include women who had no established labour and gave birth by caesarean section. Induction data include women who had induced labour and gave birth vaginally (including non-instrumental, forceps and vacuum extraction); or induced labour and gave birth by caesarean section.
- Data exclude Australian non-residents, residents of external territories and records where state or territory of residence was not stated.
- In the case of multiple births, gestational age and method of birth are based on the first-born baby.

Source: AIHW analysis of National Perinatal Data Collection.

Interpretation

Despite data limitations (see ‘Important notes on the data used in this report’), the estimates presented in this chapter suggest that the percentage of caesarean sections performed before 39 weeks without a medical or obstetric indication may be substantial, and action is needed to reduce these rates. See ‘Planned early caesarean section without a medical or obstetric indication’, below.

In the case of inductions of labour, almost all were performed with a medical or obstetric indication, but the number of babies in this group is large and the indications are not universally agreed. Further debate, and weighing of the risks and benefits could shed light on whether reducing the rate of inductions before 39 weeks could produce better outcomes for children overall. See ‘Influences on induction rates’ (page 56).

Planned early caesarean section without a medical or obstetric indication

Approximately half of the planned caesarean sections performed before 39 weeks did not have a stated medical or obstetric indication in 2017. This translates into a large number of children who may have an increased risk of adverse outcomes.

The availability of publishable data improved between 2015 and 2017, increasing from four to seven states and territories, which is an encouraging development.

Planned early caesarean section at less than 38 weeks

The third Atlas noted that the gestational age recommended in the RANZCOG position statement differed from the cut-off age used in the data item (‘approximately 39 weeks’ and ‘39 weeks’, respectively), which would have affected the interpretation of findings.⁶ For example, planned births at 38 weeks and 6 days gestation are appropriate

according to the RANZCOG position statement, but were counted in the numerator of the third Atlas data.⁶ In the fourth Atlas, additional analyses with less than 38 weeks and less than 37 weeks as the cut-off gestation period have been included, to clarify the proportion of planned caesarean sections that occurred well before the RANZCOG recommended minimum gestational age of approximately 39 weeks.

The percentage of planned caesarean sections without obstetric or medical indication occurring before 37 weeks gestation (13.3–19.3%) and before 38 weeks gestation (24.8–32.7%) shows that a substantial number are occurring well before the RANZCOG recommendation of approximately 39 weeks gestation.⁵⁰

Public versus private funding

The relationship between elected public or private accommodation status and rate of early planned caesarean section varied considerably among states and territories.

Aboriginal and Torres Strait Islander women

In 2017, 29% of Aboriginal and Torres Strait Islander women gave birth by caesarean section, compared with 35% of all women giving birth in Australia.³¹

The rates of early-term caesarean section without a medical or obstetric indication were lower among Aboriginal and Torres Strait Islander women than among other Australian women in the four reporting states. The difference was between 2 and 4 percentage points in each of the four states. Analysis by remoteness was not possible with the available data, but the rate of early planned birth among Aboriginal and Torres Strait Islander women living in remote areas may be greater because of the need to travel to a major centre.

Early planned births without medical or obstetric indication

Potential reasons for variation

The reported rates of early planned births could be influenced by a number of factors, such as variation in:

- Data factors (see 'Important notes on the data used in this report' (page 49))
- Clinician and organisational factors
 - failure to implement best-practice guidelines
 - MBS item descriptor and private health insurance payment do not reflect best practice
 - culture within individual hospitals and individual clinicians⁵¹
 - method for calculating estimated due date, which may give differing estimates
 - opinion on what constitutes a valid medical or obstetric indication for early planned birth
 - accountability for the decision to schedule an early planned birth⁵²
 - quality of information provided to enable shared decision making and informed consent
 - operating theatre capacity
- Health system factors
 - proportion of smaller units in each state or territory – limited capacity may increase rates of early planned birth
 - implementation of stillbirth prevention initiatives⁵³
 - access to midwife-led care
 - state and territory training requirements for general practitioners (GPs) providing antenatal shared care – mandatory training and refresher courses may increase awareness of risks of early planned birth
- Demographic and consumer factors
 - social factors – for example, timing to ensure that the partner is present for the birth in areas with military bases or fly-in-fly-out workers

- rates of private health insurance – early planned birth rates are higher among private patients in some states and territories; lower rates of early planned birth among Aboriginal and Torres Strait Islander women may reflect lower rates of private health insurance in this population
- maternal obesity
- proportion of pregnancies resulting from assisted reproduction technologies
- rates of induction of labour without a medical or obstetric indication before 39 weeks – a proportion become caesarean section births.

Influences on induction rates

Hospital factors appear to play a substantial role in decision-making about induction.³⁶ A New South Wales study found large variation in induction rates overall, and in early-term induction rates, between hospitals, even after accounting for differences in casemix (for example, rates of diabetes or hypertension).³⁶ Overall, half of the variation in hospital rates of induction at 37–38 weeks could be explained: 7% was explained by patient factors, and 43% by hospital factors.³⁶ Hospital factors included annual number of births, neonatal care facilities, region, and obstetric training provided. Culture within hospitals also appears to play a substantial role in influencing rates of induction.³⁶

A qualitative study of decision-making about induction in New South Wales hospitals found the following⁵²:

- Obstetricians in hospitals with high rates of induction tended to have less accountability for the decision to induce labour
- A common decision point that determined whether an induction went ahead was the acceptance of the booking in the hospital – if the bookings were taken by a senior midwife who had the authority to question the decision, the hospital was more likely to have a lower rate of induction
- Variations in decisions about induction were based on obstetricians' perceptions of risk in the pregnancy

- Where obstetricians within the same hospital had substantially different approaches to induction, induction rates tended to be higher – if a hospital had one obstetrician with a greater tendency to induce labour than their colleagues, women were able to ‘doctor shop’ within the hospital and have the induction that the previous obstetrician had refused.

Inconsistencies in guideline recommendations about indications and timing could contribute to variation in rates of induction.⁵⁴ Guidelines are most consistent on the following indications for induction:

- Prolonged pregnancy
- Decreased fetal movements and oligohydramnios, although recommendations on timing are absent or inconsistent.⁵⁴

There is little consensus on the validity or timing of induction for:

- Gestational diabetes
- Fetal macrosomia
- Elevated maternal body mass index
- Maternal age
- Ethnicity.

A lack of high-quality evidence to drive recommendations in guidelines is likely to contribute to variation in the level of consensus.⁵⁴

Distance from metropolitan areas

The need to avoid an emergency caesarean section is greater in settings without rapid, 24-hour access to an operating theatre. Rates of caesarean section before 39 weeks gestation may be higher in some nonmetropolitan areas for this reason.

Policy and guideline differences

Differences in the gestational age used as the cut-off for this indicator (‘less than 39 completed weeks’) versus that recommended in the RANZCOG position statement (‘approximately 39 weeks’) may have inflated rates reported for this item.⁶

For example, births at 38 weeks and 6 days gestation are appropriate according to the RANZCOG position statement, but are included in some of the data in this analysis.⁶

Reducing rates of early planned birth

The high rates reported for planned caesarean sections without an obstetric or medical indication occurring before 39 weeks, 38 weeks and 37 weeks gestation highlight the need for a concerted effort to address this issue.

Multifaceted approaches

The Western Australian Preterm Birth Prevention Initiative to reduce the rate of preterm births and non-medically indicated early-term births was implemented from 2014.⁵⁵ The initiative includes education materials and workshops for health professionals, as well as a consumer education campaign. The rate of preterm birth (20–37 weeks) was significantly reduced over the three years evaluated in tertiary centres.⁵⁵ The greatest reduction in preterm birth (from 16.1% in 2013 to 12.8% in 2017) was seen in pregnancies classified as low risk at the first attendance, and in established tertiary centres.⁵⁵ In non-tertiary centres, preterm birth was reduced in the first year, but not in the subsequent two years. No benefit was seen in the private sector. The rate of stillbirth did not change significantly after the program was implemented.⁵⁵ The Australian Preterm Birth Alliance grew out of the Western Australian experience, and is now adapting similar prevention strategies for implementation across Australia.⁵⁶

Many organisations in the United States have worked to reduce rates of preterm birth and birth before 39 weeks gestation without a medical or obstetric indication, and large improvements have been seen in recent years.⁵⁷ Strategies have included publishing data, undertaking public awareness campaigns, educating clinicians and prohibiting bookings for births before full term.

Early planned births without medical or obstetric indication

A multifaceted approach is also needed in Australia. This could include:

- Providing parents with information about fetal development, and the risks (and benefits, in some cases) of early-term births
- Providing support for shared and informed decision making
- Implementing hard-stop policies in hospitals (see 'Clinician education and hospital policies')
- Providing information to clinicians about the risks and benefits of early-term births, and advice about how to have conversations with parents about the issue
- Collecting data on reasons for early birth
- Using the Robson classification system to assess caesarean section practices over time at a hospital level
- Ensuring that hospital-level public reporting includes planned births without a medical or obstetric indication before 39 weeks
- Supporting case load midwifery models of care
- Including balance measures to minimise unnecessary early births prompted by initiatives to reduce stillbirth
- Supporting local initiatives to reduce early planned birth without a medical or obstetric indication
- Supporting further research to determine the risk of outcomes by gestational age, and maternal and fetal characteristics (for example, ethnicity, fetal size).

Women's knowledge, shared decision making and informed consent

Gaps in women's knowledge about the optimal timing of birth were shown in Australian research that reported that more than half of the pregnant women surveyed believed that 37–38 weeks gestation was the earliest time for safe birth.⁷ Women support education initiatives and decision aids as strategies to improve shared decision making about planned caesarean section.⁵⁸ Providing education to parents about difference in outcomes, particularly effects on

long-term child development, between early-term and full-term births could be a powerful strategy to reduce early planned birth where there are no medical or obstetric indications. Making this information available at the beginning of pregnancy and again halfway through would provide time for women to consider it before discussions about the timing of planned birth, if this was being contemplated. Decision aids show promise as a strategy to improve shared decision making about planned caesarean section, and are viewed positively by both women and clinicians.⁵⁸

Greater engagement with consumers is needed to support woman-centred maternity care. Meaningful collaboration with consumers in policy development and at an organisational level is needed to ensure that health service planning and delivery reflect consumer values and priorities.

Clinician education and hospital policies

Providing information for clinicians about the most recent evidence for optimal timing of planned birth, and how to have conversations with parents about the issue, may be useful. However, combining education with changes to hospital policies is more effective for reducing early planned birth that is not medically indicated.⁵⁹ This was shown in a United States study of three different approaches to reducing elective early-term births (inductions and caesarean sections):

- Education only – physicians were given literature and recommendations against performing purely elective births at less than 39 weeks gestation
- Education plus a 'soft-stop' approach – compliance with a policy of not scheduling purely elective births at less than 39 weeks gestation was left up to individual physicians, but all exceptions to the policy were referred to a local peer review committee
- Education plus a 'hard-stop' approach – purely elective planned births at less than 39 weeks gestation were prohibited, and the policy was enforced by hospital staff who were empowered to refuse to schedule such births.⁵⁹

During the two-year study period, the hard-stop policy was associated with the largest drop in elective births before 39 weeks (from 8.2% to 1.7%).⁵⁹ The soft-stop approach was associated with a smaller drop (from 8.4% to 3.3%).⁵⁹ Clinician education alone was less effective in changing practice, with a drop in rates from 10.9% to 6.0%.⁵⁹ Note that the data used in the study are not directly comparable with those in this report because of different denominators. For all groups combined, the rate of admissions to neonatal intensive care units fell during the study (from 8.9% to 7.5%).⁵⁹

An education campaign on optimal timing for planned birth, specifically focusing on Australian GPs, could be worthwhile, as GPs sometimes undertake shared care with obstetricians.

Increasing flexibility of access to operating theatres

In some cases, a lack of capacity in theatre lists allocated for planned caesarean section once a woman has reached 39 weeks gestation may lead to theatre bookings at an earlier gestation. Hospital policies to increase flexibility of access to operating theatres may reduce rates of planned caesarean section before 39 weeks.

Balance measures with stillbirth prevention programs

Initiatives that reduce the risk of stillbirth can come at the cost of increasing intervention in normal pregnancies, due to the lack of specificity of techniques for identifying fetuses at greatest risk.⁶⁰ This can result in increases in early planned births. Potential harms (such as early planned births), as well as benefits, of initiatives to reduce the rate of stillbirth need to be measured so that the overall impact on children at a population level can be seen and considered.

Improving detection and management of fetal growth restriction and reduced fetal movements is part of the Safer Baby Bundle, an initiative implemented in New South Wales, Queensland and Victoria to reduce the risk of stillbirth.⁶¹ These changes in practice could

increase early planned birth in healthy pregnancies, as well as those at risk of stillbirth. The Safer Baby Bundle includes messages about the need to consider the adverse consequences of planned birth before 39 weeks, but these may be overshadowed by the influence of measures to avoid stillbirth.

The risk of unintended consequences was shown in a large UK trial of a program that aimed to reduce stillbirth.⁶² Data from 409,175 pregnancies showed significant increases in rates of caesarean section and inductions, without any reduction in rates of stillbirth.⁶² The program aimed to increase women's awareness of the need for prompt reporting of reduced fetal movements, and involved standardised management, including timely planned birth.⁶²

This pattern has also been seen in Victoria in management of suspected fetal growth restriction, which is the strongest contributor to stillbirth. The number of babies born early as a result of suspected fetal growth restriction almost quadrupled between 2000 and 2017 in Victoria.⁶⁰ This increase coincided with introduction of public reporting of a hospital performance indicator of babies born severely small-for-gestational-age.⁶⁰ Births of severely small-for-gestational-age babies decreased, and the stillbirth rate fell by 3.3 per 1,000 births. However, among babies delivered because they were suspected small-for-gestational-age, the percentage with birthweights in the top 10th centile increased from 41% to 53% over the same period. In addition, admissions to a neonatal intensive care unit for babies born early for being suspected small-for-gestational-age but with a birthweight in the top 10th centile increased from 0.8% to 2.0%.⁶⁰

More accurate methods of detecting fetal growth restriction are urgently needed to reduce the harm associated with increased early intervention to reduce the risk of stillbirth. In the interim, the balance measures included in the ongoing evaluation of the Safer Baby Bundle that record harms associated with early planned births will be important for clinicians and policymakers to consider.⁵³

Early planned births without medical or obstetric indication

Hospital monitoring and public reporting of local rates

Ensuring that hospital-level public reporting includes data on planned births before 39 weeks without a medical or obstetric indication would allow women to make more informed choices. Quality improvement activities by hospitals, obstetricians and neonatologists could also provide insights into local rates of planned birth without a medical or obstetric indication before 39 weeks gestation. For example, local monitoring of clinical variation, as required by Action 1.28 of the Clinical Governance for Health Service Organisations Standard in the National Safety and Quality Health Service Standards (second edition)⁶³, could include monitoring of variation between the local rate and the state or territory rate, variation between practitioners, and deviation from evidence-based guidelines.

Midwifery continuity of care

Collaboration between midwives, obstetricians and GPs is a key element of providing safe and high-quality maternity care.⁶⁴ In Australia, a range of models of care exist for low-risk pregnant women. Continuity-of-care models that include case load midwifery have been found to be effective in reducing the rate of caesarean section in women at low risk from vaginal birth, with no change in perinatal deaths. In midwifery continuity-of-care models, antenatal care and care during labour are provided by the same midwife or small group of midwives (for example, one to three midwives), who work in collaboration with obstetricians.

In the COSMOS trial of more than 2,300 low-risk women at a Victorian maternity hospital (2007–2010), case load midwifery care, compared with standard care, reduced the rate of caesarean section (19.4% versus 24.9%).⁶⁵ The difference was primarily related to a fall in unplanned caesareans.⁶⁵ Case load midwifery may not be as effective in reducing the risk of caesarean section in women at higher risk. In the M@NGO trial of more than 1,700 pregnant women of

any risk level, case load care did not affect the overall caesarean rate, but the rate of pre-labour caesarean section was lower with case load care than with standard care (8% compared with 11%).⁶⁶ Neonatal outcomes did not differ between the two groups.⁶⁶

Improving data collection and monitoring

Collecting data on the reason for early planned birth would clarify the proportion of these births that did not have a medical or obstetric indication in Australia. This would allow efforts to be targeted where they are most needed, and show whether interventions are having an effect.

Additional data improvements could include:

- Reporting of gestational age in days to allow a better understanding of the distribution of births occurring before 39 weeks (currently a voluntary data item)
- Hospital monitoring and public reporting of local rates
- Inclusion of early planned caesarean section and early inductions without a medical or obstetric indication as hospital-acquired complications.

In the United States, planned early-term birth without a medical indication is a national perinatal quality benchmark monitored by the National Quality Forum and the Joint Commission.⁶⁷ Consumers in the United States also have access to published rates of early elective births for many hospitals.^{57,67}

Reducing early-term and preterm birth in Aboriginal and Torres Strait Islander women

Aboriginal and Torres Strait Islander mothers require access to culturally secure models of maternity care, provided by a culturally competent health system.⁶⁸ This care should be based on woman-centred principles, including continuity of care and carer; it should be integrated with culturally safe mainstream services, and committed to employment of Aboriginal and Torres Strait Islander people in a variety of roles.⁶⁸

A number of maternity indicators among Aboriginal and Torres Strait Islander mothers have shown improvements in recent years. For example, among Aboriginal and Torres Strait Islander mothers:

- The percentage who attended antenatal care in the first trimester increased from 50% in 2012 to 63% in 2017
- The proportion who reported smoking during pregnancy decreased from 52% in 2009 to 44% in 2017.³¹

Preterm birth (before 37 weeks) may be a substantially larger contributor to adverse outcomes among Aboriginal and Torres Strait Islander children than early-term planned birth, and a larger contributor than in other Australian children. In 2016–17, 14% of babies born to Aboriginal and Torres Strait Islander mothers were preterm, compared with 8.4% of babies born to other Australian mothers.⁶⁹

The Birthing in Our Community maternity service in Brisbane has demonstrated a halving of the preterm birth rate among Aboriginal and Torres Strait Islander mothers using the service.⁷⁰ The service was co-designed by two Aboriginal Community Controlled Health Organisations and a tertiary maternity hospital with the aim of reducing preterm birth. The service design included principles of⁷⁰:

- Increasing Aboriginal and Torres Strait Islander governance of, and workforce in, maternity services
- Midwifery continuity of care
- An integrated approach to supportive family services
- A community-based hub.

The rate of preterm birth was compared in records of women who gave birth to an Aboriginal or Torres Strait Islander baby between 2013 and 2017, 345 of whom attended the new service and 345 of whom received standard care. The rate of preterm birth was 7.5% in the Birth in Our Community service, and 13.9% for mothers receiving standard care.⁷⁰

The service redesign was based on the RISE framework that was developed to increase the effectiveness and cultural acceptability of services for Aboriginal and Torres Strait Islander people⁷¹:

- Redesign the health service
- Invest in the workforce
- Strengthen families
- Embed Aboriginal and Torres Strait Islander community governance and control.

Further testing of this framework may show improvements in other outcomes, including reducing early planned births, among Aboriginal and Torres Strait Islander mothers.

Australian initiatives

The information in this chapter will complement work already under way to reduce rates of non-medically indicated early caesarean section and induction in Australia. At a national level, this work includes:

- Australian Preterm Birth Prevention Alliance Initiative: The Whole Nine Months⁵⁶
- Safer Baby Bundle handbook and resource guide, Centre of Research Excellence in Stillbirth⁶¹
- Woman-centred care: strategic directions for Australian maternity services⁷²
- RANZCOG statement on timing of elective caesarean section at term⁶
- RANZCOG statement on caesarean delivery on maternal request⁵⁰
- National Agreement on Closing the Gap, Outcome 2: Aboriginal and Torres Strait Islander children are born healthy and strong⁷³
- Birthing on Country Project; Congress of Aboriginal and Torres Strait Islander Nurses and Midwives, Australian College of Midwives, CRANApplus.

Many state and territory initiatives are also in place, including:

- Policy of booking all elective caesarean sections for 39 weeks unless there is an obstetric or medical indication for earlier delivery, Australian Capital Territory (ACT)
- Canberra hospital and health services clinical guideline: induction of labour, ACT⁷⁴
- The Whole Nine Months program, ACT
- Guideline on timing of elective or pre-labour caesarean section, New South Wales²⁸
- Women and Babies Research, The Kolling Institute. Every Week Counts – consumer and health professional resources, everyweekcounts.com.au. version 1, 2019. Sydney: The University of Sydney²⁵

- NSW Health translational research project grant for 'Are we there yet? Optimising timing of planned birth to improve newborn outcomes and reduce health service costs'
- Queensland clinical guidelines: vaginal birth after caesarean section⁸¹
- Scoping to improve maternal and child continuity of care, Queensland
- Birthing in Our Community, Queensland⁷¹
- Waijungbah Jarjums, a service that connects Aboriginal and Torres Strait Islander parents with an Aboriginal and Torres Strait Islander midwife, Gold Coast, Queensland
- Queensland community maternity hubs, such as Logan Hospital and Logan Together
- Perinatal practice guidelines for caesarean section, South Australia⁸²
- Preterm birth prevention initiative, Tasmania
- Planning for birth after caesarean, Victoria⁸³
- Maternity eHandbook: induction of labour, Victoria⁸⁴
- Publication of early-term birth data, Victorian Consultative Council on Obstetric and Paediatric Mortality and Morbidity
- Birthing on Noongar Boodjar (Cultural Security and Aboriginal Birthing Women) project, Western Australia⁶⁸
- Preterm birth prevention initiative: The Whole Nine Months, Western Australia (now expanded nationally).⁵⁵

Chapter 2

Chronic disease and infection: potentially preventable hospitalisations

At a glance

Potentially preventable hospitalisations are an indicator in the National Healthcare Agreement, and include hospitalisations that may have been prevented by appropriate management earlier in the disease. Rates of potentially preventable hospitalisations are likely to reflect sociodemographic factors as well as the quality of early disease management.

More than 330,000 potentially preventable hospitalisations in Australia in 2017–18 were due to the conditions examined in this chapter: chronic obstructive pulmonary disease (COPD), kidney infections and urinary tract infections, heart failure, cellulitis, and diabetes. After standardising to remove age and sex differences, substantial variation was seen between local areas (Statistical Area 3 – SA3) in the rates of hospitalisation. Variation was greatest for COPD (the highest rate was about 18 times higher than the lowest), cellulitis (about 16 times) and diabetes complications (about 12 times). For all the conditions, hospitalisation rates were higher among Aboriginal and Torres Strait Islander people, people living in areas of socioeconomic disadvantage, and those living in remote areas.

The high hospitalisation rates and substantial variation show that recommended care is not always provided for people with chronic conditions. Despite the considerable funding provided through Medicare to better coordinate primary care for people with chronic diseases, health care can be fragmented and less than ideal.

Other likely contributors to variation include a higher proportion in some areas of patients with the most complex chronic disease, for whom hospitalisation may be inevitable. Poor access to health services in the community is also related to higher rates of potentially preventable hospitalisations.

Our health system must become better at reducing the progression of chronic disease and improving patients' quality of life. Several case studies in this chapter show how innovative solutions can improve health outcomes, such as integrated care for people with chronic conditions. Implementing successful interventions on a larger scale requires effective diffusion mechanisms, as well as funding reform.

Patients live with their chronic disease all day, every day. They must be put at the centre of prevention and management.

Recommendations

The Commission consulted widely, but is solely responsible for making the recommendations; as such, the recommendations may not reflect the views of all contributors to the Atlas.

2a. Consistent with the commitments made under the National Health Reform Agreement and building on the activities set out in the 2017 Bilateral Agreement on Coordinated Care, Local Hospital Networks, Primary Health Networks and the Aboriginal Community Controlled Health Service sector to implement the following principles in developing chronic disease management programs consistent with the National Strategic Framework for Chronic Conditions:

- i. Patients, families and carers as partners in care, where patients are activated to maximise their knowledge, skills and confidence to manage their health, aided by technology and with the support of a healthcare team
- ii. A risk stratification approach that supports identification of patients with high coordination and multiple provider needs, to ensure personalisation of service provision
- iii. Flexible service delivery and team-based care that supports integrated patient care across the continuum of the health system through shared information and care planning
- iv. A commitment to care that is of high quality and safe, including care planning and clinical decisions that are guided by evidence-based patient healthcare pathways, appropriate to the patient's needs
- v. Data collection and sharing by patients and their healthcare teams to measure patient health outcomes and improve performance.

2b. The Commission, the Independent Hospital Pricing Authority and the Administrator of the National Health Funding Pool to identify and develop alternative approaches to funding for chronic disease and infection that could be

applied to the National Health Reform Agreement Pricing and Funding model so that pricing and funding are aligned with best-practice guidelines. The alternative models could include bundled payments, capitation payments or regionally coordinated service responses.

COPD

2c. Local Hospital Networks, Primary Health Networks and the Aboriginal Community Controlled Health Service sector to implement appropriate care for the management of people with chronic obstructive pulmonary disease (COPD) using the *COPD-X Plan: Australian and New Zealand guidelines for the management of chronic obstructive pulmonary disease 2020* as the routine model of care.

Heart failure

2d. Local Hospital Networks, Primary Health Networks and the Aboriginal Community Controlled Health Service sector to implement process improvement for the effective management of people with heart failure, including:

- i. Multidisciplinary care across the acute and primary care sectors
- ii. A combination of strategies, including non-pharmacological approaches such as physical activity programs and fluid or dietary management, and pharmacotherapy.

Diabetes

2e. Local Hospital Networks, Primary Health Networks and the Aboriginal Community Controlled Health Service sector to promote appropriate care for the management of people with diabetes aligned with:

- i. *The Management of Type 2 Diabetes: A handbook for general practice* (2020)
- ii. The Australian National Diabetes Strategy 2016–2020.

2.1 Chronic obstructive pulmonary disease (COPD)

Why is this important?

Chronic obstructive pulmonary disease (COPD) is a serious, chronic lung disease that impairs quality of life and shortens lives. Approximately 8% of people in Australia aged 40 years and over and 29% of those aged 75 years and over have at least moderate symptoms of COPD.¹ COPD accounts for a substantial number of hospital bed days every year in Australia – for example, 392,434 bed days in 2017–18. Better health care can sometimes keep people with COPD well enough to reduce their need for hospitalisation.

What did we find?

Between 2014–15 and 2017–18, the rate of COPD hospitalisations per 100,000 people nationally increased by 8%. In 2017–18, the rate of hospitalisations for COPD was **18.1 times as high** in the area with the highest rate compared with the area with the lowest rate.

In 2017–18, the rate for Aboriginal and Torres Strait Islander people was 4.8 times as high as the rate for other Australians. Rates were also higher in remote areas and in socioeconomically disadvantaged areas than elsewhere.

What can be done?

The high rate of hospitalisations for COPD reported in this chapter is unacceptable, and we must implement the strategies we know can improve the health of people with this condition. This is particularly important for the groups with higher rates of hospitalisation for COPD: Aboriginal and Torres Strait Islander peoples, and those living outside metropolitan areas or in socioeconomically disadvantage areas.

Pulmonary rehabilitation – that is, health professional-led programs of exercises and education strategies to improve breathing and function – can reduce hospitalisations among people with COPD by 36–56%.^{2,3} Priority should be given to improving access to culturally safe pulmonary rehabilitation programs for Aboriginal and Torres Strait Islander people with COPD, and people living in remote areas of Australia. There should also be a focus on improving data collection and reporting for pulmonary rehabilitation programs to help health services and general practices monitor their effectiveness in improving patient outcomes. Pharmacist interventions, including providing education about medicines and lifestyle, and influenza vaccination are other interventions that can reduce hospitalisations for people with COPD.⁴

Smoking cessation can improve lung function in people with COPD.⁵ Reducing smoking rates is key to reducing hospitalisations for COPD.

Chronic obstructive pulmonary disease (COPD)

Context

COPD is a chronic lung disease that often impairs quality of life and reduces life expectancy.^{6,7} The term COPD encompasses chronic bronchitis and emphysema. Symptoms of COPD include shortness of breath with little or no exertion, as well as coughing, sputum production and wheezing. Patients with COPD may require hospitalisation for severe exacerbations, which are often caused by infections of the respiratory tract.

Evidence-based care for people with COPD may reduce the need for hospitalisation by reducing exacerbations.⁴

In 2017–18, COPD accounted for 392,434 hospital bed days in Australia, second only to heart failure for potentially preventable hospitalisations due to chronic diseases (412,693 bed days).⁸ Approximately 7% of Australians aged 65 years and over have COPD.⁹ It is more common in older people: approximately 8% of people in Australia aged 40 years and over and 29% of those aged 75 years and over have at least moderate symptoms of COPD.¹ The rate of hospitalisations for COPD was 235 per 100,000 in Canada, compared to 332 per 100,000 in Australia, for people aged 15 years and over in 2016.¹⁰

Smoking is the most common cause of COPD. There is typically a lag of decades between starting regular smoking and the appearance of symptoms.⁴ Genetic factors, chronic asthma, environmental exposures (for example, to occupational fumes and dust, indoor and outdoor air pollution), pulmonary tuberculosis and failure to achieve maximal lung growth during development are also associated with an increased risk of COPD.⁶ These additional risk factors may contribute to the markedly different rates of decline in lung function in people with COPD, despite similar smoking exposure.¹¹ Approximately 30–40% of people with COPD continue to smoke, and people with COPD often find it more difficult to quit than other smokers.¹² People with COPD also have a higher risk of lung cancer.¹³

Interventions to reduce exacerbations of COPD and hospitalisations include inhaled medicines.⁴ Vaccination against influenza has been estimated to reduce, by approximately 37%, the risk of exacerbations, hospitalisations and death in people with COPD.¹⁴ Pulmonary rehabilitation is recommended to improve exercise capacity and quality of life, and reduce hospitalisations and length of hospital stay for COPD.^{3,15–18} Further details of recommended management are in the COPD-X guidelines.⁴

Who is at greater risk?

Rates of smoking, or a history of smoking, are high in regional and remote areas, and among people with socioeconomic disadvantage. Higher smoking rates among disadvantaged groups are associated with a complex interaction between social, economic, physiological, commercial and cultural factors.¹⁹ Many of these factors originate in childhood and accumulate through an individual's lifetime.¹⁹

COPD and Aboriginal and Torres Strait Islander people

Aboriginal and Torres Strait Islander people have approximately 2.5 times the prevalence of COPD as other Australians.²⁰ COPD was the most common cause of potentially preventable hospitalisations among Aboriginal and Torres Strait Islander people in 2017–18, and the second most common cause among other Australians.⁸

A lack of culturally safe services for Aboriginal and Torres Strait Islander people may be a barrier to accessing health care effectively.²¹ This may contribute to poorer medication management, continued smoking and lower influenza vaccination rates, with resulting higher hospitalisation rates. Smoking rates among Aboriginal and Torres Strait Islander people have fallen in the past decade, but remain higher than in the Australian population as a whole.^{9,22}

About the data

Data are sourced from the National Hospital Morbidity Database, and include admitted patients in both public and private hospitals, as well as hospital care in the home.

Rates are based on the number of hospitalisations for COPD per 100,000 people of all ages in 2017–18.

Because a record is included for each hospitalisation for the condition, rather than for each patient, patients hospitalised more than once in the financial year will be counted more than once.

The analysis and maps are based on the usual residential address of the patient and not the location of the hospital.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

Data quality issues – for example, the extent of identification of Aboriginal and Torres Strait Islander status in datasets – could influence variations seen.

What do the data show?

Magnitude of variation

In 2017–18, there were 77,754 hospitalisations for COPD, representing 260 hospitalisations per 100,000 people of all ages (the Australian rate).

The number of hospitalisations for COPD across 328* local areas (Statistical Area Level 3 – SA3) ranged from 56 to 1,013 per 100,000 people. The rate was **18.1 times as high** in the area with the highest rate compared with the area with the lowest rate. The number of hospitalisations varied across states and territories, from 218 per 100,000 people in the Australian Capital Territory to 693 in the Northern Territory (Figures 2.2–2.5).

After the highest and lowest 10% of results were excluded and 264 SA3s remained, the number of hospitalisations per 100,000 people was 3.3 times as high in the area with the highest rate compared with the area with the lowest rate.

Analysis by remoteness and socioeconomic status

Rates of hospitalisation for COPD were substantially higher in remote areas than in other areas. Hospitalisation rates also increased with socioeconomic disadvantage, regardless of remoteness category (Figure 2.6).

* There are 340 SA3s. For this item, data were suppressed for 12 SA3s due to a small number of hospitalisations and/or population in an area.

Notes:

Some SA3 rates are more volatile than others. These rates are excluded from the calculation of the difference between the highest and lowest SA3 rates in Australia.

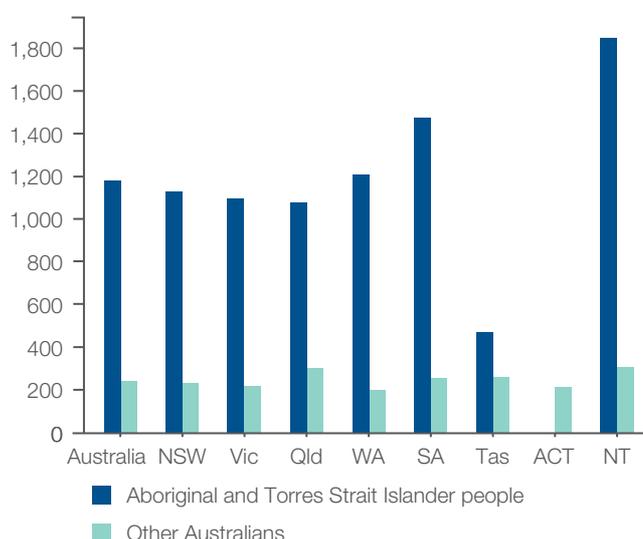

For further detail about the methods used, please refer to the Technical Supplement.

Chronic obstructive pulmonary disease (COPD)

Analysis by Aboriginal and Torres Strait Islander status

The rate of hospitalisations for Aboriginal and Torres Strait Islander people (1,178 per 100,000 people) was 4.8 times as high as the rate for other Australians (243 per 100,000 people) (Figure 2.1).

Figure 2.1: Number of potentially preventable hospitalisations – COPD per 100,000 people of all ages, age and sex standardised, by state and territory of patient residence, by Aboriginal and Torres Strait Islander status, 2017–18

The data for Figure 2.1, and the data and graphs for Analysis by Primary Health Network are available at safetyandquality.gov.au/atlas

Trends over time

Between 2014–15 and 2017–18, the rate of COPD hospitalisations per 100,000 people nationally increased by 8% (Figure 2.7).

For Aboriginal and Torres Strait Islander people, the rate of COPD hospitalisations per 100,000 people nationally increased by 16% between 2014–15 and 2017–18 (Figure 2.8).

Interpretation

Potential reasons for the variation include differences in:

- Demographic and consumer factors
 - prevalence of COPD and comorbidities
 - rates of smoking, which are influenced by socioeconomic disadvantage, psychological distress, Aboriginal and Torres Strait Islander status, and remoteness
 - rates of respiratory infections
 - patients' health literacy and ability to self-manage exacerbations
 - patients' ability to afford medicines
 - patients' social supports, frailty and comorbidities
 - air quality and occupational exposures (for example, to fumes and dust)
 - the proportion of people from non-English speaking backgrounds – the risk of hospitalisations for COPD is higher in these groups⁶
- Clinician factors
 - concordance with evidence-based guidelines by clinicians and service providers^{23–25}
 - clinician focus on smoking cessation
 - diagnostic error

Notes:

Data for ACT (Aboriginal and Torres Strait Islander people) have been suppressed. Data by Aboriginal and Torres Strait Islander status should be interpreted with caution as hospitalisations for Aboriginal and Torres Strait Islander patients are under-enumerated, with variation among states and territories. Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018. For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2017 and 2018.

- Health system factors
 - access to community pulmonary rehabilitation and multidisciplinary care
 - access to secondary prevention programs
 - rates of influenza and pneumococcal vaccination
 - primary care services that are affordable, culturally appropriate and accessible
 - emergency department admission policies (that is, admitting all COPD patients, or discharging some patients where there are sufficient community resources).

Variations between areas may not directly reflect the practices of the clinicians who are based in those areas. Area boundaries reflect where people live rather than where they obtain their health care. Patients who live in metropolitan, regional and rural areas may all travel outside their local area to receive care.

Smoking rates

The pattern of COPD hospitalisations mirrors the pattern of smoking in different population groups. The rate of smoking among Aboriginal and Torres Strait Islander people is 41%, which is approximately triple the rate for the Australian population as a whole.²⁶ Rates of smoking are higher among people living in outer remote and remote areas of Australia (19%) than among those living in inner regional areas (15%) or major cities (13%).⁹

Rates of smoking are higher in areas of greatest socioeconomic disadvantage. In areas of most disadvantage (first quintile), 22% of adults are current daily smokers, compared with 7% in the least disadvantaged areas (fifth quintile).⁹

System factors

System factors likely to influence hospitalisation rates for COPD include access to multidisciplinary respiratory specialty care (which is particularly lacking in regional and remote areas), integrated care and telehealth. Hospital management of common

comorbidities in people with COPD also plays an important role, as does good discharge planning to reduce readmissions.

Primary care

Lack of concordance with best practice in primary care can contribute to variation in hospitalisation through differences in advice to patients on how to manage exacerbations, education on inhaler technique, rates of influenza and pneumonia vaccination, and recommendations for pulmonary rehabilitation.^{23,25,27}

Reducing COPD hospitalisations

The high rate of hospitalisations for COPD reported in this chapter is unacceptable, and we must implement the strategies we know can improve the health of people with this condition. This is particularly important for the groups with higher rates of hospitalisation for COPD: Aboriginal and Torres Strait Islander peoples, and those living outside metropolitan areas or in socioeconomically disadvantage areas.

Reducing smoking rates is also key to reducing COPD rates and hospitalisations. This is particularly true for groups with high smoking rates, such as Aboriginal and Torres Strait Islander people, people at socioeconomic disadvantage, and people living in regional or remote areas.⁹ Increasing influenza vaccination rates could also reduce hospitalisations among people with COPD.¹⁴

Systems to support early diagnosis and management of COPD, and integrated services, could reduce the need for some COPD hospitalisations.²⁸ Increases in access to spirometry, smoking cessation supports and education on appropriate inhaler use have also been identified as priorities for supporting people with COPD.²⁸ Pharmacist interventions, pulmonary rehabilitation and telehealth (including remote monitoring) may reduce hospitalisations among people with COPD.

Chronic obstructive pulmonary disease (COPD)

Pulmonary rehabilitation

Pulmonary rehabilitation is a program of exercises and education strategies delivered by health professionals to improve breathing and function. A review of randomised controlled trials of pulmonary rehabilitation found that COPD-related hospitalisations were reduced by 36% in patients undertaking pulmonary rehabilitation.² Another review found that, among patients undertaking pulmonary rehabilitation after being hospitalised for an exacerbation of symptoms, the risk of readmission for any reason was reduced by 56%.³

Estimates of the use of pulmonary rehabilitation by people with COPD in Australia have ranged from less than 5% to 10%.²⁹ Uptake of pulmonary rehabilitation by Aboriginal and Torres Strait Islander people with COPD is lower than for other Australians.³⁰ One reason for the low uptake by Australian COPD patients is difficulty in accessing services.^{17,18,31} For example, access has been limited by the small number of services, restriction of services to hospital settings in many cases, and difficulties with transport and comorbidities.^{32,33} Depression and a lack of perceived benefit also prevent some people with COPD from attending pulmonary rehabilitation.³³ Access to pulmonary rehabilitation in rural and remote areas is particularly challenging.

Providing pulmonary rehabilitation in community settings with easy access to transport has shown positive results in improving attendance and reducing hospitalisations.^{17,18} A training program for health professionals in rural and remote areas in providing pulmonary rehabilitation has been trialled successfully and improved access in these areas.¹⁷ Access to culturally sensitive pulmonary rehabilitation programs will be important if these programs are to benefit Aboriginal and Torres Strait Islander people with COPD (see 'Case study: Pulmonary rehabilitation for Aboriginal and Torres Strait Islander people' on this page). Improving health literacy and self-management is particularly important for people with COPD who do not have access to pulmonary rehabilitation.

Home-based pulmonary rehabilitation may be useful for engaging people with COPD who are unable to access traditional models. A home-based pulmonary rehabilitation program, which included one home visit and seven once-weekly phone calls from a physiotherapist, was shown to have outcomes at least as beneficial as traditional centre-based programs.³⁴

Case study: Pulmonary rehabilitation for Aboriginal and Torres Strait Islander people

Aboriginal and Torres Strait Islander people with COPD have lower rates of participation in pulmonary rehabilitation than the Australian population as a whole, but a program in Hobart and Launceston, Tasmania, has succeeded in engaging patients and improving outcomes. The program combined cardiac and pulmonary rehabilitation and prevention. It was open to Aboriginal and Torres Strait Islander people with COPD, heart failure, ischaemic heart disease or at least two cardiovascular risk factors (for example, smoking, obesity, hypertension).³⁰

Dyspnoea, fatigue and mental health scores improved significantly after the eight-week program, which comprised two exercise sessions and one self-management education session per week in 2013.³⁰ The program encouraged participation by providing a variety of exercise types and transport, if required; 79% of the 92 participants attended at least half of the sessions. Aboriginal health workers recruited and supported participants, and liaised between the Aboriginal health service and external clinicians. Co-location with the Aboriginal health service and leadership by Aboriginal and Torres Strait Islander health workers were thought to be key factors in the program's success.³⁰

Reducing COPD hospitalisations among Aboriginal and Torres Strait Islander people

Complex social determinants underlie the disparities in health, and in risk factors such as smoking rates, between Aboriginal and Torres Strait Islander people and other Australians.^{35,36} Impacts of colonisation, including racism and intergenerational trauma, contribute to these determinants. To address health inequities, improvements in social factors are required – for example, in education, employment and living conditions.³⁵ In addition, the logistical and financial barriers to accessing timely and effective health care for Aboriginal and Torres Strait Islander people who live in remote areas need to be addressed.³⁵

Smoking rates among Aboriginal and Torres Strait Islander people aged 15 years and over fell from 45% in 2008 to 37% in 2018–19, although there was no significant change in remote areas.²² Further reductions in smoking and COPD rates are most likely to be achieved with multifaceted interventions that incorporate Aboriginal and Torres Strait Islander leadership, partnership and engagement.³⁷

Cultural safety and culturally appropriate care

Barriers to Aboriginal and Torres Strait Islander people accessing chronic disease care include cost, lack of transport, fear and distrust of services, and lack of culturally safe services.³⁸ Cultural safety means that health consumers are safest when health professionals have considered power relations, cultural differences and consumers' rights.²¹

Expanding use of spirometry

Early diagnosis may prevent progressive functional deterioration in COPD.⁴ Spirometry is essential for the diagnosis of COPD, and opportunistic screening of symptomatic smokers and ex-smokers in general practice could facilitate early diagnosis and management.⁴ Barriers to providing spirometry include equipment costs and insufficient remuneration, according to a survey of Australian general practitioners (GPs).³⁹

Primary Health Network support

Primary Health Networks (PHNs) support general practices managing people with COPD by providing education for clinicians and consumers, quality improvement support, data extraction and analysis, and resources such as cycle-of-care plans. In some areas, PHNs support integrated care models for chronic diseases, including COPD – for example, nurse-led respiratory disease management clinics and integrated care programs for chronic diseases.^{40,41}

Integrated care

An integrated care model for people with chronic diseases, such as COPD and diabetes, in Western Sydney included:

- Care facilitators – nurses who linked hospital, GP and allied health care; supported self-management and smoking cessation; and oversaw annual cycles of care and vaccinations
- Specialist rapid access and stabilisation services – pathways other than the emergency department to fast access to specialist care, and better transition back to primary care
- GP support line – answered by specialists to provide immediate advice on management of patients
- IT systems – including a web-based portal for healthcare provider information.⁴¹

Preliminary analysis showed that potentially preventable hospitalisations were reduced by 37% among chronic disease patients who were enrolled in, or who had attended, the rapid access and stabilisation service.⁴¹

Chronic obstructive pulmonary disease (COPD)

Pharmacist interventions

Interventions by pharmacists, either alone or as part of a multidisciplinary team, can reduce hospital admissions by 50% among people with COPD.⁴²

Interventions, conducted in outpatient clinics and/or community pharmacies, include:

- Education and counselling about medicines and lifestyle
- Assessment of medicines adherence, or medicines review
- Reminder systems, through either phone contact or home visits
- Smoking cessation programs
- Feedback to healthcare professionals.

Nutrition

Dietitians and nutritionists have a central role in managing excess weight, as well as unwanted weight loss, in people with COPD.⁴ Obesity in people with COPD is associated with carbon dioxide retention, sleep apnoea and other health problems.⁴ Excessive weight loss is a common problem in people with end-stage COPD. Nutritional supplementation can promote significant weight gain in people with COPD, improving respiratory muscle strength, walking ability and quality of life, especially in people who are malnourished.⁴³

Telehealth

Telehealth for people with COPD includes a wide range of interventions, from simple telephone support to remote monitoring of symptoms. Some meta-analyses have shown significant reductions in hospitalisations (for example, a reduction of 54% over 12 months, compared with usual care).⁴⁴ The effectiveness of different models varies widely, and identifying the common components of successful programs would help guide the future use of telehealth.

Palliative care

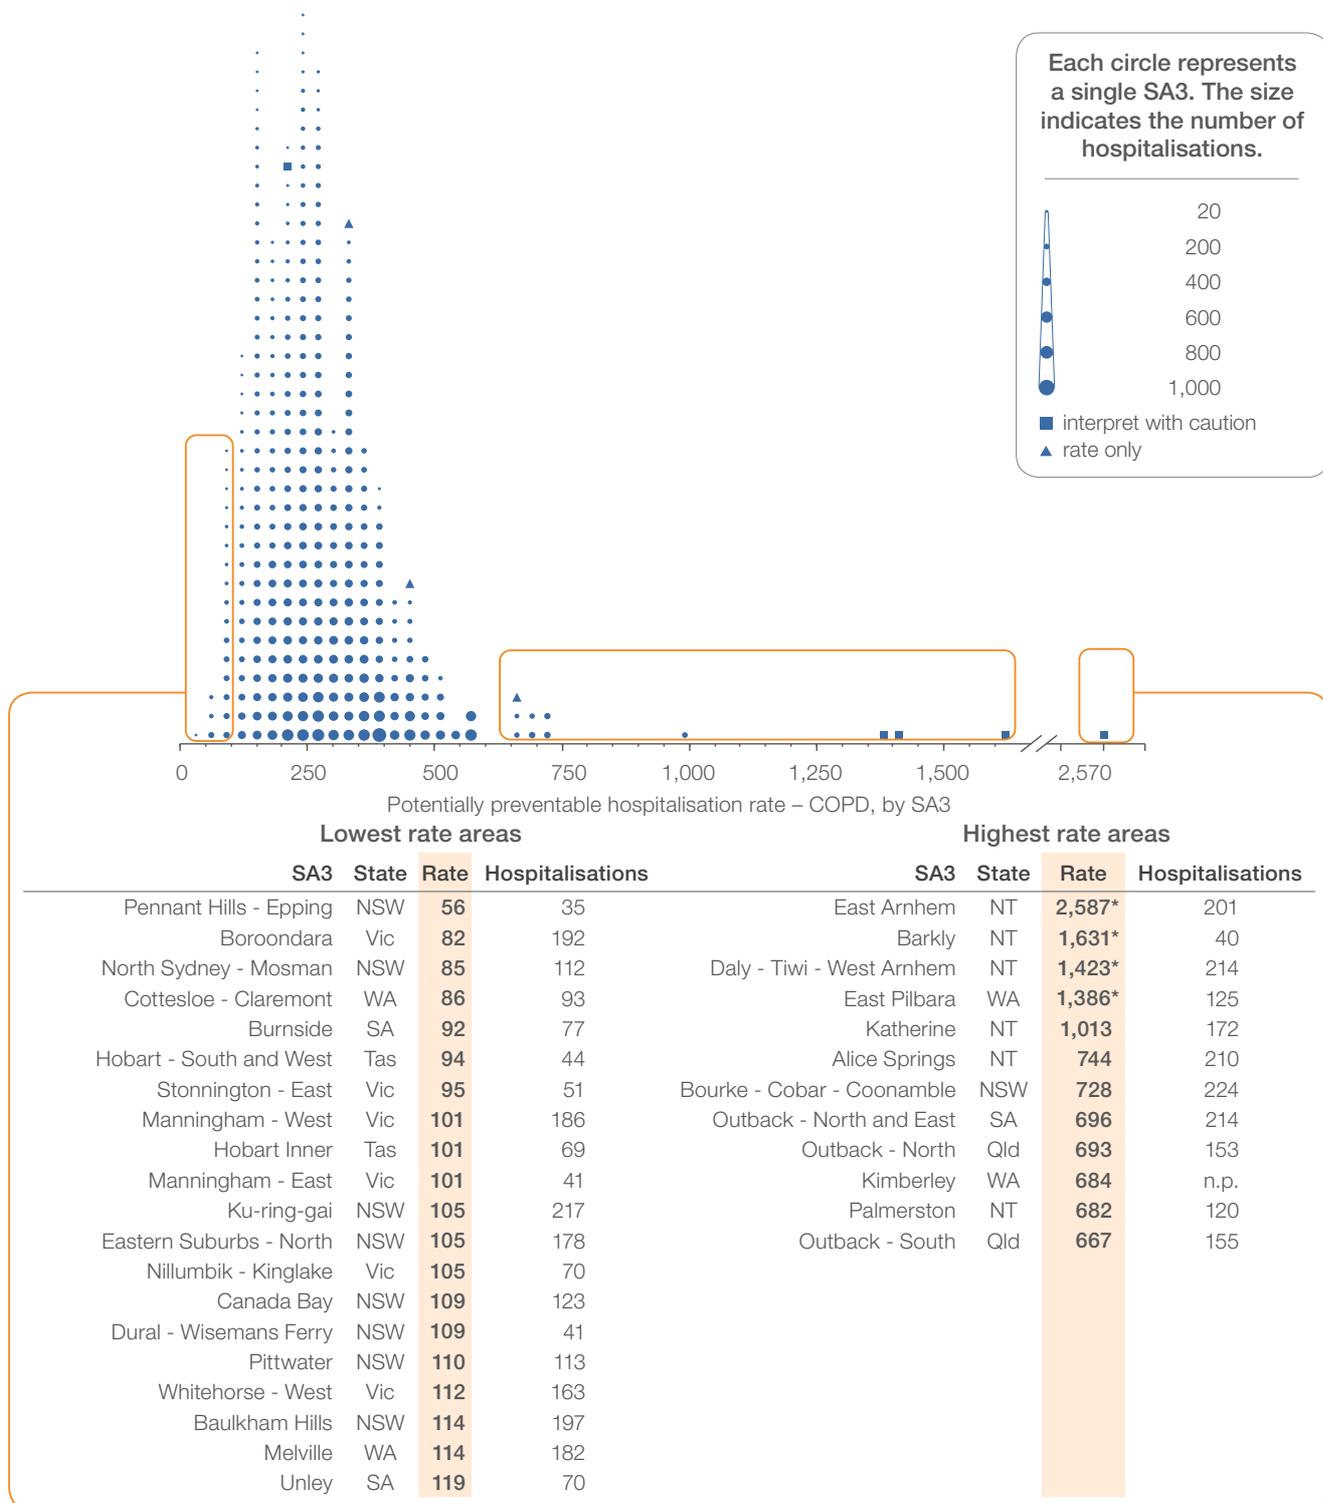

People with COPD experience distressing symptoms, such as breathlessness, anxiety and insomnia, which are often poorly controlled and under-treated in advanced disease.⁴ Early access to palliative care is recommended for people with persisting symptoms of COPD. Symptom palliation should be implemented early, and concurrently with active treatment.⁴

To avoid under-treatment of distressing symptoms of COPD, referral to palliative care should not rely on clinicians' estimates of prognosis but rather on the person's symptoms.⁴⁵ Management of distressing symptoms may be improved by introducing new models of integrated respiratory and palliative care that routinely offer all people with advanced COPD both disease-directed treatment and palliative care, as well as access to specialist palliative care.⁴⁵

A recent Australian study reported that only 5% of people who died in hospital from COPD had a written advance care directive before the admission.⁴⁵ Discussion of advance care directives may be useful for ensuring that the person's wishes regarding active treatment are considered early and documented.

Rates by local area

Figure 2.2: Number of potentially preventable hospitalisations – COPD per 100,000 people of all ages, age and sex standardised, by Statistical Area Level 3 (SA3) of patient residence, 2017–18

Notes:

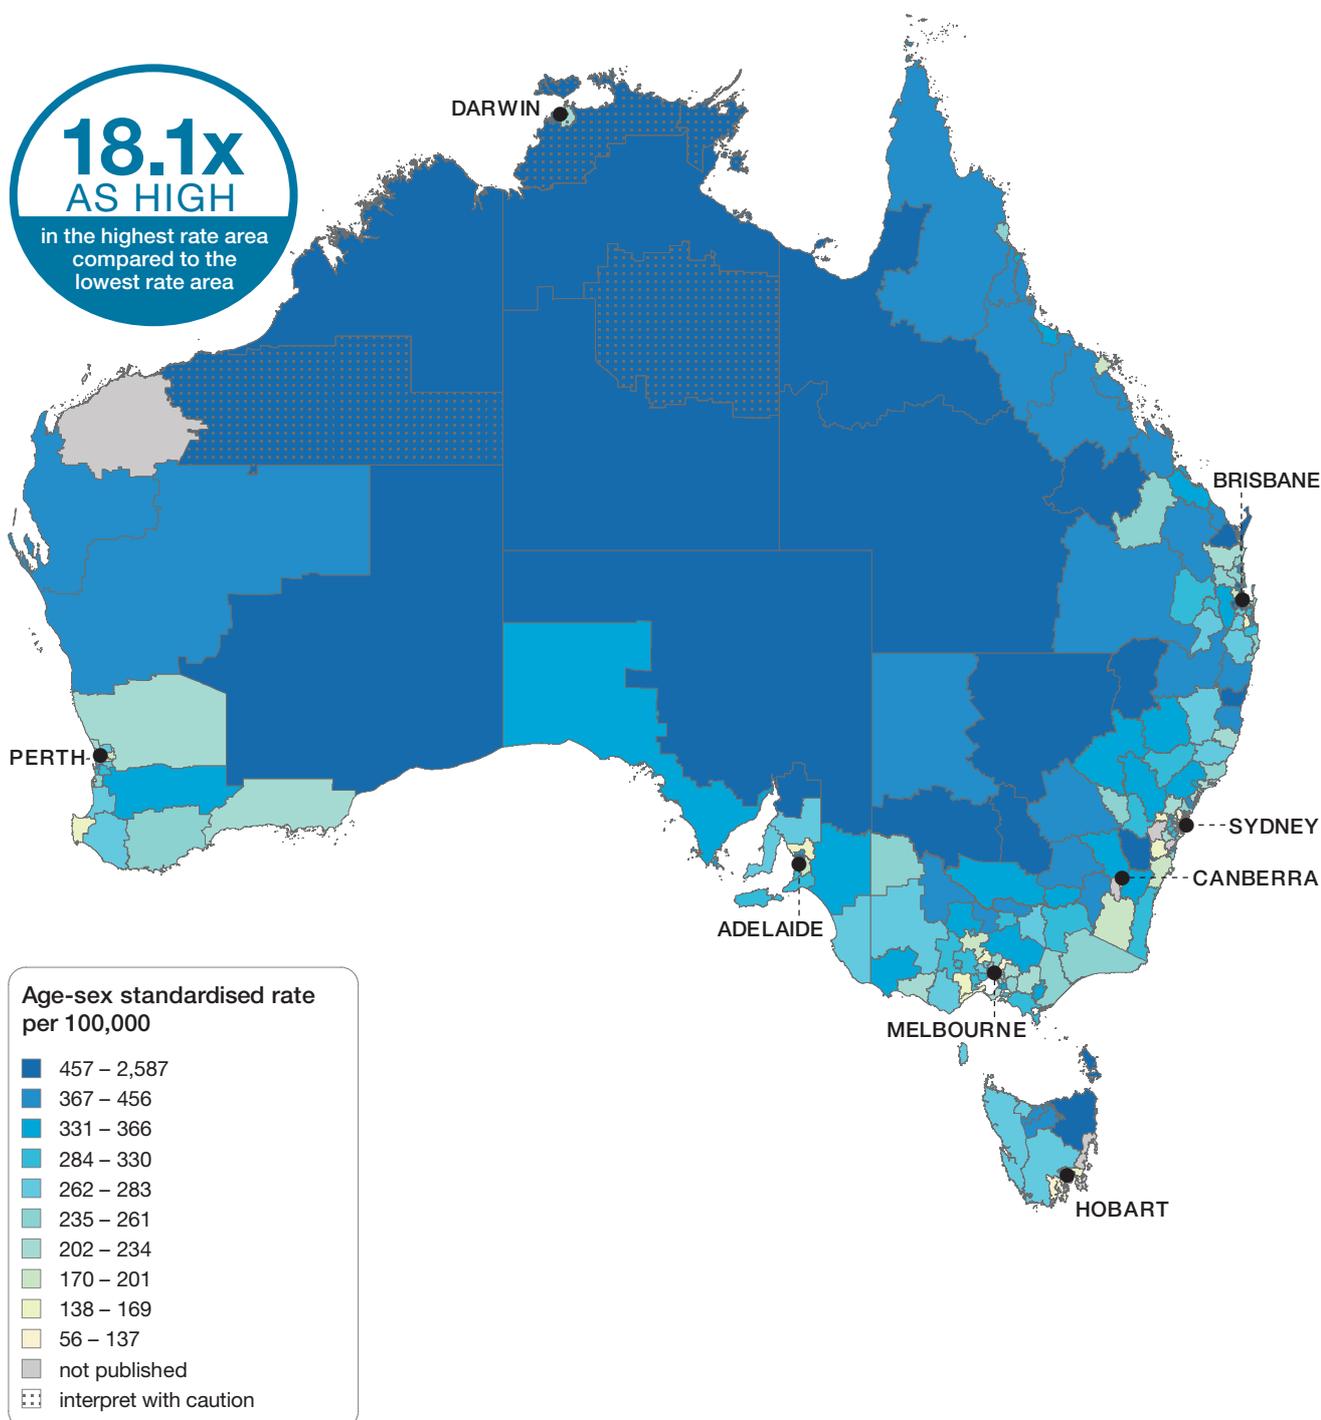

Squares (■) and asterisks (*) indicate rates that are more volatile than other rates and should be interpreted with caution. Triangles (▲) indicate SA3s where only rates are published. The numbers of hospitalisations are not published (n.p.) for confidentiality reasons. Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018. For further detail about the methods used, please refer to the Technical Supplement.

Australian initiatives

The information in this chapter will complement work already underway to prevent COPD and improve its management in Australia. At a national level, this work includes:

- National Tobacco Campaign
- National Strategic Action Plan for Lung Conditions
- Tackling Indigenous Smoking program
- Lung Foundation Australia education and support programs
- Lung Foundation Australia's Breathe Easy, Walk Easy training program for rural and remote healthcare providers.

Many state and territory initiatives are also in place, including:

- State- and territory-based tobacco control strategies
- Quitline, including Aboriginal and Torres Strait Islander counsellors
- Leading Better Value Care COPD program, New South Wales (NSW)
- Smoking Cessation Framework, NSW
- A Strategic Framework for Aboriginal Tobacco Resistance and Control in NSW
- Reports on hospital readmission rates for COPD, NSW Bureau of Health Information
- Delivering Connected Care for Complex Patients with Multiple Chronic Needs, Tasmania
- Hospital Admissions Risk Program, Victoria
- Improving Care for Aboriginal and Torres Strait Islander Patients program, Victoria
- Quit Victoria
- Aboriginal Tobacco Control Project, Western Australia
- *Respiratory Health Policy Position for the Procurement of Community Based Services*, Western Australia.²⁸

2.2 Heart failure

Why is this important?

Heart failure affects about 1–2% of people in Australia. People with heart failure often have multiple hospitalisations, and have a mortality rate of 50–75% within five years of diagnosis.¹ In 2017–18, heart failure accounted for 412,693 hospital bed days.² Hospital care is appropriate when the condition is severe, but well-coordinated care in the community can keep people with heart failure well enough to reduce their need for hospitalisation.

What did we find?

Between 2014–15 and 2017–18, the rate of heart failure hospitalisations per 100,000 people nationally increased by 4%. In 2017–18, the rate of hospitalisations for heart failure was **5.8 times as high** in the area with the highest rate compared with the area with the lowest rate. The rate for Aboriginal and Torres Strait Islander people was 2.3 times as high as that for other Australians, but decreased by 4% between 2014–15 and 2017–18.

What can be done?

Reducing hospitalisations for heart failure will take a combination of approaches:

- Primary prevention
- Consumer enablement
- More effective use of medicines
- Greater use of exercise and cardiac rehabilitation programs
- Better care in the community, including improved integration with hospital care and greater access to multidisciplinary care.

Major system changes that support widespread implementation of these changes are needed to reduce hospitalisations for heart failure. For example, system redesign to ensure outpatient clinic review within 30 days of an admission may have a marked effect on mortality. Better integration of care in the community with acute hospital care can improve outcomes for people with heart failure. Specific interventions, such as medication management and rehabilitation programs, can also reduce hospitalisations for heart failure.

Heart failure is not a new problem, and the health system must do better to manage it. Priority should be given to improving care for groups with higher rates of hospitalisation for heart failure, such as Aboriginal and Torres Strait Islander people and those living outside metropolitan areas or in socioeconomically disadvantaged areas.

Heart failure

Context

Chronic heart failure is a condition that occurs when the heart becomes weaker and/or less effective at pumping blood around the body. Symptoms of chronic heart failure include fluid accumulation in the body and breathlessness.

Ejection fraction is a measure of the volume of blood the heart pushes out with each heart beat. The major categories of heart failure are heart failure with reduced ejection fraction and heart failure with preserved ejection fraction.

The most common cause of heart failure is underlying heart disease due to impaired coronary blood supply, usually accompanied by a history of myocardial infarction (heart attack).³ Other causes include hypertension and valvular heart disease.³ Risk factors for these conditions and heart failure include age, family history, smoking, obesity and diabetes.³ Reducing these modifiable risk factors could reduce the prevalence of heart failure.

People with heart failure have high rates of hospitalisation to manage acute episodes of decompensation (severe symptoms), and have a mortality rate of 50–75% within five years of diagnosis.¹ In 2017–18, heart failure accounted for 412,693 hospital bed days.² The rate of hospitalisations for heart failure was 227 per 100,000 in Australia, compared to 164 per 100,000 in Canada, in people aged 15 years and over in 2016.⁴

The most common events that lead to hospitalisation are infection, non-adherence to fluid restrictions and non-adherence to medicines.⁵ People admitted to hospital with acute decompensation of chronic heart failure often have comorbidities with shared risk factors, such as renal disease, diabetes and pulmonary disease.⁵

Prevalence

The prevalence of heart failure in Australia is estimated at 1–2%. The prevalence of heart failure rises steeply with age, and the rate of hospitalisations for heart failure is approximately 20 times higher among people aged 75–79 years than among those aged 45–49 years.² There may be substantial numbers of people with undiagnosed heart failure in Australia.¹

National data on long-term trends in the prevalence of heart failure are not available. A Western Australian study reported that the incidence of first hospitalisations for heart failure decreased steadily between 1990 and 2005 – from 191 to 103 per 100,000 in men, and from 130 to 75 per 100,000 in women.⁶ However, hospitalisations for heart failure increased by 15% over this period, partly due to the ageing population and improved survival among people with heart failure.⁶

Rates of heart failure are higher in rural and remote areas than in metropolitan areas of Australia.¹ A combination of factors is likely to contribute to this:

- Social determinants such as education, income and employment
- Risk factors such as smoking
- Lack of access to health care or health professionals.⁷

Heart failure in Aboriginal and Torres Strait Islander people

Rates are higher among Aboriginal and Torres Strait Islander people.¹ Estimates of heart failure prevalence among Aboriginal and Torres Strait Islander people range from 1% to 5.3%.¹

Timely diagnosis of heart disease and heart failure is one of the priority areas in the Better Cardiac Care Measures for Aboriginal and Torres Strait Islander People initiative of the Australian Health Ministers' Advisory Council.⁸ The number and proportion of Aboriginal and Torres Strait Islander people, compared with other Australians, who received one or more relevant cardiac-related Medicare Benefits Schedule (MBS) diagnostic services in the previous 12 months is reported as a measure of timely diagnosis. This measure showed some improvement between 2004–05 and 2017–18, when MBS claims for cardiac-related diagnostic items rose from 7% to 11% for Aboriginal and Torres Strait Islander people and from 7% to 9% for other Australians.⁸

Management

Better health care can keep people with heart failure well enough to reduce their need for hospitalisation. However, for people with chronic progressive diseases such as heart failure with exacerbating features, hospital presentation is appropriate when the patient is decompensating.

Best-practice management of people with chronic heart failure involves evidence-based, multidisciplinary care.⁹ Effective management involves a combination of strategies, which may include:

- Non-pharmacological approaches, such as physical activity programs, and consumer and carer education about self-management of heart failure¹⁰
- Pharmacotherapy, including diuretics, beta-blockers, angiotensin-converting enzyme (ACE) inhibitors or angiotensin receptor blockers, mineralocorticoid receptor antagonists and angiotensin neprilysin receptor inhibitors (a newer type of medicine)¹⁰; note that recommended therapy differs between heart failure with reduced ejection fraction and heart failure with preserved ejection fraction
- Surgical procedures and supportive devices – for example, coronary artery bypass graft surgery, cardiac resynchronisation therapy with or without insertion of an implantable cardiac defibrillator, and heart transplant.¹⁰

About the data

All hospitalisations with a principal diagnosis of heart failure (with reduced or preserved ejection fraction) are included.

Data are sourced from the National Hospital Morbidity Database, and include admitted patients in both public and private hospitals, as well as hospital care in the home.

Rates are based on the number of hospitalisations for heart failure per 100,000 people of all ages in 2017–18.

Because a record is included for each hospitalisation for the condition, rather than for each patient, patients hospitalised for the condition more than once in the financial year will be counted more than once.

The analysis and maps are based on the residential address of the patient and not the location of the hospital.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

Data quality issues – for example, the extent of identification of Aboriginal and Torres Strait Islander status in datasets – could influence variations seen.

Heart failure

What do the data show?

Magnitude of variation

In 2017–18, there were 62,554 hospitalisations for heart failure, representing 201 hospitalisations per 100,000 people of all ages (the Australian rate).

The number of hospitalisations for heart failure across 325* local areas (Statistical Area Level 3 – SA3) ranged from 91 to 531 per 100,000 people. The rate was **5.8 times as high** in the area with the highest rate compared with the area with the lowest rate. The number of hospitalisations varied across states and territories, from 172 per 100,000 people in Tasmania to 324 in the Northern Territory (Figures 2.10–2.13).

After the highest and lowest 10% of results were excluded and 260 SA3s remained, the number of hospitalisations per 100,000 people was 2.0 times as high in the area with the highest rate compared with the area with the lowest rate.

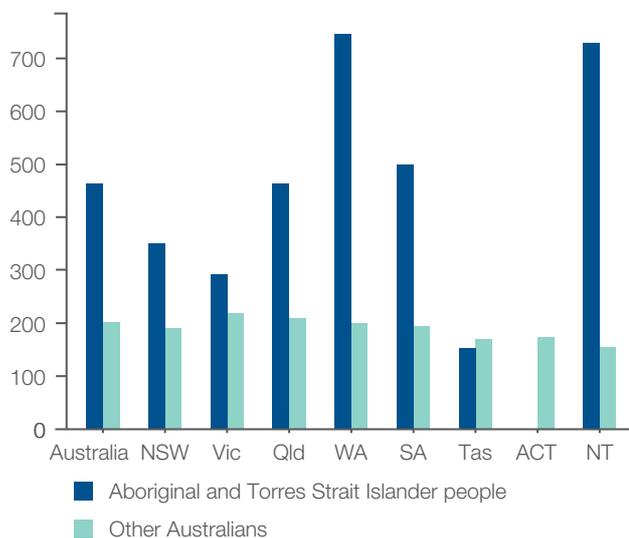

Analysis by remoteness and socioeconomic status

Rates of hospitalisation for heart failure were substantially higher in remote areas than in other areas. Hospital admission rates also increased with socioeconomic disadvantage in major cities, and inner regional and remote areas (Figure 2.14).

Analysis by Aboriginal and Torres Strait Islander status

The rate for Aboriginal and Torres Strait Islander people (462 per 100,000 people) was 2.3 times as high as the rate for other Australians (201 per 100,000 people) (Figure 2.9).

Figure 2.9: Number of potentially preventable hospitalisations – Heart failure per 100,000 people of all ages, age and sex standardised, by state and territory of patient residence, by Aboriginal and Torres Strait Islander status, 2017–18†

The data for Figure 2.9, and the data and graphs for analysis by Primary Health Network are available at safetyandquality.gov.au/atlas

* There are 340 SA3s. For this item, rates were suppressed for 15 SA3s due to a small number of hospitalisations and/or population in an area.

Notes:

Some SA3 rates are more volatile than others. These rates are excluded from the calculation of the difference between the highest and lowest SA3 rates in Australia.

† Data for ACT (Aboriginal and Torres Strait Islander people) have been suppressed. Data by Aboriginal and Torres Strait Islander status should be interpreted with caution as hospitalisations for Aboriginal and Torres Strait Islander patients are under-enumerated, with variation among states and territories. Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018.

For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2017 and 2018.

Trends over time

Between 2014–15 and 2017–18, the rate of heart failure hospitalisations per 100,000 people nationally increased by 4% (Figure 2.15).*

For Aboriginal and Torres Strait Islander people, the rate of heart failure hospitalisations per 100,000 people nationally decreased by 4% between 2014–15 and 2017–18 (Figure 2.16).

Interpretation

Potential reasons for the variation include differences in:

- Clinician factors:
 - non-concordance with management guidelines
 - diagnostic error
 - failure to refer to heart failure multidisciplinary programs that include education, psychosocial support, exercise training and optimal pharmacotherapy¹¹
- Health system factors:
 - access to post-discharge, multidisciplinary disease management programs (either hospital or community based)
 - access to review within 7–14 days of discharge to avert readmission¹⁰
 - quality of both hospital and community care, which can be affected by suboptimal communication between clinicians
 - quality, efficiency and effectiveness of primary health care
 - availability of health care that is compatible with Aboriginal and Torres Strait Islander culture¹²
- access to dialysis for Aboriginal and Torres Strait Islander people; in areas with large Aboriginal and Torres Strait Islander populations requiring dialysis for kidney disease, inadequate access to dialysis may worsen heart failure and contribute to hospitalisation numbers
- availability of primary care clinicians to increase primary and secondary prevention
- availability of services that are appropriate to the local population's health literacy levels
- Demographic and consumer factors:
 - socioeconomic disadvantage, as heart failure appears to be more prevalent among people living in lower socioeconomic areas²
 - prevalence of risk factors for heart failure, such as coronary heart disease, rheumatic fever and rheumatic heart disease, diabetes, hypertension, smoking, obesity and obesogenic environments, kidney disease and psychological distress
 - severity of heart failure and comorbidities
 - health literacy about medicines, concordance with medication regimens, ability to afford medicines.

Variations between areas may not directly reflect the practices of the clinicians who are based in those areas. Area boundaries reflect where people live rather than where they obtain their health care. Patients who live in metropolitan, regional and rural areas may all travel outside their local area to receive care.

Note:

* Since June 2017, emergency department-only episodes in New South Wales have not been counted as hospitalisations, and this will affect the time trends described above.

Heart failure

Non-concordance with guidelines

Translation of clinical guidelines into practice is poor, according to results of a recent Victorian study: only 13% of heart failure patients received an outpatient review and heart failure home visit review, and were prescribed medicines according to guidelines, within 30 days of discharge.¹³ Rates of guideline-concordant management after discharge were lower in regional areas than in metropolitan areas.¹³

Rates of prescription of ACE inhibitors and beta-blockers among patients admitted to hospital for heart failure also showed shortfalls compared with recommended use in a study in New South Wales (NSW) and the Australian Capital Territory (ACT), suggesting that uptake of evidence-based guidelines can be improved.⁵

Readmissions

Readmissions make a substantial contribution to hospitalisations for people with heart failure. The rate of readmission within 30 days, for any cause, among people with heart failure in Australia is approximately 24%.¹⁴ Factors that increase the risk of readmission for heart failure include male gender, socioeconomic disadvantage, numerous comorbidities and being admitted from an aged care setting.¹⁵ A recent study of hospitalisations with acute heart failure in NSW and the ACT found that 11% of patients were residents of aged care homes.⁵

Addressing variation

Rates of hospitalisation for heart failure in Australia have increased since publication of the *Second Australian Atlas of Healthcare Variation* in 2017. Heart failure is not a new problem, and the health system must do better to care for people with this condition.

There are pockets of excellence in managing heart failure, but major system changes are needed if we are to make meaningful progress in this area. And it is vital that we do make progress, to improve the quality of life, outcomes and experience for people with heart failure.

Reducing hospitalisations for heart failure will take a combination of approaches:

- Primary prevention
- Better care in the community, including improved integration with hospital care
- Consumer enablement
- More effective use of medicines
- Greater use of exercise and cardiac rehabilitation programs.

Primary prevention

Reducing the prevalence of risk factors for heart failure, such as hypertension, diabetes, smoking and obesity, is fundamental to reducing the prevalence of, and hospitalisations for, heart failure.¹⁶

Primary care

General practitioners (GPs) have a vital role in the community management of people with heart failure. Barriers to effective primary care for heart failure patients, and potential solutions, were identified in focus groups of GPs and practice nurses from five general practices in Sydney.¹⁷ Suggested improvements to support effective delivery of heart failure management included:

- Thorough, accurate discharge summaries from hospitals, with clear medication instructions at an appropriate level for the health literacy of the patient

- Closer contact between GPs and hospital specialists and clinical nurse consultants
- More consistent coding of heart failure, because the use of alternative terms can result in the diagnosis not being flagged and some patients being unaware of their diagnosis
- Appropriate Medicare rebates for practice nurse consultations in chronic disease management
- A Medicare rebate for outpatient testing of B-type natriuretic peptide levels, which is often useful in confirming the diagnosis of heart failure.¹⁷

Other strategies to support GP care of people with heart failure include community rapid response initiatives. For example, in Tasmania, people are referred to the Community Rapid Response Service by their GP. A nurse practitioner, community nurses, GP and other health professionals, as required, plan care together with the person referred.¹⁸ Care is delivered to the person in their home or other community setting such as an aged care home.¹⁸ Health conditions treated include exacerbations of chronic conditions such as heart failure.¹⁸

Transition to community care

The first few weeks after hospital discharge are a high-risk period for people with heart failure, but early follow-up can reduce the risk of readmission and death. Australian guidelines advise starting discharge planning early during hospitalisation for heart failure, including review within 7–14 days of discharge, an early outpatient clinic appointment and community services, as needed.¹⁰

A recent study from Victoria found that the readmission rate was 24%, and the mortality rate was 9%, within 30 days of discharge after hospitalisation for heart failure.¹⁴ Having an outpatient appointment within 30 days of discharge reduced the mortality risk by 81%.¹⁴ The referral rate at discharge was 63% for an outpatient clinic appointment, but, at 30 days post-discharge, 26% of patients with a referral were waiting for an appointment date.¹⁴ The average time to an outpatient clinic visit was 27 days.¹⁴ Rates of review in an outpatient clinic, and of referral to heart failure programs, were lower for people living in rural areas compared with metropolitan areas.¹⁴

The authors of the study suggested that system redesign is warranted to ensure rapid referrals and post-discharge review within the transitional period. This includes streamlining hospital systems to facilitate rapid follow-up and community support in this high-risk period.¹⁴

Integrated care

Better integration of care in the community with acute hospital care may improve outcomes for people with heart failure. See page 75 for a description of an integrated care model in western Sydney that reported a 37% reduction in potentially preventable hospitalisations among chronic disease patients in a preliminary evaluation.¹⁹

Consumer enablement

Ongoing self-management for heart failure is required to slow progression of the disease. Self-management includes taking prescribed medicines, modifying sodium intake and undertaking physical exercise. Consumer activation is a measure of the extent of consumers' involvement in their own health care, and is correlated with better self-management in people with heart failure.²⁰ Australian guidelines recommend that education for people with heart failure, and their carers, starts soon after diagnosis and is tailored to the person's level of health literacy.¹⁰ The National Heart Foundation website has heart failure resources for people with either low health literacy or higher health literacy.

The person's overall health, literacy and cognition are likely to affect their degree of success with self-management. A holistic approach is needed to improve outcomes in people with heart failure and cognition problems.²¹

Heart failure

Improving use of medicines

Current prescribing of medicines for heart failure with reduced ejection fraction is suboptimal, according to recent Victorian data showing that only 42% of eligible patients were prescribed the recommended triple therapy medication.¹³ Lack of prescriber confidence or awareness of gold-standard pharmacotherapy in heart failure is likely to contribute to this low rate, along with perceived difficulty in prescribing for elderly people and those with multimorbidity.¹³ Strategies to improve prescribing for heart failure have focused on monotherapy, but the study authors suggested that the focus should now be expanded to consider triple therapy in heart failure with reduced ejection fraction.¹³

Pharmacist-based interventions

Pharmacist interventions in transitions of care to improve medicines use by heart failure patients can reduce the risk of 30-day all-cause hospital readmission by 54%, compared with standard discharge processes.²² Pharmacist interventions in the transition of care process include:

- Medication reconciliation
- Patient education
- Follow-up
- Monitoring of medication adherence.²²

Another systematic review examined the impact of multidisciplinary interventions involving a pharmacist on all-cause hospitalisations over longer periods among people with heart failure. The review reported a 24% reduction in all-cause hospitalisations, which were measured over a period of six weeks to 55 months.²³ The interventions included:

- Discharge counselling
- Home visits
- Liaison with GPs
- Telephone follow-up
- Education on medicines, lifestyle changes and self-care.²³

Nurse-led titration clinics

Use of beta-adrenergic blocking agents, ACE inhibitors and angiotensin receptor blockers can reduce hospital readmissions and improve survival in people with heart failure with reduced ejection fraction. However, insufficient dosage is a common problem in primary care. Nurse-led titration clinics to optimise dosage of these medicines may reduce the risk of all-cause hospitalisations by 20% and all-cause mortality by 34% compared with usual primary care.²⁴ Interventions include:

- Patients attending a clinic primarily for the titration of beta-blockers, ACE inhibitors and angiotensin receptor blockers, based on a predetermined protocol, by a senior heart failure nurse
- Consumer and carer education about heart failure, management of heart failure at home, medicines and self-management
- Monitoring of medication adherence
- Patient assessment and symptom monitoring
- Liaison with GPs and community nurses.²⁴

Exercise and cardiac rehabilitation

Exercise and cardiac rehabilitation (which may include patient education and psychosocial support) may reduce heart failure hospitalisations by 41–43%, and all-cause hospitalisations by 23–30%.^{25,26} Barriers to providing cardiac rehabilitation in Australia include low referral rates, limited funding and geographic isolation.^{27,28}

A lack of knowledge about the benefits and safety of heart failure rehabilitation programs may contribute to low referral rates by medical professionals.²⁸ Poor transition from acute hospital care to community follow-up may also contribute to breakdown of the referral process.²⁸

Improving heart failure outcomes for Aboriginal and Torres Strait Islander people

Prevention

Complex social determinants underlie the disparities in health, including in heart failure rates and outcomes, between Aboriginal and Torres Strait Islander people and other Australians.^{29,30} Impacts of colonisation, including racism and intergenerational trauma, contribute to these determinants. To address health inequities, improvements in social factors are required – for example, in education, employment and living conditions.²⁹ In addition, the logistical and financial barriers to accessing timely and effective health care for Aboriginal and Torres Strait Islander people who live in remote areas must be addressed.²⁹

Rheumatic heart disease, which develops after acute rheumatic fever, can lead to heart failure.³¹ Approximately 90% of people living with rheumatic heart disease are Aboriginal and/or Torres Strait Islander people, and, of these, nearly 60% were under 25 years of age when diagnosed, according to 2018 data from four states and territories.³² Among people with rheumatic heart disease, 19% developed heart failure within 10 years of diagnosis, in a Northern Territory study.³¹ Acute rheumatic fever and rheumatic heart disease are preventable diseases, and improved living conditions reduce the risk.³³

Management

Earlier detection and management of cardiac conditions is likely to reduce the risk of heart failure among Aboriginal and Torres Strait Islander people, and cardiovascular disease assessments are now recommended from 18 years of age in these groups.³⁴ Other suggested strategies to improve heart failure management among Aboriginal and Torres Strait Islander people include:

- Increasing access to heart failure multidisciplinary disease management programs that include education, psychosocial support, exercise training and optimal pharmacotherapy¹¹
- Ensuring appropriate and timely follow-up of patients after discharge

- Incorporating family-based and outreach programs into models of care¹¹
- Improving prevention, early diagnosis and treatment of rheumatic fever³⁵
- Preventing progression of kidney disease
- Improving access to dialysis for Aboriginal and Torres Strait Islander communities.

Cardiac or heart failure rehabilitation programs are most likely to be successful if they are run collaboratively with local Aboriginal and Torres Strait Islander people, because developing community trust and working with local people are important for participation (see Case study: Work it Out – chronic disease management program for Aboriginal and Torres Strait Islander people' on page 96). Services that provide coordinated, holistic care and assist with navigating the health system would also benefit Aboriginal and Torres Strait Islander people with heart failure.

Cultural safety and culturally appropriate care

Misalignment of mainstream health services with Aboriginal and Torres Strait Islander culture is a barrier to accessing health care.³⁶ Increasing access to culturally safe health care will involve developing partnerships with the Aboriginal Community Controlled Health Service sector, increasing the Aboriginal and Torres Strait Islander health workforce, and improving cultural awareness and competency of mainstream health services.

Heart failure

Case study: Work it Out – chronic disease management program for Aboriginal and Torres Strait Islander people

Work it Out is a combined education and exercise program for chronic disease management for urban Aboriginal and Torres Strait Islander people.^{37,38} The program was designed, and is monitored, by an Aboriginal community controlled health organisation to be flexible and culturally accommodating. The program has been running since 2011, with Aboriginal and Torres Strait Islander participants who have, or are at risk of, cardiovascular disease. It is now running in 15 urban and regional city locations in south-east Queensland.

An Aboriginal health worker or other Aboriginal and Torres Strait Islander staff member is usually present, and works closely with an exercise physiologist and participants at each session. Sessions consist of a 45-minute ‘yarning’ (education) session, followed by an hour-long exercise program tailored to individual participants’ chronic conditions. The program runs for 12 weeks, and has flexible entry and exit points to allow for family and community responsibilities. Participants can attend two or more sessions per week.

Over the four-year study period, 1,007 patients were referred to the program, and 406 participants who completed an initial assessment and one or more 12-weekly review assessments were included in the analysis. The participants had an average of six chronic conditions, and 68% were obese. Results were assessed after participants attended between one and 11 cycles of the program, and baseline assessments were compared with participants’ last assessments.

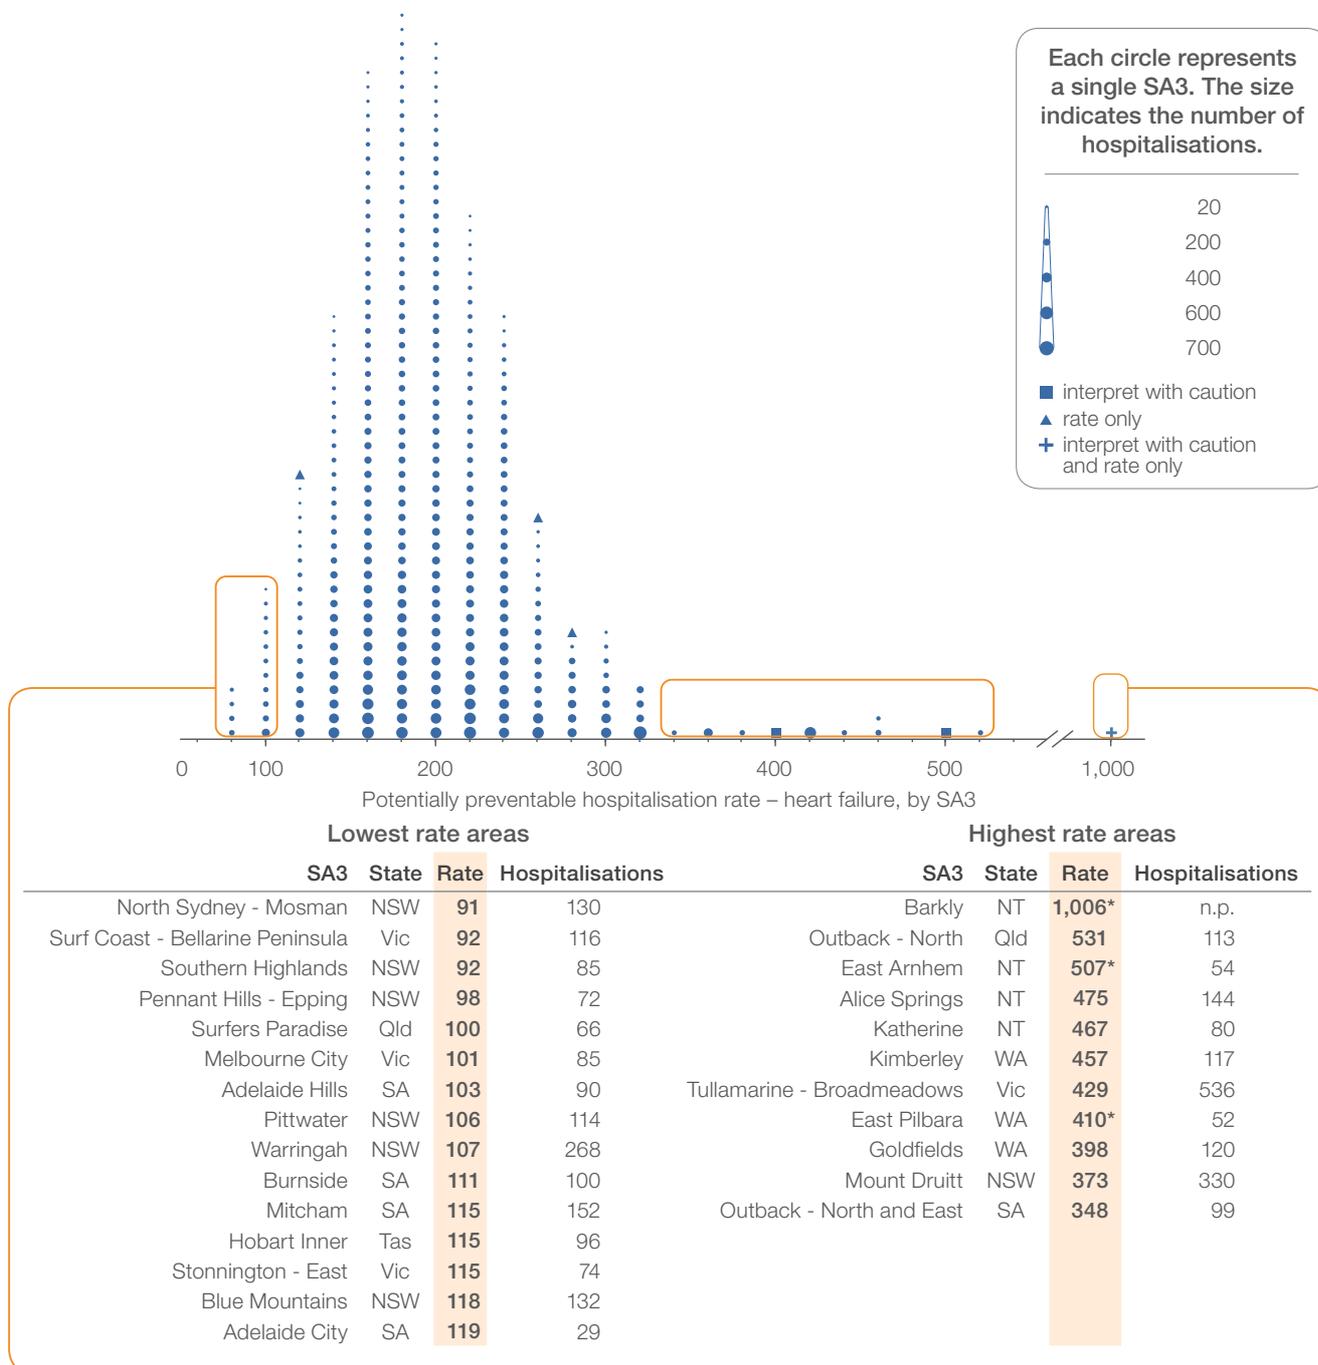

Participants achieved significant improvements in functional exercise capacity: six-minute walk distance increased by an average of 77 m. Reductions in waist and hip circumference were not significant in the group as a whole, but participants in the top tertile for waist circumference lost an average of 5.1 cm, and those in the top tertile for hip circumference lost an average of 3.2 cm.

More than half the participants attended the program for two or more 12-week cycles. Greater benefits were seen in those who attended for more than one cycle of the program. The improvement in functional exercise capacity is likely to have important clinical significance in improving health and reducing mortality risk among the participants, including those with heart failure, the authors commented.

Aboriginal staff were identified as an important factor in the success of the program: ‘I have been to other exercise places before where they are all white, and wear leotards, and no one talks to you ... I felt so uncomfortable ... whereas we can come here, not worrying how we are looking, and we still feel good.’³⁹

Rates by local area

Figure 2.10: Number of potentially preventable hospitalisations – heart failure per 100,000 people of all ages, age and sex standardised, by Statistical Area Level 3 (SA3) of patient residence, 2017–18

Notes:

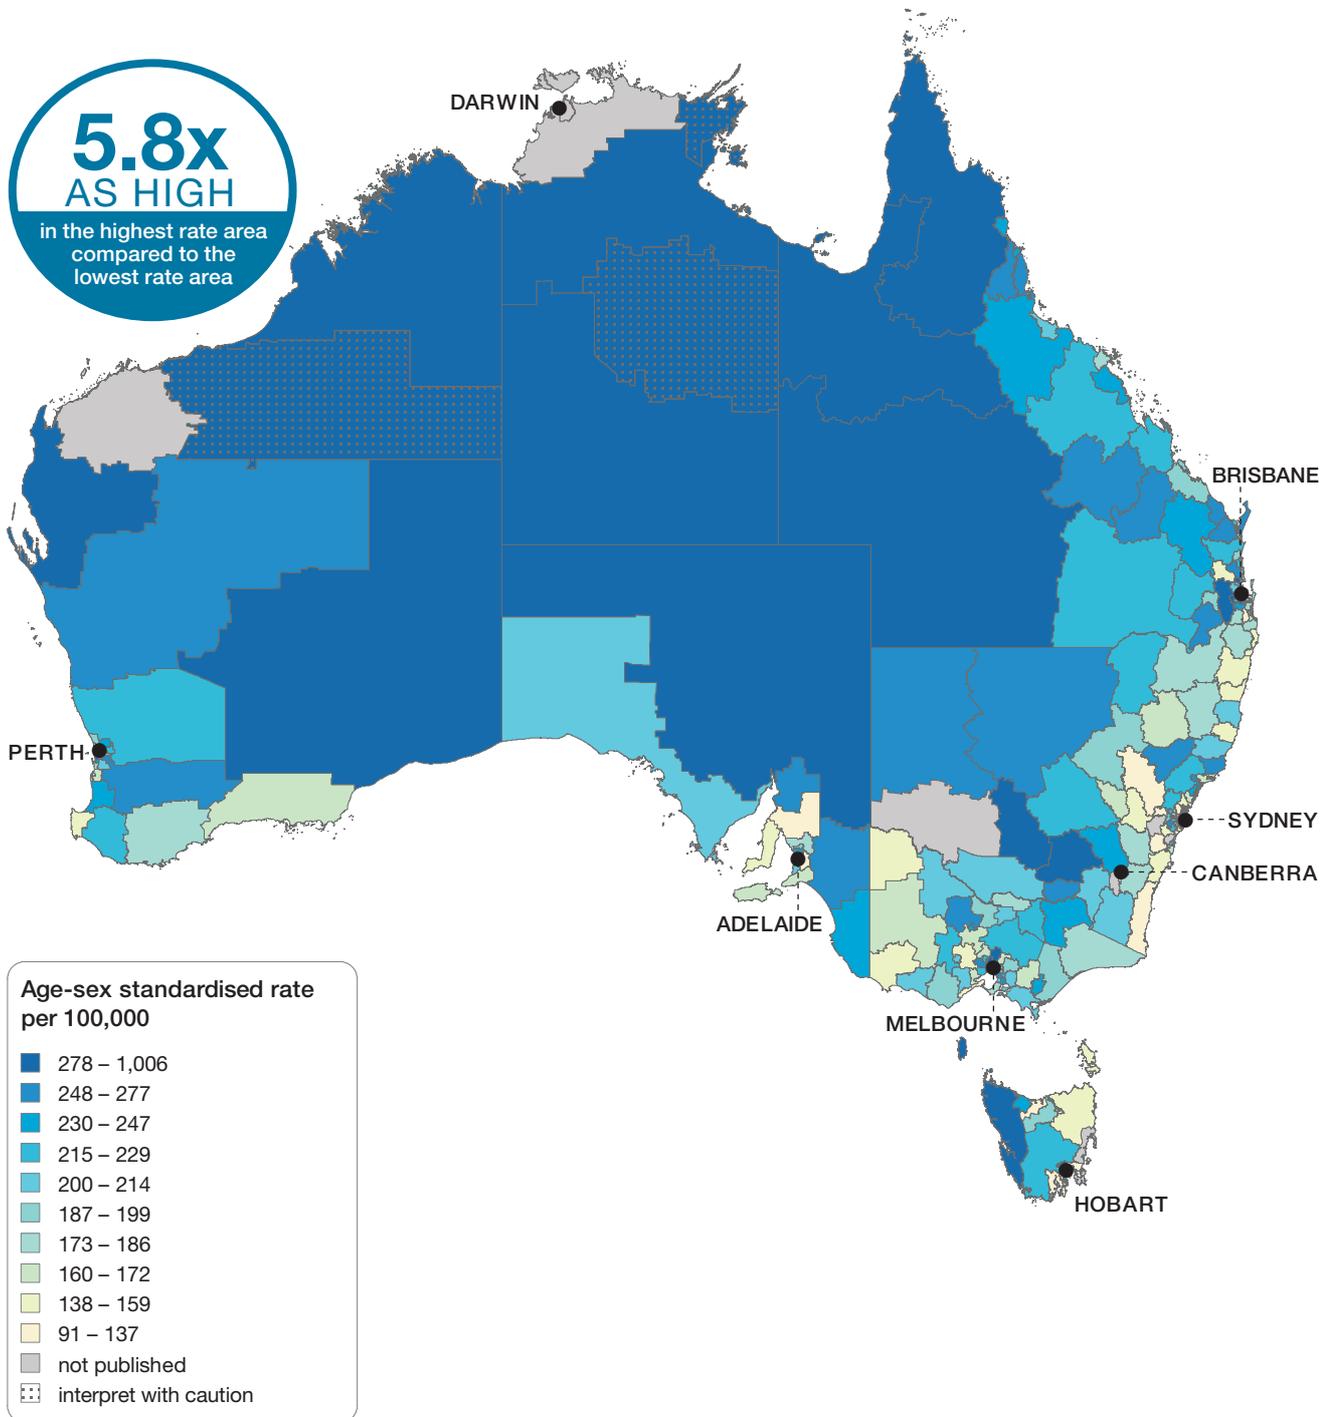

Squares (■) and asterisks (*) indicate rates that are more volatile than other rates and should be interpreted with caution. Triangles (▲) indicate SA3s where only rates are published. The numbers of hospitalisations are not published (n.p.) for confidentiality reasons. Crosses (✚) indicate SA3s where rates should be interpreted with caution. The numbers of hospitalisations are not published (n.p.) for confidentiality reasons. Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018. Australian initiatives

The information in this chapter will complement work already underway to reduce the rate of hospitalisations for heart failure in Australia. At a national level, this work includes:

- NPS MedicineWise – Heart failure: taking an active role – Clinical resources and tools, and information for consumers⁴³
- The Heart Foundation's Heart Failure Toolkit – a targeted approach to reducing heart failure readmissions
- Essential Service Standards for Equitable National Cardiovascular Care (ESSENCE) for Aboriginal and Torres Strait Islander people
- Rheumatic fever strategy.

Many state and territory initiatives are also in place to reduce the rate of hospitalisations for heart failure, including:

- Heart Failure Care Initiative – Development of Model of Care and Outcomes Framework, Capital Health Network, Australian Capital Territory
- Northern Territory Heart Failure Initiative – Clinical Audit
- Queensland Heart Failure Services
- Telephone-based lifestyle coaching (My Health for Life, Get Healthy, COACH), Queensland
- Wellness Initiative, supporting consumers to participate in telephone-based lifestyle coaching programs before surgical procedures, Queensland
- Heart failure guides in HealthPathways, Tasmanian Cardiac Network
- Heart failure education program, Tasmanian Cardiac Network
- Delivering Connected Care for Complex Patients with Multiple Chronic Needs, Tasmania
- Community Rapid Response Service, Tasmania¹⁸
- *Primary Health Tasmania Needs Assessment: Health intelligence report*⁴⁰
- Heart Health: Improved Services and Better Outcomes for Victorians policy

- Reducing heart failure admissions program. Heart Foundation Victoria; Victorian Government
- HealthLinks: Chronic Care, Victoria
- PROMETHEUS (Patient Reported Outcome Measure Education Transitions Heart failure Expertise Unifying Systems), pilot implementation of the Heart Foundation Heart Failure Toolkit, Victorian Cardiac Clinical Network
- Reports on hospital readmission rates for heart failure, NSW Bureau of Health Information
- Bettering Aboriginal Heart Health in Western Australia project
- 1 Deadly Step program, NSW Health and the Australian Rugby League
- State and territory cardiac networks.

2.3 Diabetes complications

Why is this important?

Approximately 6% of adults in Australia had diabetes in 2017–18.¹ The prevalence of diabetes in adults has almost doubled since 2001, although there was little change between 2014–15 and 2017–18.¹ Long-term complications of diabetes include stroke, heart disease, kidney disease, eye disease, nerve problems and foot ulcers.² Diabetes complications accounted for 276,965 hospital bed days and 7% of all potentially preventable hospitalisations in Australia in 2017–18.³

What did we find?

Between 2014–15 and 2017–18, the rate of hospitalisations for diabetes complications nationally increased by 7%.

In 2017–18, the rate was **12.2 times as high** in the area with the highest rate compared with the area with the lowest rate. Rates of hospitalisations for diabetes complications were markedly higher in remote areas than in other areas. Rates increased with socioeconomic disadvantage in major cities, and outer regional and remote areas. The rate for Aboriginal and Torres Strait Islander people was 3.7 times as high as the rate for other Australians.

What can be done?

Successful interventions for reducing hospitalisations for diabetes complications include supporting self-management; for example, a six-week structured program of education on self-management for people with diabetes reported an 88% reduction in hospitalisations.⁴ A model of integrated care in Australia has reduced hospitalisations for diabetes complications by 47% in an early evaluation.⁵ Telehealth program types and outcomes vary widely, but can reduce haemoglobin A1c (HbA1c) levels by approximately half⁶, and some have led to reported reductions in hospitalisations.⁷ HbA1c levels give an indication of average blood glucose levels and are used to estimate how well a person's diabetes is being managed.

Long-term interventions to address the social determinants of health may also reduce the rate of diabetes and its complications in Australia.

Diabetes complications

Context

Approximately 6% of adults in Australia had diabetes in 2017–18.¹ The prevalence in adults has almost doubled since 2001, although there was little change between 2014–15 and 2017–18.¹ Long-term complications of diabetes include stroke, heart disease, kidney disease, eye disease, nerve problems and foot ulcers.² Short-term complications include diabetic ketoacidosis.

Diabetes complications accounted for 276,965 hospital bed days and 7% of all potentially preventable hospitalisations in Australia in 2017–18.³ The rate of hospitalisations for diabetes was 144 per 100,000 in Australia, and 93 per 100,000 in Canada, in people aged 15 years and over, in 2016.⁸

Of hospitalisations with a principal diagnosis of diabetes, type 2 diabetes accounts for most (64%), followed by type 1 diabetes (29%), gestational diabetes (5%) and other or unspecified diabetes (1%).⁹

Risk factors for type 2 diabetes

Risk factors for developing type 2 diabetes include physical inactivity, excess weight, poor diet and a genetic predisposition.¹ Aboriginal and Torres Strait Islander people are almost 3 times as likely to have diabetes as are other Australians, as a result of higher rates of risk factors for type 2 diabetes.^{1,10}

Socioeconomic disadvantage strongly increases the risk: in 2011–12, adults in the lowest socioeconomic group had twice the rate of diabetes as those in the highest socioeconomic group (8% and 4%, respectively).¹¹ People who live in outer regional or remote areas of Australia have higher rates of diabetes than those in major cities or inner regional areas (7% and approximately 5%, respectively).¹²

Preventing complications

Hospitalisation is appropriate for certain complications of diabetes, such as kidney and foot damage, which are likely to require hospitalisation for effective treatment.¹³ Some of these hospitalisations are considered potentially preventable because optimal management of blood glucose levels reduces the risk of diabetes complications.

Access to comprehensive, systematic care and follow-up reduces complications and preventable hospitalisations among people with diabetes.^{14,15} For example, hospitalisation and lower-extremity amputation may be avoided by regular care in a high-risk foot clinic that includes vascular, orthopaedic, endocrine and podiatry services.¹⁶

About the data

All hospitalisations with a principal diagnosis of type 1, type 2 and unspecified diabetes are included.

Data are sourced from the National Hospital Morbidity Database, and include admitted patients in both public and private hospitals, including hospital care in the home.

Rates are based on the number of hospitalisations for diabetes complications per 100,000 people of all ages in 2017–18.

Because a record is included for each hospitalisation for the condition, rather than for each patient, patients hospitalised for the condition more than once in the financial year will be counted more than once.

The analysis and graphs are based on the usual residential address of the patient and not the location of the hospital.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

Data quality issues – for example, the extent of identification of Aboriginal and Torres Strait Islander status in datasets – could influence variations seen.

What do the data show?

Magnitude of variation

In 2017–18, there were 50,273 hospitalisations for diabetes complications, representing 184 hospitalisations per 100,000 people of all ages (the Australian rate).

The number of hospitalisations for diabetes complications across 325* local areas (Statistical Area Level 3 – SA3) ranged from 64 to 782 per 100,000 people. The rate was **12.2 times as high** in the area with the highest rate compared with the area with the lowest rate. The number of hospitalisations varied across states and territories, from 147 per 100,000 people in New South Wales to 277 in the Northern Territory (Figures 2.18–2.21).

After the highest and lowest 10% of results were excluded and 261 SA3s remained, the number of hospitalisations per 100,000 people was 2.9 times as high in the area with the highest rate compared with the area with the lowest rate.

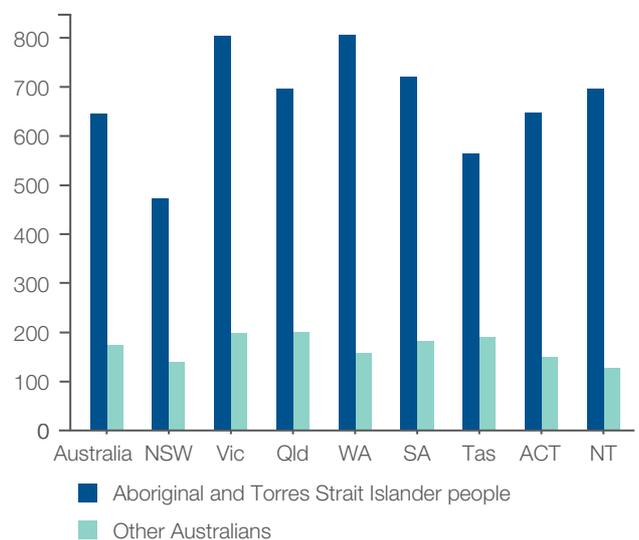

Analysis by remoteness and socioeconomic status

Rates of hospitalisations for diabetes complications were markedly higher in remote areas than in other areas. Rates increased with socioeconomic disadvantage in major cities, and outer regional and remote areas (Figure 2.22).

Analysis by Aboriginal and Torres Strait Islander status

The rate for Aboriginal and Torres Strait Islander people (647 per 100,000 people) was 3.7 times as high as the rate for other Australians (173 per 100,000 people) (Figure 2.17).

Figure 2.17: Number of potentially preventable hospitalisations – Diabetes complications per 100,000 people of all ages, age and sex standardised, by state and territory of patient residence, by Aboriginal and Torres Strait Islander status, 2017–18†

The data for Figure 2.17, and the data and graphs for analysis by Primary Health Network are available at safetyandquality.gov.au/atlas

* There are 340 SA3s. For this item, data were suppressed for 15 SA3s due to a small number of hospitalisations and/or population in an area.

Notes:

Some SA3 rates are more volatile than others. These rates are excluded from the calculation of the difference between the highest and lowest SA3 rates in Australia.

† Data by Aboriginal and Torres Strait Islander status should be interpreted with caution as hospitalisations for Aboriginal and Torres Strait Islander patients are under-enumerated, with variation among states and territories.

Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018.

For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2017 and 2018.

Diabetes complications

Trends over time

Between 2014–15 and 2017–18, the rate of hospitalisations for diabetes complications per 100,000 people nationally increased by 7% (Figure 2.23).

For Aboriginal and Torres Strait Islander people, the rate of hospitalisations for diabetes complications per 100,000 people nationally increased by 8% between 2014–15 and 2017–18 (Figure 2.24).

Interpretation

The reported variation in the rate of hospitalisations for diabetes complications could be influenced by a number of factors, such as variation in:

- The prevalence of diabetes and risk factors for type 2 diabetes
- The level of concordance with guidelines by clinicians
- Access to integrated hospital and primary care
- Availability of out-of-hospital models of care, which may be lower outside major cities
- Systems for recall, referral and follow-up of people with diabetes
- Implementation of preventive health strategies
- The availability of allied health care and services for complications (for example, clinics for foot, eye and kidney complications)
- The availability of diabetes educators and access to support for diabetes self-management
- The level of consumer enablement
- Prevalence of mental health disorders that affect the ability to self-care, and use of antipsychotic medicines that increase the risk of obesity

- The frequency of preventive checks in primary care
- Socioeconomic disadvantage, health literacy and access to healthy food
- The ability to self-manage diabetes, including access to refrigeration for insulin
- The prevalence of risk factors for complications, including smoking, suboptimal management of blood glucose levels and dialysis (which can contribute to suboptimal management of blood glucose levels)¹⁷
- Clustering of populations with higher prevalence of type 2 diabetes, such as Aboriginal and Torres Strait Islander people, people born in the Pacific islands, and people born in southern and central Asia^{2,18}
- Clustering of people with diabetes in aged care homes
- Access to healthcare services that provide culturally appropriate care
- The availability of Aboriginal and Torres Strait Islander staff for diabetes prevention and management
- The availability of health staff in remote areas
- Resourcing of primary care services relative to the local prevalence of diabetes
- Diagnostic error.

Because a record is included for each hospitalisation for the condition, rather than for the patient, patients hospitalised more than once for the condition or transferred between hospitals in the financial year will be counted more than once. This may increase the apparent rates of hospitalisations for people from outer regional or remote areas, who are more likely to be transferred to a major hospital.

Variations between areas may not directly reflect the practices of the clinicians who are based in these areas. Area boundaries reflect where people live, rather than where they obtain their health care. Patients may travel outside their local area to receive care.

Socioeconomic and demographic factors

Socioeconomic and demographic factors have a strong influence on rates of potentially preventable hospitalisations for chronic conditions, and are a greater influence than availability of primary care.¹⁹ In some areas, the socioeconomic profile may have changed over the course of the time series.

Variation in health care and self-care

Quality of health care and self-care among people with diabetes varies. For example, people with diabetes in Australia receive care that corresponds to best-practice guidelines in approximately 63% of encounters with healthcare providers, according to data from 2009–10.²⁰ Levels of self-care and outcomes among people with type 2 diabetes improve with increasing levels of education and income.²¹

Change in New South Wales coding

National figures based on hospital admission data are strongly influenced by estimates from New South Wales (NSW), because this state accounts for around one-third of the total Australian population. Administrative changes to admission practices in NSW emergency departments occurred in July 2017: since then, only more severe cases (usually managed by emergency management units in emergency departments) have been included in hospital admission data. This resulted in an overall drop in hospital episodes (of around 3–5%), which may have an impact on trend analyses.

Reducing hospitalisations for people with diabetes

The increase in diabetes hospitalisations between 2014–15 and 2017–18 in the population overall, and in Aboriginal and Torres Strait Islander people, is concerning and should be addressed using a variety of strategies. These could be aimed at reducing rates of type 2 diabetes and improving management of all types of diabetes.

Integrated care models

Effective management of diabetes requires multidisciplinary, coordinated care.²² The team of clinicians providing care may include general practitioners (GPs), medical specialists, nurses and allied health professionals. Although some people with diabetes are fortunate enough to receive this care, the current Australian health system does not provide the optimal supports for integrated team care.²³

Health services are often fragmented, with poor communication between providers, and between community and hospital services.²² For example, in some cases, the acute reason for hospitalisation may be managed without addressing the underlying suboptimal diabetes management. Partnerships between primary care providers – including Aboriginal Community Controlled Health Services (ACCHSs) – and specialists in the community, allied health professionals and hospitals are needed to provide better integrated care.

The majority of systematic reviews of integrated care for people with diabetes have shown a reduction in hospitalisations and improvements in management of blood glucose levels.²⁴ The term ‘integrated care’ covers a wide variety of models, and studies to clarify which models and components of care have the greatest impact would be valuable for guiding future implementation.²⁴ The differences between models, and in the type of outcomes measured, make it difficult to estimate the impact of the integrated care approach.

Diabetes complications

Models of care that integrate different specialties and primary care have been implemented with success in Australia – for example:

- An integrated primary and secondary care service in the community (see ‘Case study’ on this page)
- An outreach model for remote Aboriginal and Torres Strait Islander communities (see ‘Case study: Outreach integrated care for remote Aboriginal and Torres Strait Islander communities’ on page 115)²⁵
- Integrated primary and tertiary care for women with diabetes in pregnancy in the Northern Territory (see page 119).²⁶

Case study: Integrated primary and secondary care clinic for diabetes

A multidisciplinary, integrated primary and secondary care diabetes service has approximately halved the rate of hospitalisations due to diabetes complications in an early evaluation.⁵ The success of this model is particularly encouraging, given that the users of the service had complex type 2 diabetes and were from socioeconomically disadvantaged areas.

The clinical team was made up of an endocrinologist, two or three GPs with advanced training in managing diabetes, a diabetes educator, a podiatrist, and other allied health professionals, as required. A trial of the model compared outcomes in 182 consumers who lived in the service catchment area in South Brisbane and 145 consumers who received usual care at a hospital outpatient clinic. Consumers attending the integrated service were less educated and had a significantly higher baseline HbA1c level than the control group (8.6% and 7.9%, respectively). Despite these differences, the average number of hospitalisations with a diabetes complication as the principal diagnosis was 47% lower in the intervention group than in the usual care group in the two years after the trial began. Eye and foot complications were the most common reason for hospitalisation.

The model of care has been expanded to a second site, and a randomised controlled trial found that blood glucose levels among consumers at the two sites were similar to those achieved in a hospital-based outpatient clinic.²⁷ Integrating primary and secondary care to develop the skills of the primary care team during consumer management is also being done in other ways – for example, through case conferences conducted by a specialist and involving the consumer, GP and practice nurse. Another recent Australian initiative based on this model has shown significant improvements in management of blood glucose levels and blood pressure.²⁰

Case study: Outreach integrated care for remote Aboriginal and Torres Strait Islander communities

People living in remote Aboriginal and Torres Strait Islander communities of Australia have a critical need for accessible and culturally appropriate diabetes care, as well as the benefits of integrated specialist and primary care. Rates of diabetes and its complications are disproportionately high in these remote communities.

To address these challenges, an outreach specialist service was created in partnership with remote Aboriginal and Torres Strait Islander communities, and the local primary healthcare services in the Northern Territory.²⁵ The outreach team comprised diabetes nurse educators and endocrinologists. Each community clinic was visited three or four times a year by a diabetes nurse educator and twice yearly by an endocrinologist. People with suboptimal blood glucose levels and with complications were prioritised for care.

The outreach team reviewed consumers at each visit and provided management recommendations for the consumers, local doctors, Aboriginal health workers and remote area nurses. Care plans were made collaboratively between the outreach team and the local primary healthcare team, who then implemented the plans. The outreach team also strengthened the capacity of local primary healthcare providers through education sessions in diabetes management, as well as clinical support between visits.

An evaluation was conducted in three remote communities that had diabetes rates between 28% and 60% among adults.²⁵ By 12 months, the consumers' average HbA1c level was significantly reduced, and 63% of consumers had achieved a reduction in HbA1c.

According to the study authors, equitable partnerships between service providers and communities are crucial for ensuring that communities have the opportunity to help shape the way care is delivered, so that it is acceptable to consumers.²⁵

Diabetes complications

Telehealth

A range of telehealth strategies are effective in improving management of blood glucose levels in people with type 2 diabetes, and can be significantly more effective than usual care.⁶ For example, a one-year telephone self-management program for people with diabetes in the United States reduced hospitalisations by 10%.⁷ Telehealth can decrease hospitalisations among adults with diabetes, but the type of intervention, and the results, vary widely.²⁸

Teleconsultation (two-way communication between consumers and clinicians, or between clinicians) is the most effective type of telehealth for type 2 diabetes.⁶ Supplementing outreach clinics for remote communities with telehealth consultations would reduce overall costs associated with delivery of specialist diabetes services, and reduce time away from usual activities for both consumers and clinicians.²⁹

Telehealth is being used effectively in some parts of Australia.³⁰ Examples of telehealth for diabetes care include the Royal Flying Doctor Service in Victoria, which has provided an endocrinology telehealth program since 2013 via a customised videoconference platform, and the Diabetes Telehealth Service for Regional WA (see the 'Case study' on this page).

Telehealth has the potential for much wider use to improve access to health care in regional and remote areas, and for people with mobility problems or young children. Barriers to uptake of telehealth in regional and remote areas of Australia include³¹:

- Lack of adequate internet access in some areas
- Consumers not being aware of, or not knowing how to access, telehealth
- Cultural safety of telehealth services for Aboriginal and Torres Strait Islander people
- Lack of access to clinicians providing telehealth services
- Lack of Medicare item numbers for telehealth
- Lack of resourcing at the consumer end and the primary care end.

Case study: Diabetes Telehealth Service for Regional WA

The Diabetes Telehealth Service for Regional WA is a publicly funded, community-based, diabetes educator-led telehealth service for all types of diabetes. It promotes a hybrid, shared care approach connecting people with local face-to-face options, where possible. The service also offers access to a virtual endocrinology clinic for diabetes consumers, which their GPs or practice nurses can attend.

Kimberley Aboriginal Medical Services and Diabetes WA are currently collaborating to explore a model aiming to improve the cultural security of the Diabetes Telehealth Service for Regional WA, to increase community engagement. Diabetes WA is also collaborating with Royal Perth Hospital to enable more timely access to a multidisciplinary diabetes team via the Diabetes Telehealth Service for Regional WA for consumers on their waitlist with less complex needs.

Consumer enablement

Diabetes requires intensive self-management to prevent complications, and structured diabetes education has significant potential to improve outcomes for people with diabetes.³²⁻³⁴ Structured diabetes education is evidence based, suits the needs of the person, has specific learning objectives and a structured curriculum, and is delivered by trained educators.³⁵ Structured education for people with type 2 diabetes addresses risk factors for complications, such as dietary habits, foot care and smoking.³⁴

Reduction in hospitalisations has been reported; for example, a randomised controlled trial reported an 88% reduction in hospitalisations among people with type 2 diabetes who attended education sessions, compared with the control group.⁴ The intervention consisted of a six-week program of 2.5-hour weekly classroom training sessions on diabetes self-management.⁴ Structured education for people with type 1 diabetes also reduces the frequency of severe hypoglycaemic events.³⁶

The Diabetes Education and Self-Management for Ongoing and Newly Diagnosed (DESMOND) program is a structured group education program based on a philosophy of consumer empowerment. A trial of the DESMOND program in 26 locations across regional Western Australia (WA) reported a significant increase in consumer activation, which is a measure of the extent of consumer involvement in their health care.³⁷ Consumer activation can be used as a reliable tool for improving type 2 diabetes self-management and clinical outcomes.³⁸ A high degree of activation may be needed to self-refer to a DESMOND program, and strategies to involve less-activated consumers are needed.³⁷ This might include increasing referrals from primary care providers to DESMOND programs.³⁷

Advances in medical treatment

Newer medicines for lowering blood glucose, sodium–glucose cotransporter-2 (SGLT-2) inhibitors and glucagon-like peptide-1 (GLP-1) analogues can reduce the risk of cardiovascular and renal complications in people with type 2 diabetes.^{39,40} SGLT-2 medicines may reduce heart failure hospitalisations by 30% in people with type 2 diabetes, compared with those taking placebo or other diabetes medicines.⁴¹

SGLT-2 and GLP-1 analogue medicines are now recommended by guidelines for consumers with diabetes who have, or are at high risk of, heart disease or chronic kidney disease.^{42–44}

Preventing diabetic eye and kidney disease

Diabetic retinopathy is a leading cause of blindness in Australians aged 20–74 years. Early detection and management can prevent severe vision loss and blindness in almost all cases.² Screening for diabetic retinopathy has been shown to be effective in preventing blindness in rural and urban Australian settings, and preventive eye care is highly cost-effective.⁴⁵ Rural and remote populations have successfully been screened via telehealth.⁴⁵ National diabetic retinopathy screening programs in other countries have shown impressive reductions in blindness among people with diabetes, and the feasibility of a similar program in Australia merits examination.⁴⁵

Earlier diagnosis of diabetes

Point-of-care testing for HbA1c has been suggested as a strategy to facilitate earlier diagnosis of diabetes – obtaining a fasting blood sugar level or undertaking an oral glucose tolerance test can present a barrier to diagnosis for many consumers.⁴⁶ Women who have had gestational diabetes are 7 times as likely to develop type 2 diabetes as other women, and follow-up of these women is often poor.⁴⁷ Among Australian women with gestational diabetes, Aboriginal and Torres Strait Islander women are 4 times as likely as other women to develop type 2 diabetes.⁴⁸ Improving detection and follow-up of diabetes in pregnancy could reduce complications in both the mother and the child.

Improving care for inpatients with diabetes

The estimated prevalence of diabetes among hospital inpatients in Australian studies is approximately 30%, and outcomes for this group are poorer than for those without diabetes.^{49–51} Optimising care in hospital early in the admission could improve outcomes, and prevent or delay readmissions for future complications.⁵⁰ Aboriginal liaison officers and other Aboriginal and Torres Strait Islander hospital staff play an important role in supporting the consumer journey in hospital and at discharge.

In surgical patients, diabetes significantly increases the risk of six-month mortality, major complications, admission to intensive care and length of stay.⁴⁹ Suboptimal blood glucose levels before surgery appear to be an important contributor, and triaging consumers with diabetes (particularly those with suboptimal blood glucose levels) to pathways of care dedicated to higher-risk consumers may improve outcomes from surgery.⁴⁹

Diabetes complications

Preventing type 2 diabetes

Preventing type 2 diabetes is key to reducing hospitalisations for diabetes complications in the future. Strategies to address the social determinants of health are needed to reduce the high rates of type 2 diabetes in areas of socioeconomic disadvantage. These determinants include education levels, employment, income levels and access to nutritious food.⁵² Multifaceted approaches are needed to create environments that support healthy lifestyles, such as urban planning for active transport and policies to promote healthy eating.

Population health programs, such as lifestyle coaching services, can be effective in reducing risk factors for type 2 diabetes (see 'Case study' on this page). Type 1 diabetes is not preventable, but optimal blood glucose levels can prevent complications.

Case study: Telephone-based lifestyle coaching

The Get Healthy Information and Coaching Service is a free telephone-based intervention that aims to reduce risk factors for several chronic conditions. One component is aimed at decreasing excess weight among high-risk groups in New South Wales. The program includes a module tailored for adults at risk of developing type 2 diabetes.⁵³

The program was successful in engaging high-risk groups; 42% of participants were from the two lowest socioeconomic brackets, and 43% lived outside major cities. After six months, participants had lost an average of 3.4 kg, and nearly one-third of participants lost at least 5% of their body weight.⁵³ Participants also significantly increased their healthy eating and physical activity behaviours.

The Get Healthy Information and Coaching Service includes a tailored service for Aboriginal and Torres Strait Islander people. Participants in the Aboriginal Program also lost an average of 4 kg, and significantly increased their physical activity and improved healthy eating behaviours.⁵⁴

Improving care for Aboriginal and Torres Strait Islander people

Complex social determinants underlie the disparities in health, including diabetes rates and outcomes, between Aboriginal and Torres Strait Islander people and other Australians.^{55,56} To address health inequities, improvements in social factors are required – for example, in education, employment and living conditions.⁵⁵

In addition, the logistical and financial barriers to accessing timely and effective health care for Aboriginal and Torres Strait Islander people who live in remote areas need to be addressed.⁵⁵ Logistical barriers include time delays in laboratory analysis of samples for glucose testing. Glucose breakdown in samples while in transit to laboratory analysis was estimated to result in a 62% under-diagnosis of gestational diabetes in women in regional, rural and remote areas of WA.⁵⁷ ACCHS clinics in the Kimberley have implemented an alternative protocol for sample collection, using different collection tubes, to overcome this problem.

Cultural safety and culturally appropriate care

Misalignment of mainstream health services with Aboriginal and Torres Strait Islander culture is a barrier to accessing health care.⁵⁸ Culturally safe care can improve clinical diabetes outcomes and consumer satisfaction among Aboriginal and Torres Strait Islander people.⁵⁹

Holistic, integrated and multidisciplinary models of care

Models of care that have shown early success for Aboriginal and Torres Strait Islander people with diabetes include home-based outreach case management that provides holistic, multidisciplinary care. A program for Aboriginal and Torres Strait Islander people with complex chronic conditions, including diabetes, has incorporated these principles using a participatory approach, in which consumers set their own health and wellbeing goals.⁶⁰

This exploratory study, using home-based, outreach case management of chronic disease, was developed and implemented in an urban Aboriginal and Torres Strait Islander primary healthcare service in Brisbane. The initial in-home assessment included a discussion about social, health and economic issues that would affect the consumer's ability to achieve their goals. The case manager coordinated services and case conferences with health professionals. Having care delivered in their own homes was important to consumers, as it increased their sense of safety

and receiving comprehensive care, and minimised inconvenience and cost of travel.⁶⁰ Case managers worked in a culturally appropriate manner, contributing to a mutually respectful relationship.⁶⁰ After 12 months, 73% of consumers had good, very good or excellent self-rated health status, compared with 33% at baseline.⁶⁰ Significant increases were also seen in appointments with medical specialists and allied health professionals. Significant improvements were seen in blood pressure, but not in HbA1c or excess weight levels.⁶⁰

In the Fitzroy Valley of the Kimberley region, WA, preventive management of diabetes in Aboriginal and Torres Strait Islander people has been improved through partnerships between the Aboriginal medical service, the local hospital, the population health unit and the community health centre. This has enabled primary care services in the area to be integrated, and health services to be reoriented from predominantly acute, reactive care to more preventive activities and primary care. Activities include health promotion days for screening and education, and team outreach clinics for developing self-management plans with consumers. An increase by a factor of almost 10 in the proportion of eligible consumers having a diabetes annual cycle of care was seen after the culturally appropriate, integrated model of care was introduced, according to data from 2010.⁶¹

The Northern Territory Diabetes in Pregnancy Partnership includes an enhanced model of care, as well as a clinical register and longitudinal birth cohort.²⁶ The goals of the model of care include:

- Early testing of women
- Integration of primary and tertiary care for women with diabetes in pregnancy
- Improved communication between service providers
- Development of integrated care plans within existing IT systems
- Provision of care according to current guidelines.²⁶

Diabetes complications

Health professionals involved in focus groups to evaluate the model said that it had improved contact between clinicians, resulting in more coordinated care.²⁶ For example, workshops and regional meetings increased understanding of roles, and engagement of clinicians in developing referral pathways resulted in increased uptake of referral pathways and care plans.²⁶ Increased access to specialist services through telehealth and allied health outreach visits also increased local health professionals' knowledge.²⁶ Persisting barriers to integration identified by the focus groups included workforce shortages and difficulties integrating the IT systems between government, non-government and ACCHS sectors.²⁶

Food and nutrition

Access to traditional foods for Aboriginal and Torres Strait Islander people has been disrupted by colonisation, and improving nutrition could reduce the burden of type 2 diabetes in these populations. Positive effects on nutrition and chronic disease indicators can be achieved by incorporating nutrition and breastfeeding advice into maternal and child health services, and through multifaceted community nutrition programs.⁶² The most important factor in determining the success of such programs is Aboriginal and Torres Strait Islander involvement in, or control of, the program.⁶²

Eye care

Annual eye screening, clearly defined pathways of care and timely management are key to improving eye health in Aboriginal and Torres Strait Islander people with diabetes.⁶³ The Roadmap to Close the Gap for Vision includes a range of strategies, some of which have been implemented, to increase the accessibility and uptake of eye-care services by Aboriginal and Torres Strait Islander people.¹⁸

Foot care

A mobile outreach service that provides foot care and diabetes education in Perth, WA, has been well received by the Aboriginal and Torres Strait Islander community. The service addresses social issues as well as clinical care, and consumers are managed in partnership with their GPs. This model has achieved high attendance levels. Its outcomes are currently being evaluated.⁶⁴ Greater resourcing of high-risk foot services in remote Australia, including outreach services, could reduce the burden of diabetic foot complications in these areas.

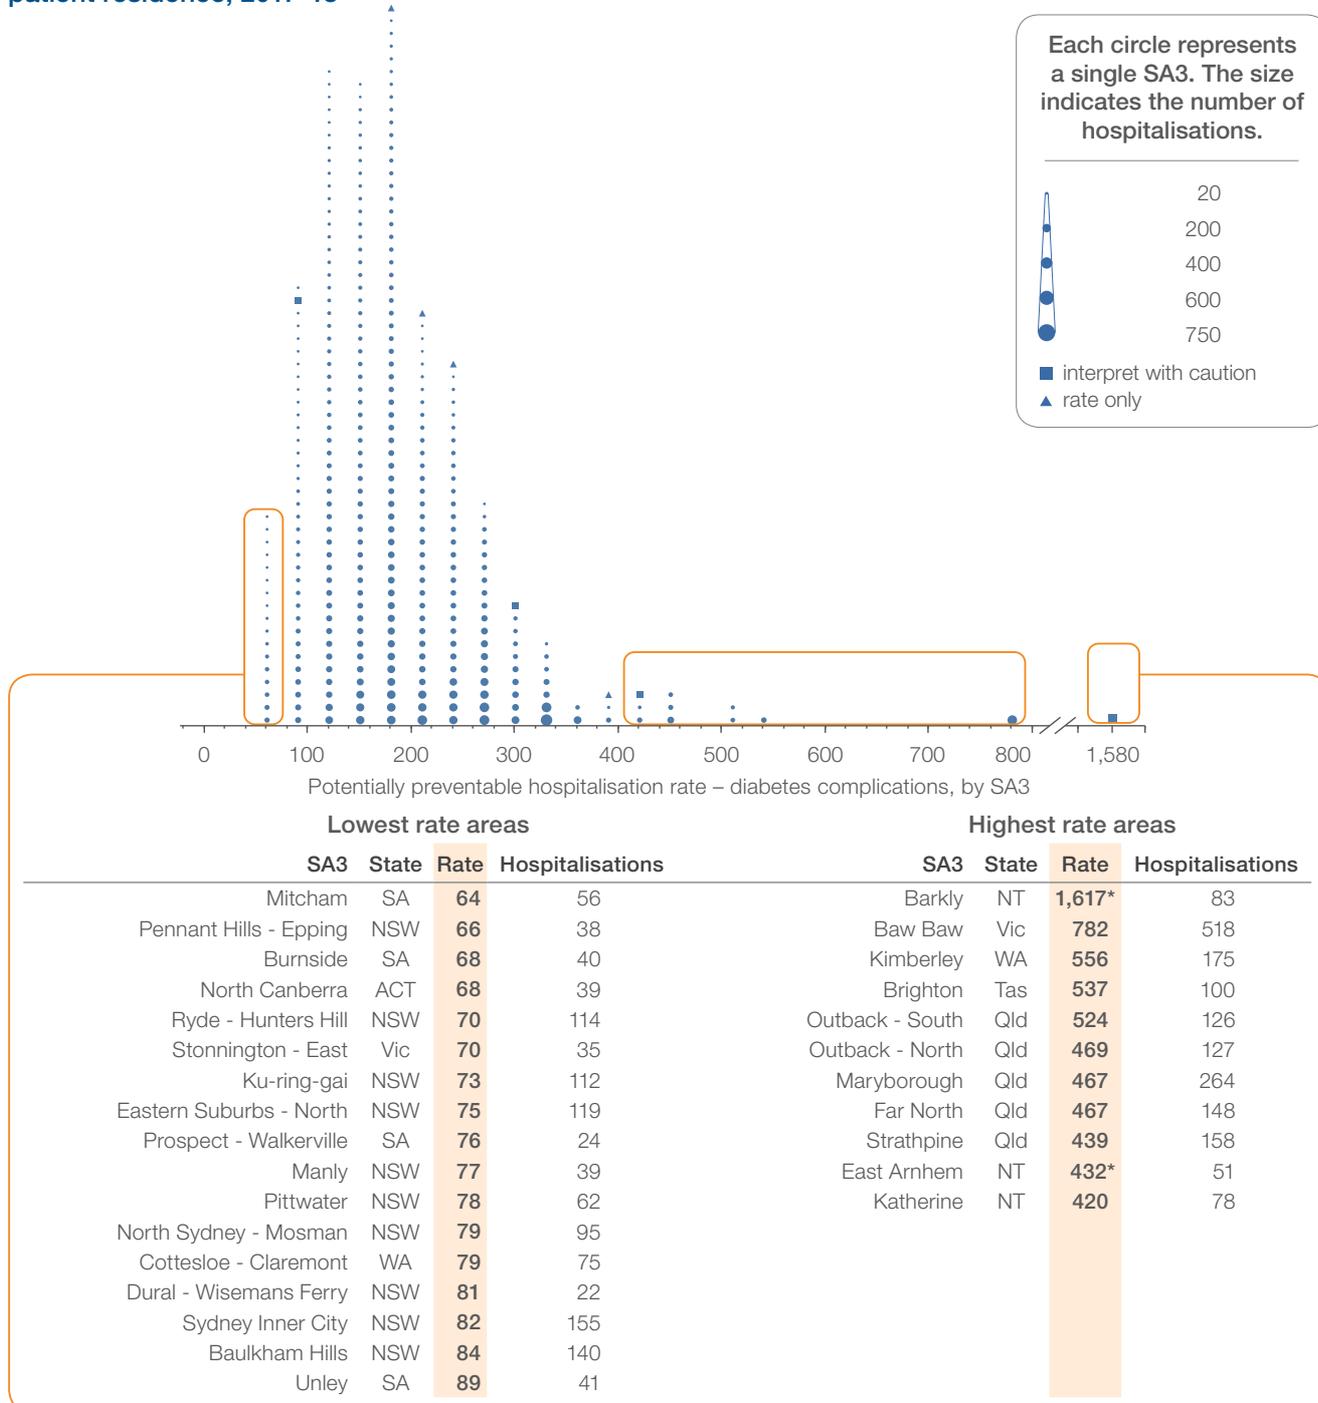

Medical-grade footwear and orthotics can help prevent diabetic foot complications, but are difficult to access for people in many rural and remote areas. Providing appropriate footwear for Aboriginal and Torres Strait Islander people with diabetes in remote areas could prevent a substantial number of foot complications.⁶⁵

End-stage kidney disease

Diabetes is the leading cause of end-stage kidney disease in Australia. The rate of end-stage kidney disease in Aboriginal and Torres Strait Islander people is more than 6 times higher than in other Australians.⁶⁶ Targeted chronic kidney disease programs appear to be effective in improving outcomes for Aboriginal and Torres Strait Islander people with chronic kidney disease.⁶⁷ Early detection of diabetes is also key to preventing long-term kidney damage.

Rates by local area

Figure 2.18: Number of potentially preventable hospitalisations – diabetes complications per 100,000 people of all ages, age and sex standardised, by Statistical Area Level 3 (SA3) of patient residence, 2017–18

Notes:

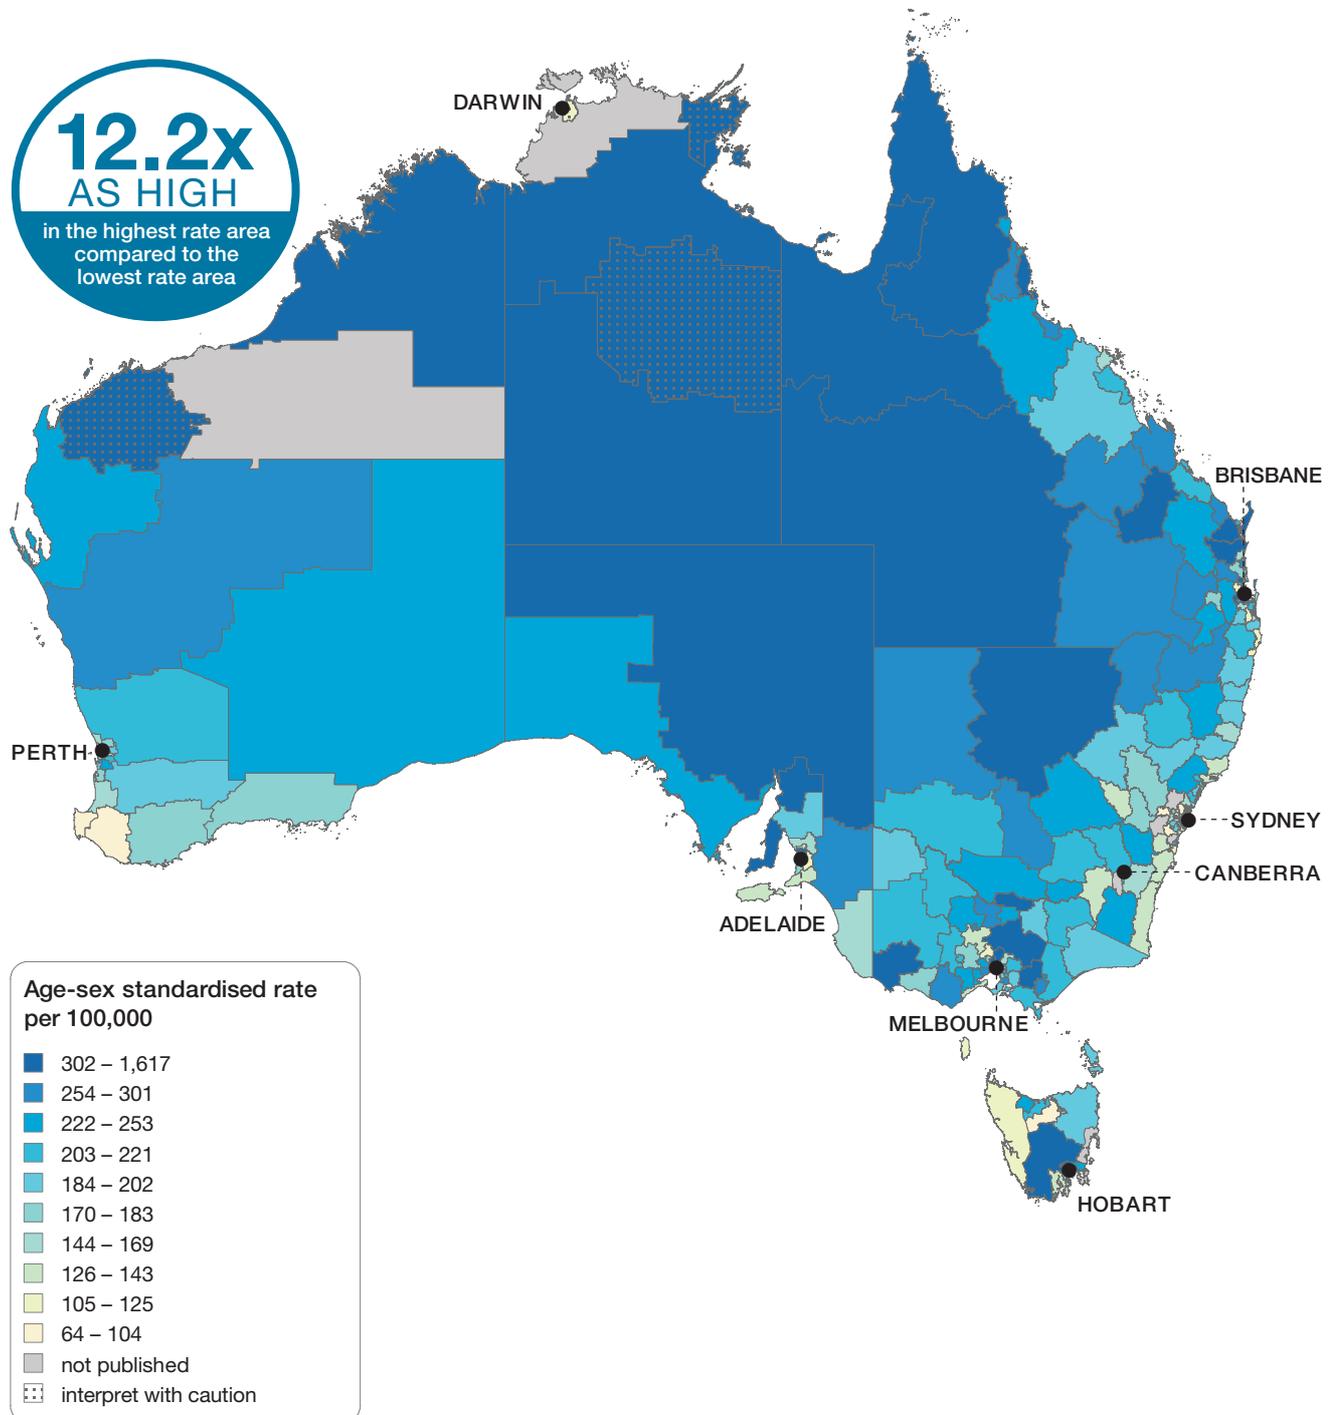

Squares (■) and asterisks (*) indicate rates that are more volatile than other rates and should be interpreted with caution. Triangles (▲) indicate SA3s where only rates are published. The numbers of hospitalisations are not published for confidentiality reasons. Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018. For further detail about the methods used, please refer to the Technical Supplement.

Diabetes complications

Rates across Australia

Figure 2.19: Number of potentially preventable hospitalisations – diabetes complications per 100,000 people of all ages, age and sex standardised, by Statistical Area Level 3 (SA3) of patient residence, 2017–18

Notes:

Dotted areas indicate rates that are considered more volatile than other published rates and should be interpreted with caution. These rates are excluded from the calculation of the difference between the highest and lowest SA3 rates in Australia.

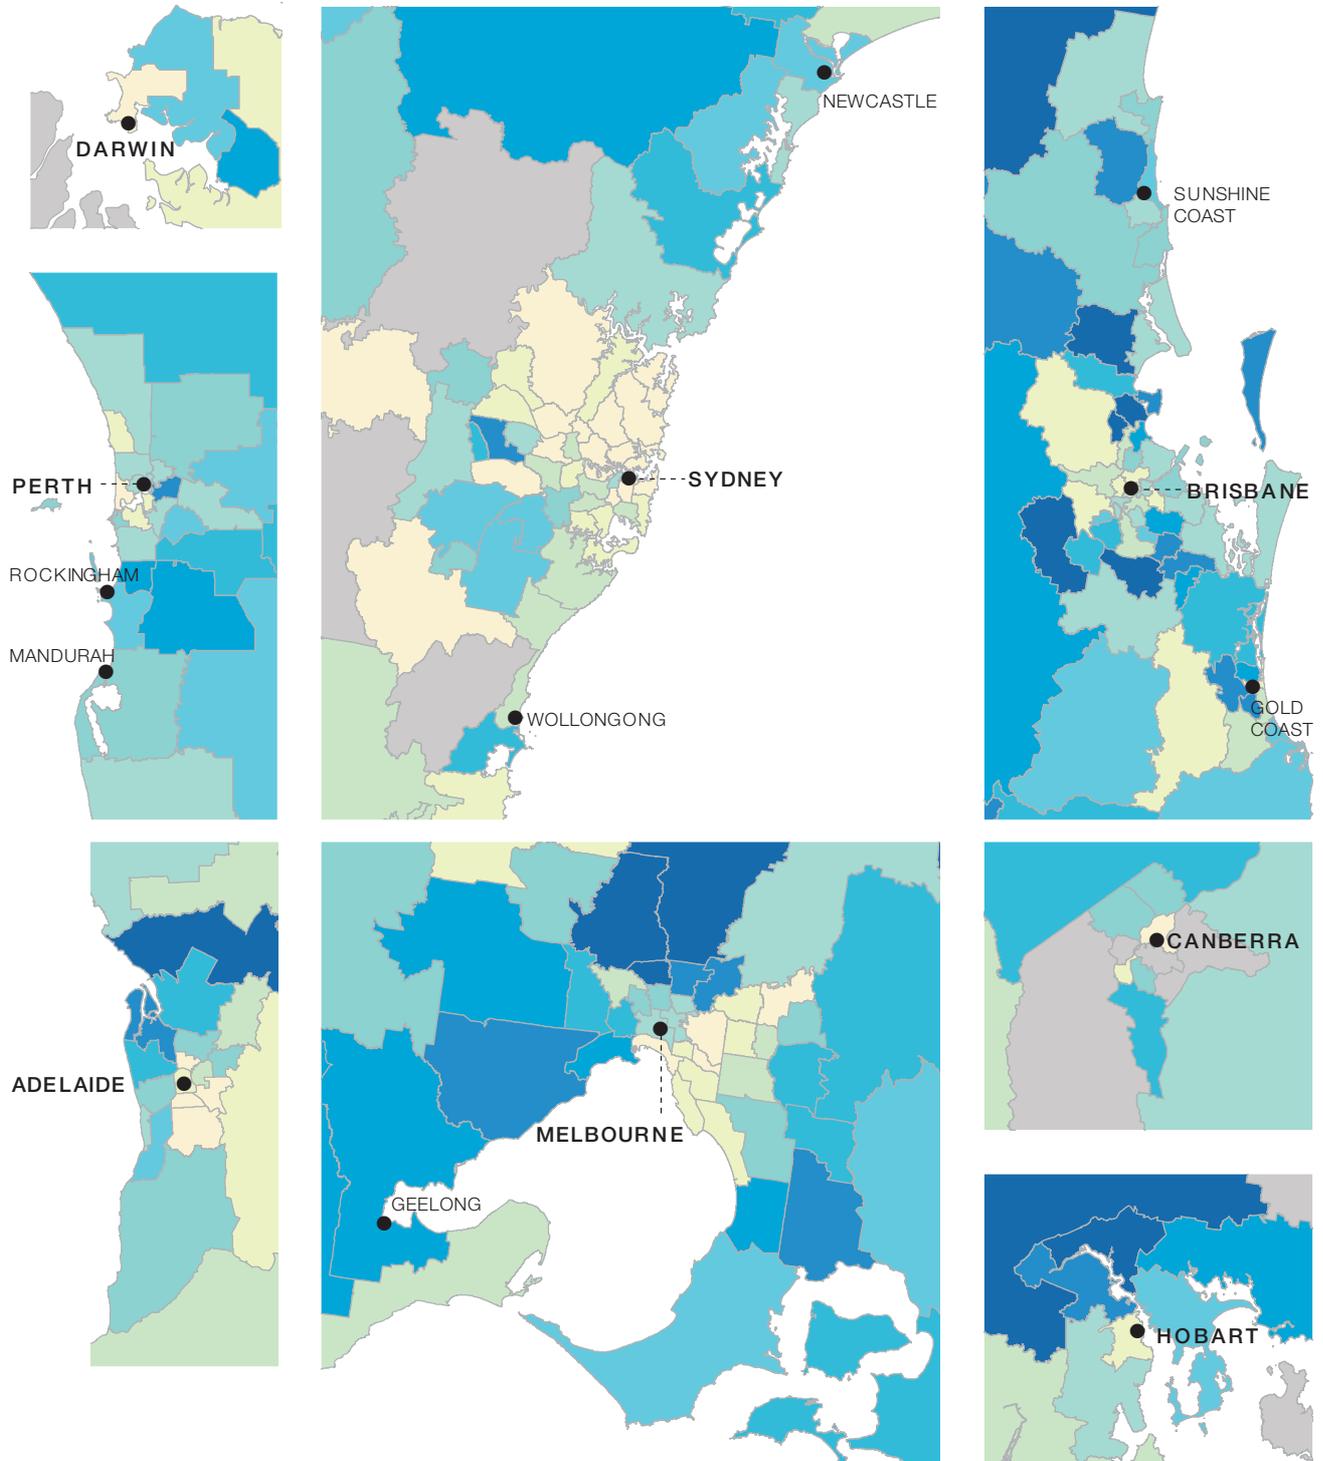

Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018.

For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2017 and 2018.

Rates across capital city areas

Figure 2.20: Number of potentially preventable hospitalisations – diabetes complications per 100,000 people of all ages, age and sex standardised, by Statistical Area Level 3 (SA3) of patient residence, 2017–18

Notes:

Dotted areas indicate rates that are considered more volatile than other published rates and should be interpreted with caution. Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018. For further detail about the methods used, please refer to the Technical Supplement.

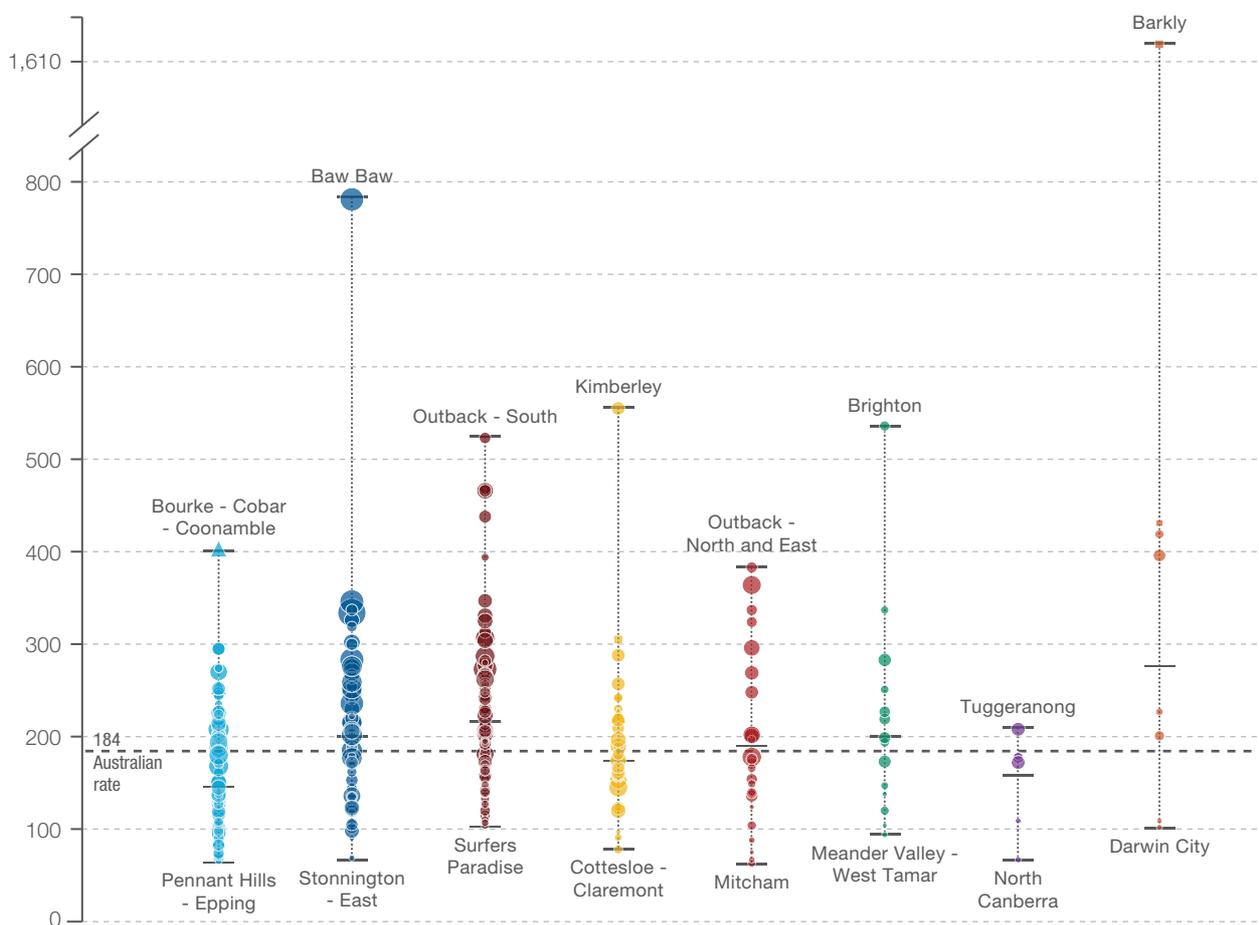

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2017 and 2018.

Diabetes complications

Rates by state and territory

Figure 2.21: Number of potentially preventable hospitalisations – diabetes complications per 100,000 people of all ages, age and sex standardised, by Statistical Area Level 3 (SA3) of patient residence, 2017–18

	NSW	Vic	Qld	WA	SA	Tas	ACT	NT
Highest rate	404	782	524	556	384	537	209	1,617*
State/territory	147	200	217	175	190	201	159	277
Lowest rate	66	70	105	79	64	95	68	103
No. hospitalisations	13,134	14,004	11,696	4,803	3,850	1,270	649	617

Each circle represents a single SA3. The size indicates the number of hospitalisations.

▲ rate only

■ interpret with caution

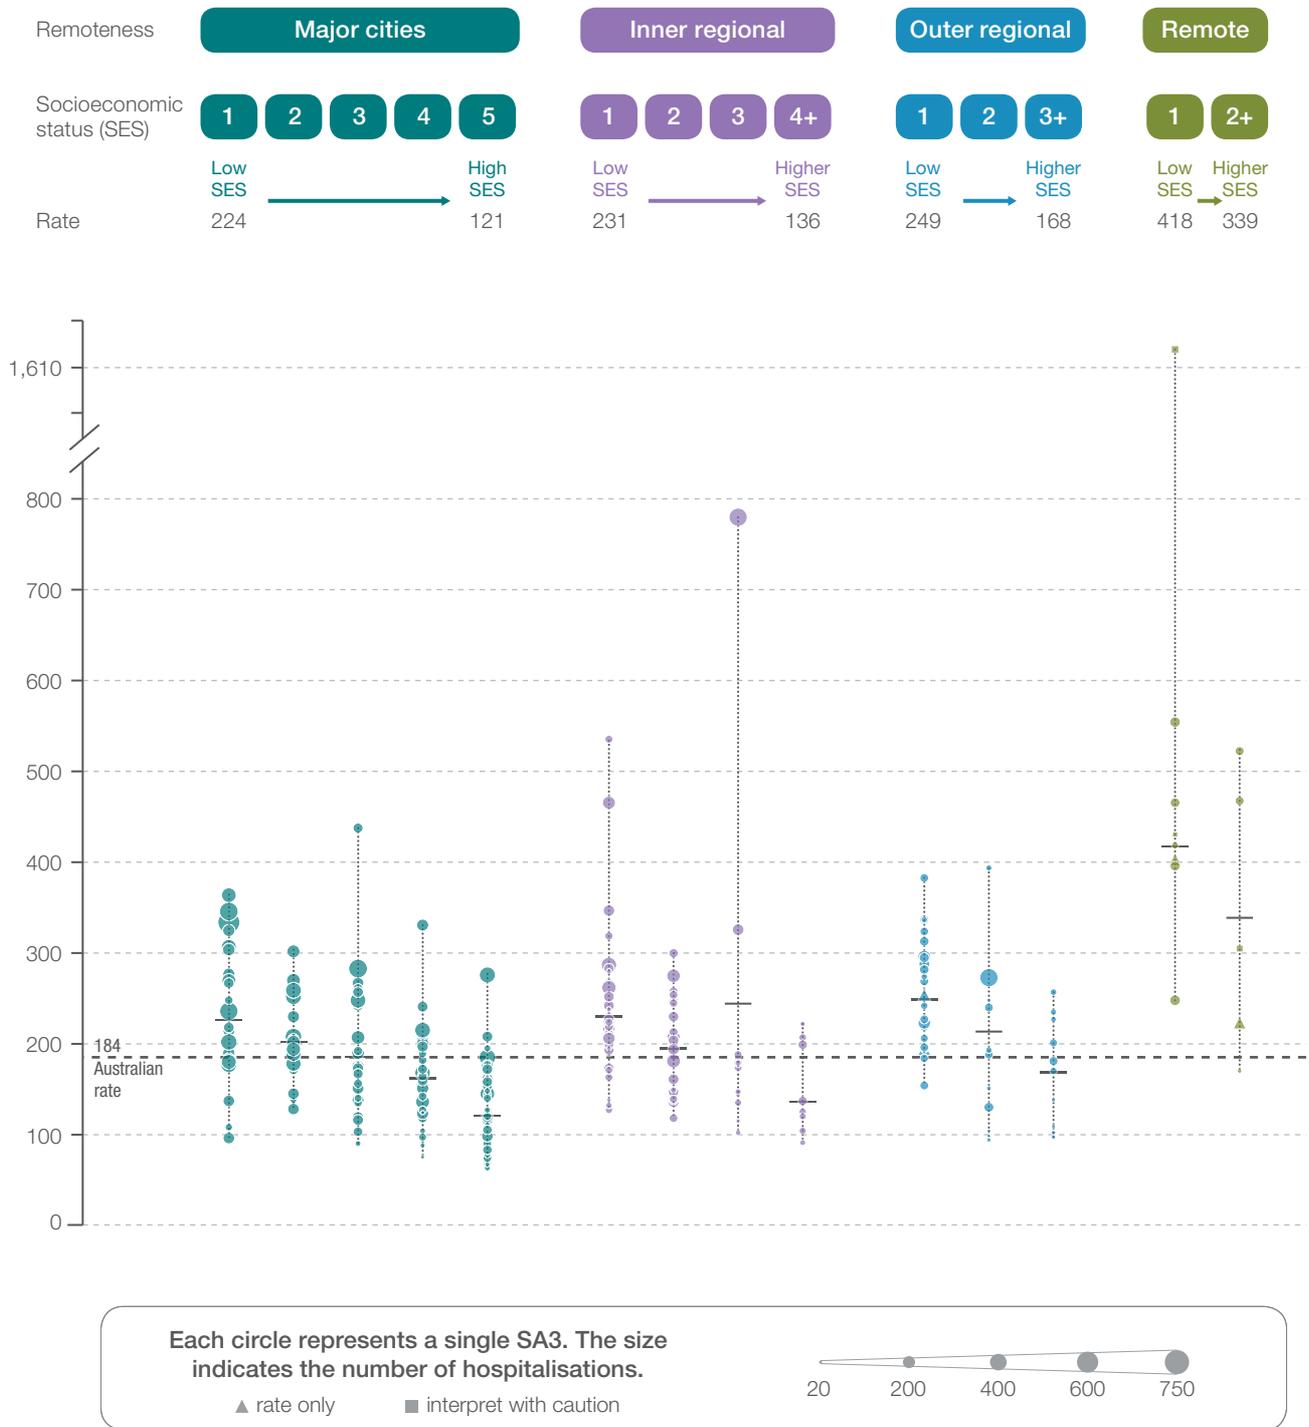

Notes:

Squares (■) and asterisks (*) indicate rates that are more volatile than other rates and should be interpreted with caution. Triangles (▲) indicate SA3s where only rates are published. The numbers of hospitalisations are not published for confidentiality reasons. Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018. For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2017 and 2018.

Rates by remoteness and socioeconomic status

Figure 2.22: Number of potentially preventable hospitalisations – diabetes complications per 100,000 people of all ages, age and sex standardised, by Statistical Area Level 3 (SA3) of patient residence, 2017–18

Notes:
 Squares (■) indicate rates that are more volatile than other rates and should be interpreted with caution.
 Triangles (▲) indicate SA3s where only rates are published. The numbers of hospitalisations are not published for confidentiality reasons.
 Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018.
 For further detail about the methods used, please refer to the Technical Supplement.

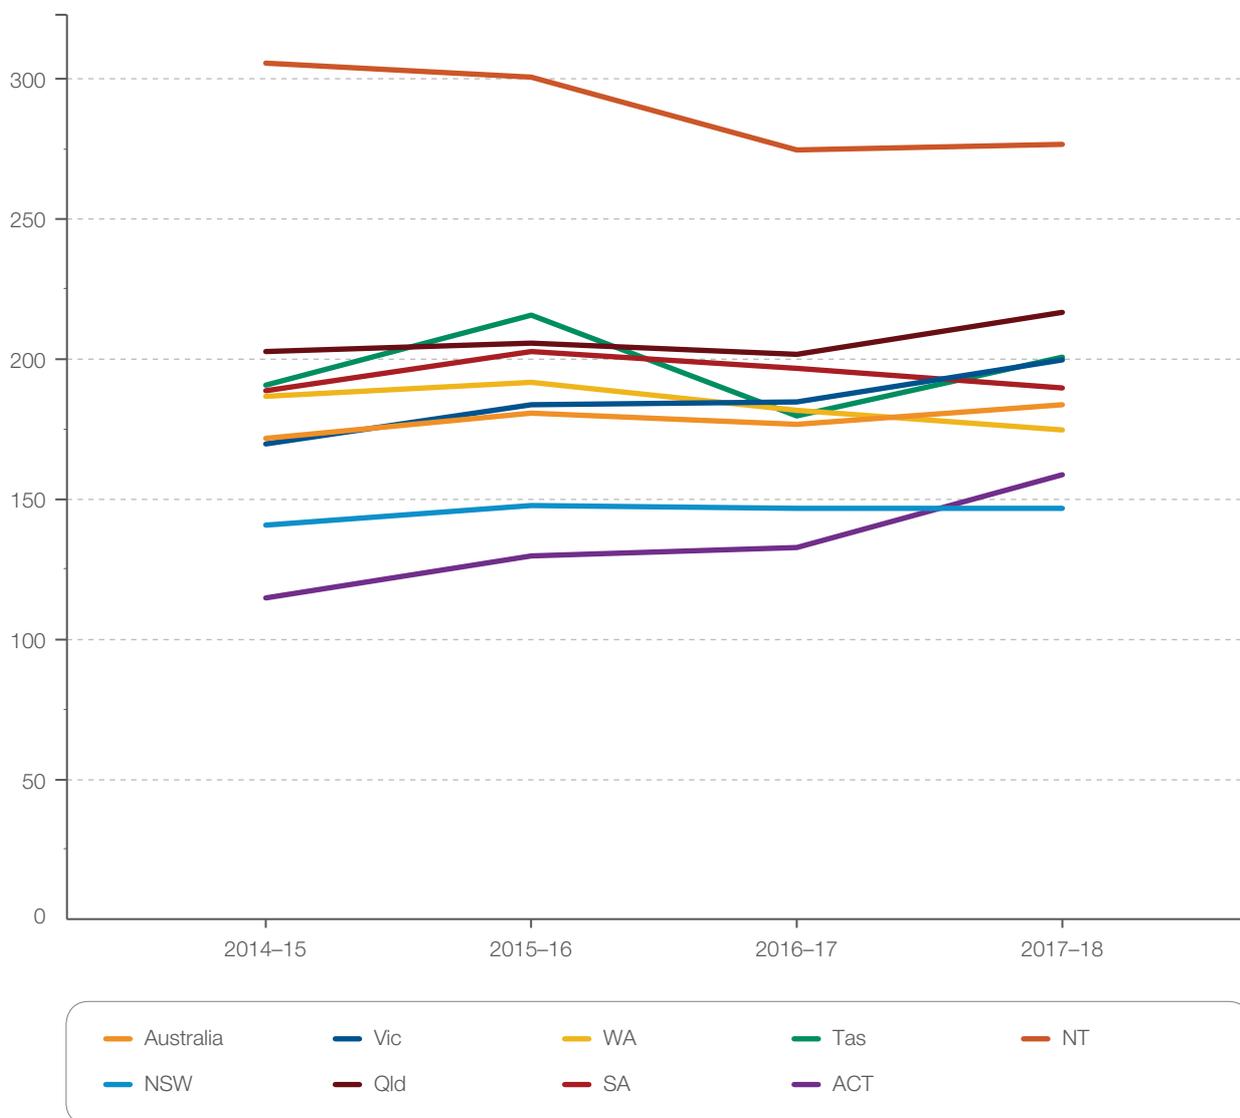

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2017 and 2018.

Diabetes complications

Rates across years

Figure 2.23: Number of potentially preventable hospitalisations – diabetes complications per 100,000 people of all ages, age and sex standardised, by state and territory of patient residence, 2014–15 to 2017–18

	2014–15	2015–16	2016–17	2017–18
Highest SA3 rate	2,034*	1,600*	681	1,617*
Australian rate	172	181	177	184
Lowest SA3 rate	52	51	46	64
Magnitude of variation	11.8	12.7	14.8	12.2
Magnitude of variation without top & bottom 10% SA3	2.8	2.8	2.8	2.9

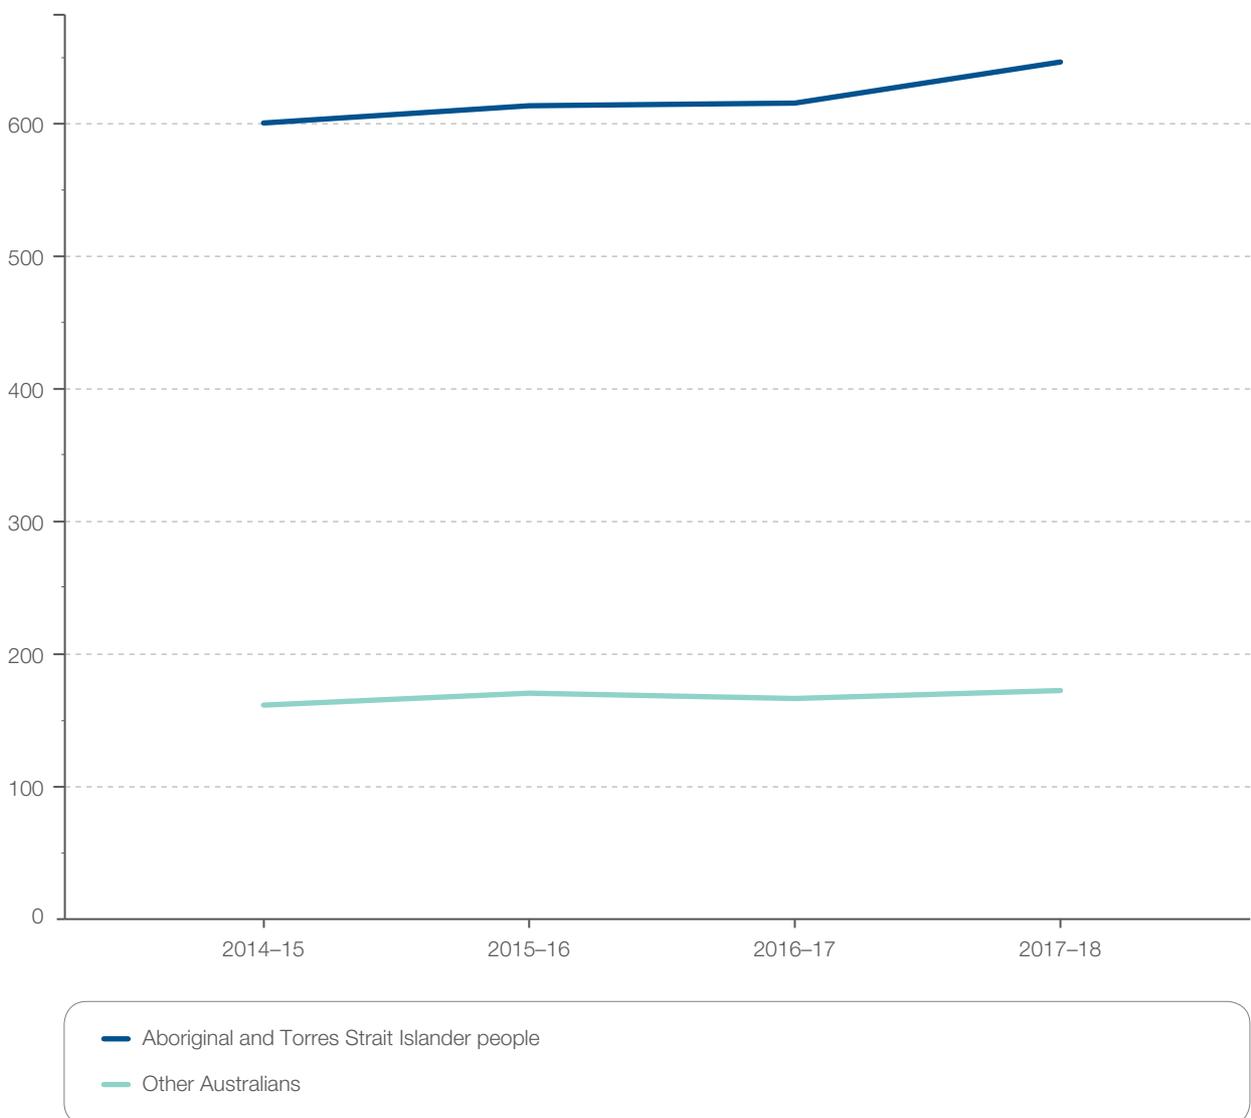

Notes:

The asterisks (*) indicate rates that are considered more volatile than others, and should be interpreted with caution. These rates are excluded from the calculation of the difference between the highest and lowest SA3 rates in Australia. Population estimates as at 31 December of the relevant year are calculated as the average of the 30 June populations before and after the relevant December. For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2014 to 2018.

Rates for Aboriginal and Torres Strait Islander people across years

Figure 2.24: Number of potentially preventable hospitalisations – diabetes complications per 100,000 people of all ages, age and sex standardised, by Aboriginal and Torres Strait Islander status, 2014–15 to 2017–18

Notes:

Data by Aboriginal and Torres Strait Islander status should be interpreted with caution as hospitalisations for Aboriginal and Torres Strait Islander people are under-enumerated, with variation among states and territories. Population estimates as at 31 December of the relevant year are calculated as the average of the 30 June populations before and after the relevant December. For further detail about the methods used, please refer to the Technical Supplement.

Australian initiatives

The information in this chapter will complement work already underway to prevent diabetes and improve its management in Australia. At a national level, this work includes:

- Australian National Diabetes Audit
- National Association of Diabetes Centres (NADC) Models of Care toolkit
- NADC *Collaborative Interdisciplinary Diabetes High Risk Foot Services Standards*
- Wellbeing framework for Aboriginal and Torres Strait Islander people living with chronic disease
- KeepSight program
- Australian National Diabetes Strategy 2016–2020
- National Diabetes Services Scheme, including support programs and expansion to subsidise new technologies.

Many state and territory initiatives are also in place, including:

- Move for Diabetes, Australian Capital Territory and NSW
- Diabetes Taskforce, NSW Agency for Clinical Innovation
- Get Healthy Information and Coaching Service, NSW
- Western Sydney Diabetes project, NSW
- Hunter Alliance program, NSW
- Aunty Jean's Good Health Team program, NSW
- NSW Integrated Care trials
- Diabetes across the Lifecourse: Northern Australia Partnership
- Education services for heart disease and diabetes, Northern Territory (NT) and far north Queensland

- Improving Health Outcomes in the Tropical North (HOT North); NT, Queensland and WA
- Structured systems approach to improving health promotion practice for chronic disease prevention in Aboriginal and Torres Strait Islander communities, NT
- HealthLAB project, NT
- Diabetes in Pregnancy Partnership, NT
- Better Living Diabetes Program, Queensland
- Diabetes Queensland Aboriginal and Torres Strait Islander Online Peer Support Program, Queensland
- Improving diabetes care and management in Torres Strait remote primary healthcare settings, Queensland
- Model of Care for People with Diabetes, Darling Downs, Queensland
- Queensland Beacon clinics for integrated diabetes care
- Diabetes Service, Country Health SA, South Australia
- South Australian Aboriginal Diabetes Strategy
- South Australian Health and Medical Research Council Aboriginal and Torres Strait Islander diabetes foot complication prevention program, including the Kimberley Foot Initiative
- COACH Program, Tasmania
- Delivering Connected Care for Complex Patients with Multiple Chronic Needs, Tasmania
- LIFE! program, Victoria
- Combined renal and diabetes integrated care clinics, Victoria
- Royal Flying Doctor Service telehealth endocrinology services, Victoria
- Aboriginal Health Promotion and Chronic Care partnership initiative, Victoria
- Improving Care for Aboriginal and Torres Strait Islander Patients, Victoria
- Hospital Admission Risk Program (HARP), Victoria

2.4 Kidney infections and urinary tract infections

Why is this important?

Kidney infections and urinary tract infections (UTIs) were the second most common cause of potentially preventable hospitalisations in 2017–18 in Australia.¹ Hospitalisation for UTI often results in the inappropriate use of broad-spectrum antimicrobials, contributing to increased antimicrobial resistance in bacteria.²

What did we find?

The rate of hospitalisations for kidney infections and UTIs in 2017–18:

- Varied across states and territories, from 212 per 100,000 people in Tasmania to 559 per 100,000 people in the Northern Territory
- Was higher in remote areas, and increased with socioeconomic disadvantage in inner regional and remote areas
- Was twice as high among Aboriginal and Torres Strait Islander people as among other Australians, nationally (although rates in Tasmania were similar in the two groups).

Between 2014–15 and 2017–18, the rate of hospitalisations for kidney infections and UTIs:

- Decreased in the Australian population as a whole by 1%
- Increased by 3.6% among Aboriginal and Torres Strait Islander people.

What can be done?

The ageing population, and misdiagnosis of asymptomatic bacteriuria as UTI in older people, are likely contributors to the high rates of hospitalisation. Early diagnosis and appropriate antibiotic treatment of UTIs in the community could reduce patient morbidity and the need for hospitalisation. Reducing the misdiagnosis of asymptomatic bacteriuria as UTI could reduce unnecessary hospitalisation of elderly patients, particularly from aged care homes. More accurate diagnosis could also reduce delays in treatment for the true cause of symptoms incorrectly ascribed to UTI.

Implementation of evidence-based guidelines for assessment and treatment of residents of aged care homes with suspected UTI will reduce the inappropriate exposure of these residents to antibiotics, the development of multidrug-resistant organisms and the development of UTIs with antibiotic-resistant organisms (which are more likely to require hospitalisation). Ensuring that people who need a catheter on an ongoing basis or intermittent self-catheterisation have access to community continence services, and are provided with education and resources before discharge, could reduce the incidence of UTIs in this group and the need for readmission.

Kidney infections and urinary tract infections

Context

UTIs are common in the community, accounting for 1.2% of all problems managed in Australian general practice consultations.³ Kidney infections and UTIs were the second most common cause of potentially preventable hospitalisations in Australia in 2017–18.⁴

Few international rates of hospitalisation for kidney infection and urinary tract infection are available for comparison. Available data suggest kidney infections and UTIs also account for substantial numbers of hospitalisations in other countries. In England, kidney infections and UTIs are the second most common cause of emergency hospital admissions for ambulatory care sensitive conditions.⁵ In Ireland, kidney infections and urinary tract infections accounted for 2.6% of all publicly-funded hospital bed days in 2016.⁶

People over 65 years of age had approximately six times the rate of hospitalisation for kidney infections and UTIs, compared to younger people, in Australia in 2017–18.⁴ Other countries with ageing populations are also experiencing high numbers of hospitalisations for kidney infections and UTIs among older people; for example, in Ireland people aged 65 years and over accounted for 78% of hospital bed days for kidney infections and UTIs in 2016.⁶

Symptoms of uncomplicated cystitis (infection of the bladder or lower urinary tract) include dysuria, and urinary urgency and frequency.⁷ Symptoms of a pyelonephritis (kidney/upper urinary tract infection) include fever, flank pain and costovertebral angle tenderness.⁷ Asymptomatic bacteriuria is not considered an infection, and should only be treated in particular circumstances (see 'Asymptomatic bacteriuria' on this page).⁷

Hospital care is required to manage severe kidney infection or UTI with sepsis, persistently high fever, pain, marked physical weakness, or inability to take oral medications or fluid.⁸ Hospital care is also warranted when urinary tract obstruction is suspected.⁸ Among people hospitalised for UTI, diabetes significantly increases the risk of death.⁹

People with diabetes also have poorer outcomes from pyelonephritis, and have a significantly higher rate of treatment failure than people without diabetes.¹⁰

UTI with multidrug-resistant organisms is a growing problem, and increases the need for hospital treatment. Inappropriate use of antimicrobials for UTIs adds to the spread of antimicrobial resistance (see page 141).

Asymptomatic bacteriuria

The presence of bacteria in an appropriately collected urine specimen from a person without symptoms of UTI is termed asymptomatic bacteriuria.¹¹ It is common, and most patients with asymptomatic bacteriuria experience no adverse consequences and do not benefit from antimicrobial therapy.¹¹ Antimicrobials are often prescribed inappropriately for treatment and prophylaxis of asymptomatic bacteriuria in Australian residents of aged care homes (see 'Over-diagnosis of UTI' on page 139).¹¹

Treatment for asymptomatic bacteriuria is recommended only in pregnancy and before invasive urological procedures.¹¹ Pregnant women should be screened and, if necessary, treated for asymptomatic bacteriuria because it may increase the risk of preterm birth, low birthweight and pyelonephritis.¹²

Risk factors for kidney infections and UTIs include:

- Female gender⁷
- Diabetes¹³
- Bladder dysfunction⁷
- Sexual activity⁷
- Use of spermicides
- Urinary catheterisation
- Decline in functional status in elderly institutionalised women.⁷

See page 141 for further discussion of risk factors.

Kidney infections and UTIs among Aboriginal and Torres Strait Islander people

Aboriginal and Torres Strait Islander people, particularly women, have much higher rates of kidney infections and UTIs than other Australians. Screening, treatment and follow-up of these infections among Aboriginal and Torres Strait Islander people is often inadequate.¹⁴ This can have serious consequences, including poorer pregnancy outcomes, acute kidney injury and chronic kidney disease.¹⁵⁻¹⁷

Severe UTIs are highly prevalent among Aboriginal and Torres Strait Islander people living in remote communities.¹⁸ Recent research in Aboriginal and Torres Strait Islander communities in north Queensland has shown that an extremely high background rate of community-acquired kidney infections and UTIs, and a high prevalence of type 2 diabetes, lead to excess hospitalisation for these infections.¹⁸ UTI was the second most common cause of hospitalisation for infection, and cellulitis was the most common cause, in this study.¹⁸

UTI can contribute to acute kidney injury, which, if untreated, increases the risk of chronic kidney disease and end-stage renal disease.^{15,16} The rate of end-stage renal disease in Aboriginal and Torres Strait Islander people is 7 times as high as that in other Australians.¹ Chronic kidney disease was responsible for 2% of the Aboriginal and Torres Strait Islander burden of disease in 2011.¹⁹

Factors contributing to poor health, including kidney infections and UTIs, among Aboriginal and Torres Strait Islander people are complex. They include a combination of broad historical, social, cultural and economic factors, as well as biomedical risk factors.²⁰ For example, traditional active lifestyles and healthy diets of Aboriginal and Torres Strait Islander people have been affected by displacement and colonisation by European settlers.²⁰

Kidney infections and UTIs among older people

The rate of hospitalisations for kidney infections and UTIs is about 5 times higher for people over 65 years of age than for younger adults in Australia.⁴ Frail, elderly people with functional decline leading to diminished ability to manage their hygiene needs are particularly susceptible to UTIs and the effects of these infections, and minor exacerbations can necessitate hospital admission. However, misdiagnosis of UTI is common in elderly people (see 'Over-diagnosis of UTI' on page 139).

About the data

All hospitalisations with a principal diagnoses of urinary tract infection are included.

Data are sourced from the National Hospital Morbidity Database and include admitted patients in both public and private hospitals, as well as Hospital in the Home care.

Rates are based on the number of hospitalisations for kidney infections and/or UTIs per 100,000 people of all ages in 2017–18.

Because a record is included for each hospitalisation for the conditions, rather than for each patient, patients hospitalised for the conditions more than once in the financial year will be counted more than once.

The analysis and maps are based on the usual residential address of the patient and not the location of the hospital.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

Data quality issues – for example, the extent of identification of Aboriginal and Torres Strait Islander status in datasets – could influence the variation seen.

Kidney infections and urinary tract infections

What do the data show?

Magnitude of variation

In 2017–18, there were 76,854 hospitalisations for kidney infections and UTIs, representing 281 hospitalisations per 100,000 people of all ages (the Australian rate).

The number of hospitalisations for kidney infections and UTIs across 326* local areas (Statistical Area Level 3 – SA3) ranged from 141 to 893 per 100,000 people. The rate was **6.3 times as high** in the area with the highest rate compared with the area with the lowest rate. The number of hospitalisations varied across states and territories, from 212 per 100,000 people in Tasmania to 559 in the Northern Territory (Figures 2.27–2.30).

After the highest and lowest 10% of results were excluded and 261 SA3s remained, the number of hospitalisations per 100,000 people was 2.3 times as high in the area with the highest rate compared with the area with the lowest rate.

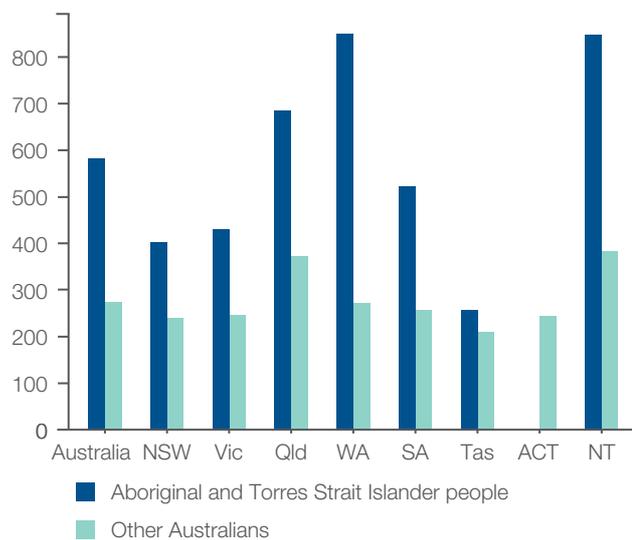

Analysis by remoteness and socioeconomic status

Rates of hospitalisations for kidney infections and UTIs were substantially higher in remote areas than in other areas. Hospitalisation rates also increased with socioeconomic disadvantage in inner regional and remote areas (Figure 2.31).

Analysis by Aboriginal and Torres Strait Islander status

The rate for Aboriginal and Torres Strait Islander people (581 per 100,000 people) was 2.1 times as high as the rate for other Australians (274 per 100,000 people) (Figure 2.25). However, rates in Tasmania were similar in the two groups.

Figure 2.25: Number of potentially preventable hospitalisations – kidney and urinary tract infections per 100,000 people of all ages, age and sex standardised, by state and territory of patient residence, by Aboriginal and Torres Strait Islander status, 2017–18†

The data for Figure 2.25, and the data and graphs for Analysis by PHN are available at safetyandquality.gov.au/atlas

* There are 340 SA3s. For this item, data were suppressed for 14 SA3s due to a small number of hospitalisations and/or population in an area.

Notes:

Some SA3 rates are more volatile than others. These rates are excluded from the calculation of the difference between the highest and lowest SA3 rates in Australia.

† Data for ACT (Aboriginal and Torres Strait Islander people) have been suppressed. Data by Aboriginal and Torres Strait Islander status should be interpreted with caution as hospitalisations for Aboriginal and Torres Strait Islander patients are under-enumerated, with variation among states and territories.

Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018.

For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2017 and 2018.

Trends over time

Between 2014–15 and 2017–18, the rate of hospitalisations for kidney infections and UTIs per 100,000 people decreased by 1% in the population as a whole (Figure 2.32).

Since June 2017, emergency department–only episodes in New South Wales have not been counted as hospitalisations, and this will affect the time trends described above.

For Aboriginal and Torres Strait Islander people, the rate of hospitalisations for kidney infections and UTIs per 100,000 people nationally increased by 3.6% between 2014–15 and 2017–18 (Figure 2.33).

Interpretation

Potential reasons for the variation include geographical differences in

- Demographic and consumer factors
 - clustering of populations with a high risk of UTIs, such as residents of aged care homes²¹, people with type 2 diabetes and people with socioeconomic disadvantage
 - populations with poor diabetes control
 - access to medicines, including affordability
 - incidence of infection with multidrug-resistant extended-spectrum β -lactamase-producing bacteria
 - rates of urological procedures, such as stent insertion
- Clinician factors
 - diagnostic error, leading to over- or under-diagnosis
 - adherence to evidence-based guidelines, including choice of antimicrobial and length of treatment
- Health system factors
 - use of emergency department short-stay units, where a patient stay is counted as a hospitalisation rather than an emergency department–only visit
 - implementation of hospital avoidance schemes
 - access to primary care, including availability, acceptability and affordability
 - access to community services
 - access to information about self-management at an appropriate health literacy level and in languages other than English
 - access to, and availability of, culturally appropriate health care for Aboriginal and Torres Strait Islander people
 - antimicrobial stewardship interventions.

Kidney infections and urinary tract infections

Variations between areas may not directly reflect the practices of the clinicians who are based in these areas. Area boundaries reflect where people live rather than where they obtain their health care. Patients who live in metropolitan, regional and rural areas may all travel outside their local areas to receive care.

Access to primary care is likely to affect hospitalisation rates for kidney infections and UTIs. Barriers to access include distance, lack of transport, cost, and a lack of health services that provide culturally appropriate care for Aboriginal and Torres Strait Islander people, and people from other culturally and linguistically diverse backgrounds.

Low health literacy is also a barrier to seeking care and managing treatment effectively. Inability of people with cognitive impairment, such as some residents of aged care homes, to communicate symptoms may contribute to delays in obtaining care.

Addressing variation

UTI treatment with broad-spectrum antimicrobial agents contributes to bacterial resistance, making the management of subsequent UTIs more difficult.² Antimicrobials remain the recommended treatment for UTIs, but including other prevention measures could reduce the incidence of UTIs, the use of antimicrobials and the development of resistance.² Prevention should follow this order:

- Counselling about reducing modifiable risk factors (see below)
- Non-antimicrobial measures
- Antimicrobial prophylaxis.²

Identification and management of risk factors such as vaginal infections, use of spermicides and atrophic vaginitis due to oestrogen deficiency could reduce the rate of UTIs and the need for antimicrobials.² Increasing access to health care for people with anatomical abnormalities of the urinary tract could also reduce the rate of UTIs among this group of patients.

Over-diagnosis of UTI

Although elderly people are at higher risk of UTIs, over-diagnosis of UTIs is also common in this group.²² Our ageing population, and misdiagnosis of asymptomatic bacteriuria as UTI in older people, are likely contributors to the high rates of hospitalisation reported in this chapter. An incorrect diagnosis of UTI in an elderly person has several negative consequences, including not identifying or treating the actual cause of their symptoms and increasing the risk of subsequent infection with antimicrobial-resistant organisms after treatment with an unnecessary antimicrobial. Difficulties in accurate diagnosis of UTIs in older people include:

- High rates of asymptomatic bacteriuria, which can lead to a positive urine dipstick result and misinterpretation as a UTI
- Lack of a fast, accurate test that distinguishes asymptomatic bacteriuria from active infection
- Comorbidities, such as cognitive impairment, that impede assessment.²³

Review of patient notes in a United Kingdom (UK) hospital study found that 43% of patients over 75 years of age who were given a diagnosis of UTI did not meet diagnostic criteria.²² Of the patients incorrectly diagnosed with UTI, 37% had asymptomatic bacteriuria.²² Guidelines recommend against treating asymptomatic bacteriuria, except in pregnancy and before some urological procedures.¹² Asymptomatic bacteriuria affects approximately 19% of women and 9% of men over 80 years of age²⁴, and can lead to a positive urine dipstick result in the absence of a UTI. A positive urinalysis result is not a reliable method for identifying UTI in elderly emergency department patients.²⁵

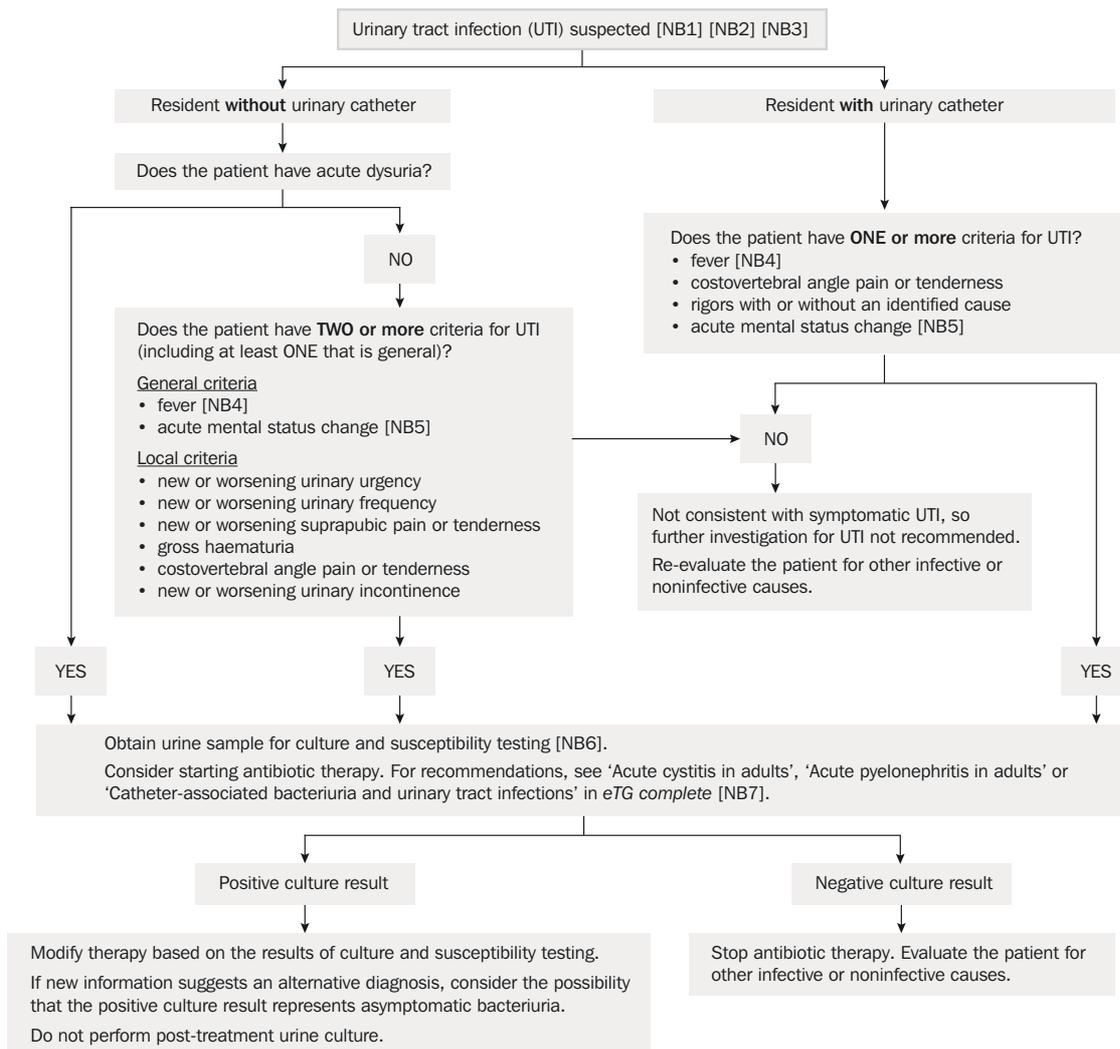

Time pressure in hospital emergency departments may contribute to over-diagnosis of UTIs in elderly people. UK emergency department staff interviewed for a qualitative study said that quickly diagnosing UTI by urine testing was a method of securing hospital admission.²⁶ One staff member commented that she needed ‘to find a cause to admit somebody to hospital when we think they are not right to go home, we’ve only got so much time to make the decision ... so that’s what I’m going to come up with’.²⁶

Reducing over-diagnosis in elderly people

Strategies to reduce over-diagnosis of UTIs in elderly people include selective use of urine testing in emergency departments, and only after considering the probability of UTI based on history and examination.²³ Ensuring midstream clean-catch urine collection, or using an in/out catheter if necessary, will increase the accuracy of urine tests, as will removal of a long-term indwelling catheter and insertion of a fresh catheter before collecting urine samples.²³ Following Australian guidelines on assessment and treatment of residents of aged care homes with suspected UTI could also increase diagnostic accuracy in this group (see Figure 2.26 on page 140).^{11,23}

Kidney infections and urinary tract infections

Figure 2.26: Flowchart on assessment and treatment of aged-care facility residents with suspected urinary tract infection¹²

NB1: Do not investigate or treat cloudy or malodorous urine in aged-care facility residents who do not have other signs or symptoms of UTI.
 NB2: Consider whether an alternative diagnosis is likely. Consider both infective (e.g. pneumonia) and non-infective (e.g. medication-related adverse events) causes.
 NB3: Establish whether an advance care plan is in place as it may influence assessment and management (e.g. whether investigations are performed or antibiotics are given).
 NB4: Fever is defined as a temperature higher than 38°C or an increase of more than 1.5°C above baseline temperature.
 NB5: Acute mental status changes include new change in level of consciousness, periods of altered perception, disorganised speech and lethargy.
 NB6: If the resident has an indwelling urinary catheter, see eTG complete for a guide to collecting urine samples in patients with indwelling urinary catheters.
 NB7: The duration of therapy does not need to be modified for this patient group and should always be stated on the prescription.

Healthcare-associated UTIs

UTIs are a common healthcare-associated infection. Many are associated with indwelling urinary catheters.²⁷ Note that a UTI acquired during a hospital admission for another reason would not be counted in the data presented in this chapter, but a readmission to manage the UTI would be counted. In Australia in 2017–18, there were 5,362 unplanned readmissions for UTI within 28 days of discharge from a public hospital (excluding Western Australia).²⁸ This figure includes unplanned readmissions after initial admission for any reason, and includes readmissions to the same hospital only.

Approximately 1.7% of patients who were hospitalised for more than two days acquired a UTI, according to a study of eight Australian hospitals.²⁷ The estimated extra length of stay due to these healthcare-associated UTIs was four days.²⁷

Contributing factors that must be considered include whether indwelling urethral catheterisation is necessary, duration of the indwelling catheter, and how the catheter is inserted.⁷ Intermittent clean catheterisation should be considered in many people in both inpatient and outpatient settings to prevent catheter-associated UTIs. Reducing the proportion of patients with an indwelling catheter will reduce the incidence of UTIs and the likelihood of re-presentation to hospital with that UTI because of diagnostic failure or inadequate treatment before discharge.

Impact of antimicrobial-resistant bacteria

Increasing incidence of multidrug-resistant extended-spectrum β -lactamase-producing bacteria in Australia will contribute to increasing rates of hospitalisation for UTIs that do not respond to initial treatment, and longer hospital stays due to more complex treatment. Australian guidelines have been updated in light of growing antibiotic resistance.¹²

If possible, the susceptibility of organisms recently identified in patient samples should guide antimicrobial choice.¹² Trimethoprim continues to be recommended as empirical oral antimicrobial therapy for acute cystitis, but not for non-severe pyelonephritis because it is a more serious infection with a higher risk of adverse outcomes with treatment failure.¹² Amoxicillin–clavulanic acid has an unnecessarily broad spectrum of activity for empirical therapy of cystitis (that is, treatment before the responsible organism is known), and increases the risk of selecting for antimicrobial-resistant organisms.^{12,29}

People with renal failure may be less likely to receive targeted antimicrobial agents because of concerns about renal function, and may receive antimicrobials that have less reliable effectiveness (for example, cefalexin, ceftriaxone). For patients in remote areas with renal failure, delays in receiving microbiology study results may add to the barriers to receiving effective treatment.

Risk factors for UTIs with multidrug-resistant bacteria include recent overseas travel, previous exposure to antimicrobials and living in an aged care home.³⁰ Urine culture before starting treatment is advisable for patients with any of these risk factors to guide antimicrobial choice.³⁰

Kidney infections and urinary tract infections

Reducing UTIs among Aboriginal and Torres Strait Islander people

Developing culturally appropriate and accessible information in partnership with Aboriginal and Torres Strait Islander communities could reduce the impact of UTIs in these groups.³¹ This should include information emphasising the importance of prompt medical attention for symptoms of UTI to minimise the risk of acute kidney injury and subsequent chronic kidney disease.³¹

Improving access to culturally safe care may increase the early detection and treatment of UTIs in Aboriginal and Torres Strait Islander people. Strengthening the capacity of the Aboriginal Community Controlled Health Service sector and improving the cultural safety of mainstream services are both important elements. Improving access for Aboriginal and Torres Strait Islander mothers to culturally safe models of maternity care may improve detection and treatment of UTIs in pregnancy in this group.³² See page 60 for examples of successful strategies for improving antenatal care for Aboriginal and Torres Strait Islander mothers.

Reducing risk factors for diabetes could reduce the rate of UTIs among Aboriginal and Torres Strait Islander people, as diabetes increases the risk of UTI. Diabetes prevalence is strongly related to social disadvantage among Aboriginal and Torres Strait Islander people, and the underlying social determinants of health need to be considered to address the increasing rate of diabetes.³³ The logistical and financial barriers to accessing health care for Aboriginal and Torres Strait Islander people living in remote areas also need to be addressed.

Preventing recurrent UTIs

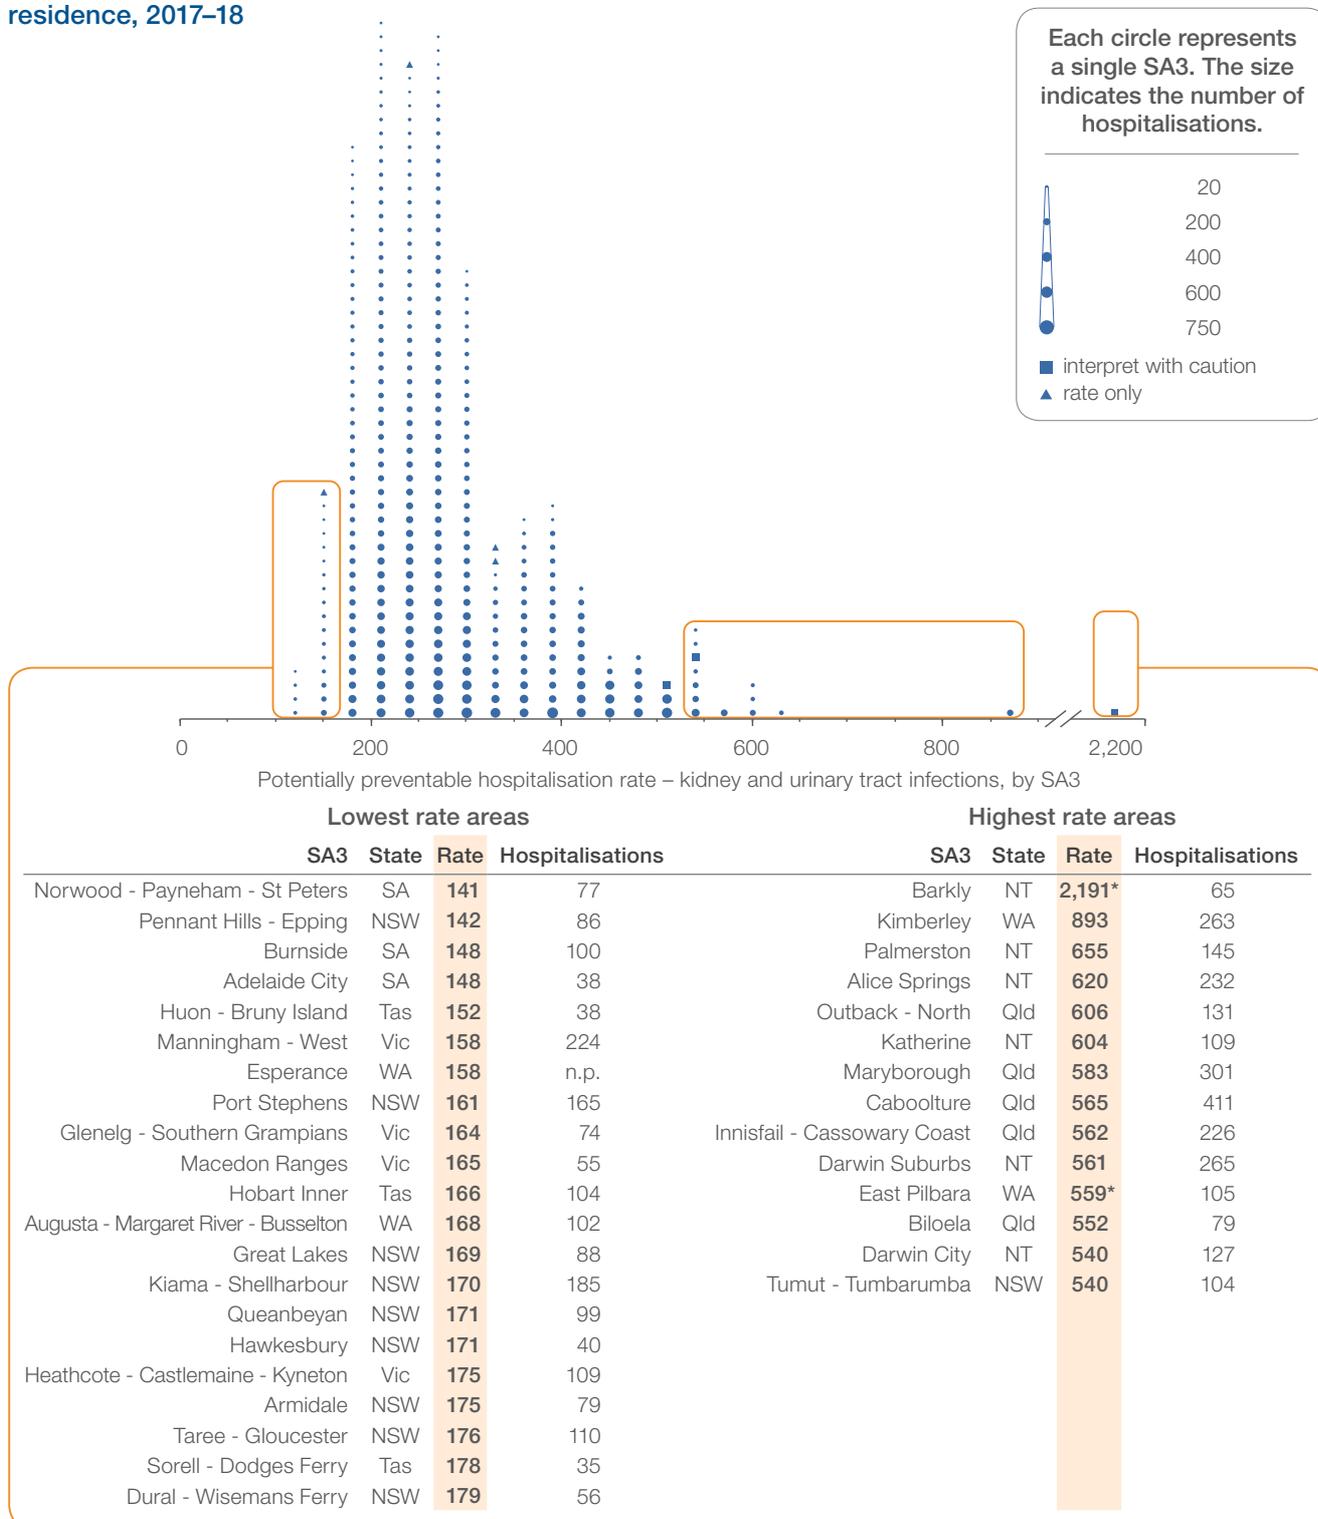

Recurrent UTIs account for a substantial number of infections, and prophylaxis may be appropriate for certain groups of patients after evaluation for contributing factors.¹² Patient-initiated treatment with antimicrobials at the onset of symptoms may also be appropriate for women who have frequent symptomatic UTIs, and this approach reduces overall antimicrobial use compared with prophylaxis.¹²

On discharging older patients from hospital with a diagnosis of UTI, communication to general practitioners emphasising recommendations to reduce the risk of recurrent UTIs may reduce the need for future hospitalisations.²³ In postmenopausal women, vaginal oestrogen may reduce recurrences of UTIs. Increasing water intake may reduce recurrences in premenopausal women.¹²

The evidence for cranberry products to prevent UTIs is conflicting. A meta-analysis published in 2017 concluded that cranberry products significantly reduce the risk of UTIs.³⁴ Another meta-analysis published in 2012 reported a non-significant trend to fewer UTIs; this review also commented that the high withdrawal rate in trials suggests that use of cranberry products may not be an acceptable intervention for some patients.³⁵ There is not enough high-quality evidence to determine whether probiotics are effective for preventing UTIs.³⁶

Rates by local area

2.5 Cellulitis

Why is this important?

Cellulitis is an infection of the subcutaneous tissues. Crowded living conditions and socioeconomic disadvantage increase the risk of some bacterial causes of cellulitis.¹

What did we find?

Between 2014–15 and 2017–18, the rate of cellulitis hospitalisations nationally increased by 9%. The rate increased by 18% among Aboriginal and Torres Strait Islander people. The rate for Aboriginal and Torres Strait Islander people was 3.0 times as high as the rate for other Australians.

Rates of hospitalisation for cellulitis were substantially higher in remote areas than in other areas. Hospital admission rates also increased with socioeconomic disadvantage, regardless of remoteness, except in outer regional areas.

What can be done?

The rates of hospitalisation for cellulitis reported in this chapter are unacceptably high, and more must be done to prevent these infections. Addressing the social determinants of skin health, such as housing conditions, is key to reducing skin infections and cellulitis among Aboriginal and Torres Strait Islander people.^{2,3} More effective prevention and management of type 2 diabetes, an important risk factor for cellulitis, may also reduce rates of hospitalisation for cellulitis. Increasing availability of podiatry services that specialise in care of diabetic and ischaemic foot ulcers may help prevent infections and hospitalisations, particularly in rural and remote areas. Increasing availability of lymphoedema services and specific compression stockings may reduce rates of cellulitis in patients with chronic lymphoedema. Improving the accuracy of cellulitis diagnoses – for example, by early consultation with an infectious diseases specialist and/or a dermatologist – could reduce unnecessary hospitalisations and antibiotic use.

Cellulitis

Context

Cellulitis is an infection of the subcutaneous tissues. It occurs in a range of disparate conditions and circumstances, with different causes and management – for example, penetrating injuries, insect bites and wounds.⁴ Risk factors for recurrent cellulitis include lymphoedema, obesity, diabetes and pre-existing skin infections such as tinea.^{4,5} Crowded living conditions and socioeconomic disadvantage increase the risk of some infections associated with cellulitis.¹

Cellulitis was the fourth most common cause of potentially preventable hospitalisation in Australia in 2017–18, after dental conditions, kidney infections and urinary tract infections combined, and chronic obstructive pulmonary disease.⁶ Among Aboriginal and Torres Strait Islander people, cellulitis was the second most common cause of potentially preventable hospitalisation in 2017–18, after chronic obstructive pulmonary disease.⁷ Hospitalisations for cellulitis accounted for 275,653 bed days in Australia in 2017–18.⁶

Older, frail people are particularly at risk of hospitalisation due to cellulitis because even minimal infection can mean that they are unable to manage at home. The rate of hospitalisation for cellulitis in Australia is 3.0 times higher among people aged 65 years and over compared with younger adults.⁷

Few international rates of hospitalisation for cellulitis are available for comparison. The rate of hospital discharge for treatment for infection of the skin or subcutaneous tissues was 359 per 100,000 in Australia, compared to 328 per 100,000 in New Zealand, in 2016.⁸

Cellulitis is caused by a variety of pathogens. Spontaneous, rapidly spreading cellulitis and non-purulent recurrent cellulitis (for example, associated with lymphoedema) are most commonly caused by *Streptococcus pyogenes* or other streptococci.⁹

Purulent cellulitis is usually caused by *Staphylococcus aureus* (*S. aureus*).⁹ Some community-acquired *S. aureus* infections in Australia are now due to methicillin-resistant organisms.¹⁰ Cellulitis caused by *S. aureus* is less common than cellulitis caused by streptococci, and is often associated with an abscess, ulceration or penetrating injury.⁹

Oral antibiotics are recommended for cellulitis without systemic features of infection. Intravenous antibiotics are usually required for patients with two or more features of systemic infection.⁹

About the data

All hospitalisations with a principal diagnoses of cellulitis are included.

Data are sourced from the National Hospital Morbidity Database, and include admitted patients in both public and private hospitals, including Hospital in the Home care.

Rates are based on the number of hospitalisations for cellulitis per 100,000 people of all ages in 2017–18.

Because a record is included for each hospitalisation for cellulitis, rather than for each patient, patients hospitalised for cellulitis more than once in the financial year will be counted more than once.

The analysis and maps are based on the usual residential address of the patient and not the location of the hospital.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

Data quality issues – for example, the extent of identification of Aboriginal and Torres Strait Islander status in datasets – could influence the variation seen.

What do the data show?

Magnitude of variation

In 2017–18, there were 68,663 hospitalisations for cellulitis, representing 256 hospitalisations per 100,000 people of all ages (the Australian rate).

The number of hospitalisations for cellulitis across 330* local areas (Statistical Area Level 3 – SA3) ranged from 90 to 1,393 per 100,000 people. The rate was **15.5 times as high** in the area with the highest rate compared with the area with the lowest rate. The number of hospitalisations varied across states and territories, from 185 per 100,000 people in the Australian Capital Territory to 679 in the Northern Territory (Figures 2.35–2.38).

After the highest and lowest 10% of results were excluded and 264 SA3s remained, the number of hospitalisations per 100,000 people was 2.9 times as high in the area with the highest rate compared with the area with the lowest rate.

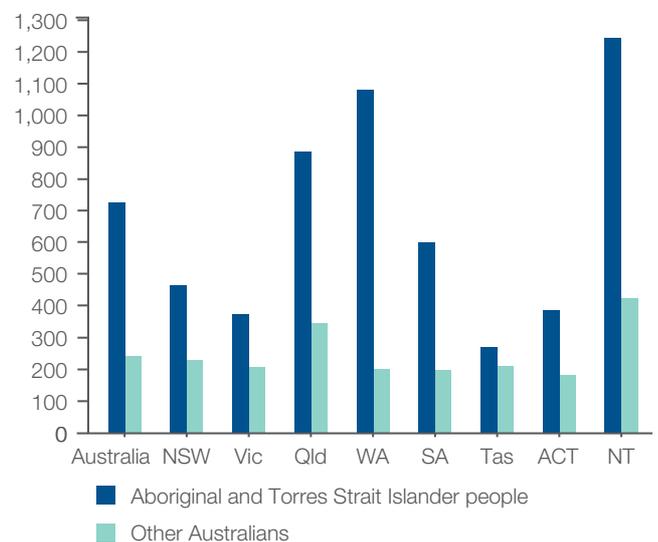

Analysis by remoteness and socioeconomic status

Rates of hospitalisation for cellulitis were substantially higher in remote areas than in other areas. Hospital admission rates also increased with socioeconomic disadvantage, regardless of remoteness category, except in outer regional areas (Figure 2.39).

Analysis by Aboriginal and Torres Strait Islander status

The rate for Aboriginal and Torres Strait Islander people (727 per 100,000 people) was 3.0 times as high as the rate for other Australians (242 per 100,000 people) (Figure 2.34).

Figure 2.34: Number of potentially preventable hospitalisations – cellulitis per 100,000 people of all ages, age and sex standardised, by state and territory of patient residence, by Aboriginal and Torres Strait Islander status, 2017–18†

The data for Figure 2.34, and the data and graphs for Analysis by Primary Health Network are available at safetyandquality.gov.au/atlas

* There are 340 SA3s. For this item, data were suppressed for 10 SA3s due to a small number of hospitalisations and/or population in an area.

Notes:

Some SA3 rates are more volatile than others. These rates are excluded from the calculation of the difference between the highest and lowest SA3 rates in Australia.

† Data by Aboriginal and Torres Strait Islander status should be interpreted with caution as hospitalisations for Aboriginal and Torres Strait Islander patients are under-enumerated, with variation among states and territories.

Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018.

For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2017 and 2018.

Cellulitis

Trends over time

Between 2014–15 and 2017–18, the rate of cellulitis hospitalisations per 100,000 people nationally increased by 9% (Figure 2.40).

For Aboriginal and Torres Strait Islander people, the rate of cellulitis hospitalisations per 100,000 people nationally increased by 18% between 2014–15 and 2017–18 (Figure 2.41).

Interpretation

Potential reasons for the variation include geographical differences in:

- Clinician factors:
 - Diagnostic error, potentially leading to both under-diagnosis and over-diagnosis of cellulitis. Several other conditions can be mistaken for cellulitis, due to its non-specific features, and reported rates of misdiagnosis range from 30% to 74% in United States (US) hospitals.^{11,12} In one US study where 30% of cellulitis diagnoses were later found to be incorrect, 85% of the misdiagnosed patients were unnecessarily hospitalised and 92% received unnecessary antibiotics due to the misdiagnosis¹³ (see ‘Improving diagnostic accuracy’ on page 157).
- Demographic and consumer factors
 - prevalence of diabetes, and poorly managed diabetes, which increase the risk of skin disease; diabetes is more prevalent among Aboriginal and Torres Strait Islander people
 - prevalence of obesity, chronic venous stasis, immobility and lymphoedema, which increase the risk of oedema and cellulitis, and prevalence of heart failure with lymphoedema
 - prevalence of community-associated methicillin-resistant *Staphylococcus aureus* (MRSA), which is high in outer regional, remote and very remote areas compared with major cities and inner regional areas of Australia¹⁴
- Health system factors
 - prevalence of streptococcal infections in some Aboriginal and Torres Strait Islander communities
 - overcrowded housing
 - swimming facilities (type, cleanliness and frequency of use); use of swimming pools may reduce skin infections¹⁵
 - occupational risk factors for skin injury
 - density of populations with a high risk of cellulitis, such as residents of aged care homes¹⁶
 - temperature and humidity, and associated effects (for example, open footwear, tinea).
- Health system factors
 - delayed or inadequate access to appropriate health care; poor health literacy may contribute to delays in seeking health care, resulting in increased need for hospitalisation
 - access to dermatologists for managing serious skin conditions and preventing progression to cellulitis
 - access to culturally appropriate health care for Aboriginal and Torres Strait Islander people
 - implementation of hospital avoidance schemes
 - availability of integrated care that connects patients with social services and programs
 - use of emergency department short-stay units, where a patient stay is coded as a hospitalisation rather than an emergency department-only visit.

Variations between areas may not directly reflect the practices of the clinicians who are based in these areas. Area boundaries reflect where people live rather than where they obtain their health care. Patients who live in metropolitan, regional and rural areas may all travel outside their local areas to receive care.

Impact of MRSA

The prevalence of community-associated MRSA is higher in outer regional, remote and very remote areas than in major cities and inner regional areas of Australia.¹⁴ In 2017, 41% of *S. aureus* infections in remote areas were methicillin resistant, compared with 20% in major cities of Australia.¹⁴ Prevalence of MRSA increased in Australia overall between 2015 and 2017, but to a larger extent in remote and very remote areas than in major cities.¹⁴ Higher prevalence of MRSA is likely to contribute to higher rates of hospitalisation for cellulitis for several reasons:

- Ineffectiveness of antibiotics used for empirical treatment can result in progression of the infection
- MRSA infections require surgical drainage, which is more likely to require hospital care
- Higher prevalence of MRSA may cause an increase in rates of skin abscesses, furuncles and boils, which can progress to cellulitis.

In addition, longer waiting times for the results of microbiological investigations in remote areas lead to longer periods before a change in antibiotic if there is a mismatch in susceptibility, and greater opportunity for progression of infection.

Addressing variation

The rates of hospitalisation for cellulitis reported in this chapter are unacceptably high, and more must be done to prevent these severe infections. The 9% increase in cellulitis hospitalisations overall, and the 18% increase among Aboriginal and Torres Strait Islander people, between 2014–15 and 2017–18 underscore this need. Suitable strategies to reduce potentially preventable hospitalisations for cellulitis will depend on the specific underlying causes in local areas and their accurate diagnosis.

Improving diagnostic accuracy

Several other conditions can be mistaken for cellulitis, due to its non-specific features. Reported rates of misdiagnosis range from 30% to 74% in US hospitals.^{11,12} In one US study where 30% of cellulitis diagnoses were later found to be incorrect, 85% of the misdiagnosed patients were unnecessarily hospitalised, and 92% received unnecessary antibiotics as a result of the misdiagnosis.¹³

Early consultation with an infectious diseases specialist or a dermatologist can improve outcomes for patients with a presumed diagnosis of cellulitis, and so reduce antibiotic use.¹¹ In a US trial, patients who were assessed by a dermatologist within 24 hours of admission had significantly better clinical improvement after two weeks, and had significantly lower duration of antibiotic treatment, than patients treated by the usual medical team.¹¹

Ambulatory Care

Many patients with cellulitis are treated in ambulatory settings, community health, specialist outpatient clinics, general practice and Hospital in the home. Ambulatory settings may be preferable for selected older patients, to reduce the risk of geriatric complications such as delirium.¹⁷

Cellulitis

Managing predisposing conditions and recurrent cellulitis

More effective prevention and management of type 2 diabetes, an important risk factor for cellulitis, may contribute to reducing rates of hospitalisation for cellulitis. Access to information about self-management at an appropriate health literacy level, and in languages other than English, is fundamental to enabling consumers to prevent future episodes of cellulitis. Improved self-management of skin diseases such as eczema, and encouraging early action to prevent worsening of infections, may reduce hospitalisations for cellulitis.

Increasing availability of podiatry services that specialise in care of diabetic and ischaemic foot ulcers may help prevent infections and hospitalisations, particularly in rural and remote areas. Similarly, increasing availability of lymphoedema services and specific compression stockings may reduce rates of cellulitis in patients with chronic oedema. In a small Australian trial, leg compression therapy halved the rate of hospitalisation for cellulitis among patients with chronic oedema of the leg and recurrent cellulitis.¹⁸

Other factors that increase the risk of recurrent cellulitis include tinea of the feet, lymphoedema and lymphatic malformation.⁹ In addition to managing these risk factors, giving patients with recurrent cellulitis a prescription for antibiotic treatment so that they can start treatment as soon as symptoms appear may prevent rapid progression of infection.⁹

Antibiotic prophylaxis is recommended for some people with frequent recurrences.^{9,19} Recommended prophylaxis is phenoxymethylpenicillin 250 mg orally, twice daily for up to six months initially, followed by regular review.⁹

Individualising treatment

Using better-tolerated treatments for impetigo (also known as school sores) in primary care may encourage earlier presentation. Delays in presentation due to the pain of treatment with penicillin G injection may contribute to treatment failure in the primary healthcare setting. Previous experience of ineffective treatment with flucloxacillin or other β -lactam antibiotics for MRSA infections may also contribute to treatment failure in the primary healthcare setting.

Treatment for patients with suspected MRSA or risk factors

For patients with purulent cellulitis (or suspected *S. aureus* infection) and risk factors for MRSA infection, intravenous vancomycin is recommended.²⁰ In some areas, clindamycin or lincomycin is a suitable alternative, based on local community-associated MRSA susceptibility patterns.²⁰

Risk factors for infection with MRSA include:

- Living in an area with a high prevalence of MRSA (for example, the Northern Territory, remote communities in northern Queensland, regions north of metropolitan Perth in Western Australia – especially the Pilbara and Kimberley)
- Previous colonisation or infection with MRSA, particularly if recent (this also applies to neonates exposed to caregivers colonised or infected with MRSA)
- Residence in an aged care home with a high prevalence of MRSA, particularly if the patient has had several courses of antibiotics
- Frequent stays, or a current prolonged stay, in a hospital with high MRSA prevalence, particularly if the patient has had antibiotic treatment or recent surgery.²⁰

Promoting skin health among Aboriginal and Torres Strait Islander people

The burden of bacterial skin infections and parasitic skin infestations among Aboriginal and Torres Strait Islander people is highest in remote communities.²¹ These conditions can lead to impetigo and cellulitis.²¹ The risk of skin infections is reduced by adequate housing conditions, including adequate space for the number of people living in the house.²²

The Housing for Health Program involves repairs and maintenance of housing items required for healthy living practices. The program has significantly reduced the rate of hospitalisations for skin infections, and led to other benefits for people living in Aboriginal community housing (see 'Case study: Housing for health' on this page).²³

Children in remote Aboriginal and Torres Strait Islander communities in northern Australian have the highest rates of impetigo in the world.²⁴ Prevention programs for skin infections can increase protective factors against cellulitis in these settings.^{25,26} Public swimming pools have also been associated with a lower prevalence and severity of skin sores in remote Aboriginal and Torres Strait Islander communities, and may decrease the burden of infections and staphylococcal diseases in particular.^{15,27}

In areas with very high rates of skin infections in children, such as the Kimberley and Pilbara, skin infections may become normalised, meaning that clinicians may not offer treatment unless asked, and patients may not seek treatment.³ However, in settings with a high burden of skin infections, individual treatment without community-level interventions is likely to be ineffective, partly because of extensive community-level transmission of impetigo.² Addressing the normalisation of skin infections and the social determinants of skin health is key to increasing protective factors against skin infections among Aboriginal and Torres Strait Islander children.^{2,3}

Strengthening the capacity of the Aboriginal Community Controlled Health Service sector and improving the cultural safety of mainstream services are important for improving access to care for Aboriginal and Torres Strait Islander people. Strengthening the Aboriginal and Torres Strait Islander health workforce is also fundamental to improving access to culturally safe health care.

Case study: Housing for health

The risk of skin infections is increased by poor housing conditions, including inadequate facilities for healthy living practices.²² The Housing for Health Program involves repairs and maintenance of housing items required for healthy living practices. The program has significantly reduced the rate of hospitalisations for skin infections, and led to other benefits for people living in Aboriginal community housing.²³

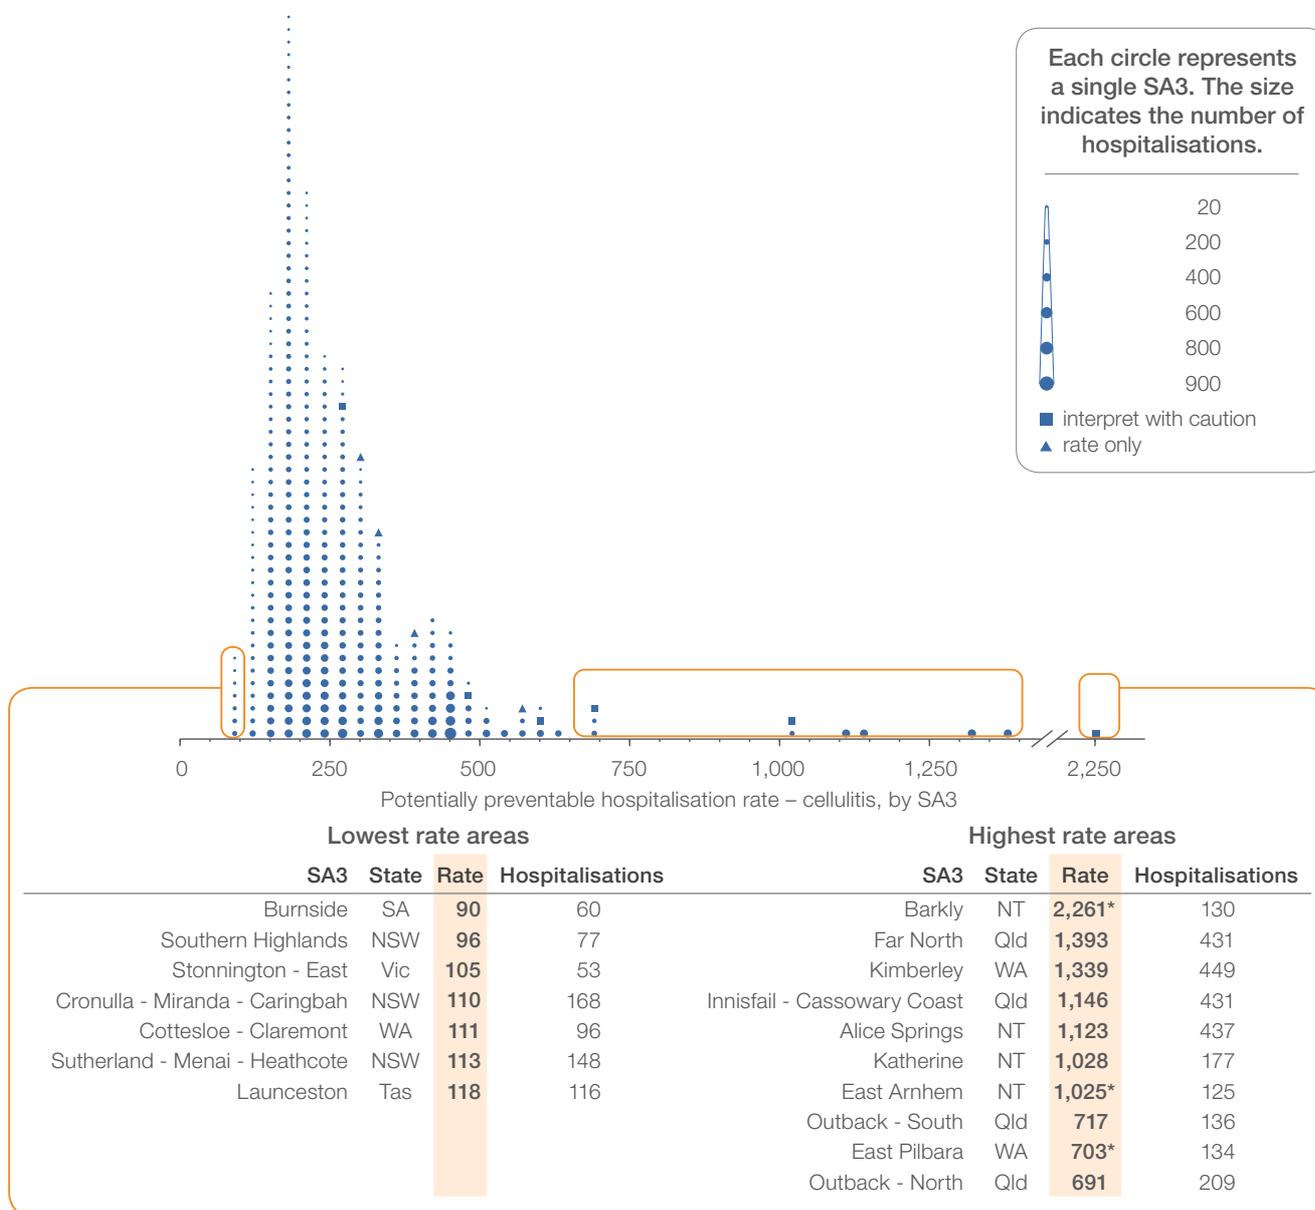

Over the 10-year evaluation period, repairs were made to 2,230 houses in 71 communities around New South Wales. Repairs included fixing hot water systems, showers, washing machines, toilets and insect screens. Repairs to improve safety, temperature control, and the ability to store and prepare food were also carried out. The proportion of houses with adequate facilities for residents to wash themselves, their clothes and their bedding doubled after the intervention.

The rate of hospitalisations for skin infections was 19% lower in the intervention group than in the non-intervention group. Hospitalisations were also reduced by 42% for respiratory conditions and by 43% for intestinal infections. The program had broader benefits in building goodwill through timely repairs (either the same day or the day after houses were surveyed), and employing local Aboriginal and Torres Strait Islander tradespeople to carry out repairs, where possible.²³

Australian initiatives

The information in this chapter will complement work already underway to reduce the rate of hospitalisations for cellulitis in Australia. At a national level, this work includes:

- National Partnership Agreement on Remote Indigenous Housing, Council of Australian Governments
- HotNorth collaborative skin health projects, hotnorth.org.au/projects

Many states and territory initiatives are also in place, including:

- Housing for Health in the Aboriginal community, New South Wales
- Integrated Care initiatives, New South Wales
- *Cellulitis* patient fact sheet, Victoria³⁰
- Delivering Connected Care for Complex Patients with Multiple Chronic Needs, Tasmania
- Aboriginal Environmental Health Program, Western Australia.

Chapter 3

Ear, nose and throat surgery for children and young people

At a glance

Tonsillectomy

Tonsillectomy is used to treat recurrent throat infections (tonsillitis) and obstructive sleep apnoea (OSA), but there are uncertainties about its benefits. It is one of the most common surgical procedures performed in children in Australia.

The Atlas found that, in 2017–18, the rate of hospitalisation for tonsillectomy in children and young people was six times higher in the local area with the highest rate than in the area with the lowest.* It also found that the rate of tonsillectomy hospitalisations increased by 3% between 2012–13 and 2017–18.

More information is needed to ensure evidence-based care for children with recurrent tonsillitis or OSA. Further developing the Australian Society of Otolaryngology Head and Neck Surgery ENT data registry could add to the knowledge base about outcomes for specific patient groups and support more effective peer review of tonsillectomy.

Myringotomy

Myringotomy is another common surgical procedure in young children. It is used to treat otitis media, a middle ear infection that can cause hearing loss.

Myringotomy (with insertion of grommets) is recommended for children who have otitis media with effusion (fluid) and documented hearing loss in both ears for more than three months.

Otitis media is the key cause of hearing loss in Aboriginal and Torres Strait Islander children, who are at risk of earlier, more severe and longer-lasting middle ear disease than other children. This chapter examined rates in Aboriginal and Torres Strait Islander children for the first time in the Atlas series.

The Atlas found that, in 2017–18, the rate of hospitalisation for myringotomy in children and young people was about eight times higher in the local area with the highest rate than in the area with the lowest.* Although the rate for Aboriginal and Torres Strait Islander children was 6% higher than the rate for other children, it was lower than would be expected if surgery rates matched the prevalence of otitis media in this group.

A comprehensive approach combining prevention, early treatment and coordinated management is urgently required to reduce rates of otitis media in Aboriginal and Torres Strait Islander children.

* After standardising to remove age and sex differences between populations.
The Fourth Australian Atlas of Healthcare Variation

Recommendations

The Commission consulted widely, but is solely responsible for making the recommendations; as such, the recommendations may not reflect the views of all contributors to the Atlas.

Tonsillectomy

3a. The Australian and New Zealand Society of Paediatric Otorhinolaryngology to work with relevant clinical colleges to develop clinical guidelines on tonsillectomy in children, and subsequent to this the Commission to develop a clinical care standard with safety and quality indicators.

3b. Health service organisations to:

- i. Conduct audits of indications for tonsillectomy and tonsillectomy rates to monitor variation and provide the results back to clinicians to act upon in line with Action 1.28 of the National Safety and Quality Health Service (NSQHS) Standards

 - ii. Incorporate individual clinicians' audit data as part of re-credentialing processes.
-

Myringotomy

3c. State and territory health departments and health service organisations to set benchmarks for access to paediatric audiology services.

3d. The Australian Government Department of Health to develop and implement two national ear and hearing health performance indicators for Aboriginal and Torres Strait Islander children consistent with the recommendations of the National Aboriginal and Torres Strait Islander Hearing Health Advisory Panel:

- i. Measure the proportion of Aboriginal and Torres Strait Islander children who received an annual ear and hearing health check and the proportion of these who were found to have ear and/or hearing health conditions

 - ii. Measure the proportion of Aboriginal and Torres Strait Islander children who received audiology services and the proportion of these diagnosed with hearing loss.
-

3e. The Australian Government Department of Health, as part of the Roadmap for Hearing Health, to publish data on progress against the integrated national approach to undertaking ear health checks of children aged 0–6, with the goal of every Aboriginal and Torres Strait Islander child having regular ear health checks.

3f. Health service organisations to:

- i. Conduct audits of myringotomy and myringotomy rates to monitor variation and provide the results back to clinicians to act upon in line with Action 1.28 of the NSQHS Standards

 - ii. Incorporate individual clinician's audit data as part of recredentialing processes.
-

3.1 Tonsillectomy hospitalisations, 17 years and under

Why is this important?

Tonsillectomy is one of the most common procedures performed in children in Australia.¹ The rate of tonsillectomy in people of all ages is higher in Australia than in New Zealand or the United Kingdom.² Tonsillectomy is used to treat recurrent throat infections that affect the tonsils (tonsillitis) and obstructive sleep apnoea (OSA), but there are uncertainties about its benefits. There is moderate-quality evidence to support tonsillectomy over watchful waiting in children with recurrent tonsillitis.³ There is also evidence that tonsillectomy benefits some children with OSA, but some children get better without surgery.⁴ Uncertainties about benefits of tonsillectomy can make it difficult for parents to make decisions about treatment.

What did we find?

In 2017–18, the rate of hospitalisation for tonsillectomy in people aged 17 years and under was **6.0 times as high** in the area with the highest rate compared with the area with the lowest rate. Between 2012–13 and 2017–18, the rate of tonsillectomy hospitalisations increased by 3%.

What can be done?

There is an urgent need for information about the short- and long-term outcomes of tonsillectomy. Further developing the ear, nose and throat (ENT) data registry of the Australian Society of Otolaryngology Head and Neck Surgery could capture information on eligible patients, provide information for effective peer review of tonsillectomy and add to the knowledge base about outcomes for specific patient groups. All parents who decide their children should have tonsillectomy should be informed about the registry. If the child meets the registration criteria, parents should be asked if they are willing for the child to be included. Surgeons should contribute data on all consenting patients, and regularly audit and review patient outcome data with their peers.

Other actions to address variation include updating the 2008 Australian clinical practice guidelines, providing information to parents about the risks and benefits of surgery, and encouraging shared decision making.

Tonsillectomy hospitalisations, 17 years and under

Context

The first *Australian Atlas of Healthcare Variation* identified substantial variation in age-standardised hospitalisations for tonsillectomy in children and young people. This variation – 6.5 times as high in the local area (Statistical Area Level 3 – SA3) with the highest rate as in the area with the lowest rate – warrants further investigation.⁵

Tonsillectomy is a surgical procedure to remove the tonsils, which are soft tissue masses on each side at the back of the throat. Tonsils are prone to infection and inflammation that can lead to enlargement. In some children, significant enlargement of the tonsils may cause a range of breathing problems during sleep, including OSA.⁶

Tonsillectomy can be performed with or without surgical removal of the adenoids (adenoidectomy).⁶ Adenoids are glands that sit in the back of the throat behind the nose. Like tonsils, adenoids help defend the body against harmful bacteria and viruses that enter the body through the mouth and nose. An adenotonsillectomy is when the tonsils and the adenoids are removed.

Tonsillectomy is one of the most common procedures performed in children in Australia.¹ The rate of tonsillectomies is higher in Australia than in many reporting Organisation for Economic Co-operation and Development (OECD) countries. In an analysis of OECD data on tonsillectomies per 100,000 people of all ages between 1993 and 2014, the rate in Australia was 1.7 times and 1.9 times as high as the rates in New Zealand and the United Kingdom, respectively.²

Tonsillectomy has traditionally been used to treat recurrent throat infections that affect the tonsils (tonsillitis). In the United States in the past 30 years, there has been a decline in the use of tonsillectomy to treat recurrent tonsillitis and a gradual increase in the use of tonsillectomy to treat OSA.⁶

In Australia, a multi-centre Victorian study of almost 60,000 patients showed that tonsillectomy for OSA had driven an increase in the number of tonsillectomies

between 2010 and 2015.⁷ An accompanying small decline in the rate of tonsillectomies for recurrent tonsillitis led to OSA overtaking throat infections as the main reason for tonsillectomy in Victoria in 2014–15.⁷ The reason for the increase in tonsillectomies for OSA is unclear but could involve greater awareness of the possible links between OSA and learning and behavioural problems.⁷

Recurrent tonsillitis

Compared with no surgery, in children who have frequent tonsillitis, tonsillectomy reduces the number of throat infections, visits to the doctor and school absences in the first year after the procedure, but the benefits do not last.⁸

A Cochrane systematic review of adenotonsillectomy for recurrent tonsillitis in children found that children who had surgery had fewer episodes of sore throat in the first year than those who had non-surgical treatment. However, the effect was small, and many children improved spontaneously without surgery. The authors concluded that the potential benefit of surgery must be weighed against the risks of the procedure, particularly bleeding.³

There are no current Australian or United Kingdom evidence-based guidelines for the role of tonsillectomy in managing recurrent throat infections in children.

A 2018 United States guideline advises that clinicians may recommend tonsillectomy as an option for children who have frequent tonsillitis (seven or more episodes per year, five or more per year for two years, or three or more per year for three years).⁶ The guideline states that patient preference should have a substantial role in the decision.

Obstructive sleep apnoea

Children with OSA have repeated episodes of partial or complete blockage of the upper airways, which can cause problems during sleep, including snoring, gasping or choking, and pauses in breathing.⁶ Untreated OSA in some children may lead to impaired growth, cognitive and behavioural problems, and cardiovascular effects.⁹

OSA is thought to be usually caused by large tonsils and adenoids (adenotonsillar hypertrophy).⁶ It is common in children, with peak incidence between 2 and 8 years of age, most likely due to the large size of tonsils and adenoids compared with the size of the airway.⁹

OSA is more common in obese children, and in children who have Down syndrome, abnormalities of the brain and facial bones, or neuromuscular disorders.¹⁰

General practitioners (GPs) use snoring and sleep-related symptoms to identify children with possible moderate to severe OSA who should be referred for consideration of adenotonsillectomy. Overnight sleep studies that measure obstructive respiratory events per hour are the gold standard for diagnosing OSA.^{6,11} In Australia, sleep studies can only be ordered and assessed by a sleep specialist.¹² OSA can be categorised by this type of sleep study as mild, moderate or severe.

Adenotonsillectomy is generally considered the first-line intervention for children with moderate or severe OSA and enlarged tonsils.⁹ Watchful waiting for six months may be an acceptable option for some otherwise-healthy children with mild or moderate OSA and tolerable symptoms.⁹

A Cochrane systematic review found mixed evidence about the impact of adenotonsillectomy in otherwise-healthy children aged 5–9 years with mild to moderate OSA (diagnosed by sleep study) up to 12 months after the surgery.⁴ It found:

- High-quality evidence that the procedure has no benefit in terms of objective measures of attention and cognitive function compared with watchful waiting
- High-quality evidence that it improves sleep study scores compared with watchful waiting
- Moderate-quality evidence that it is beneficial in terms of symptoms, behaviour and quality of life (as rated by caregivers).

The review noted that, in one key randomised trial (the CHAT study)¹³, sleep study findings returned to normal in 46% of the non-surgical group within seven months, compared with 79% of the surgical group.

Two recent randomised controlled trials examined a gap in evidence – the impact of adenotonsillectomy on young children with OSA. A Swedish study compared surgery with watchful waiting in 60 children aged 2–4 years with mild to moderate OSA. It found no statistically significant difference between the groups in changes in sleep study scores (the primary outcome of the study). However, surgery was more effective than watchful waiting in improving sleep study scores in a small group of children with moderate OSA ($n = 24$). The study also found a statistically significant difference in quality-of-life scores after adenotonsillectomy at six months compared with watchful waiting. The researchers concluded that otherwise-healthy children aged 2–4 years with mild OSA and mild effect on quality of life would benefit from watchful waiting, whereas children with moderate OSA should be considered for surgery.¹⁴

The other study, in Australia, compared outcomes in preschool children with mild to moderate OSA who had early adenotonsillectomy with children on the waiting list who had no surgery. At 12 months, no differences were seen in cognitive function between the two groups. However, children who had adenotonsillectomy had reduced obstructive respiratory events (measured by sleep study) and improved behaviour (rated by parents) compared with children who did not have surgery.¹⁵

Uncertainties about the benefits of tonsillectomy for children with OSA and limited access to formal diagnostic testing can make it difficult for clinicians and parents to make appropriate decisions about treatment. These uncertainties include a lack of evidence about the long-term impact of tonsillectomy¹⁶, and how parents and clinicians can distinguish between simple snoring and OSA in the absence of sleep studies.⁴ The Cochrane review summarised above found that there was inconclusive evidence that children who had been diagnosed with OSA based on clinical grounds alone benefit from tonsillectomy.⁴

Tonsillectomy hospitalisations, 17 years and under

Given the uncertainties around the procedure to treat OSA, the Cochrane review authors suggested that doctors and parents should carefully consider the benefits and risks of surgery versus watchful waiting, because children could get better without treatment.⁴

OSA and children with obesity

OSA is more common in children who are obese: prevalence is 19–61% in children with obesity, compared with 1–6% in children with a healthy weight.¹⁷ Children with obesity are more likely to have severe OSA.⁶

With the prevalence of childhood OSA expected to increase in line with rising obesity levels in many developed countries⁴, the management of obesity-related OSA is a key issue.

A systematic review found that children with OSA who are obese benefited from tonsillectomy. However, the outcome was less satisfactory than in normal-weight children, and there was a higher risk of persistent OSA after surgery (33–76% in children who are obese, compared with 15–37% in normal-weight children).¹⁷ Children with obesity also have a higher risk of respiratory complications immediately after surgery.¹⁸

There is evidence that weight loss can significantly improve OSA symptoms in children and adolescents with obesity, although few studies have been conducted.¹⁷ More research is needed into the effectiveness of weight loss as a treatment for OSA in children.^{4,17} Weight loss is also recommended for children who are obese who still have OSA symptoms after adenotonsillectomy.⁹

Potential harms of tonsillectomy

Tonsillectomy has the highest rate of postoperative complications of all childhood surgical procedures.¹⁹ Complications include respiratory compromise, pain, bleeding, dehydration, nausea and vomiting, speech disorders and, rarely, death.^{6,20} Postoperative bleeding is the most common complication of tonsillectomy and can be life-threatening. Rates of readmission due to bleeding vary in studies from 2% to 5%.¹

Rates of unplanned readmission after tonsillectomy are high in Australia²¹ and internationally.¹⁹ In Australia, in 2015–16, the rate of unplanned readmission after adenotonsillectomy (34.7 per 1,000 separations) was the highest for selected procedures in public hospitals.²²

Why revisit variation in tonsillectomy?

The first Atlas examined age-standardised hospitalisations for tonsillectomy for children aged 17 years and under.

It found that, in 2012–13, the number of tonsillectomy hospitalisations was 6.5 times higher in the area with the highest rate compared with the area with the lowest rate. Rates were highest in inner regional areas and lowest in remote areas. There were no patterns in hospitalisation rates for tonsillectomy according to socioeconomic status.

However, since the first Atlas, there has been evidence of differences in rates of tonsillectomy according to socioeconomic advantage. In 2017–18, people living in the most socioeconomically disadvantaged areas had the lowest rate of separations for tonsillectomy (2.1 per 1,000 population), compared with rates of 2.5–2.7 per 1,000 population for areas with higher socioeconomic status.²³

Given the wide variation seen in the first Atlas, and evidence of differences in access to tonsillectomy according to socioeconomic status, it is important to revisit the item to provide a comparison over time, particularly to see whether local variations continue.

It is also important to revisit variation in tonsillectomy because Australia continues to have a higher rate than New Zealand or the United Kingdom², and because of uncertainties about the benefits of tonsillectomy and the lack of current Australian guidelines.

About the data

Data are sourced from the National Hospital Morbidity Database, and include admitted patients in both public and private hospitals.

Rates are based on the number of hospitalisations for tonsillectomy per 100,000 people aged 17 years and under in 2012–13, 2015–16 and 2017–18.

Because a record is included for each hospitalisation for the procedure, rather than for each patient, patients hospitalised for the procedure more than once in the financial year will be counted more than once.

The analysis and maps are based on the usual residential address of the patient and not the location of the hospital.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

Data quality issues – for example, the extent of identification of Aboriginal and Torres Strait Islander status in datasets – could influence the variation seen.

Some private hospitals in Tasmania admit public patients under a contractual arrangement. There is a small over-count of hospitalisations for the procedure in Tasmania because hospitalisations were recorded by both contracting hospital and contracted hospital.

What do the data show?

Magnitude of variation

In 2017–18, there were 42,509 hospitalisations for tonsillectomy, representing 750 hospitalisations per 100,000 people aged 17 years and under (the Australian rate). The median age for patients was 5 years, and this was similar across Australia.

The number of hospitalisations for tonsillectomy across 320* local areas (Statistical Area Level 3 – SA3) ranged from 305 to 1,836 per 100,000 people. The rate was **6.0 times as high** in the area with the highest rate compared with the area with the lowest rate. The number of hospitalisations varied across states and territories, from 387 per 100,000 people in the Northern Territory to 850 per 100,000 people in the Australian Capital Territory (Figures 3.3–3.6).

After the highest and lowest 10% of results were excluded and 256 SA3s remained, the number of hospitalisations per 100,000 people was 2.2 times as high in the area with the highest rate compared with the area with the lowest rate.

Analysis by remoteness and socioeconomic status

Rates for tonsillectomy hospitalisations were higher in inner regional areas than outer regional areas, major cities and remote areas (Figure 3.7). There was no clear pattern according to socioeconomic status in major cities and inner regional areas. In outer regional areas, rates were higher in areas of socioeconomic disadvantage. In remote areas, rates were lower in areas of socioeconomic disadvantage.

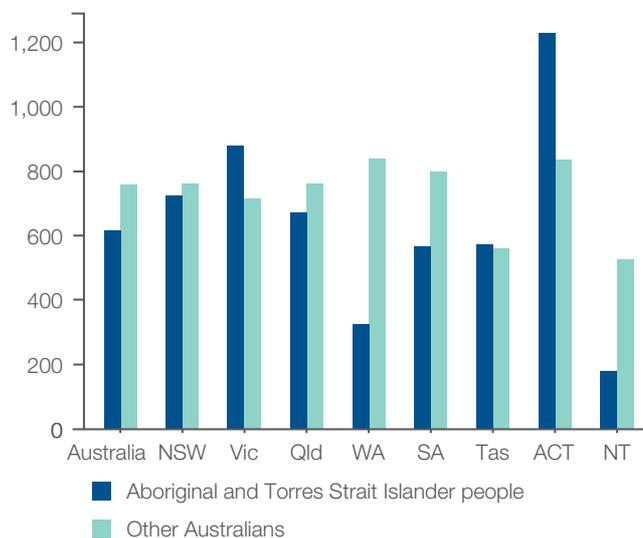

* There are 340 SA3s. For this item, data were suppressed for 20 SA3s due to a small number of hospitalisations and/or population in an area.

Tonsillectomy hospitalisations, 17 years and under

Analysis by Aboriginal and Torres Strait Islander status

In 2017–18, the rate for Aboriginal and Torres Strait Islander children (620 per 100,000 people) was 18% lower than the rate for other Australians (759 per 100,000 people) (Figure 3.1).

Figure 3.1: Number of hospitalisations for tonsillectomy per 100,000 people aged 17 years and under, age and sex standardised, by state and territory of patient residence, by Aboriginal and Torres Strait Islander status, 2017–18

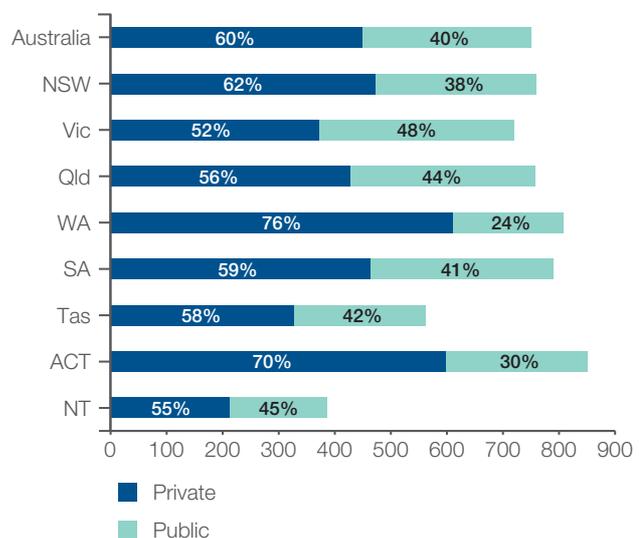

The data for Figures 3.1 and 3.2, and the data and graphs for analysis by Primary Health Networks are available at safetyandquality.gov.au/atlas

Analysis by patient funding status

Overall, 60% of hospitalisations for tonsillectomy were for privately funded patients. This proportion varied from 52% in Victoria to 76% in Western Australia (Figure 3.2).

Figure 3.2: Number of hospitalisations for tonsillectomy per 100,000 people aged 17 years and under, age and sex standardised, by state and territory of patient residence, by patient funding status, 2017–18

Notes:

Data by Aboriginal and Torres Strait Islander status should be interpreted with caution as hospitalisations for Aboriginal and Torres Strait Islander people are under-enumerated, with variation among states and territories.

Hospitalisations for public patients do not incur a charge to the patient or a third-party payer (for example, a private health insurance fund), unlike hospitalisations for private patients.

Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018.

For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2017 and 2018.

Trends over time

Between 2012–13 and 2017–18, the rate of tonsillectomy hospitalisations per 100,000 people nationally increased by 3% (Figure 3.8).

For Aboriginal and Torres Strait Islander children, the rate of tonsillectomy hospitalisations per 100,000 people nationally increased by 58% during this period (Figure 3.9).

Interpretation

Variation in rates of tonsillectomy is likely to be due to geographical differences in the factors discussed below.

Variations between areas may not directly reflect the practices of the clinicians who are based in these areas. The analysis is based on where people live rather than where they obtain their health care. Patients may travel outside their local area to receive care.

Rates of underlying disease

Variation is warranted and desirable when it reflects variation in the underlying need for care. However, use of tonsillectomy may not match patterns of patient need.

There are indications that rates of sore throat and rates of obstructive sleep symptoms may be higher in areas of severe socioeconomic disadvantage.⁷ Indigenous children from the Torres Strait and Northern Peninsula Area had a relatively high prevalence of symptoms suggestive of obstructive sleep problems in a 2004 study²⁴, although research in this area is lacking.²⁵

Clinical decision-making

High or low rates of tonsillectomy in some areas may be related to clinical practice that is not supported by evidence.

A recent Australian study found that around one-quarter of patients with serious recurrent episodes of tonsillitis were not referred for a tonsillectomy.²⁶ A similar pattern has been observed in the United Kingdom, where a study found that selection for tonsillectomy did not regularly follow evidence-based criteria.²⁷

There is no current Australian evidence-based guideline for the use of tonsillectomy in managing recurrent throat infections and OSA in children. The most recent national document is a 2008 position paper on indications for tonsillectomy and adenotonsillectomy.²⁸

Differences in diagnosing OSA may contribute to variation. The gold standard for diagnosing OSA before tonsillectomy is an overnight inpatient sleep study.^{1,6,10} The test is expensive, and there is growing demand for use of the limited facilities that provide sleep studies for children in Australia^{1,10,29}, demonstrating the need for appropriate patient selection.

The referral process for sleep studies may also contribute to variation. Under the Medicare Benefits Schedule, a paediatric sleep specialist is required to review a child with OSA symptoms before and after the sleep study. These requirements may reduce appropriate access to sleep studies and increase waiting times for review of ENT symptoms – for example, in rural and remote areas.³⁰

Tonsillectomy hospitalisations, 17 years and under

Access to tonsillectomy services

Ability to pay out-of-pocket costs for tonsillectomy is likely to be lower in areas of socioeconomic disadvantage.

Research has identified increasing rates of adenotonsillectomy in children who live in areas of socioeconomic advantage, suggesting increasing demand for tonsillectomy in more advantaged areas and lack of access to surgery in disadvantaged groups.⁷

This pattern was not reflected across all Atlas data, apart from remote areas, where the rate was lower in areas of socioeconomic disadvantage.

Distance to travel to see ENT surgeons may affect clinical decision-making. Remote and rural patients often have to travel a long way to see a specialist. This may influence a surgeon to recommend surgery earlier, because of difficulties for the patient in returning for follow-up visits.

For metropolitan patients, healthcare access may depend on cost as well as health literacy (which may be influenced by cultural and language barriers).

Parents of Aboriginal and Torres Strait Islander children may not seek care for OSA because of lack of awareness of potential implications for the child's health. Support from family and friends is an important factor in influencing the uptake of therapy.³¹ Improved access to ENT surgeons through government programs may have contributed to the increase in tonsillectomy rates for Aboriginal and Torres Strait Islander children between 2012–13 and 2017–18.

Rates of private health insurance and waiting times

Access to a hospital bed is likely to be one of the largest influences on variation in care.

Having private health insurance allows affordable access to the procedure in private hospitals. Atlas data found that, overall, 60% of hospitalisations for tonsillectomy were for privately funded patients.

This aligns with other admitted patient data that showed that, in 2017–18, 50% more tonsillectomies were performed in private hospitals than in public hospitals (1.5 operations per 1,000 population in private hospitals, compared with 1.0 per 1,000 population in public hospitals).²³

In 2017–18, the median waiting time for elective tonsillectomy in a public hospital was 121 days, ranging from 23 days in the Northern Territory to 293 days in New South Wales and 326 days in the Australian Capital Territory.³² Having private health insurance significantly reduces waiting time for a tonsillectomy in a public hospital. In 2015–16, public patients waited almost three times longer than privately insured patients to have a tonsillectomy in a public hospital (median waiting times 138 days and 49 days, respectively).³³ However, shorter waiting times for private patients may reflect severe OSA or other medical problems.

Long waits for surgery in public hospitals may mean that some parents choose to pay for their child's operation in the private system rather than having the child continue to have OSA or tonsillitis.

Lower rates of tonsillectomy among Aboriginal and Torres Strait Islander children may reflect lower rates of private health insurance cover in this population.

Parents' preference

Consumers' understanding of the options, and risks and benefits of tonsillectomy may affect variation. Parents may not understand that symptoms might resolve without treatment. They may also have unrealistic beliefs that tonsillectomy will always cure OSA.⁶ (Tonsillectomy does not resolve around 17–40% of uncomplicated cases of OSA.²¹)

The first Atlas recommended that the Australian Commission on Safety and Quality in Health Care review patient information about tonsillectomy in Australia.⁵ The review found that most (37 out of 50) resources examined did not include a description of what would occur if recurrent tonsillitis and OSA were not treated.³⁴

Similarly, an Australian study found that most online consumer health information about adenotonsillectomy for children with OSA was highly favourable about the potential benefits of surgery and downplayed potential complications or non-surgical options.³⁵ Since this study, Safer Care Victoria has published a fact sheet to help GPs and families discuss the risks and benefits of tonsillectomy.³⁶

Addressing variation

More information is needed to ensure that evidence-based care is provided to children with recurrent tonsillitis or OSA. There is an urgent need for information about the short- and long-term outcomes of tonsillectomy for different indications.

Further developing the ENT data registry of the Australian Society of Otolaryngology Head and Neck Surgery could capture information on eligible patients, provide comparative feedback to ENT surgeons on their rates of tonsillectomy and add to the knowledge base about outcomes for specific groups of patients. All parents who decide that their children should have tonsillectomy should be informed about the ENT data registry and, if their child meets the registration criteria, should be asked if they are willing for them to be included. Surgeons undertaking this procedure should contribute data on eligible patients to the ENT data registry and participate in routine peer review.

Other options to address variation include the following:

Improve evidence base, and access to diagnosis and appropriate treatment

- Improve the evidence behind the indications for surgery and non-surgical options to inform clinical practice
- Update Australian clinical practice guidelines, although in the United Kingdom variation in rates of tonsillectomy increased despite publication of guidelines³⁶
- Disseminate the guidelines and promote uptake, including through parent-focused education and an awareness strategy using fact sheets, social media and other channels

- Ensure that the updated guidelines include specific and targeted recommendations to increase access to tonsillectomy among Aboriginal and Torres Strait Islander children who need the procedure
- Prioritise public health, clinical research and intervention programs that aim to address disparity and improve Aboriginal and Torres Strait Islander children's access to surgery and other treatments
- Ensure that culturally capable and publicly funded ENT services are embedded in the Aboriginal and Torres Strait Islander community care sector, and that there are processes to ensure appropriate selection and triage for remote Aboriginal and Torres Strait Islander children to have ENT surgery in public hospitals.

Improve data about access

- Improve data about access to tonsillectomy, such as ENT surgeon distribution, rates of private health insurance by SA3 and waiting lists.

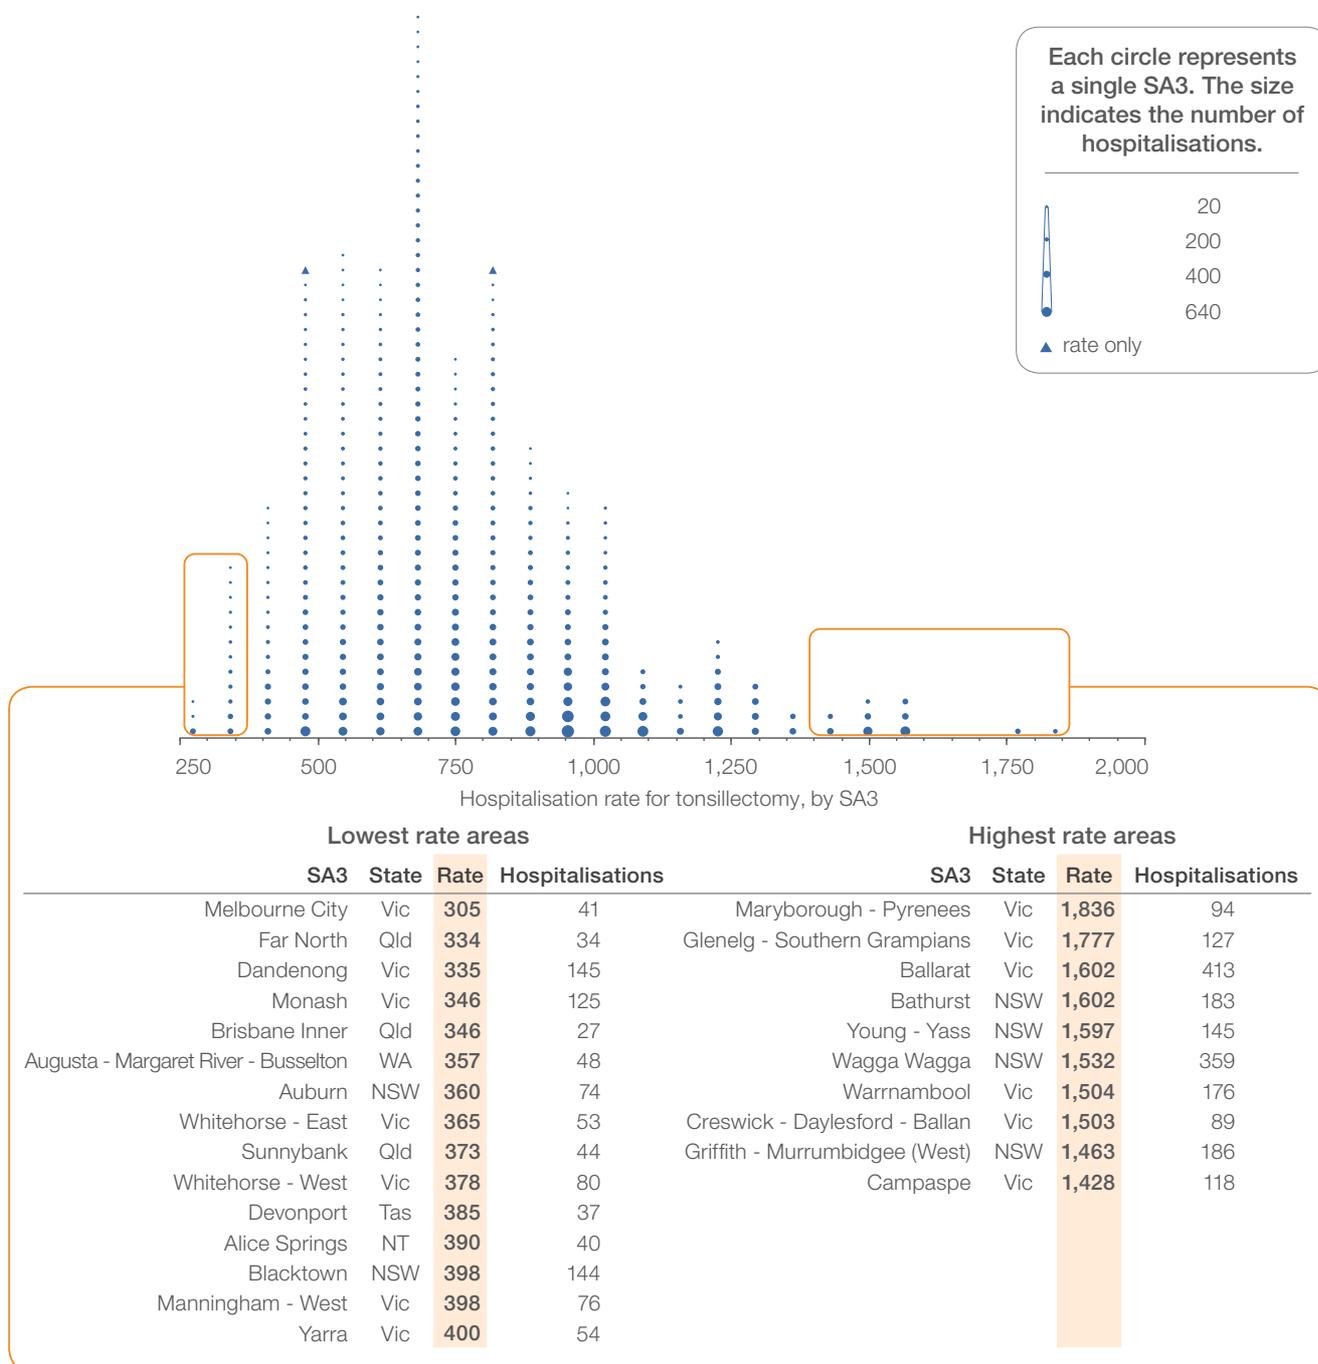

Improve shared decision making

- Encourage shared decision making so that rates of the procedure are based on patients' needs and assessment of benefits and risks³⁷
- Support shared decision making by giving patients accurate information, and informing GPs to avoid over- or underestimating the risks and benefits of tonsillectomy, which could drive variation in referral to an ENT surgeon; Safer Care Victoria's decision-making tools for GPs and parents for tonsillectomy (see 'Australian initiatives' on page 190) provide this opportunity for shared decision making and could be disseminated nationally
- Raise awareness of the health risks of untreated OSA and the benefits of treatment as an important first step for Aboriginal and Torres Strait Islander people to seek treatment.³¹

Tonsillectomy hospitalisations, 17 years and under

Rates by local area

Figure 3.3: Number of hospitalisations for tonsillectomy per 100,000 people aged 17 years and under, age and sex standardised, by Statistical Area Level 3 (SA3) of patient residence, 2017–18

Notes:

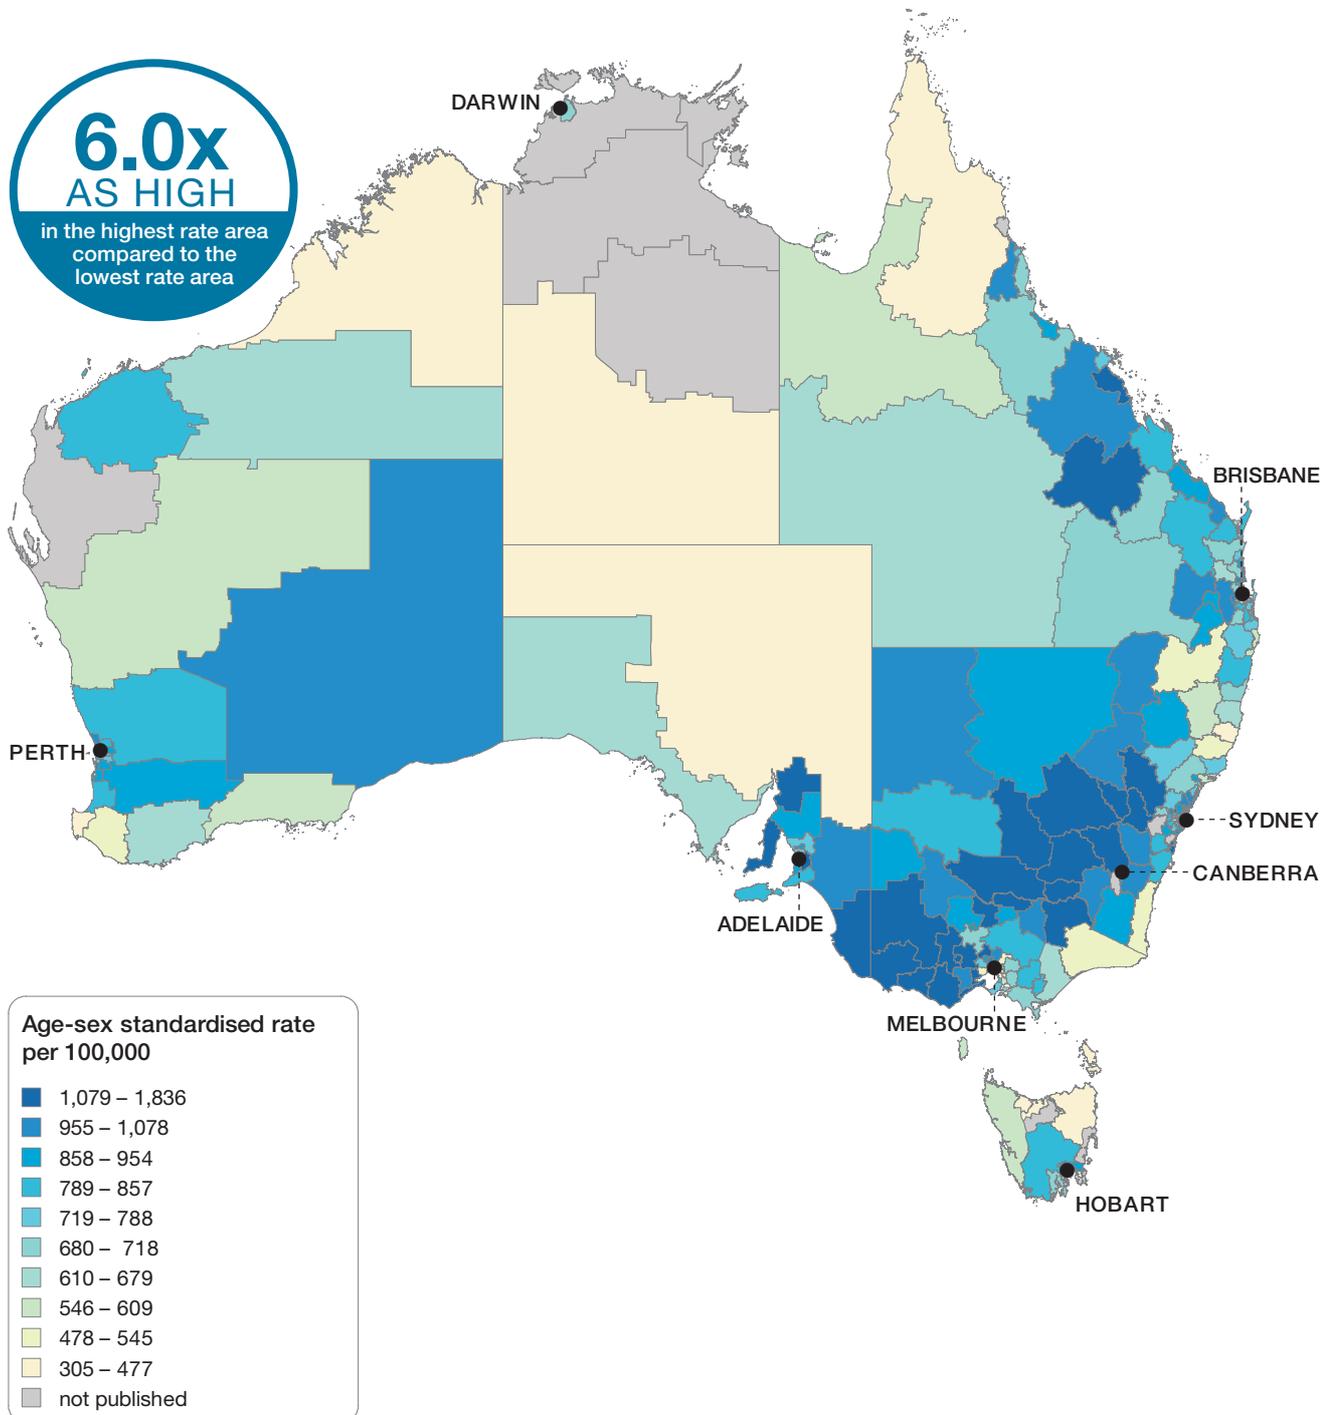

Triangles (▲) indicate SA3s where only rates are published. The numbers of hospitalisations are not published for confidentiality reasons. Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018. For further detail about the methods used, please refer to the Technical Supplement.

Resources for GPs

Resources to support GPs in shared decision making with families were introduced in November 2018, as part of the Statewide Paediatric HealthPathways Project, under the Victorian and Tasmanian Primary Health Network Alliance partnership (vtphna.org.au/our-work/best-practice-prevention-management-and-support/statewide-paediatric-healthpathways-project). The clinical pathways and associated referral pages cover:

- Snoring and obstructive sleep apnoea in children
- Sore throat in children.

Australian initiatives

ENT surgical registry

The Australian Society of Otolaryngology Head and Neck Surgery operates a surgical registry that collects data on ENT surgical procedures. The registry, which has been operating for two years, collects data on tonsillectomy, insertion of grommets and septoplasty.

Shared decision-making resources

Safer Care Victoria has developed a suite of consumer resources to support patient decision-making for tonsillectomy (bettersafercare.vic.gov.au/resources/tools/making-a-decision-about-tonsillectomy), including a fact sheet.³⁵

HealthPathways

HealthPathways is a free online health information portal with evidence-based guidance on the assessment, management and referral of common clinical conditions.³⁹ These resources, which have been developed locally across Australia, have the potential to improve the standardisation of treatment.⁴⁰

Paediatric sleep unit in Darwin

A paediatric sleep service was established as part of the local Darwin adult sleep clinic in 2016. The service, which provides telehealth consultations by paediatric sleep physicians, and diagnostic and treatment services, has improved the management of sleep issues, including OSA, in Aboriginal and Torres Strait Islander children.⁴¹

3.2 Myringotomy hospitalisations, 17 years and under

Why is this important?

Myringotomy is one of the most common surgeries performed in young children. It is used to treat otitis media, an infection of the middle ear that can cause hearing loss.

Myringotomy (with insertion of grommets) is recommended for children who have otitis media with effusion (fluid) and documented hearing loss in both ears for more than three months.^{1,2} The likelihood of benefit of myringotomy increases with the severity of the hearing loss.²

The first Atlas found wide variation in the rates of myringotomy, and a correlation between higher rates of myringotomy and higher socioeconomic status in some areas.

There is continuing concern about variation in myringotomy rates that might not align with the expected prevalence of the conditions being treated. Otitis media is the key cause of hearing loss in Aboriginal and Torres Strait Islander children, who are at risk of earlier, more severe and longer-lasting middle ear disease than other children.³ This is the first Atlas to examine rates in Aboriginal and Torres Strait Islander children.

What did we find?

In 2017–18, the number of hospitalisations for myringotomy across 314 local areas (Statistical Area Level 3 – SA3) ranged from 198 to 1,607 per 100,000 people aged 17 years and under. The rate was **8.1 times as high** in the area with the highest rate compared with the area with the lowest rate.

The rate for Aboriginal and Torres Strait Islander children was 6% higher than the rate for other children. It is less than what would be expected if surgery rates matched the prevalence of otitis media in Aboriginal and Torres Strait Islander children.

What can be done?

A comprehensive approach combining prevention, early treatment and coordinated management is urgently required to reduce rates of otitis media in Aboriginal and Torres Strait Islander children. Prevention strategies in Aboriginal and Torres Strait Islander communities must take a wide-ranging, whole-of-community approach driven by primary health care.⁴ Strategies to ensure that children who need myringotomy surgery receive it include improving the collection and monitoring of data on ear health and hearing, obtaining better data on access to myringotomy and surgery outcomes, improving training of general practitioners (GPs) and other health professionals in diagnostic techniques, and updating Australian clinical guidelines.

Myringotomy hospitalisations, 17 years and under

Context

The first *Australian Atlas of Healthcare Variation* identified substantial variation in hospitalisations for myringotomy in children and young people in 2012–13. This variation – up to 6.8 times as high in the area with the highest rate compared with the area with the lowest – warrants further investigation.⁵

Myringotomy is a procedure to make a small cut in the eardrum (tympanic membrane) to drain fluid from the middle ear. It usually involves inserting grommets (tympanostomy tubes) to keep the cut open, and to allow ventilation and drainage of the middle ear.⁶

It is most commonly used to treat otitis media, an infection of the middle ear that is common in young children. Otitis media is a spectrum of diseases, ranging from otitis media with effusion (OME; where fluid builds up behind the eardrum) to acute otitis media (AOM; painful infection of the middle ear) and chronic suppurative otitis media (CSOM; perforated eardrum with chronic discharge).⁷

Myringotomy with insertion of grommets is one of the most common surgical procedures performed in children in Australia.⁷ It is most often performed in children aged 0–4 years.⁸

This Atlas again maps hospitalisation rates for myringotomy in children and young people (aged 17 years and under), and also examines rates in Aboriginal and Torres Strait Islander children and young people.

In 2016, the Medicare Benefits Schedule Review Taskforce recommended further work to examine the reasons for geographic variation in rates of myringotomy, particularly the low rates in the Northern Territory, where lack of service provision could have serious implications for hearing problems in Aboriginal and Torres Strait Islander communities.⁹

Otitis media in Aboriginal and Torres Strait Islander children

Aboriginal and Torres Strait Islander children experience the highest rate of middle ear disease in the world.⁷ Otitis media is the key cause of hearing loss in Aboriginal and Torres Strait Islander children, who are at risk of earlier, more severe and longer-lasting middle ear disease than other children.³

Recurrent episodes of acute otitis media (AOM) can lead to chronic suppurative otitis media (CSOM; ‘runny ear’), which causes chronic discharge through a perforation in the eardrum. CSOM is the most disabling form of otitis media and is most likely to persist without treatment.¹⁰ The discharge from CSOM can last for years and can cause permanent hearing loss. The prevalence of CSOM in Aboriginal and Torres Strait Islander children declined from 24% in 2001 to 14% in 2012.¹¹ This is still higher than the World Health Organization’s measure of 4% prevalence that indicates a ‘massive public health problem’.¹²

Hearing loss in the critical first 1,000 days of life can have a devastating impact on Aboriginal and Torres Strait Islander children that can continue into adulthood. It can affect speech and language development, leading to problems in education, including language development, inattention, truancy and early school leaving.¹³

There are national guidelines on the management of otitis media in Aboriginal and Torres Strait Islander populations.² The priority for primary care programs for Aboriginal and Torres Strait Islander people is to improve identification of children with otitis media, hearing loss, or speech and language problems, and to offer early and effective guideline-recommended care.

Place of myringotomy in therapy

Myringotomy with grommets is an effective procedure for some children who have had OME for more than three months.¹⁴ It may decrease episodes in some children who have recurrent AOM, although evidence is limited.¹⁵ Guidelines do not recommend the procedure as a first-line treatment for either condition in most cases¹⁶, nor myringotomy without insertion of grommets.²

Otitis media with effusion

OME, also known as glue ear, causes a build-up of fluid (effusion) in the middle ear. It has been described as an insidious disease that may be overlooked because it usually has no symptoms apart from hearing loss.¹⁶ OME is often found in children after an episode of AOM.¹⁷

In most cases, OME resolves without treatment within three months.¹ However, OME persists in at least 25% of children, and can cause ongoing hearing loss, and problems with language, education and behaviour.¹⁶

Clinical practice guidelines note there is strong evidence to support watchful waiting for three months for children who do not have other risk factors (such as speech delays) to see if OME resolves without surgery. The guidelines recommend myringotomy (with insertion of grommets) for children who have OME in both ears for more than three months and documented hearing loss.^{1,2,16,18}

Myringotomy with grommets achieves a modest improvement in hearing for the first 6–9 months compared with watchful waiting.¹⁴ The likelihood of benefit increases with the severity of the hearing loss.² The procedure has also been found to prevent fluid build-up in the middle ear (while the grommets are in place).¹

Acute otitis media

AOM is one of the most common reasons for severe pain in babies and children. It is an infection of the middle ear that comes on suddenly and causes pain, fever, a red and bulging eardrum, and fluid in the middle ear.²

United States clinical practice guidelines advise that clinicians may offer myringotomy with insertion of grommets as an option for a child who has had three episodes of AOM in six months or four in a year.¹⁹ The American Academy of Otolaryngology recommends (on the basis of strong evidence) that grommets should not be inserted for recurrent AOM unless middle ear effusion is also present at the time of assessment.¹⁹

A Cochrane systematic review found that children who received grommets were less likely to have recurrences of AOM than those who had active monitoring and placebo medication (low to very low-quality evidence). The effect was modest, with only one fewer episode of AOM at six months in children who received grommets.¹⁵

The review also found that it was uncertain whether grommets were more effective than antibiotics in preventing recurrent AOM. It pointed out that none of the studies had looked at how grommets affected the severity of AOM recurrences or antibiotic use. This was important because grommets could reduce the severity of AOM recurrences and allow the use of antibiotic eardrops, reducing the risk of side effects and antimicrobial resistance associated with oral antibiotics.¹⁵

The reviewers concluded that the modest potential benefits of grommets need to be balanced against the risks of both the procedure and any surgical intervention in young children, and called for new and high-quality randomised controlled trials.¹⁵

Myringotomy hospitalisations, 17 years and under

What are the potential harms?

The most common postoperative complication of grommet insertion is discharge through the grommets (otorrhoea), which occurs in about one-quarter of children while the grommet is in place.²⁰ Eardrum perforations, which may require repair, occur in about 2% of children who have short-term grommets.²⁰

Preventing otitis media

Otitis media may be prevented to some extent through improved living standards, maternal education, breastfeeding, a smoke-free environment and pneumococcal vaccination.² The pneumococcal conjugate vaccine reduces the risk of AOM and recurrent AOM in children.²

Prevention should have a whole-of-community approach driven by primary health care.²

Why revisit variation in myringotomy?

The first *Australian Atlas of Healthcare Variation* examined hospitalisations for myringotomy for people aged 17 years and under.⁵ It found that, in 2012–13, the number of myringotomy hospitalisations across 308 local areas (SA3s) ranged from 205 to 1,398 per 100,000 people aged 17 years and under.

The first Atlas found a correlation between higher rates of myringotomy and higher socioeconomic status in metropolitan, inner regional and remote areas. This correlation was reversed in outer regional areas, which had lower rates of surgery than other remote categories.

Given the wide variation seen in the first Atlas, it is important to revisit the item to provide a comparison over time, particularly to see whether variations between local areas (relatively high or low rates compared with others) continue. Examining rates over time improves the rigour of data.

There is also continuing concern about variation in myringotomy rates that might not align with the expected prevalence of the conditions being treated.

In 2016, the Medicare Benefits Schedule Review Taskforce highlighted the need for further work to explore the finding in the first Atlas of geographical variation in rates of myringotomy, including higher rates on the North Shore of Sydney, and in Adelaide and Perth.⁹

This Atlas also examines rates in Aboriginal and Torres Strait Islander children and young people, given the high burden of disease and low rates of myringotomy in this group.

About the data

Data are sourced from the National Hospital Morbidity Database, and include admitted patients in both public and private hospitals.

Rates are based on the number of hospitalisations for myringotomy per 100,000 people aged 17 years and under in 2012–13, 2015–16 and 2017–18.

Because a record is included for each hospitalisation for the procedure, rather than for each patient, patients hospitalised for the procedure more than once in the financial year will be counted more than once.

The analysis and maps are based on the usual residential address of the patient and not the location of the hospital.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

Data quality issues – for example, the extent of identification of Aboriginal and Torres Strait Islander status in datasets – could influence variations seen.

Some private hospitals in Tasmania admit public patients under a contractual arrangement. There is a small over-count of hospitalisations for the procedure in Tasmania because hospitalisations are recorded by both contracting hospital and contracted hospital.

What do the data show?

Magnitude of variation

In 2017–18, there were 34,755 hospitalisations for myringotomy, representing 600 hospitalisations per 100,000 people aged 17 years and under (the Australian rate). The median age for patients was 3 years, and this was similar across Australia.

The number of hospitalisations for myringotomy across 314* local areas (Statistical Area Level 3 – SA3) ranged from 198 to 1,607 per 100,000 people aged 17 years and under. The rate was **8.1 times as high** in the area with the highest rate compared with the area with the lowest rate. The number of hospitalisations varied across states and territories, from 458 per 100,000 people in the Northern Territory to 895 in South Australia (Figures 3.12–3.15).

After the highest and lowest 10% of results were excluded and 252 SA3s remained, the number of hospitalisations per 100,000 people was 2.3 times as high in the area with the highest rate compared with the area with the lowest rate.

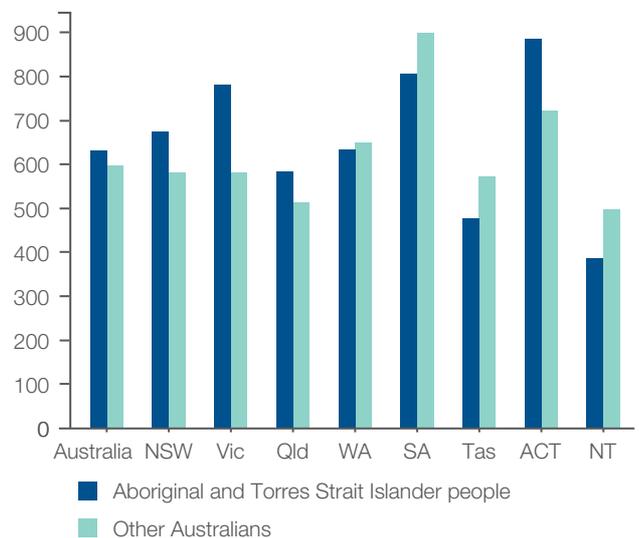

Analysis by remoteness and socioeconomic status

Rates for myringotomy hospitalisations were higher in inner regional areas than elsewhere. There was a pattern of higher rates with higher socioeconomic status in major cities and inner regional areas; the reverse pattern was seen in outer regional areas. No socioeconomic pattern was seen in remote areas (Figure 3.16).

Analysis by Aboriginal and Torres Strait Islander status

In 2017–18, the rate for Aboriginal and Torres Strait Islander people aged 17 years and under (632 per 100,000 people) was 6% higher than the rate for other people of the same age (598 per 100,000 people) (Figure 3.10).

Figure 3.10: Number of hospitalisations for myringotomy per 100,000 people aged 17 years and under, age and sex standardised, by state and territory of patient residence, by Aboriginal and Torres Strait Islander status, 2017–18

The data for Figure 3.10 are available at safetyandquality.gov.au/atlas

* There are 340 SA3s. For this item, data were suppressed for 26 SA3s due to a small number of hospitalisations and/or population in an area.

Notes:

Data by Aboriginal and Torres Strait Islander status should be interpreted with caution as hospitalisations for Aboriginal and Torres Strait Islander people are under-enumerated, with variation among states and territories.

Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018.

For further detail about the methods used, please refer to the Technical Supplement.

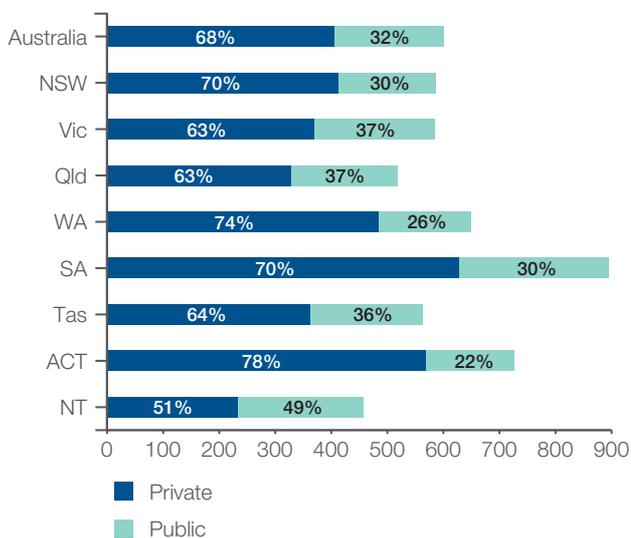

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2017 and 2018.

Myringotomy hospitalisations, 17 years and under

Analysis by patient funding status

In 2017–18, overall, 68% of hospitalisations for myringotomy were for privately funded patients. This proportion varied from 51% in the Northern Territory to 78% in the Australian Capital Territory (Figure 3.11).

Figure 3.11: Number of hospitalisations for myringotomy per 100,000 people aged 17 years and under, age and sex standardised, by state and territory of patient residence, by patient funding status, 2017–18

The data for Figure 3.11, and the data and graphs for analysis by Primary Health Networks are available at safetyandquality.gov.au/atlas

Trends over time

Between 2012–13 and 2017–18, the rate of myringotomy hospitalisations per 100,000 people aged 17 years and under, nationally, decreased by 4%. The rate increased from 625 per 100,000 people aged 17 years and under in 2012–13 to 628 in 2015–16, before falling to 600 in 2017–18 (Figure 3.17).

For Aboriginal and Torres Strait Islander people, the rate of myringotomy hospitalisations per 100,000 people aged 17 years and under, nationally, increased by 30% between 2012–13 and 2017–18. The rate increased from 488 in 2012–13 to 550 in 2015–16, and rose again to 632 in 2017–18 (Figure 3.18).

Interpretation

Variation in rates of myringotomy is likely to be due to geographical differences in the factors discussed below.

Variation between areas may not directly reflect the practices of the clinicians who are based in these areas. The analysis is based on the usual residential address of the patient and not the location of the hospital. Patients may travel outside their local area to receive care.

Rates of underlying disease

Variation is warranted and desirable when it reflects variation in the underlying need for care.

Australia's Health 2018 reported that, between July 2014 and June 2016, the overall rate of myringotomy and tympanoplasty procedures for children aged 0–14 years was similar for Aboriginal and Torres Strait Islander children (5.6 per 1,000) and other children (5.7 per 1,000).²¹ However, ear disease is more common in Aboriginal and Torres Strait Islander children; if not treated, it can have devastating educational and social consequences. The burden

Notes:

Hospitalisations for public patients do not incur a charge to the patient or a third-party payer (for example, a private health insurance fund), unlike hospitalisations for private patients.

Population estimates as at 31 December 2017 are calculated as the average of the 30 June populations in 2017 and 2018.

For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2017 and 2018.

of disease from otitis media in Aboriginal and Torres Strait Islander children is 8.5 times as high as in other children.²¹ Also, there is substantial under-reporting of hearing impairment in the Aboriginal and Torres Strait Islander population.²²

A Western Australian study examining Aboriginal and Torres Strait Islander children's access to surgery for otitis media found that children from disadvantaged backgrounds (Aboriginal and other children) had higher rates of hospitalisation for otitis media but lower rates of grommet insertion than children from advantaged backgrounds. It found that the rates of grommet surgery increased with greater socioeconomic advantage and were higher for children living in major cities than in remote areas, even though the disease burden was greater in socioeconomically disadvantaged families.²³

This is consistent with a New South Wales study that found that the rates of grommet surgery in Aboriginal and Torres Strait Islander children aged under 4 years were around two-thirds of the rates in other children. This 'significant inequality' in grommet surgery between Aboriginal and Torres Strait Islander and other children was due to differences in socioeconomic status and geographical remoteness.²⁴

The findings of this Atlas have shown a 30% increase in the national myringotomy rates in Aboriginal and Torres Strait Islander children between 2012–13 and 2017–18.

Although the 2017–18 Atlas data show that the myringotomy rate for Aboriginal and Torres Strait Islander children is 6% higher than the rate for other children, it does not match the rate that would be expected if surgery rates matched the prevalence of otitis media in Aboriginal and Torres Strait Islander children.

Clinical decision-making

High or low rates of myringotomy in some areas may be related to clinical practice that is not supported by evidence-based guidelines.

The only current national Australian guidelines on the management of otitis media in children are clinical care guidelines on the management of otitis media in Aboriginal and Torres Strait Islander populations², which were developed in 2010 and updated in 2017.

Guidelines developed in the United States¹⁹ and the United Kingdom¹⁶ also guide practice in Australia.

Despite the availability of guidelines, it can be challenging for clinicians to advise parents about treatment because recommendations vary depending on the child's age, the condition, the risk of complications and parents' preferences.⁷

There is also concern that clinicians may interpret and apply guidelines from the United States and the United Kingdom differently, and this may lead to inconsistency in care.²⁵

Parents' preferences

Consumers' understanding of the options, and risks and benefits, of myringotomy may affect variation.

Clinicians may recommend watchful waiting in line with clinical guidelines, but ultimately parents make treatment decisions and may push for surgical intervention, often after months of experiencing the social, financial and emotional impacts of caring for a child with recurrent otitis media.²⁵

A qualitative study of Australian parents who had a child booked to have grommet surgery found that parents had been frustrated with watchful waiting and the requirement for a minimum number of episodes of otitis media a year before referral to an ear, nose and throat (ENT) surgeon. Some parents who were unhappy with their GP's response had pushed for a referral or had shopped around for another GP who would refer for surgery. All parents in the study expected that surgery would improve their child's symptoms and quality of life; some parents believed that surgery would cure their child.²⁵

Myringotomy hospitalisations, 17 years and under

Parents of Aboriginal and Torres Strait Islander children may feel less empowered to push for their child to have a myringotomy because of a lack of culturally safe services.²⁶

Diagnostic skills and training

Early detection of chronic otitis media is vital to prevent hearing loss in children.³ Otitis media is often diagnosed and managed in general practice.²⁷ There are concerns that GPs may over- or under-diagnose OME, partly as a result of challenges in accurate diagnosis.²⁷

Clinical guidelines recommend the use of two diagnostic tools – pneumatic otoscopy and tympanometry – to accurately detect fluid in the middle ear.¹ A small qualitative Australian study reported that some GPs believe that pneumatic otoscopy and tympanometry may not be practical in general practice and that the techniques were not essential to diagnosing otitis media. It also found that there was a lack of training for GPs in these techniques and that GPs might need to be convinced of the benefits of using these techniques to detect otitis media in general practice.²⁷

Access to audiology services

The availability of audiology services may affect the timely detection of otitis media and rates of myringotomy. Audiology services can be used to triage children and select those requiring specialist review.²⁸

Access to myringotomy services

Access to myringotomy surgery may be affected by the availability of ENT specialists, which varies across states and territories. Australian Government Department of Health figures show that, in 2016, there were 460 ENT specialists (also known as otolaryngologists) in Australia, of whom 85% worked in a major city and 0.2% worked in the most remote areas.²⁹ South Australia had the highest ratio of otolaryngologists to population (2.3 per 100,000 people), compared with the Northern Territory, which had the lowest ratio (0.8 per 100,000 people).²⁹ These figures largely reflect surgeons' primary places of practice.

Atlas data show that South Australia had the highest number of myringotomy hospitalisations (895 per 100,000 people aged 17 years and under) of any state or territory, and the Northern Territory had the lowest (458).

Distance to travel to see ENT surgeons may affect clinical decision-making. Remote and rural patients often have to travel a long way to see a specialist. These factors may influence a surgeon to recommend surgery earlier, due to difficulties in their patient returning for follow-up visits. Health literacy, cultural and language barriers may affect access in some areas.

Rates of private health insurance and waiting times

Having private health insurance allows affordable access to the procedure in private hospitals. Atlas data found that, overall, 68% of hospitalisations for myringotomy were for privately funded patients.

This aligns with other admitted patient data showing that, in 2017–18, the rate of myringotomy performed in private hospitals was almost double the rate performed in public hospitals (1.1 operations per 1,000 people in private hospitals, compared with 0.6 in public hospitals).³⁰

Having private health insurance significantly reduces the waiting time for a myringotomy in a public hospital. In 2015–16, public patients waited 3 times longer than privately insured patients to have a myringotomy in a public hospital (median waiting time 63 days versus 21 days).³¹

In areas of socioeconomic disadvantage, the burden on the public system is higher, and public patients may have no other option but to access the private system as self-funded patients rather than wait for surgery in the public system and risk hearing loss, and speech and language delays.

Addressing variation

Aboriginal and Torres Strait Islander children

Interventions to improve prevention, diagnosis and treatment of otitis media in Aboriginal and Torres Strait Islander children are a priority.

A comprehensive approach combining prevention, early treatment and coordinated management is required to address the disparity in rates of otitis media between Aboriginal and Torres Strait Islander children and other children.⁴

Primary prevention includes working with families to encourage breastfeeding, encourage healthy eating, reduce exposure to second-hand smoke, clear nasal passages, seek early medical assessment and encourage vaccination.²

Otitis media prevention must include a wide-ranging, whole-of-community approach driven by primary health care. A central part of community messaging must be awareness of the devastating implications of hearing loss at an early age.²

Once otitis media develops, medical management should be in line with the *Recommendations for Clinical Care Guidelines on the Management of Otitis Media in Aboriginal and Torres Strait Islander Populations*.²

Specific interventions could include the following:

Improved monitoring of ear health

- Improve data collection to monitor the national prevalence of ear disease, geographic distribution, wait times between referrals, and whether timely and appropriate treatments are being delivered
- Undertake annual national reporting of readily available data on hospital treatment and interventions for Aboriginal and Torres Strait Islander children with middle ear disease and hearing loss
- Develop national ear and hearing health performance indicators.

Training and workforce innovations

- Train GPs at registrar level to use pneumatic otoscopy
- Primary care networks to train all staff in appropriate otoscopy use, including encouraging and supporting development of Aboriginal and Torres Strait Islander staff in ear health
- Increase the use of alternative health professionals for ear examination, such as speech pathologists and audiologists, who could perform pneumatic otoscopy and tympanometry screening in at-risk populations. Audiologists can provide an initial assessment before a child is referred to an ENT specialist and may be more available than ENT specialists, particularly outside major urban centres³
- Use innovation in training Aboriginal and Torres Strait Islander health workers on country to be knowledge bearers and health guides to ENT access
- Focus on recruiting ENT surgeons to work in remote areas of Australia where there is reduced access to surgery.

Clinical guidelines

- Update Australian clinical practice guidelines, stratified for at-risk groups, with efforts to disseminate the guidelines and promote uptake, including parent-focused education and awareness through use of fact sheets, social media and other channels
- Ensure that guidelines are practical and appropriate for rural and remote practice, and match availability of equipment.

Myringotomy hospitalisations, 17 years and under

Improved healthcare pathways

- Develop accelerated ENT pathways specifically for Aboriginal and Torres Strait Islander people
- Develop culturally safe care pathways, such as the Australian Government's Eye and Ear Surgical Support Program, which provides wraparound care for the patient and their carer when accessing ear surgery
- Improve coordination of ENT outreach services to better accommodate patient needs.

Support for shared decision making

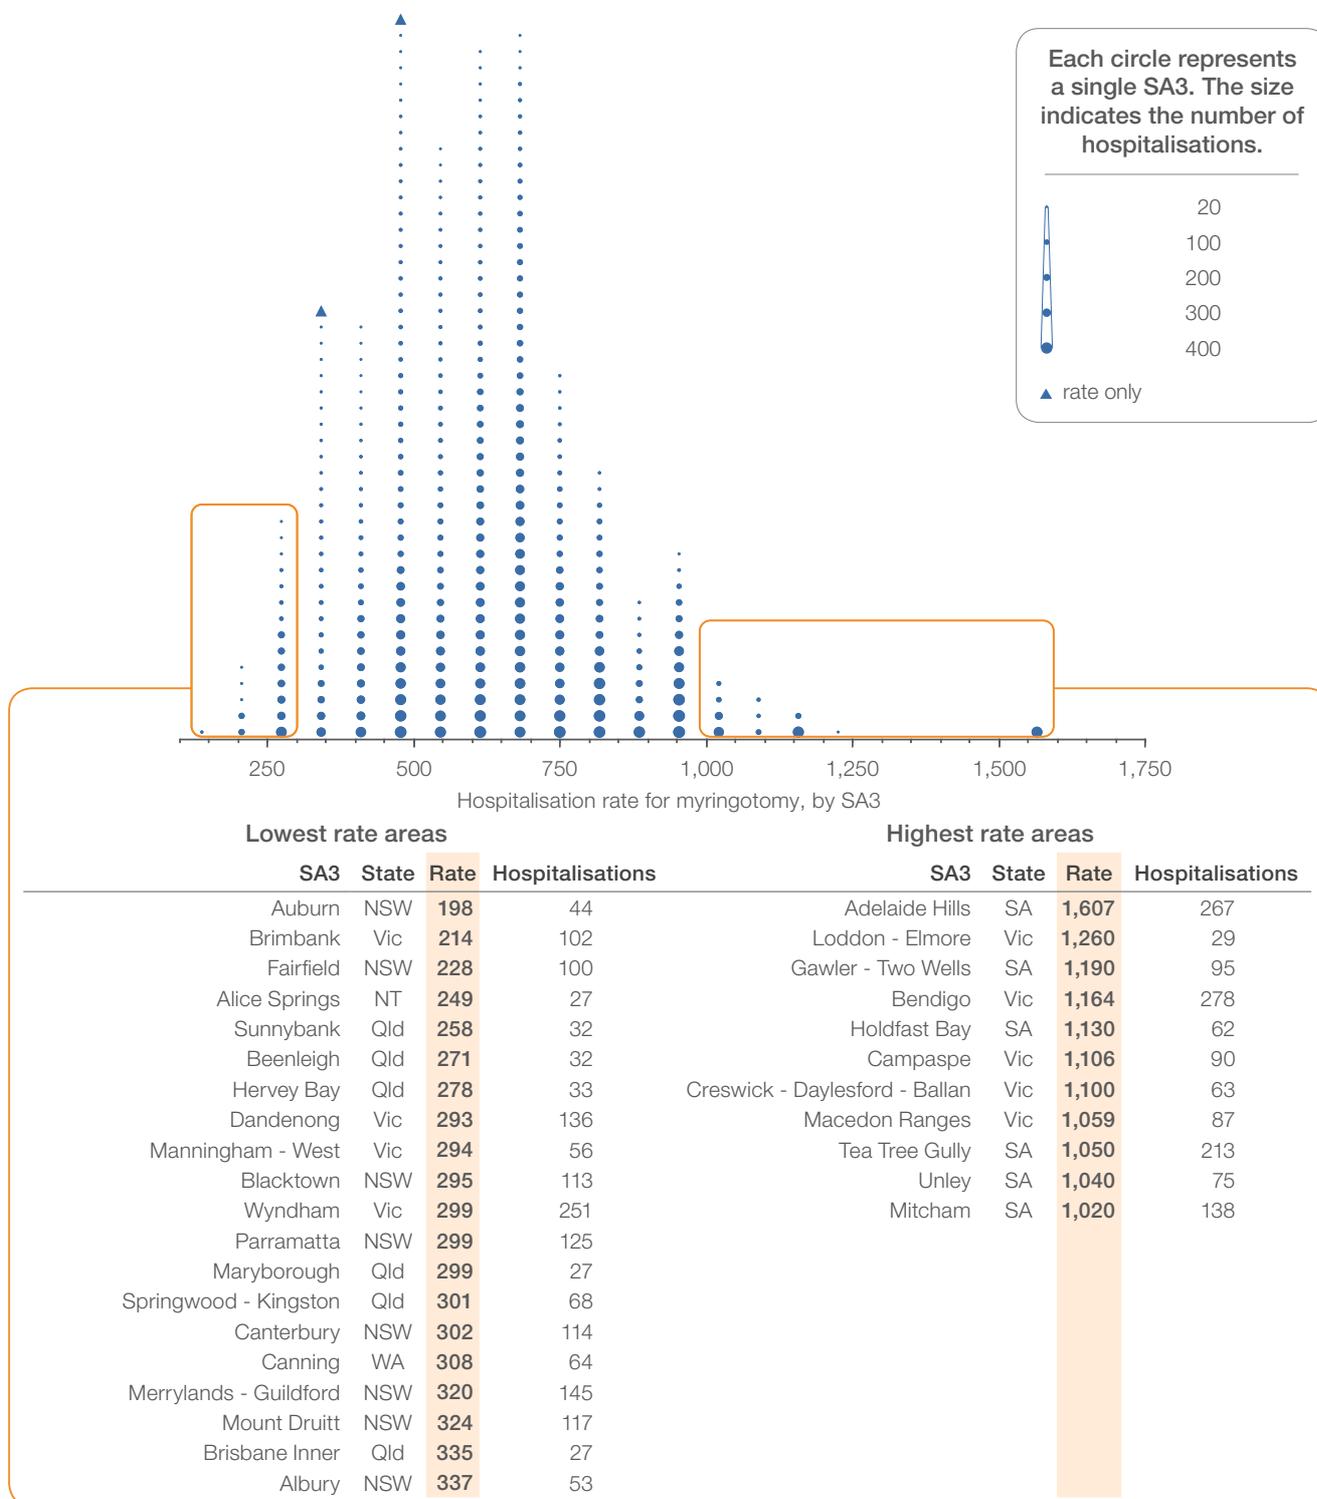

- Support shared decision making to establish what level of variation is appropriate based on patients' needs and assessment of risk.³² Supporting shared decision making means giving patients accurate information, as well as informing GPs to avoid over- or underestimating the risks and benefits of myringotomy, which is likely to drive variation in referral to an ENT surgeon.

Improved data collection

- Improve data about access to myringotomy, such as the distribution of ENT surgeons and length of waiting lists. This would focus efforts on improving access in areas with the lowest rates of myringotomy. Some of these efforts could include financial incentives to improve access to surgery in areas that have low rates
- Further develop the Australian Society of Otolaryngology Head and Neck Surgery data registry to record patient outcomes after surgery (see 'Australian initiatives' on page 210).

Rates by local area

Figure 3.12: Number of hospitalisations for myringotomy per 100,000 people aged 17 years and under, age and sex standardised, by Statistical Area Level 3 (SA3) of patient residence, 2017–18

Australian initiatives

Roadmap for Hearing Health

The Roadmap for Hearing Health works to foster collaboration between stakeholders to address the challenges facing an estimated 3.6 million Australians who experience some form of hearing impairment. The second domain of the Roadmap – Closing the Gap for Aboriginal and Torres Strait Islander Ear and Hearing Health – addresses the catastrophic levels of ear disease among Aboriginal and Torres Strait Islander people.³⁴

Clinical guidelines

Recommendations for Clinical Care Guidelines on the Management of Otitis Media in Aboriginal and Torres Strait Islander Populations

The clinical care guidelines (otitismediaguidelines.com)² were first published in 2001, and updated in 2010 and 2017. They were disseminated nationally to all Aboriginal Community Controlled Health Services, and accompanied by clinical training and supply of equipment. The recommendations provide the evidence base for local clinical guidelines, and ear health manuals and frameworks.³⁵

Vaccination

The pneumococcal conjugate vaccine (13vPCV) is part of the National Immunisation Program, and is available for all children free of charge starting at the age of 2 months. In addition, the seasonal influenza vaccine is available free for all children aged 6 months to under 5 years. (Influenza vaccination may result in a small reduction in AOM, which often follows a viral infection such as influenza.)³⁶

Hearing support

Children need access to hearing support, including audiology services and ENT surgeons. Hearing Australia is piloting hearing testing in Aboriginal and Torres Strait Islander children. This may identify children needing myringotomy procedures.⁷

#Earhealthforlife (<https://earandhearinghealth.org.au/blog/ear-health-life-taskforce>) is a network that is committed to a national Aboriginal and Torres Strait Islander Hearing Health Taskforce that can provide evidence-based advice to government about hearing health.

HealthPathways provides clinicians with access to evidence-based guidelines on assessment, management and referral of children with AOM and OME. HealthPathways may help to achieve standardisation of care among GPs.³⁷

Shared decision making

In July 2020, the Victorian Department of Health and Human Services advised Victorian health services that a variety of procedures (including myringotomy) were to be performed only for a specific list of clinical indications. Hospitals were advised that communication must involve shared and documented decision making with the patient about the evidence, risks and benefits, and other options for care. See Resources for best-care guidance on insertion of grommets for middle ear disease.

Diagnosis and treatment for Aboriginal and Torres Strait Islander children

The Australian Government's Hearing Assessment Program – Early Ears (HAP-EE) started in late 2018–19. Hearing Australia is delivering ear and hearing assessments nationally. Follow-up ENT services are delivered through the Australian Government's jurisdictional fundholders for outreach hearing services.

Queensland's Deadly Ears Program

This program was started in 2007 and provides access to specialist ear and hearing services, including audiology services and ENT surgeons, for Aboriginal and Torres Strait Islander children from communities across rural and remote Queensland.³⁸

ENT surgical registry

The Australian Society of Otolaryngology Head and Neck Surgery operates a surgical register that collects data on ENT surgical procedures. The registry, which has been operating for two years, collects data on tonsillectomy, insertion of grommets and septoplasty.

Chapter 4

Lumbar spinal surgery

At a glance

Lumbar spinal surgery refers to surgery in the lumbar spine or lower back. It is sometimes used to treat degenerative spinal disorders, which is the focus of this chapter. The Atlas excludes use of spinal surgery for treating infection, tumours or injury.

Degenerative spinal disorders are a diverse group of conditions that can cause chronic low back pain, leg pain and disability. Lumbar spinal surgery is generally only considered for certain degenerative spinal disorders if non-surgical options have not worked. There are limited data on patient outcomes, due in part to difficulties in conducting high-quality randomised controlled trials of these types of surgery. Two common lumbar spinal procedures are fusion and decompression.

Spinal fusion surgery involves joining two or more vertebrae using a bone graft. It has a role in treating a small minority of people who have degenerative spinal disorders that include nerve-related problems. Most people with chronic low back pain related to degenerative disorders do not have nerve-related symptoms. The role of spinal fusion in these circumstances is limited and controversial.

The Atlas found that, in 2015–2018, the rate of hospitalisation for lumbar spinal fusion was about 12 times higher in the local area with the highest rate than in the area with the lowest.* There was a 4% fall in the national rate of lumbar spinal fusion, and a 25% fall in the rate of lumbar spinal fusion excluding decompression, between 2012–2015 and 2015–2018.

Spinal decompression aims to increase the amount of the space in the spinal canal to relieve pressure on nerves and blood vessels.

The Atlas found that, in 2015–2018, the rate of hospitalisation for lumbar spinal decompression was about eight times higher in the local area with the highest rate than in the area with the lowest.* The national rate of lumbar spinal decompression fell by 6% between 2012–2015 and 2015–2018.

To address variation, it is important to improve access to services that provide multidisciplinary review and non-surgical treatments for chronic low back pain, and to develop the Australian Spine Registry to collect data on patient outcomes and support audit and peer review.

* After standardising to remove age and sex differences between populations.
The Fourth Australian Atlas of Healthcare Variation

Recommendations

The Commission consulted widely, but is solely responsible for making the recommendations; as such, the recommendations may not reflect the views of all contributors to the Atlas.

4a. Health service organisations and Primary Health Networks to implement evidence-based pathways for the management of low back pain consistent with the care described in the Low Back Pain Clinical Care Standard (planned for publication in late 2021).

4b. Health service organisations where lumbar spinal surgery is conducted to implement evidence-based guidelines; for example, the National Institute for Health and Care Excellence guidelines: *Low Back Pain and Sciatica in Over 16s: Assessment and management*.

4c. The Royal Australasian College of Surgeons to require surgeons performing lumbar spinal surgery to participate in the Australian Spine Registry as part of mandatory continuing professional development requirements.

4d. The Commission to work with relevant specialist organisations to develop a list of key safety and quality indicators for the management of specified spinal conditions, which can be used by members for audit of their practice.

4e. Health service organisations to:

i. Develop and implement scope of clinical practice models for surgeons undertaking spinal surgery

ii. Audit spinal surgery and provide the results back to clinicians to act upon in line with Action 1.28 of the National Safety and Quality Health Service (NSQHS) Standards

iii. Incorporate individual spinal surgeons' audit data as part of re-credentialing processes

iv. Report key performance indicators, trends and adverse events in spinal surgery to their governing body, consistent with the NSQHS Standards.

4f. Primary Health Networks to implement a nationally agreed health pathway for management of low back pain, including imaging and referral indications, based on the Commission's Low Back Pain Clinical Care Standard (planned for publication in late 2021).

4.1 Lumbar spinal fusion, 18 years and over

Why is this important?

Degenerative spinal disorders are a diverse group of conditions that can cause chronic low back pain, leg pain and disability.¹ Non-surgical treatments are mainly recommended as the first-line management because they help many people and the risk of harms is generally low.²

Spinal fusion surgery involves fusing two or more vertebrae using a bone graft. It has a role in treating a small minority of people with degenerative spinal disorders: where there is nerve or spinal cord compression³, or where there are severe nerve-related problems.⁴ Complication rates are higher for spinal fusion than for spinal decompression surgery.^{5,6}

Most people with chronic low back pain related to degenerative disorders do not have nerve-related symptoms. The role of spinal fusion in these circumstances is limited and controversial.⁴

The *Second Australian Atlas of Healthcare Variation* found marked differences in rates of lumbar spinal fusion. There has been little change to the evidence base for lumbar spinal fusion since publication of the second Atlas in June 2017.

What did we find?

In 2015–2018, the rate of hospitalisation for lumbar spinal fusion was **12.4 times as high** in the area with the highest rate compared with the area with the lowest rate. Between 2012–2015 and 2015–2018, there was a small decline (4%) in the rate of lumbar spinal fusion, and a larger decline (25%) in the rate of lumbar spinal fusion excluding decompression.

What can be done?

Priority should be given to examining and improving access to services that provide multidisciplinary review and non-surgical treatments for chronic low back pain.

The substantial variation in rates of lumbar spinal fusion, a procedure recommended in limited circumstances, suggests an urgent need for high-quality evidence on who may benefit from this surgery and the degree of benefit.

Clinical trials are difficult to conduct for lumbar spinal fusion, so it is essential to improve collection of registry data on patient outcomes. The Australian Spine Registry should be developed to support data collection for all consenting patients having lumbar spinal surgery. Patients offered spinal fusion surgery should be fully informed of the potential benefits and risks for them. Surgeons should contribute data on all consenting patients, and regularly audit and review patient outcome data with their peers. Health services should include clinical audit as a credentialing requirement for surgeons who perform lumbar spinal surgery.

Lumbar spinal fusion, 18 years and over

Context

Lumbar spinal fusion is a surgical procedure that uses a bone graft to permanently join (fuse) two or more vertebrae to stop them from moving against each other. The procedure can be done with or without the use of hardware (internal fixation), such as screws, cages or plates, which support the vertebrae while the bone graft is healing.

Spinal fusion can be performed on its own or with spinal decompression, a surgical procedure that increases the amount of space in the spinal canal to relieve pressure on nearby nerves and blood vessels.

This item examines lumbar spinal fusion with or without decompression. It excludes the use of spinal fusion for infection, tumours, injury and spinal deformities such as scoliosis, and therefore focuses on the use of spinal fusion for degenerative spinal disorders and associated chronic low back pain.

Degeneration of the lumbar spinal joints and intervertebral discs is part of ageing.⁵ In some people, it can cause low back pain, leg pain related to pressure on nerves (radicular pain), and reduced mobility.⁷ Common types of degenerative conditions include lumbar spinal stenosis (narrowing of the spinal canal), spondylolisthesis (where one vertebra slips over another) and herniated disc (where disc material protrudes into the spinal canal or outer nerves).^{5,8}

Non-surgical measures are recommended as first-line treatment for most people with acute or chronic low back pain.^{7,9} These include exercise, weight loss, cognitive behavioural therapy and physiotherapy.⁹ Most people with acute pain will improve within six weeks, but some people have recurrences, and around 40% develop chronic low back pain (lasting for more than three months).¹⁰

Surgical intervention, including spinal fusion, is recommended for patients where nerve compression from spinal degeneration causes severe or progressive weakness, or bladder and bowel problems.⁴ It is also recommended in selected patients where instability (e.g. spondylolisthesis) causes nerve or spinal compression.³

Most people with chronic low back pain related to degenerative disorders do not have nerve-related symptoms. The role of spinal fusion in these circumstances is limited and controversial.⁴

Cochrane and other systematic reviews have reported inconclusive findings on the effectiveness of spinal fusion due to uncertainties in the available evidence, and have noted difficulties in conducting high-quality trials in this area.^{2,11-13}

Spinal fusion may be an option for people who have persistent (for more than one year) disabling low back pain and significantly impaired quality of life, and who have not responded to non-surgical treatment.⁴ However, most people with isolated low back pain without evidence of nerve compression are unlikely to benefit from spinal fusion.^{9,14}

People who have persistent radicular pain may benefit from surgery, but the evidence about who benefits and the degree of benefit is not clear. Adding spinal fusion to decompression has not been clearly shown to achieve better outcomes for patients with spinal stenosis.¹¹ Added spinal fusion may result in better outcomes than decompression alone for spondylolisthesis.⁶

Sometimes spinal fusion is added to repeat decompression surgery to treat recurrent herniated disc, although this has not been shown to improve clinical outcomes compared with decompression alone.¹²

Adding fusion to decompression increases the risks of complications compared with decompression alone, and doubles the hospital costs.^{5,11} Spinal fusion surgery is associated with a risk of serious complications; the risk increases with the age of the patient and complexity of the fusion procedure.^{5,6} The risk of major complications with complex fusion procedures (joining of more than two vertebrae) is several times the risk of major complications of decompression alone.⁵

It is important that patients are informed about the possible complications of spinal fusion, particularly older people and Aboriginal and Torres Strait Islander people, who may have other medical conditions (comorbidity) that can increase the risk of complications.⁶

Reoperation because of continuing symptoms may also be needed. Rates of reoperation depend on the type of degenerative condition and type of surgery.¹⁵

Guidelines from the United Kingdom National Institute for Health and Care Excellence (NICE) recommend against spinal fusion to treat low back pain unless as part of a randomised controlled trial.⁹ Belgian guidelines recommend that spinal fusion for people with low back pain should only be considered after non-surgical interventions have failed as part of a multidisciplinary evaluation. The treatment should also preferably be recorded in a register.¹⁶

Why revisit variation in lumbar spinal fusion?

The first and second editions of the *Australian Atlas of Healthcare Variation* examined hospitalisation rates for lumbar spinal surgery in people aged 18 years and over.^{17,18}

The first Atlas examined variation in lumbar spinal decompression and lumbar spinal fusion combined, and found that, over the three-year period 2010–11 to 2012–13, the rate was 4.8 times as high in the area with the highest rate as in the area with the lowest rate.¹⁷

The second Atlas separately explored variation in spinal decompression (without fusion) and lumbar spinal fusion (with or without decompression). It found that, over the three-year period 2012–2015, the number of hospitalisations for lumbar spinal fusion across 305 local areas (Statistical Area Level 3 – SA3) ranged from 10 to 69 per 100,000 people aged 18 years and over. The rate was 6.9 times as high in the area with the highest rate compared with the area with the lowest rate. Rates of surgery were higher in inner regional areas than in major cities or outer regional areas, and were lowest in remote areas.¹⁸

It is important to continue to monitor rates of spinal fusion for degenerative spinal conditions because of the low quality of the evidence on the effectiveness of this procedure.

About the data

Data are sourced from the National Hospital Morbidity Database, and include admitted patients in both public and private hospitals.

Rates are based on the number of hospitalisations for lumbar spinal fusion (with or without decompression) per 100,000 people aged 18 years and over in 2012–13 to 2014–15 and 2015–16 to 2017–18. Hospitalisations resulting from infection, tumours, injury and spinal deformities such as scoliosis are excluded from this analysis.

Because a record is included for each hospitalisation for the procedure, rather than for each patient, patients hospitalised for the procedure more than once in the financial year will be counted more than once.

It is not possible to estimate rates of staged surgery across separate hospitalisations from these data. Hospitalisations for the same patient have not been linked. Therefore, a patient who was hospitalised for spinal fusion without decompression may have had a hospitalisation for decompression in the same data collection period.

The analysis and maps are based on the usual residential address of the patient and not the location of the hospital.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures. Data quality issues – for example, the extent of identification of Aboriginal and Torres Strait Islander status in datasets – could influence the variation seen.

It is not possible to examine variation in fusion for chronic axial back pain at a small area level because of confidentiality reasons.

Lumbar spinal fusion, 18 years and over

Principal diagnoses included and the percentage of hospitalisations for lumbar spinal fusion with or without decompression for 2015–2018* are:

- Spinal stenosis (lumbar and lumbosacral), 36%
- Lumbar and other intervertebral disc disorders with radiculopathy, 21%
- Spondylolisthesis (lumbar and lumbosacral), 25%
- Radiculopathy (lumbar and lumbosacral), 5%
- Low back pain, 5%
- Other specified intervertebral disc displacement, 5%
- Lumbago with sciatica, 1%
- Lumbar and other intervertebral disc disorders with myelopathy, 1%
- Unspecified dorsalgia (lumbar and lumbosacral) and other dorsalgia (lumbar and lumbosacral), 1%.

What do the data show?

Magnitude of variation

Over the three-year period 2015–2018, there were 14,608 hospitalisations for lumbar spinal fusion (with or without decompression), representing 24 hospitalisations per 100,000 people aged 18 years and over (the Australian rate). The median age for patients was 64 years, and varied across states and territories, from 55 in the Northern Territory to 67 in South Australia.

The number of hospitalisations for lumbar spinal fusion (with or without decompression) across 307† local areas (Statistical Area Level 3 – SA3) ranged from 7 to 87 per 100,000 people. The rate was **12.4 times as high** in the area with the highest rate compared with the area with the lowest rate. The number of hospitalisations for lumbar spinal fusion (with or without decompression) varied across states and territories, from 11 per 100,000 people in the Northern Territory to 50 in Tasmania (Figures 4.3–4.6).

After the highest and lowest 10% of results were excluded and 249 SA3s remained, the number of hospitalisations per 100,000 people was 2.7 times as high in the area with the highest rate compared with the area with the lowest rate.

There were 1,860 hospitalisations for lumbar spinal fusion excluding decompression for people aged 18 years and over during this three-year period. This equates to an Australian rate of 3 hospitalisations per 100,000 people. The graph for this analysis is available at safetyandquality.gov.au/atlas

Analysis by remoteness and socioeconomic status

Rates for lumbar spinal fusion (with or without decompression) hospitalisations were generally higher in inner regional areas than in outer regional areas or major cities, and were lowest in remote areas. In major cities and remote areas, rates decreased with socioeconomic disadvantage, but this pattern was not evident for other categories of remoteness (Figure 4.7).

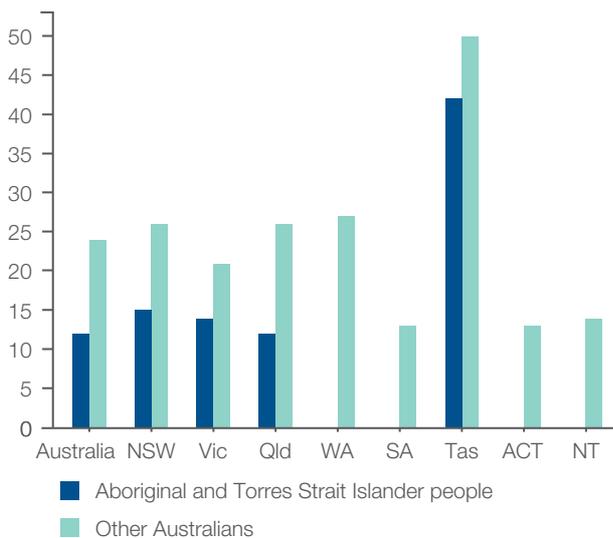

* Australian Commission on Safety and Quality in Health Care analysis of Admitted Patient Care National Minimum Data Set, 2015–16 to 2017–18.

† There are 340 SA3s. For this item, data were suppressed for 33 SA3s due to a small number of hospitalisations and/or population in an area.

Analysis by Aboriginal and Torres Strait Islander status

The rate for Aboriginal and Torres Strait Islander people (12 per 100,000 people) was 50% lower than the rate for other Australians (24 per 100,000 people). This difference was most pronounced in Queensland, where the rate for Aboriginal and Torres Strait Islander people was 54% lower than the rate for other Australians (Figure 4.1).

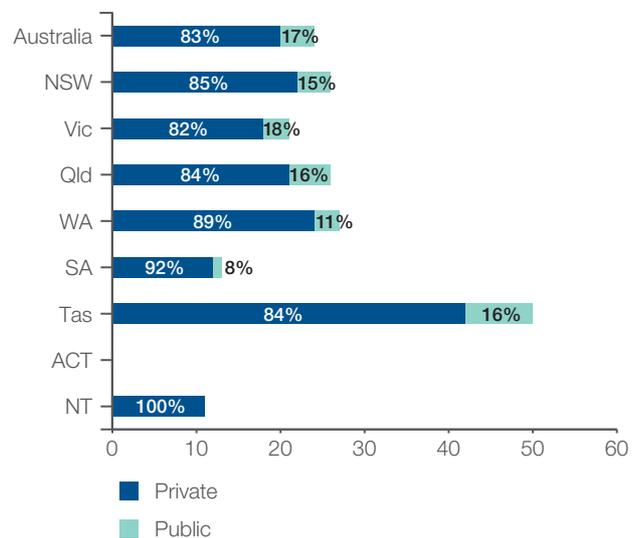

Figure 4.1: Number of hospitalisations for lumbar spinal fusion (with or without lumbar spinal decompression) per 100,000 people aged 18 years and over, age and sex standardised, by state or territory of patient residence, by Aboriginal and Torres Strait Islander status, 2015–16 to 2017–18*

Analysis by patient funding status

Overall, 83% of hospitalisations for lumbar spinal fusion (with or without decompression) were for privately funded patients. This proportion varied from 82% in Victoria to 100% in the Northern Territory (Figure 4.2).†

Figure 4.2: Number of hospitalisations for lumbar spinal fusion (with or without lumbar spinal decompression) per 100,000 people aged 18 years and over, age and sex standardised, by state or territory of patient residence, by patient funding status, 2015–16 to 2017–18†

The data for Figures 4.1 and 4.2 are available at safetyandquality.gov.au/atlas

Notes:

* Data for some states and territories (Aboriginal and Torres Strait Islander people) have been suppressed. Data by Aboriginal and Torres Strait Islander status should be interpreted with caution as hospitalisations for Aboriginal and Torres Strait Islander people are under-enumerated, with variation among states and territories.

† Data for the Northern Territory (public patients) are not published for reliability reasons. The 100% private patients are a result of rounding. For 2016–17, there were data quality issues related to the recording of patient funding source for patients admitted to ACT private hospitals. ACT private hospitals for 2016–17 are excluded from the analysis and data for the ACT are not published. Hospitalisations for public patients do not incur a charge to the patient or a third-party payer (for example, a private health insurance fund), unlike hospitalisations for private patients.

Denominator populations are the sum of the population estimates as at 31 December of 2015 to 2017. Population estimates as at 31 December are calculated as the average of the 30 June populations before and after the relevant December.

For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2015 to 2018.

Lumbar spinal fusion, 18 years and over

Analysis by age group

Rates for lumbar spinal fusion (with or without decompression) hospitalisations were higher for patients aged 75–84 years (73 per 100,000 people) and 65–74 years (70 per 100,000 people) than for patients aged 18–64 years (16 per 100,000 people) or 85 years and over (17 per 100,000 people).

The data and graphs for analysis by age group and by Primary Health Network are available at safetyandquality.gov.au/atlas

Trends over time

Between 2012–2015 and 2015–2018, the rate of hospitalisations for lumbar spinal fusion (with or without decompression) decreased by 4% (from 25 per 100,000 people to 24 per 100,000 people) in the Australian population as a whole (Figure 4.8).

The rate for Aboriginal and Torres Strait Islander people increased by 50% (from 8 per 100,000 people to 12 per 100,000 people) over the same period.

Over the same period, the rate of hospitalisations for lumbar spinal fusion excluding decompression decreased by 25% (from 4 per 100,000 people to 3 per 100,000 people) in the population as a whole.

The data for analysis over time for Aboriginal and Torres Strait Islander people, and analysis by Primary Health Network are available at safetyandquality.gov.au/atlas

Interpretation

Variation in rates of lumbar spinal fusion surgery is likely to be due to geographical differences in the factors discussed below.

Variations between areas may not directly reflect the practices of the clinicians who are based in these areas. The analysis is based on where people live rather than where they obtain their health care. Patients may travel outside their local area to receive care.

Clinical decision making

Problems with the current evidence base may contribute to variation in rates of spinal fusion. In the absence of good evidence and clearly established guidelines, differing perceptions among spinal surgeons about the benefits that some patients derive from spinal fusion will lead to variation in practice.

Patients' expectations

Patients' expectations about the need for spinal surgery to deal with chronic low back pain may drive variation. These expectations may be affected by psychosocial factors, such as dependence on alcohol or other drugs (e.g. opioids), depression and job loss.

Access to services

One reason for the very high variation in the rates of spinal fusion may be lack of access to affordable and accessible alternatives to surgery, such as physiotherapy with cognitive behavioural therapy, multidisciplinary back pain assessment clinics and pain clinics. People who are unable to access these types of care and who have persistent disabling pain may be referred for surgical opinion in the absence of other options for management of pain.

Having private health insurance allows affordable and timely access to spinal fusion in private hospitals. Atlas data found that most (83%) hospitalisations for lumbar spinal fusion (with or without decompression) were for privately funded patients.

Also, private health insurance may not cover the cost of non-surgical treatments for degenerative spinal conditions.

Workforce issues

Workforce factors may influence the overall rates of spinal surgery and geographic variation in rates, and this should be explored further. One possible reason for high rates in some areas is an undersupply of health practitioners who provide alternatives to surgical intervention. Differences in geographical access to spinal surgeons will also influence the use of these interventions. An oversupply of surgeons may lead to increased rates of surgery.

Addressing variation

Considering the burden of disease, the costs associated with low back pain and the number of spinal operations occurring in Australia, priority should be given to ensuring that there are appropriate services for multidisciplinary review and non-surgical management of chronic back pain in health services throughout the country.

Because of uncertainty in the evidence base and the risks of spinal fusion surgery, high-quality research is needed to identify whether there are subgroups of patients who would benefit from the surgery, and what degree of benefit might be gained compared with use of more conservative treatments. Better information on surgery outcomes, including patient-reported outcomes in the medium to longer term, is also required.

Given the burden of disease, and numbers of spinal operations occurring in Australia, priority should be given to further developing the Australian Spine Registry so that it can capture information on all eligible patients, provide information for effective peer review of spinal surgery and add to the knowledge base about outcomes for specific groups of patients.

Patients with degenerative spinal conditions who are offered the option of spinal fusion surgery should be fully informed of the potential benefits and the risk of complications for them.

All patients who decide to have surgery should be informed about the Australian Spine Registry and, if they fulfil the registration criteria, should be asked if they are willing to be included. Surgeons undertaking this procedure should contribute data on all eligible patients to the Australian Spine Registry and participate in routine peer review.

Initiatives to address variation could include the following:

High-quality research and outcome monitoring

- Undertake high-quality research to resolve uncertainties about benefit for patients with degenerative spinal conditions
- Ensure resourcing to support widespread use of the Australian Spine Registry
- Develop agreed measures for audit

Clear information for patients

- Ensure that all patients have clear information about treatment options, likely risks and benefits, and the uncertainties about the evidence base – before and after specialist referral

Access to services

- Increase access to healthcare services that provide alternatives to surgical intervention, particularly physiotherapy services with cognitive behavioural therapy and specialist pain management services, especially for those with opioid dependence
- Ensure that psychosocial factors are part of any assessment for axial chronic low back pain before referral for surgery
- Establish a targeted strategy to improve access to spinal surgery for Aboriginal and Torres Strait Islander people

Lumbar spinal fusion, 18 years and over

Training and professional development

- Improve fellowship training through ongoing curriculum review
- Improve post-fellowship training and possibly develop a qualification
- Focus on continuing professional development, mentoring and peer review
- Educate clinicians about the benefits, costs and complications of surgery compared with other options

Credentialing and scope of practice

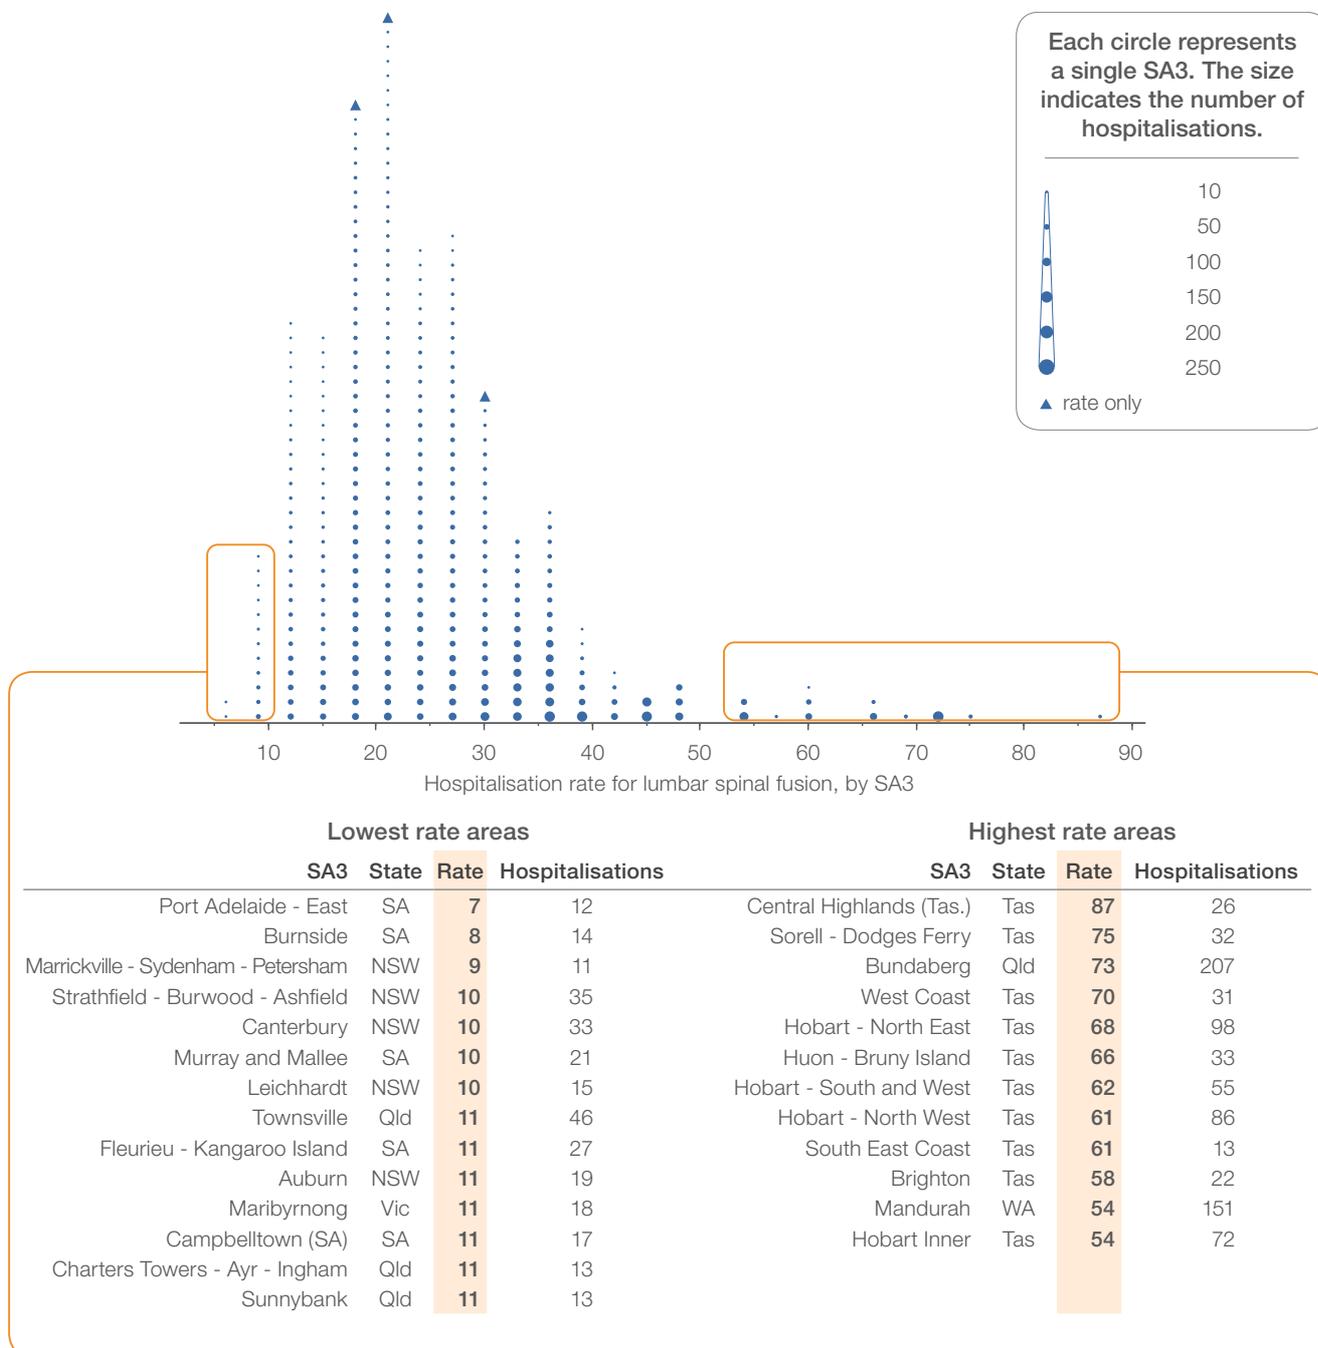

- Develop appropriate credentialing and definition of scope of practice in all hospitals
- Develop best-practice guidelines, especially in complex surgery

Care pathways

- Implement multidisciplinary clinical pathway and multidisciplinary preoperative review
- Develop evidence-based care pathways, including referral guidelines for general practitioners

Rates by local area

Figure 4.3: Number of hospitalisations for lumbar spinal fusion (with or without lumbar spinal decompression) per 100,000 people aged 18 years and over, age and sex standardised, by Statistical Area Level 3 (SA3) of patient residence, 2015–16 to 2017–18

Notes:

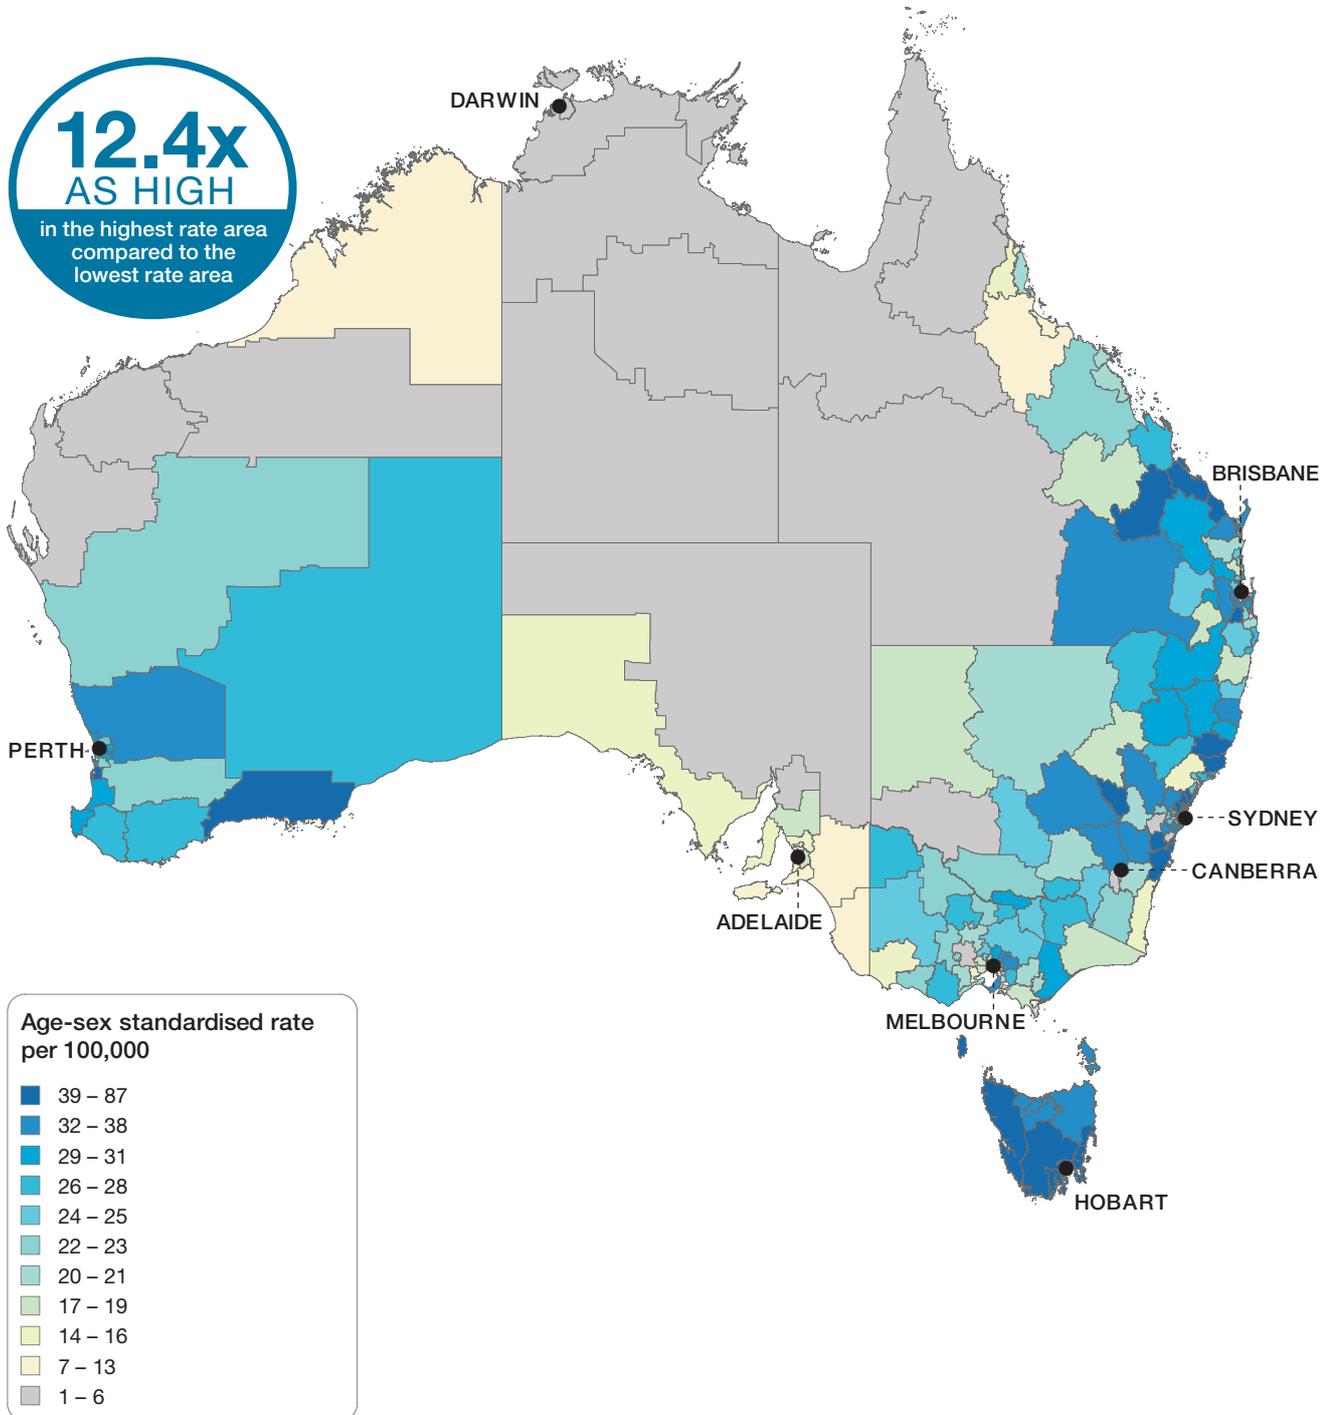

Triangles (▲) indicate SA3s where only rates are published. The numbers of hospitalisations are not published for confidentiality reasons. Australian initiatives

The Australian Spine Registry (spineregistry.org.au) has been collecting data since January 2018 about spine surgery in Australia, aiming to improve the quality of care. The registry is supported by the Spine Society of Australia, in partnership with Monash University. It collects data on the frequency of spine surgery; the usefulness, safety and results of different procedures; factors that predict favourable and unfavourable outcomes; and the care provided to Australians having spine surgery and how it compares with international best practice.

In July 2020, the Victorian Department of Health and Human Services advised health services that a range of procedures (including spinal fusion for chronic axial back pain) should be performed only for a specific list of clinical indications. Hospitals were advised that communication must involve shared and documented decision making with the patient about evidence, risks and benefits, and other options for care. Victoria is developing resources to support patients and healthcare providers to make decisions together about the most appropriate pathways of care. Spinal fusion surgery for chronic axial low back pain is one of these pathways.

4.2 Lumbar spinal decompression, 18 years and over

Why is this important?

Degenerative spinal disorders are a diverse group of conditions that can cause chronic low back pain, leg pain and disability.¹ Non-surgical treatments are mainly recommended as the first-line management because they help many people and the risk of harms is generally low.²

Spinal decompression surgery aims to increase the space in the spinal canal to reduce pressure on nerves and blood vessels. It may be considered when non-surgical treatments have not worked or for selected people with serious symptoms.³

The *Second Australian Atlas of Healthcare Variation* found marked differences in rates of lumbar spinal decompression. There has been little change to the evidence base for lumbar spinal decompression since publication of the second Atlas in June 2017.

What did we find?

In 2015–2018, the rate of hospitalisation for lumbar spinal decompression (excluding lumbar spinal fusion) was **7.7 times as high** in the area with the highest rate compared with the area with the lowest rate. There was a small decline (6%) in the national rate of lumbar spinal decompression between 2012–2015 and 2015–2018.

What can be done?

Priority should be given to improving access to services that provide multidisciplinary review and non-surgical treatments for chronic low back pain.

Clinical trials are difficult to conduct for lumbar spinal decompression, so it is essential to improve collection of registry data on patient outcomes. The Australian Spine Registry should be developed to support data collection for all consenting patients having lumbar spinal surgery. Patients offered lumbar spinal decompression surgery should be fully informed of the potential benefits and risks for them. Surgeons should contribute data on all consenting patients, and regularly audit and review patient outcome data with their peers. Health services should include clinical audit and review as a credentialing requirement for surgeons who perform lumbar spinal surgery.

Lumbar spinal decompression, 18 years and over

Context

Lumbar spinal decompression is a surgical procedure that increases the amount of space in the spinal canal to relieve pressure on nearby nerves and blood vessels.

Spinal decompression procedures include laminectomy (removal of a section of bone from one of the vertebrae) and discectomy (removal of a section of a damaged disc). In many cases, a combination of these techniques is used.

Spinal decompression is sometimes performed to treat spinal injuries such as fractures, and spinal cord compression due to metastatic cancer. Spinal decompression can be performed in combination with spinal fusion surgery (joining at least two vertebrae to stop movement), but it is often done on its own.⁴

This item focuses on the use of spinal decompression for degenerative spinal conditions. It excludes the use of spinal decompression for infection, tumours and injury, and therefore focuses on degenerative spinal disorders and associated chronic low back pain.

Spinal decompression is often performed to treat symptoms associated with degenerative conditions of the spine where there is pressure on the nerves. These conditions include lumbar spinal stenosis (narrowing of the spinal canal), spondylolisthesis (where one vertebra slips over another) and herniated disc (where disc material protrudes into the spinal canal or outer nerves).^{4,5}

Degenerative spinal disorders are a diverse group of conditions that cause a range of symptoms and disabling effects. Although some patients are likely to benefit from surgery, in other patients the place of surgery for treating these conditions is not clear. There are limited data on patient outcomes, and it is difficult to conduct high-quality randomised controlled trials comparing treatment options and outcomes.⁶

Lumbar spinal stenosis

People with spinal stenosis can experience a range of symptoms due to nerve compression, including low back pain that radiates to the buttocks and legs, numbness and weakness, and problems with walking and balance. Symptoms are often worse when standing or walking.³ Spinal stenosis is a common condition in older people⁷, and sometimes occurs with degenerative spondylolisthesis.

Conservative measures are recommended as first-line treatments for most people with spinal stenosis who have mild symptoms.^{3,8} Spinal decompression is recommended as an option if conservative measures have not worked and there is sciatica (pain going down one or both legs).⁸ It is also recommended when there are serious symptoms, such as progressive weakness, or bladder or bowel disturbance related to nerve compression.^{3,9}

Herniated disc

A herniated (or prolapsed) disc can press on nearby nerves and lead to sciatica.⁸ A herniated disc is usually the result of disc degeneration due to ageing, although it can occur in a younger age group.

Most people with herniated disc will get better without treatment.⁵ Conservative treatments, including physiotherapy and steroid injections, are usually tried first if symptoms persist.⁵

Spinal decompression (discectomy) is considered when there is uncontrolled pain, numbness or weakness, or bladder or bowel problems, and conservative measures have not worked.⁵ It has been found to be more effective than conservative management in relieving back and leg pain and disability in people whose herniated disc has not responded to initial conservative options.^{5,10}

Complications from lumbar spinal decompression

It is important that patients are informed about the possible complications of spinal decompression, particularly older people and Aboriginal and Torres Strait Islander people, who may have other medical conditions (comorbidity) that can increase the risk of complications.¹¹

Reoperation because of continuing symptoms may also be needed. Rates of reoperation depend on the type of degenerative condition.^{12–14}

Why revisit variation in lumbar spinal decompression?

The first and second editions of the *Australian Atlas of Healthcare Variation* examined hospitalisation rates for lumbar spinal surgery in people aged 18 years and over.^{15,16}

The first Atlas examined variation in lumbar spinal decompression and lumbar spinal fusion combined. It found that, over the three-year period 2010–11 to 2012–13, the rate was 4.8 times as high in the area with the highest rate as in the area with the lowest rate.¹⁵

The second Atlas separately explored variation in spinal decompression (without fusion). It found that, over the three-year period 2012–2015, the number of hospitalisations for lumbar spinal decompression across 322 local areas (Statistical Area Level 3 – SA3) ranged from 30 to 156 per 100,000 people aged 18 years and over. The rate was 5.2 times as high in the area with the highest rate compared with the area with the lowest rate.¹⁶

Rates of surgery were higher in inner regional areas than in major cities, and were lowest in outer regional areas and remote areas. Rates of surgery decreased with socioeconomic disadvantage.¹⁶

It is important to continue to monitor rates of spinal decompression for degenerative spinal stenosis as the evidence on effectiveness of different therapies develops and because of changes in the supply of the health workforce.

About the data

Data are sourced from the National Hospital Morbidity Database, and include admitted patients in both public and private hospitals.

Rates are based on the number of hospitalisations for lumbar spinal decompression (excluding lumbar spinal fusion) per 100,000 people aged 18 years and over in 2015–2018. Hospitalisations resulting from infection, tumours and injury are excluded from this analysis.

Because a record is included for each hospitalisation for lumbar spinal decompression surgery, rather than for each patient, patients hospitalised for the procedure more than once in the financial year will be counted more than once.

The analysis and maps are based on the usual residential address of the patient and not the location of the hospital.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

Data quality issues – for example, the extent of identification of Aboriginal and Torres Strait Islander status in datasets – could influence the variation seen.

Some private hospitals in Tasmania admit public patients under a contractual arrangement. There is a small over-count of hospitalisations for the procedure in Tasmania because hospitalisations were recorded by both contracting hospital and contracted hospital.

Lumbar spinal decompression, 18 years and over

What do the data show?

Over the three-year period 2015–2018, there were 43,185 hospitalisations for lumbar spinal decompression (excluding lumbar spinal fusion), representing 74 hospitalisations per 100,000 people aged 18 years and over (the Australian rate). The median age for patients was 58 years, and varied across states and territories, from 49 in the Northern Territory to 62 in South Australia.

The number of hospitalisations for lumbar spinal decompression (excluding lumbar spinal fusion) across 327* local areas (Statistical Area Level 3 – SA3) ranged from 27 to 209 per 100,000 people. The rate was **7.7 times as high** in the area with the highest rate compared with the area with the lowest rate. The number of hospitalisations varied across states and territories, from 34 per 100,000 people in the Australian Capital Territory to 126 in Tasmania (Figures 4.11–4.14).

After the highest and lowest 10% of results were excluded and 265 SA3s remained, the number of hospitalisations per 100,000 people was 2.1 times as high in the area with the highest rate compared with the area with the lowest rate.

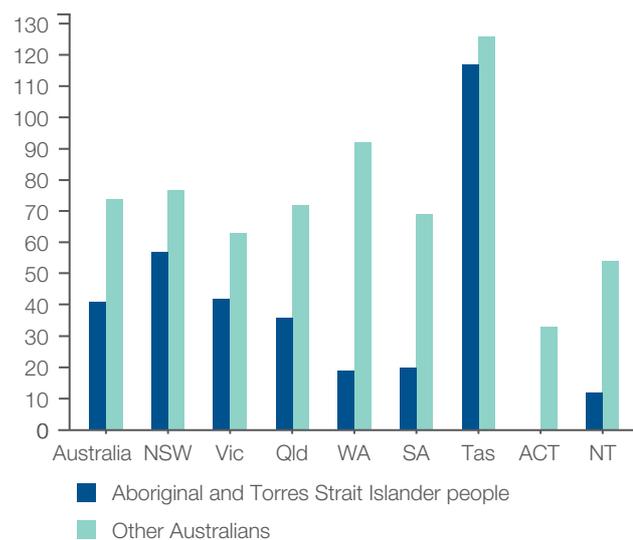

Analysis by remoteness and socioeconomic status

Rates for lumbar spinal decompression (excluding lumbar spinal fusion) hospitalisations were higher in inner regional areas than in major cities or outer regional areas, and were lowest in remote areas. In inner regional and remote areas, rates decreased with socioeconomic disadvantage. This pattern was not evident in major cities or outer regional areas (Figure 4.15).

Analysis by Aboriginal and Torres Strait Islander status

The rate for Aboriginal and Torres Strait Islander people (41 per 100,000 people) was 45% lower than the rate for other Australians (74 per 100,000 people). This difference was most pronounced in Western Australia, where rates for Aboriginal and Torres Strait Islander people were 79% lower than rates for other Australians (Figure 4.9).

Figure 4.9: Number of hospitalisations for lumbar spinal decompression (excluding lumbar spinal fusion) per 100,000 people aged 18 years and over, age and sex standardised, by state and territory of patient residence, by Aboriginal and Torres Strait Islander status, 2015–16 to 2017–18

* There are 340 SA3s. For this item, data were suppressed for 13 SA3s due to a small number of hospitalisations and/or population in an area.

Notes:

Data for some states and territories (Aboriginal and Torres Strait Islander people) are not published for reliability reasons.

Data by Aboriginal and Torres Strait Islander status should be interpreted with caution as hospitalisations for Aboriginal and Torres Strait Islander people are under-enumerated among states and territories.

Denominator populations are the sum of the population estimates as at 31 December of 2015 to 2017. Population estimates as at 31 December are calculated as the average of the 30 June populations before and after the relevant December.

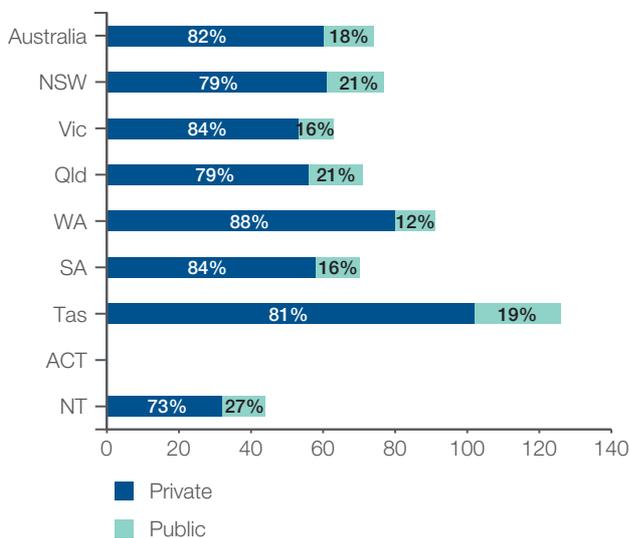

For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2015 to 2018.

Analysis by patient funding status

Overall, 82% of hospitalisations for lumbar spinal decompression (excluding lumbar spinal fusion) were for privately funded patients. This proportion varied from 73% in the Northern Territory to 88% in Western Australia (Figure 4.10).

Figure 4.10: Number of hospitalisations for lumbar spinal decompression (excluding lumbar spinal fusion) per 100,000 people aged 18 years and over, age and sex standardised, by state and territory of patient residence, by patient funding status, 2015–16 to 2017–18

The data for Figures 4.9 and 4.10 are available at safetyandquality.gov.au/atlas

Trends over time

Between 2012–2015 and 2015–2018, the rate of hospitalisations for lumbar spinal decompression excluding lumbar spinal fusion per 100,000 people decreased by 6% (from 79 per 100,000 people to 74 per 100,000 people) in the Australian population as a whole (Figure 4.16).

The rate for Aboriginal and Torres Strait Islander people increased by 37% (from 30 per 100,000 people to 41 per 100,000 people) over the same period.

The data for analysis over time for Aboriginal and Torres Strait Islander people, and analysis by Primary Health Network are available at safetyandquality.gov.au/atlas

Notes:

For 2016–17, there were data quality issues related to the recording of patient funding source for patients admitted to ACT private hospitals. ACT private hospitals for 2016–17 are excluded from the analysis and data for the ACT are not published.

Hospitalisations for public patients do not incur a charge to the patient or a third-party payer (for example, a private health insurance fund), unlike hospitalisations for private patients.

Denominator populations are the sum of the population estimates as at 31 December of 2015 to 2017. Population estimates as at 31 December are calculated as the average of the 30 June populations before and after the relevant December.

For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of National Hospital Morbidity Database and ABS Estimated Resident Populations 30 June of 2015 to 2018.

Lumbar spinal decompression, 18 years and over

Interpretation

Variation in rates of lumbar spinal decompression surgery is likely to be due to geographical differences in the factors discussed below.

Variations between areas may not directly reflect the practices of the clinicians who are based in these areas. The analysis is based on where people live rather than where they obtain their health care. Some patients may travel outside their local area to receive care.

Clinical decision making

High or low rates of spinal decompression in some areas may be related to differences between clinicians in interpretation of the available evidence about the effectiveness of spinal decompression, and differing clinical beliefs about the likelihood of benefits and complications of this type of spinal surgery for some groups of patients.

Patients' expectations

Patients' expectations about the need for spinal surgery to deal with chronic low back pain may drive variation. These expectations may be affected by psychosocial factors, such as dependence on alcohol or other drugs, depression and job loss.

Access to services

One reason for the high variation in the rates of spinal decompression may be lack of access to affordable and accessible alternatives to surgery, such as physiotherapy with cognitive behavioural therapy, multidisciplinary back pain assessment clinics and pain clinics. People who are unable to access these types of care and who have persistent disabling pain may be referred for surgical opinion in the absence of other options for management of pain.

Having private health insurance allows affordable access to spinal decompression in private hospitals. Atlas data found that most (82%) hospitalisations for lumbar spinal decompression were for privately funded patients.

Also, private health insurance may not cover the cost of non-surgical treatments for degenerative spinal conditions.

Workforce issues

Workforce factors may influence the overall rates of spinal surgery and geographic variation in rates, and this should be explored further. One possible reason for high rates in some areas is an undersupply of health practitioners who provide alternatives to surgical intervention. Differences in geographical access to spinal surgeons will also influence the use of these interventions. An oversupply of surgeons may lead to increased rates of surgery.

Addressing variation

Considering the burden of disease, the costs associated with low back pain and the number of spinal operations occurring in Australia, priority should be given to ensuring that there are appropriate services for multidisciplinary review and non-surgical management of chronic back pain in health services throughout the country.

Because of uncertainty in the evidence base, high-quality research is needed to identify whether there are subgroups of patients who would benefit from spinal surgery, and what degree of benefit might be gained compared with use of more conservative treatments. Better information on surgery outcomes, including patient-reported outcomes in the medium to longer term, is also required.

Given the burden of disease and numbers of spinal operations occurring in Australia, priority should be given to further developing the Australian Spine Registry so that it can capture information on all eligible patients, provide information for effective peer review of spinal surgery and add to the knowledge base about outcomes for specific groups of patients.

Patients with degenerative spinal conditions who are offered the option of spinal decompression surgery should be fully informed about the potential benefits and the risk of complications for them.

All patients who decide to have surgery should be informed about the Australian Spine Registry and, if they fulfil the registration criteria, should be asked if they are willing to be included. Surgeons undertaking this procedure should contribute data on all eligible patients to the Australian Spine Registry and participate in routine peer review.

Initiatives to address variation could include the following:

High-quality research and outcome monitoring

- Undertake high-quality research to resolve uncertainties about benefit
- Ensure resourcing to support widespread use of the Australian Spine Registry
- Develop agreed measures for audit

Clear information for patients

- Ensure that all patients have clear information about treatment options, likely risks and benefits, and the uncertainties about the evidence base – before and after specialist referral

Access to services

- Increase access to healthcare services that provide alternatives to surgical intervention
- Ensure that psychosocial factors are part of any assessment for axial chronic low back pain before referral for surgery
- Establish a targeted strategy to improve access to spinal surgery for Aboriginal and Torres Strait Islander people

Training and professional development

- Improve fellowship training through ongoing curriculum review
- Improve post-fellowship training and possibly develop a qualification
- Focus on continuing professional development, mentoring and peer review
- Educate clinicians about the benefits, costs and complications of surgery compared with other options

Credentialing and scope of practice

- Develop appropriate credentialing and definition of scope of practice in all hospitals
- Develop best-practice guidelines, especially in complex surgery

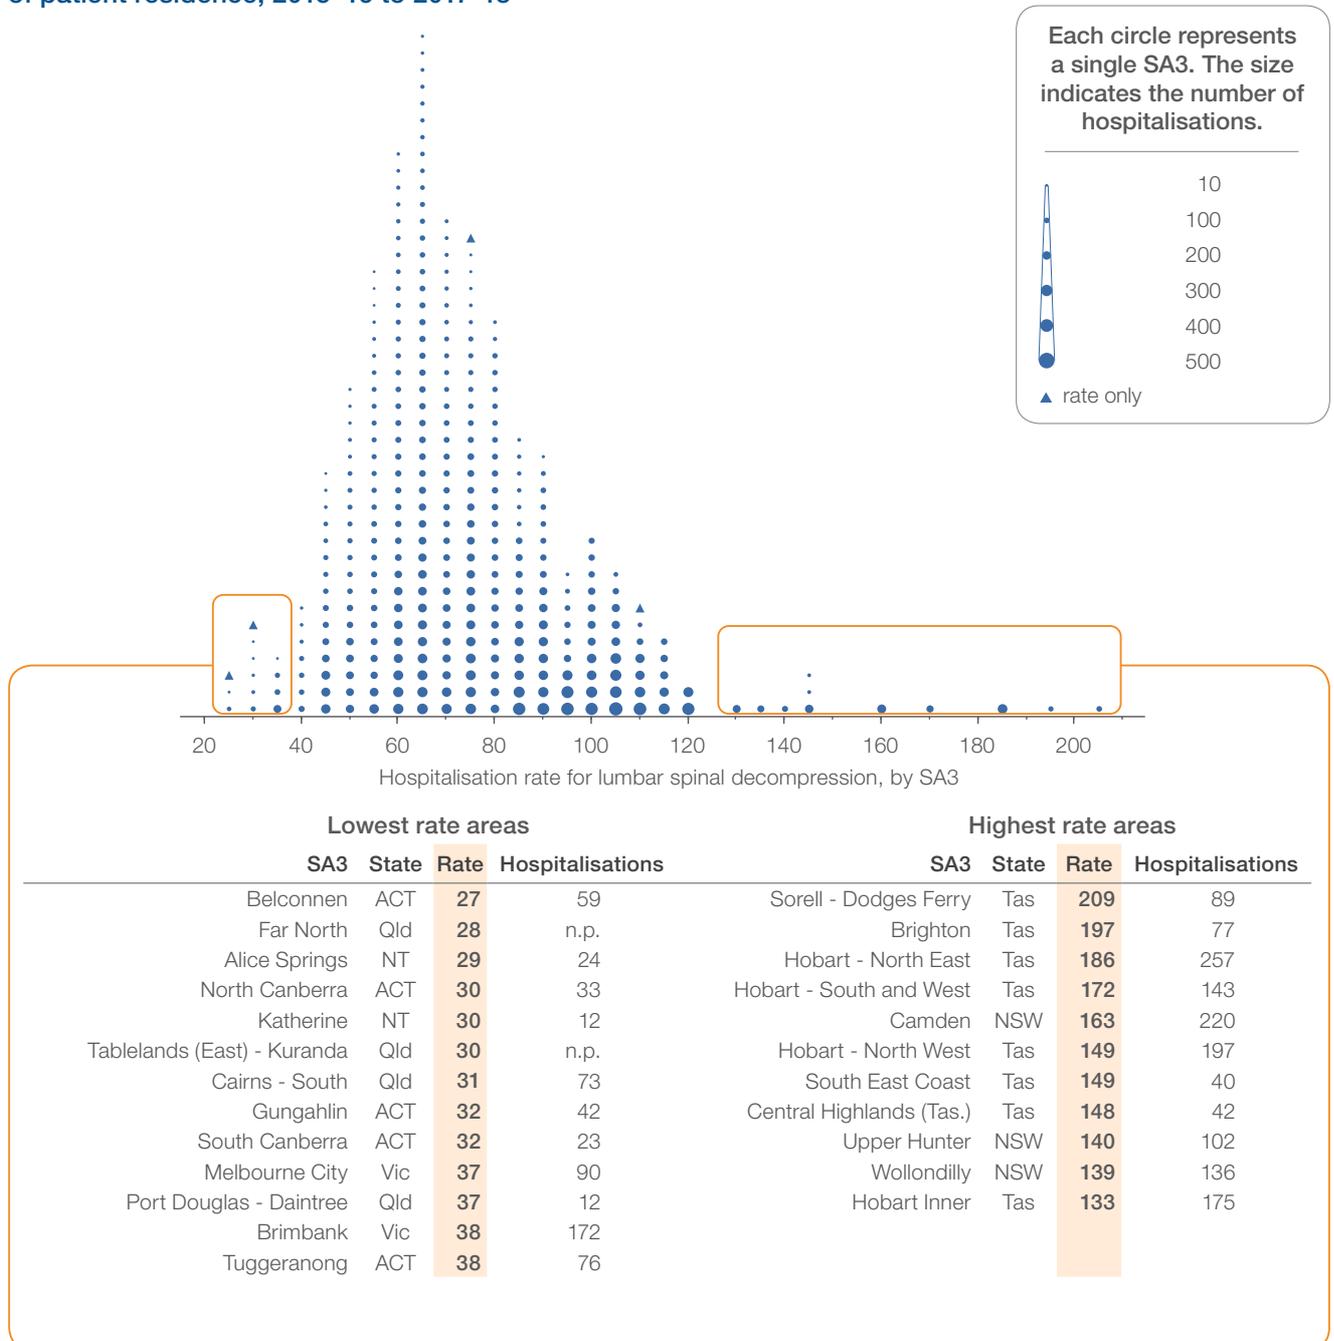

Care pathways

- Implement multidisciplinary clinical pathways and multidisciplinary preoperative review
- Develop evidence-based care pathways, including referral guidelines for general practitioners

Australian initiatives

SUcceSS trial: SUrgery for Spinal Stenosis

This Australian trial will help to fill a gap in evidence by measuring the effect of spinal decompression versus placebo surgery on walking and function in patients with symptomatic lumbar spinal stenosis. This will be the first randomised placebo-controlled trial of surgery for spinal stenosis. It aims to provide high-quality evidence on the efficacy of spinal decompression for treating spinal stenosis.¹⁷ The trial is enrolling participants until December 2022.

Australian Spine Registry

The Australian Spine Registry (spineregistry.org.au) has been collecting data since January 2018 about spine surgery in Australia, aiming to improve the quality of care. The registry is supported by the Spine Society of Australia, in partnership with Monash University. It collects data on the frequency of spine surgery; the usefulness, safety and results of different procedures; factors that predict favourable and unfavourable outcomes; and the care provided to Australians having spine surgery and how it compares with international best practice.

Chapter 5

Gastrointestinal investigations

At a glance

Gastroscopy is used to investigate, treat or monitor conditions of the upper gastrointestinal (GI) tract. Most conditions that affect the upper GI tract and require gastroscopy are uncommon in people aged under 55 years.

The Atlas found that, in 2018–19, the rate of Medicare Benefits Schedule (MBS)–subsidised services for gastroscopy for people aged 18–54 years was almost 11 times higher in the local area with the highest rate than in the area with the lowest.* Rates were markedly higher in major cities than elsewhere. Almost two-thirds of gastroscopy services were performed on the same day as a colonoscopy for the same person.

Few people who have an initial gastroscopy require another within three years. Repeat gastroscopy is used mainly to monitor conditions that increase the risk of upper GI cancer or bleeding in high-risk groups.

The Atlas found that, in 2018–19, the rate of MBS-subsidised services for repeat gastroscopy performed within two years and 10 months of an earlier gastroscopy was almost 15 times higher in the local area with the highest rate than in the area with the lowest.* Rates were markedly

higher in major cities and also increased with socioeconomic advantage.

National guidance on appropriate use of gastroscopy, including when to perform repeat gastroscopy, is needed. Education for clinicians and consumers about the low risk of upper GI cancer for most people, especially those aged under 55 years, and improved consumer understanding about the role of gastroscopy, are required.

Repeat colonoscopy is used mainly to monitor for bowel cancer in people at increased risk. The timing of repeat colonoscopy is based on bowel cancer risk. There are limited reasons for repeating a colonoscopy within three years.

The Atlas found that, in 2018–19, the rate of MBS-subsidised services for repeat colonoscopy performed within two years and 10 months of an earlier colonoscopy was almost 20 times higher in the local area with the highest rate than in the area with the lowest.* Rates were markedly higher in major cities and increased with socioeconomic advantage.

A focus on driving implementation of national guidelines and the *Colonoscopy Clinical Care Standard* is needed.

* After standardising to remove age and sex differences between populations.

Recommendations

The Commission consulted widely, but is solely responsible for making the recommendations; as such, the recommendations may not reflect the views of all contributors to the Atlas.

5a. State and territory health departments to develop and implement evidence-based triage criteria for the prioritisation and allocation of patients to gastroscopy, colonoscopy, and gastroscopy performed with colonoscopy.

5b. Health service organisations to:

- i. Audit clinicians performing endoscopy services and provide the results back to clinicians to act upon, in line with Action 1.28 of the National Safety and Quality Health Service (NSQHS) Standards

 - ii. Incorporate individual clinicians' audit data as part of re-credentialing processes

 - iii. Report key performance indicators, trends and adverse events in endoscopy to the governing body, consistent with the NSQHS Standards.
-

5c. The Gastroenterological Society of Australia to develop a position statement on the appropriate use and timing of gastroscopy, and of gastroscopy performed with colonoscopy, for gastroenterologists and general practitioners.

5.1 Gastroscopy MBS services, 18–54 years

Why is this important?

Gastroscopy is used to investigate or treat conditions affecting the upper gastrointestinal (GI) tract. It can also be used to monitor conditions affecting the upper GI tract that lead to cancer in certain high-risk groups.¹⁻³

Most conditions affecting the upper gastrointestinal (GI) tract that require a gastroscopy are uncommon in people aged under 55 years. Oesophageal and stomach cancers are very rare in this age group, and even less common in people without certain risk factors, such as smoking.¹⁻³

The *Third Australian Atlas of Healthcare Variation* found substantial variation in hospitalisations for gastroscopy among people of all ages.⁴ Higher rates were seen in areas of socioeconomic advantage in major cities, and in women. These findings are not consistent with the prevalence of GI disease.

The fourth Atlas now examines gastroscopy services that are subsidised under the Medicare Benefits Schedule (MBS) in a population that has few indications for its use: people aged 18–54 years.

What did we find?

In 2018–19, there were 154,338 MBS-subsidised services for gastroscopy for people aged 18–54 years. The rate was **10.8 times as high** in the area with the highest rate as in the area with the lowest rate.

Rates were markedly higher in major cities than elsewhere. The national rate for women was 1.6 times as high as the rate for men. About six in every 10 gastroscopy services were performed on the same day as a colonoscopy service for the same person.

What can be done?

Development of national guidance on the appropriate use of gastroscopy is a priority. Guidelines should include recommendations on when gastroscopy should be done at the same time as a colonoscopy. Structured referral forms could aid assessment of appropriateness against guidelines. Health service organisations could ensure that credentialing requirements for clinicians performing gastroscopy include audit of adherence to guidelines.

Interventions are needed that focus on educating consumers and clinicians that the risk of upper GI cancer in this age group is low. Improving consumer understanding about the role of gastroscopy is also important.

More attention needs to be given to clinicians' education on the causes of iron deficiency anaemia in women aged under 55 years. Heavy menstrual bleeding, a commonly unrecognised cause, should be excluded before referral for gastroscopy.

Gastroscopy MBS services, 18–54 years

Context

This item examines rates of MBS-subsidised services for gastroscopy for people aged 18–54 years in Australia in 2018–19.

What is gastroscopy?

Gastroscopy, also known as an upper GI endoscopy, is the examination of the upper part of the GI tract, using a small, flexible tube with a camera on the end, called an endoscope. The procedure can also include a biopsy, if needed. The procedure, requires an empty stomach for an accurate examination. It is usually quick to perform, taking up to about 15 minutes.^{1,5}

What is it used for?

Gastroscopy is used to investigate, treat or monitor certain upper GI symptoms or diseases. Recommended uses are¹:

- Investigation of suspected bleeding from the upper GI tract and upper small bowel
- Investigation of symptoms suggestive of cancer (such as difficulty swallowing, weight loss, bleeding and stomach pain) or no response to acid suppression therapy
- Tissue diagnosis of suspected cancer or coeliac disease
- Surveillance of high-risk groups with chronic conditions that can increase cancer risk (for example, Barrett's oesophagus).

Gastroscopy is also used to treat bleeding in the upper GI tract, some upper GI cancers or a narrowed oesophagus (oesophageal stricture). However, gastroscopies for treatment (therapeutic gastroscopies) are not included in this data item.

Most conditions affecting the upper GI tract that require investigation with gastroscopy are uncommon in people aged under 55 years. They become more common with increasing age, the onset of chronic disease, or the use of certain medicines such as non-steroidal anti-inflammatory drugs.^{2,3}

Gastroscopy is not required to investigate uncomplicated reflux^{2,3,6,7}, a common condition that affects more than one in 10 people in Australia^{8,9}, with a few exceptions. This is because:

- Most people with reflux have heartburn or regurgitation that can be diagnosed clinically without investigation and managed effectively with dietary or lifestyle modifications, or acid suppression medicines⁶
- Only about one-third of people with gastro-oesophageal reflux disease (GORD), a condition in which reflux affects wellbeing and requires treatment, have abnormalities visible on gastroscopy²
- Most reflux does not progress to changes in the cells lining the upper GI tract, which can lead to Barrett's oesophagus or oesophageal cancer.²

Investigation with gastroscopy is required if reflux does not respond to a trial of acid suppression therapy and if 'alarm features' suggestive of cancer are present, such as difficulty swallowing, bleeding, weight loss, recurrent vomiting and anaemia. It is also required if the diagnosis is unclear or there are complications such as stricture.^{2,6,7,10-12}

Upper GI cancer is rare in people of any age and even lower in people aged under 55 years. Use of gastroscopy for population-based screening for upper GI cancer is not recommended because the chance of diagnosing serious disease is low. Upper GI cancer rates are lower in women than in men, and lower in people without risk factors, such as those who have never smoked^{2,13-17} (Table 5.1). These are important considerations for the appropriate use of gastroscopy, particularly for common conditions.

Table 5.1: Upper GI cancer rates per 100,000 people, by sex and age group, 2019

Age	Oesophageal cancer		Gastric cancer	
	Males	Females	Males	Females
35–39	0.5	0.1	1.6	1.9
40–44	1.0	0.2	3.4	2.5
45–49	2.9	1.3	5.6	1.6
50–54	7.2	1.5	11.2	5.7

Source: Australian Institute of Health and Welfare¹⁸

Coeliac disease is a common and under-diagnosed condition. Gastroscopy is used to confirm a diagnosis for people with positive coeliac serology or where the diagnosis is uncertain.^{6,10,19} Repeat gastroscopy after treatment with a gluten-free diet is controversial and is yet to be shown as cost-effective.²⁰

Gastroscopy is also used to investigate causes of suspected GI blood loss. People without a clear reason for iron deficiency should have a gastroscopy to exclude GI bleeding or malignancy (for example, postmenopausal women and most men). Menstruating women, blood donors and people with vegetarian or vegan diets should have other common causes of iron deficiency excluded first to avoid a missed diagnosis and unnecessary gastroscopy.^{21,22}

Why examine gastroscopy in people aged 18–54 years?

This Atlas examines variation in MBS-subsidised gastroscopy services for an age group in which signs and symptoms appropriate for investigation with gastroscopy are uncommon: adults aged under 55 years. Findings from the *Third Australian Atlas of Healthcare Variation* and a New South Wales study support exploration of variation in gastroscopy in this age group.^{4,23}

The third Atlas reported more than half a million (505,544) hospitalisations for gastroscopy among people of all ages in Australia in 2016–17.⁴ The rate in the area with the highest rate was 7.4 times as high as the rate in the area with the lowest rate. Higher rates were seen in areas of socioeconomic advantage in major cities, and in women. More than one-third (36%) of hospitalisations for colonoscopy included a gastroscopy.

The third Atlas findings highlighted a clear anomaly between the prevalence of risk factors for upper GI disease and gastroscopy hospitalisations, suggesting that some people are receiving care that is inappropriate and of no or little benefit.

Inappropriate use of gastroscopy in people aged under 55 years was examined in a New South Wales study.²³ Use of gastroscopy for investigating dyspepsia (indigestion or heartburn) in people aged under 55 years was considered low-value care – defined as care that provides no benefit, or a risk of harm that is greater than the benefit, or a benefit that is disproportionately low compared with its cost. About 14% of gastroscopies in adults aged under 55 years in New South Wales public hospitals were identified as low-value care in 2016–17. The rate of low-value gastroscopy increased by about 8% each year between 2010–11 and 2016–17.

Gastroscopy MBS services, 18–54 years

About the data

Data are sourced from the MBS dataset. This dataset includes information on MBS claims processed by Services Australia. It covers a wide range of services (attendances, procedures, tests) provided across primary care and hospital settings.

The dataset does not include:

- Services for publicly funded patients in hospital
- Services for patients in public outpatient clinics
- Services covered under Department of Veterans' Affairs arrangements.

The dataset does not allow analysis by Aboriginal and Torres Strait Islander status.

Rates are based on the number of MBS-subsidised services for gastroscopy per 100,000 people aged 18–54 years in 2018–19.

Because a record is included for each service rather than for each patient, patients who receive the service more than once in the financial year will be counted more than once.

The analysis and maps are based on the patient's postcode recorded in their Medicare file and not the location of the service.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

What do the data show?

Magnitude of variation

In 2018–19, there were 154,338 MBS-subsidised services for gastroscopy, representing 1,247 services per 100,000 people aged 18–54 years (the Australian rate).

The number of MBS-subsidised services for gastroscopy across 327* local areas (Statistical Area Level 3 – SA3) ranged from 218 to 2,348 per 100,000 people. The rate was **10.8 times as high** in the area with the highest rate compared with the area with the lowest rate. The number of MBS-subsidised services for gastroscopy varied across states and territories, from 481 per 100,000 people in the Northern Territory to 1,312 in Victoria (Figures 5.5–5.8).

After the highest and lowest 10% of results were excluded and 263 SA3s remained, the number of MBS-subsidised services per 100,000 people was 2.9 times as high in the area with the highest rate compared with the area with the lowest rate.

Analysis by remoteness and socioeconomic status

Rates were markedly higher in major cities than in other areas, and markedly lower in remote areas than in other areas. Overall, the rate for major cities was 3.4 times as high as the rate for remote areas (Figures 5.1 and 5.9).

Rates decreased with socioeconomic disadvantage in major cities, and in inner regional and remote areas. Overall, the rate of gastroscopy in the highest socioeconomic group was 1.4 times as high as in the lowest group (Figures 5.2 and 5.9).

* There are 340 SA3s. For this item, data were suppressed for 13 SA3s due to a small number of services and/or population in an area, or potential identification of individual patients, practitioners or business entities.

Notes:

Some SA3 rates are more volatile than others. These rates are excluded from the calculation of the difference between the highest and lowest SA3 rates in Australia.

For further detail about the methods used, please refer to the Technical Supplement.

Figure 5.1: Number of MBS-subsidised services for gastroscopy per 100,000 people aged 18–54 years, age and standardised, by remoteness of patient residence, 2018–19

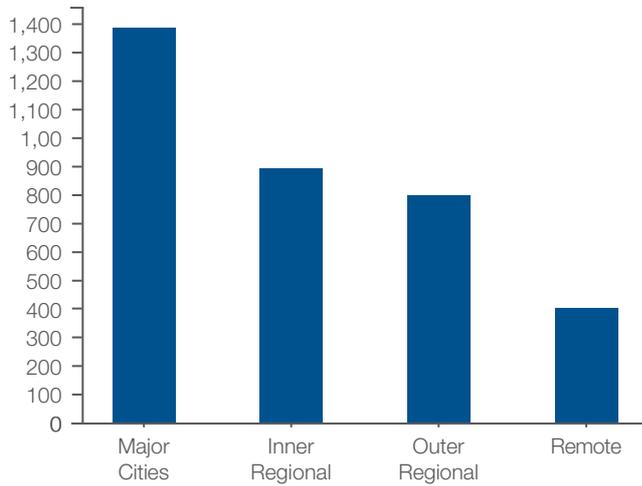

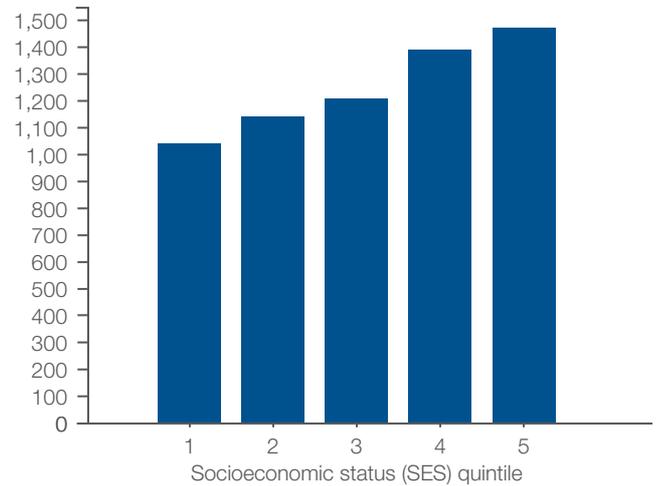

Figure 5.2: Number of MBS-subsidised services for gastroscopy per 100,000 people aged 18–54 years, age and standardised, by socioeconomic area of patient residence, 2018–19*

Notes:

* Areas with a low SES (=1) have a high proportion of relatively disadvantaged people. Areas with a high SES (=5) have a low proportion of relatively disadvantaged people.

Gastrosocopy MBS services, 18–54 years

Number of MBS-subsidised services for gastroscopy and colonoscopy for the same patient on the same day

In 2018–19, 58% of MBS-subsidised services for gastroscopy were performed on the same day as an MBS-subsidised service for colonoscopy for the same patient. There were 89,399 services for gastroscopy that accompanied a colonoscopy (Figure 5.3).

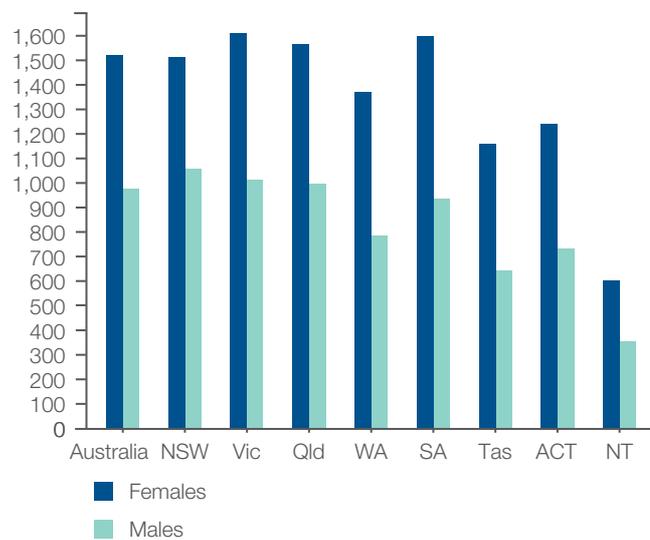

Figure 5.3: Number of MBS-subsidised services for gastroscopy on the same patient and same day as an MBS-subsidised service for colonoscopy, per 100,000 people aged 18–54 years, age and sex standardised, by state and territory of patient residence, 2018–19

Analysis by sex

The national rate of MBS-subsidised services for gastroscopy for females was 1.6 times as high as the rate for males. Rates were consistently higher for females in all states and territories (Figure 5.4).

Figure 5.4: Number of MBS-subsidised services for gastroscopy per 100,000 people aged 18–54 years, age and sex standardised, by state and territory of patient residence, by sex, 2018–19

The data for Figures 5.3 and 5.4, and the data and graphs for analysis by Primary Health Network are available at safetyandquality.gov.au/atlas

Notes:

Interpretation

There is wide variation in gastroscopy use, probably involving overuse in some areas and underuse in others. Rates of gastroscopy were markedly higher in major cities than elsewhere. Rates were also higher for women than for men in all states and territories.

These findings are consistent with those in the third Atlas, which examined public and private hospitalisations for gastroscopy.

Variation in rates of gastroscopy is likely to be due to geographical differences in the factors discussed below.

Variation between areas may not directly reflect the practices of the clinicians who are based in these areas. The analysis is based on where people live rather than where they obtain their health care. People may travel outside their local area to receive health care.

Clinical decision-making

Variation in adherence with available clinical guidelines may influence rates of gastroscopy.

International evidence suggests that a high proportion of gastroscopies do not accord with guideline recommendations. A 2010 meta-analysis of more than 13,000 patients undergoing gastroscopy found that 22% of procedures did not align with recommended indications in European and American guidelines.²⁴ More recently, a 2018 systematic review and meta-analysis reported that up to 54% of gastroscopies in 15 countries were performed for inappropriate indications.²⁵ Despite guidelines that recommend against using gastroscopy to investigate uncomplicated GORD^{6,7,11,26}, a New Zealand study reported this as one of the most common inappropriate indications for performing gastroscopy.²⁷

Differences in clinical opinion on management where the evidence is unclear may contribute to variation. For example, further evidence is needed to demonstrate the benefit of gastroscopy after a diagnosis of coeliac disease.²⁰

Difficulties in keeping up to date with rapidly changing evidence may also influence rates.²⁵

Some clinicians may perform gastroscopy in low-risk people, such as those aged under 55 years, to relieve patient anxiety and reassure them that they do not have GI cancer. However, this reassurance may be short lived, and the procedure has a low chance of diagnosing significant disease.²⁸⁻³⁰

Fear of litigation for not investigating symptoms may influence clinicians' decisions about use of gastroscopy, particularly if they are unaware of current recommendations or evidence about the incidence of upper GI cancers. Concerns about late diagnosis and subsequent litigation, as well as few disincentives for over-testing may also contribute to overuse of gastroscopy.²⁵

Higher rates of gastroscopy in women than in men may be related to higher rates of iron deficiency in women. Gastroscopy might have been used before exclusion of dietary causes of iron deficiency, or heavy menstrual bleeding in menstruating women. Higher gastroscopy rates in women raise concern of delayed diagnoses and treatment, because common causes of iron deficiency are being missed.

Gastroscopy and colonoscopy performed on the same day

The ease of performing a gastroscopy at the same time as a colonoscopy may contribute to variation. About six in 10 gastroscopy services were performed on the same day in the same person. Both procedures should be performed concurrently for only a limited number of conditions, so the high rates suggest inappropriate use.

Australia's National Bowel Cancer Screening Program offers a two-yearly faecal occult blood test (FOBT) for people aged 50–74 years. Guidelines recommend colonoscopy for people who have a positive FOBT to assist with diagnosing disease.³¹ Some clinicians performing gastroscopies may be unaware that a FOBT only detects lower GI tract bleeding.

Gastrosocopy MBS services, 18–54 years

Higher rates of both procedures may also reflect investigation of iron deficiency in menstruating women before excluding diet or heavy menstrual bleeding as the cause.

Referral practices

Variation in gastrosocopy rates may be due to referral practices. A New Zealand study found that 42% of referrals did not follow American Society of Gastroenterology criteria. No cancers were found in gastrosocopies from inappropriate referrals.²⁷ Surveillance of healed benign lesions was the most common inappropriate reason to request a gastrosocopy among hospital-based clinicians (31% of consultant requests). Investigation of symptoms considered functional in origin (heartburn) was the most common inappropriate reason among general practitioners (GPs) (25% of requests).

Consumer expectations

Consumer expectations and perception of cancer risk may contribute to variation in rates of gastrosocopy use.^{26,32} People often have incorrect beliefs about their cancer risk.^{32,33} This may influence their perceptions about the benefits of interventions such as screening to detect GI cancer, and their preference and demand for investigations, even when their risk of cancer is low.

In the United Kingdom, the ‘Be Clear on Cancer’ campaign in 2015, which aimed to raise awareness of GI cancers, increased demand for gastrosocopy by 48% but did not affect the rate of cancer diagnosis.³⁴

Access to services and number of clinicians providing services

Access to clinicians may influence the likelihood of people seeking care and the rates of gastrosocopy use. The practice styles of individual clinicians may be more likely to affect rates in areas with fewer clinicians, such as rural and regional locations, than in areas with more clinicians.

Availability and affordability of services may also influence patterns of use. Ability to pay out-of-pocket costs for gastrosocopy is likely to be lower in areas of socioeconomic disadvantage, and access is likely to be more difficult in areas with fewer services. Open-access endoscopy services, where GPs are able to request gastrosocopy without specialist review, may also influence patterns of use.

Financial incentives

Greater remuneration for providing a service rather than consultation may lead to variation and over-servicing in some areas.

Promoting appropriate care

Unwarranted variation in the use of gastrosocopy in people aged under 55 years could be addressed by reducing the rate of inappropriate gastrosocopies and increasing access in areas that are under-served.

Australia’s finite health resources should be directed to high-value care, and away from low-value care such as use of gastrosocopy to investigate reflux in people aged under 55 years, where it will not change the diagnosis or management. Improving awareness of the causes of iron deficiency unrelated to the upper GI tract will reduce unnecessary gastrosocopy and avoid delays in diagnosis. Reducing inappropriate referrals for gastrosocopy could also free up resources to reduce waiting times for public colonoscopy services.

Guideline and resource development

Development of national guidance to support appropriate use of gastrosocopy is a priority. These could be used to assess appropriateness of referrals and for clinical audit of clinicians’ gastrosocopy practices. The guidelines should cover guidance on appropriate use of same-day upper and lower GI endoscopy, as recommended by the Medicare Benefits Schedule Review Taskforce.³⁵

Integration of cancer mortality and lifestyle data into healthcare pathways, training guidelines, and specialist and consumer resources could also support appropriate use of gastrosocopy.

Clinical decision-making

Strategies to improve clinicians' skills in provisional diagnosis could improve the assessment of reflux symptoms and iron deficiency, and reduce unnecessary gastroscopy.

Use of medicines that can cause GORD symptoms should be excluded in people presenting with reflux.

Dietary causes and heavy menstrual bleeding should be excluded in women with iron deficiency. Improved awareness and application of the *Heavy Menstrual Bleeding Clinical Care Standard* may reduce delays in diagnosis of heavy menstrual bleeding and the rates of unnecessary gastroscopy in menstruating women.^{4,36}

Improved use of medicines to manage GORD symptoms may help reduce inappropriate gastroscopies. Proton pump inhibitors (PPIs), which are commonly used to manage GORD symptoms, are most effective when taken at least half an hour before the first meal of the day.⁶ Taking PPI medicines at the wrong time can lead to poor symptom control, and may contribute to unnecessary use of gastroscopy to investigate symptoms.

Consumer education and reassurance

Informing people aged under 55 years about the limited role of gastroscopy in the management of most upper GI symptoms, and reassuring them that their risk of developing upper GI cancer is very low may reduce demand for inappropriate gastroscopy. Interactive tools that identify a person's risk or the incidence of cancer – such as the Australian Institute of Health and Welfare cancer summary data tool (see 'Resources' on page 264) – may help clinicians when having conversations with their patients about upper GI cancer risk.¹⁸

Consumer education for women about the importance of considering heavy menstrual bleeding or diet as a cause of iron deficiency anaemia may also reduce unnecessary demand and use of gastroscopy.

Reducing risk factors

Making lifestyle changes to reduce the risk of GORD, upper GI cancers and bowel cancer should be the focus for people aged under 55 years presenting with reflux symptoms who are concerned about cancer, rather than having a gastroscopy. For example, weight loss can reduce GORD symptoms. In women, a 3.5 kg/m² reduction in body mass index can result in a nearly 40% reduction in the risk of frequent GORD symptoms.^{37,38} Improving a person's understanding about their cancer risk – particularly in people aged under 55 years – is important to reduce anxiety and dispel myths about cancer.³⁹

Public health initiatives that address diet, smoking, obesity, excessive alcohol consumption and sedentary lifestyle should be targeted to areas with a high prevalence of risk factors for upper GI disease.

Clinical audit and clinician education

Clinical audit is a tool that could be used more widely to support appropriate use of gastroscopy in Australia.

Health service organisations could ensure that credentialing requirements for clinicians include a clinical audit against evidence-based guidelines. Audits in this area could form part of continuing education requirements for clinicians.

A study of Australian GPs found that participation in clinical self-audit against Gastroenterological Society of Australia recommendations improved management of GORD.⁴⁰ Referral for gastroscopy fell from 48% to 45% of patients during the audit program. Other aspects of management improved – for example, identification of risk factors that triggered symptoms (such as medicines), and recommendations for lifestyle changes such as weight loss and dietary changes.⁴⁰

An indicator to measure gastroscopies performed after a positive FOBT (which is contrary to guidelines which recommend a colonoscopy only) could be developed for clinical audits.

Gastroscopy MBS services, 18–54 years

Structured referral forms and checklists for GPs could support appropriate requests for gastroscopy in younger adults. Using guidelines to assess the appropriateness of referrals could also increase the likelihood that the procedure will assist with providing a diagnosis.

Educational programs for gastroenterologists and GPs could improve the appropriateness of requests for gastroscopy. Education could cover the:

- Non-GI causes of iron deficiency anaemia
- Low risk of upper GI cancer in people aged under 55 years
- Limited role of gastroscopy in GORD
- Low chance that gastroscopy will diagnose significant disease for simple upper GI symptoms.

Appropriate prioritisation of colonoscopy and gastroscopy

Health service organisations need to examine the volume of gastroscopies that may be tying up resources needed to perform colonoscopies. Colonoscopy for people with a positive FOBT should be prioritised over gastroscopy for people whose management is unlikely to change as a result of the gastroscopy, such as people aged under 55 years with typical symptoms of reflux. Better use of resources according to clinical need would improve the likelihood of diagnosing significant disease and reduce delays in diagnosis.

Triage systems

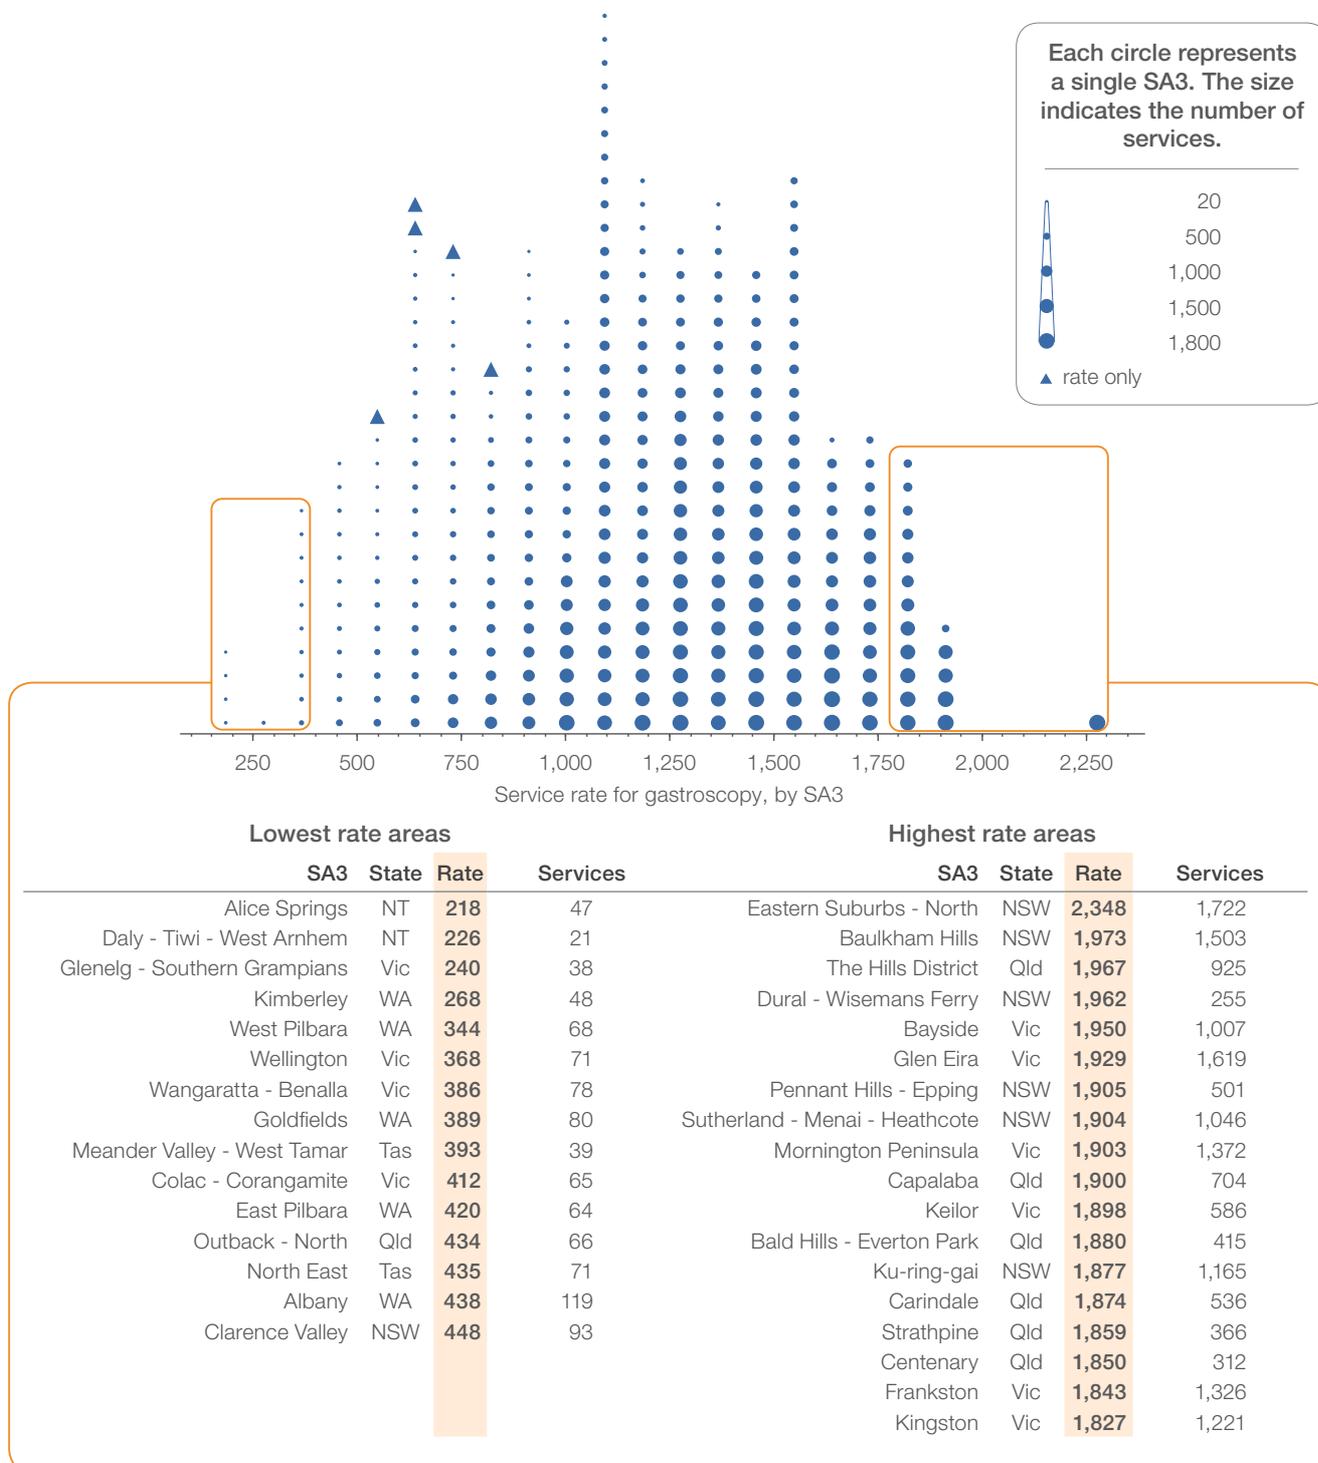

Many states and territories are introducing evidence-based triage systems for prioritising and allocating people for gastroscopy and colonoscopy, with the aim of reducing variation in use of these procedures:

- Victorian health services require clinicians to refer people for gastroscopy according to the categorisation guidelines; these guidelines specify the appropriate use of gastroscopy in people aged under 55 years who have symptoms of GORD with no alarm features, and surveillance of people with Barrett's oesophagus⁴¹
- Tasmania has adopted the Victorian categorisation guidelines and formed a statewide endoscopy network to monitor the quality of its services⁴²
- Queensland and Western Australia have introduced clinical prioritisation criteria for many clinical areas, including gastroenterology, to triage patients referred to public specialist outpatient services.^{43,44}

Wider use of these triage systems could result in more appropriate prioritisation of gastroscopy and colonoscopy.

Rates by local area

Australian initiatives

The information in this chapter will complement work already underway to improve the use of gastroscopy in Australia. At a national level, this work includes:

- Royal Australasian College of Surgeons, Choosing Wisely recommendation 4: Do not use endoscopy for investigation in gastric band patients with symptoms of reflux⁴⁶
- A review of the impact of the changes made to the MBS items for gastroenterology services in response to the Medicare Benefits Schedule Review Taskforce.³⁵

Many state and territory initiatives are also in place to address access to gastroscopy, including:

- *Upper Gastrointestinal Endoscopy Categorisation Guidelines for Adults*, Victoria⁴¹
- *Endoscopy Action Plan*, Queensland⁴⁷
- Clinical prioritisation criteria: endoscopy⁴⁸ and Clinical prioritisation criteria: gastroenterology⁴³, Queensland
- *Referral Guidelines: Direct Access Gastrointestinal Endoscopic Procedures*, Western Australia⁴⁹
- *Urgency Categorisation and Access Policy for Public Direct Access Adult Gastrointestinal Endoscopy Services*, Western Australia⁴⁴
- Statewide endoscopy care network, which monitors and assesses the quality of endoscopy services, Tasmania.⁴²

5.2 Repeat colonoscopy MBS services, all ages

Why is this important?

Colonoscopy is used to investigate bowel problems or symptoms. Repeat colonoscopy is mainly used to monitor for bowel cancer and its precursor, polyps (adenomas), in people with an increased risk of developing bowel cancer. Less commonly, colonoscopy is repeated to manage chronic inflammatory conditions of the bowel.

The first and third Atlases in the *Australian Atlas of Healthcare Variation* series found substantial variation in rates of colonoscopy according to where people live.^{1,2} Differences in adherence to surveillance guidelines were identified as a possible reason for the variation. Guideline recommendations on the timing of repeat colonoscopies are based on bowel cancer risk. There are limited reasons for repeating a colonoscopy after a period of less than three years.

The fourth Atlas examines rates of colonoscopy that are repeated within two years and 10 months of an earlier colonoscopy, using Medicare Benefits Schedule (MBS) data.

What did we find?

In 2018–19, there were almost 148,000 MBS-subsidised services for repeat colonoscopy performed within two years and 10 months in people of all ages.

The rate in the area with the highest rate was **19.9 times as high** as the rate in the area with the lowest rate. Rates were markedly higher in major cities than elsewhere. In major cities, rates increased with socioeconomic advantage.

What can be done?

More needs to be done to improve the consistent application of the national guidelines on bowel cancer screening and surveillance. A concerted focus by clinicians, medical colleges and health service organisations to drive implementation of the *Colonoscopy Clinical Care Standard* and national guidelines could reduce inappropriate requests for repeat colonoscopies and free up services for people at high risk of bowel cancer.³⁻⁵

Structured referral forms could aid assessment of requests for repeat colonoscopies against guidelines. Health service organisations could ensure that re-credentialing requirements for clinicians performing colonoscopy include clinical audit against guidelines to promote high-quality colonoscopies.

Wider consumer awareness about the impact of lifestyle on cancer risk is needed. Educating people on ways they can reduce their risk of bowel cancer and improve their general health should be an integral part of surveillance. Integration of data about cancer incidence and lifestyle into healthcare pathways, training guidelines and consumer resources could help prompt discussion between clinicians and patients and may reduce inappropriate repeat colonoscopy.

Repeat colonoscopy MBS services, all ages

Context

This item examines rates of MBS-subsidised services for repeat colonoscopy performed within two years and 10 months of an earlier colonoscopy for people of all ages in Australia in 2018–19.

What is colonoscopy?

Colonoscopy is the examination of the large bowel (colon) using a small, flexible tube with a camera on the end, called a colonoscope. It can also include removal of polyps (adenomas) or other abnormal growths, and a biopsy. Polyps can be precursors of bowel cancer and are a marker of increased risk.

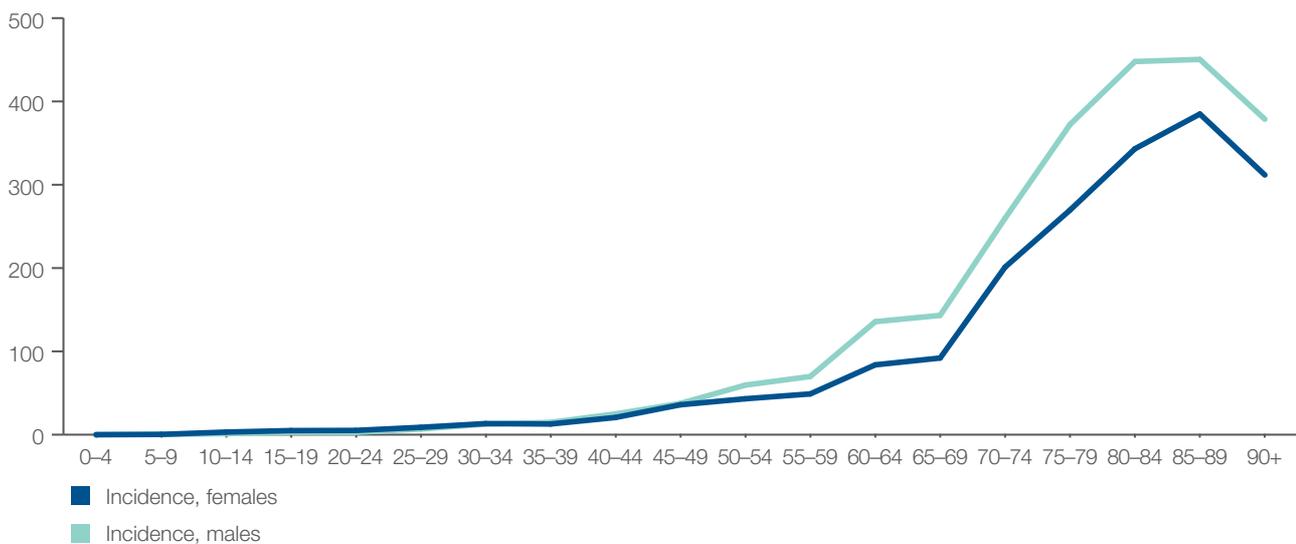

What is it used for?

Colonoscopy is used to investigate bowel problems or symptoms. It is also used to monitor for and detect polyps or bowel cancer (colorectal cancer) in people with no symptoms but with an increased risk, and to manage chronic conditions of the bowel, such as inflammatory bowel disease (IBD). Increased

risk of bowel cancer can be identified from a faecal occult blood test (FOBT) of a person's bowel motion (possibly done as part of the National Bowel Cancer Screening Program [NBCSP]), previous results of a colonoscopy, a family history of bowel cancer or a high-risk genetic condition.³ Bowel cancer is the fourth most commonly diagnosed cancer in Australia.^{6,7} After the age of 50, the incidence of bowel cancer steadily increases (Figure 5.10).⁴ About 55% of the bowel cancer burden in Australia can be attributed to lifestyle factors including diet (high in processed meat, red meat and sugar), physical inactivity, being overweight, smoking and alcohol use.⁷

While the age-standardised incidence of bowel cancer in Australia declined from 2001 to 2020* (from 66 to 51 cases per 100,000 people), the estimated number of people diagnosed with bowel cancer increased (from 12,806 to 15,494 people) because of the ageing population.⁸

Figure 5.10: Colorectal cancer rates (per 100,000 people), by sex and age group, 2020*

* 2020 incidence estimates are projections based on 2007–2016 incidence data.

Source: Australian Institute of Health and Welfare.⁸

When does a colonoscopy need to be repeated?

The most common reasons to repeat a colonoscopy are^{4,5}:

- Monitoring (surveillance) of the bowel after colorectal surgery or removal of polyps that can lead to bowel cancer
- Monitoring (surveillance) of chronic conditions of the bowel such as IBD
- Regular screening of people with a strong family history of bowel cancer, or a hereditary cancer syndrome that can lead to bowel cancer
- Removal (treatment) of previously identified polyps
- Onset of new signs or symptoms thought to be from the lining of the bowel
- Inadequate previous colonoscopy; for example, because of an incomplete colonoscopy or poor bowel preparation.

High-quality colonoscopy can detect about 95% of bowel cancers and polyps, but it is an invasive and costly procedure with a risk of complications.⁵ For this reason, colonoscopy for population screening is reserved for people with an increased risk of bowel cancer, if there is a higher chance of diagnosing significant disease.⁷ Similarly, recommendations for a repeat colonoscopy and its timing for greatest benefit are based on a person's risk of bowel cancer.

The national *Colonoscopy Clinical Care Standard* mandates that, if surveillance is required, colonoscopy is repeated at intervals consistent with evidence-based guidelines.³ Two Australian national guidelines address the need for and timing of repeat colonoscopy – one focuses on the use of colonoscopy in screening high-risk groups (that is, people with a family history of bowel cancer or a hereditary cancer syndrome), while the other focuses on the use of colonoscopy for surveillance.^{4,5}

If guidelines are followed, a small proportion of people who have an initial colonoscopy might be expected to need a repeat within three years. These would usually be people identified as having a high risk of bowel cancer or who have IBD. A poor-quality colonoscopy, or uncertainty about when a previous colonoscopy was performed, are also reasons a colonoscopy may be repeated within one or two years.^{4,5} However, the *Colonoscopy Clinical Care Standard* addresses the problem of uncertainty about the timing of a previous colonoscopy by stipulating that the results of colonoscopies are communicated to the person who had the procedure, the general practitioner (GP) and any other relevant clinicians involved in the person's care.³

Colonoscopy surveillance guidelines identify a person's risk of bowel cancer based on the results of their previous colonoscopy or colonoscopies.^{5,9} These guidelines apply to anyone who has had a colonoscopy, including participants in the NBCSP who had a colonoscopy because of a positive FOBT. The timing of the next colonoscopy, if needed, depends on the number, size and type of polyps removed.⁹ The greater the risk, the smaller the interval before repeating the procedure. People at potentially high risk will generally require a repeat colonoscopy every one to two years. Yearly colonoscopies are also recommended for high-risk people with IBD, and a repeat colonoscopy is also recommended within 12 months of bowel resection (surgery).⁵

A colonoscopy is also recommended every one to two years for people with, or at high risk of having, a hereditary cancer syndrome, such as Lynch syndrome, and may start at 25 years or younger for people with this syndrome.⁴

Repeat colonoscopies are also recommended for other groups, such as people with a strong family history and people otherwise at moderate risk of bowel cancer. However, for most people in these groups, the recommended intervals between colonoscopies are longer than that examined in this Atlas.^{4,5}

Repeat colonoscopy MBS services, all ages

Why examine repeat colonoscopy?

The first and third Atlases in the *Australian Atlas of Healthcare Variation* series examined MBS-subsidised services for colonoscopy and hospitalisations for colonoscopy, respectively.^{1,2} Although these Atlases used different datasets, each found substantial variations in colonoscopy rates according to where people live. They also found patterns of use that did not match the burden of disease. Outer regional areas and areas of socioeconomic disadvantage have the highest rates of bowel cancer incidence and mortality in Australia^{7,10}, yet both Atlases found the highest rates of colonoscopy in the most socioeconomically advantaged areas of major cities.

Clinical practice that is not supported by guidelines, such as repeating colonoscopies sooner than is recommended, was identified as a possible reason for the high rates of colonoscopy in some metropolitan areas. Differences in uptake of the NBCSP were also identified as a possible reason for the variation between major cities and other areas.^{1,2}

Little is known about the rate of repeat colonoscopies in Australia. This Atlas examines variation in rates of short-interval repeat colonoscopy using MBS-subsidised services performed in the same person in 2018–19. The interval of two years and 10 months was chosen to exclude services to people who present early for their three-yearly colonoscopy.

Data from this Atlas item should provide a baseline for evaluating changes to MBS items for colonoscopy introduced by the Australian Government in 2019, which included new item numbers with guideline-recommended surveillance intervals.¹¹ It should also be helpful for evaluating implementation of the *Colonoscopy Clinical Care Standard*, mandated in 2019, as part of the National Safety and Quality Health Service (NSQHS) Standards for the accreditation of all hospitals and day procedure services performing colonoscopy.^{3,12}

About the data

Data are sourced from the MBS dataset. This dataset includes information on MBS claims processed by Services Australia. It covers a wide range of services (attendances, procedures, tests) provided across primary care and hospital settings.

The dataset does not include:

- Services for publicly funded patients in hospital
- Services for patients in outpatient clinics of public hospitals
- Services covered under Department of Veterans' Affairs arrangements.

The dataset does not allow analysis by Aboriginal and Torres Strait Islander status.

Rates are based on the number of MBS-subsidised services for repeat colonoscopy per 100,000 people of all ages, age and sex standardised, in 2018–19.

Because a record is included for each service rather than for each patient, patients who receive the service more than once in the financial year will have more than one service counted.

In the patient count analysis, patient counts reflect the number of unique patients, regardless of the number of services the patient may have received in the year.

The analysis and maps are based on the patient's postcode recorded in their Medicare file and not the location of the service.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

What do the data show?

Magnitude of variation

In 2018–19, there were 147,875 MBS-subsidised services for repeat colonoscopy performed within two years and 10 months, representing 522 services per 100,000 people of all ages (the Australian rate).

The number of MBS-subsidised services for repeat colonoscopy across 324* local areas (Statistical Area Level 3 – SA3) ranged from 62 to 1,236 per 100,000 people. The rate was **19.9 times as high** in the area with the highest rate compared with the area with the lowest rate. The number of MBS-subsidised services for repeat colonoscopy varied across states and territories, from 191 per 100,000 people in the Northern Territory to 596 in Queensland (Figures 5.13–5.16).

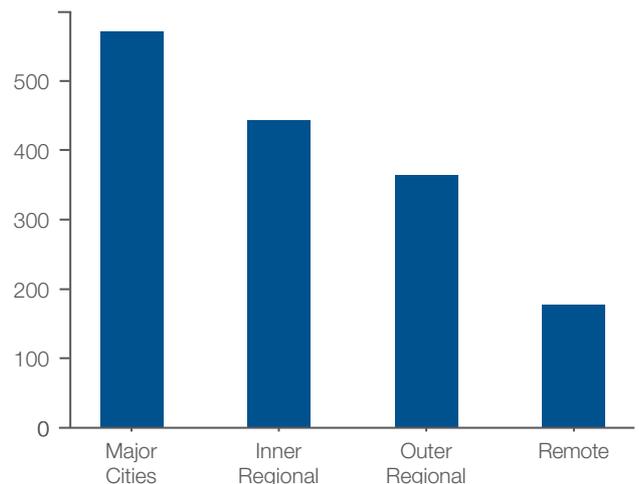

After the highest and lowest 10% of results were excluded and 260 SA3s remained, the number of MBS-subsidised services per 100,000 people was 2.7 times as high in the area with the highest rate compared with the area with the lowest rate.

Analysis by remoteness and socioeconomic status

Rates for MBS-subsidised services for repeat colonoscopy were higher in major cities than elsewhere. The rate for major cities was 3.2 times as high as the rate for remote areas (Figures 5.11 and 5.17).

Rates increased with socioeconomic advantage in major cities and overall. The rate in the highest socioeconomic group was 1.6 times as high as the rate in the lowest (Figures 5.12 and 5.17).

Figure 5.11: Number of MBS-subsidised services for repeat colonoscopy per 100,000 people of all ages, age and sex standardised, by remoteness of patient residence, 2018–19

The data for Figures 5.11 and 5.12 are available at safetyandquality.gov.au/atlas

* There are 340 SA3s. For this item, data were suppressed for 16 SA3s due to a small number of services and/or population in an area, or potential identification of individual patients, practitioners or business entities.

Notes:

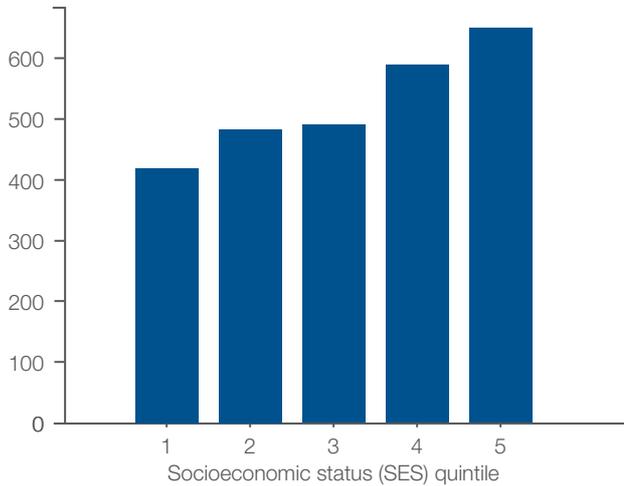

Some SA3 rates are more volatile than others. These rates are excluded from the calculation of the difference between the highest and lowest SA3 rates in Australia.

For further detail about the methods used, please refer to the Technical Supplement.

Repeat colonoscopy MBS services, all ages

Figure 5.12: Number of MBS-subsidised services for repeat colonoscopy per 100,000 people of all ages, age and sex standardised, by socioeconomic area of patient residence, 2018–19

Analysis by number of people who had at least one repeat colonoscopy

In 2018–19, there were 139,072 people who had at least one MBS-subsidised service for repeat colonoscopy, representing 491 people per 100,000 people of all ages.

Analysis by number of repeat colonoscopy services without polyp removal

In 2018–19, there were 71,464 MBS-subsidised services for repeat colonoscopy without polyp removal, representing 257 services per 100,000 people of all ages (the Australian rate). The percentage of MBS-subsidised services for repeat colonoscopy without polyp removal was 49%, and varied across states and territories, from 35% in the Australian Capital Territory to 55% in Victoria and the Northern Territory.

The data and graphs for analysis by number of people who had at least one repeat colonoscopy, analysis by number of repeat colonoscopy services without polyp removal, and analysis by Primary Health Network are available at safetyandquality.gov.au/atlas

Notes:

Areas with a low SES (=1) have a high proportion of relatively disadvantaged people. Areas with a high SES (=5) have a low proportion of relatively disadvantaged people.

For further detail about the methods used, please refer to the Technical Supplement.

Sources: AIHW analysis of Medicare Benefits Schedule data and ABS Estimated Resident Population 30 June 2018.

Interpretation

Variation is warranted when it reflects variation in underlying disease and need for care; however, the rates of repeat colonoscopy do not appear to match this pattern, nor do they match the epidemiology of disease. There was widespread variation in repeat colonoscopy use, with rates much higher in major cities compared with elsewhere. Rates were also lower in areas of socioeconomic disadvantage.

These findings are consistent with the findings in the first and third Atlases, which examined rates of MBS-subsidised colonoscopy, and public and private hospitalisations for colonoscopy, respectively.

Variation in rates of repeat colonoscopy is likely to be due to the geographical differences in the factors discussed below.

Variation between areas may not directly reflect the practices of the clinicians who are based in these areas. The analysis is based on where people live rather than where they obtain their health care. Patients may travel outside their local area to receive health care.

Clinical decision-making

High rates of early repeat colonoscopy may be related to clinical practice that is not supported by guidelines. Australian and international studies have found that one-third of colonoscopies are repeated at intervals sooner than the guidelines recommend, with some reporting this to be as high as half.¹³⁻¹⁸ Difficulties in keeping up to date with guidelines and differences in clinical opinion on management may also contribute.¹⁹

Fear of litigation for not investigating symptoms may also influence clinicians' decisions about when and how often to provide repeat colonoscopies for the same person, particularly if they are unaware of current recommendations, or of evidence about the incidence of gastrointestinal (GI) cancers and the risk of symptoms leading to significant disease. Concerns about late diagnosis and subsequent litigation, and a lack of disincentives for over-testing, may also contribute to overuse.¹⁹

Some colonoscopies may be repeated because the previous report was not easily accessible or did not contain the information required to guide clinical decision-making.

Quality of bowel preparation

High-quality bowel preparation is essential for a successful colonoscopy.⁵ In the United Kingdom, poor bowel preparation has been reported to account for up to 25% of failed colonoscopies.²⁰ Poor bowel preparation results in poor visualisation of the colon, and has been associated with up to 47% lower likelihood of detecting and removing polyps that can lead to the development of bowel cancer.²¹ For this reason, people who had a colonoscopy with poor bowel preparation require a repeat colonoscopy within a year.^{5,22} Poor bowel preparation also results in considerable inconvenience and waste. Australian guidelines recommend that successful bowel preparation should be achieved in at least 90% of colonoscopies.⁵

The training and experience of the colonoscopist may also contribute to variation. International studies report a three-to-six-fold difference in adenoma detection rate variability between colonoscopists.⁵

Consumer expectations

A person's understanding about their risk of bowel cancer and the rate of development of bowel cancer may drive anxiety and lead to more frequent surveillance. Anxiety about interval cancers – cancers that occur between routine surveillance – has been suggested as a reason for repeating colonoscopies at shorter intervals than guidelines currently recommend.²³ Lack of access to a GP, specialist or surgeon who is informed about the evidence to help allay a person's anxiety about their risk of developing cancer may also lead to inappropriate repeat colonoscopies.

Repeat colonoscopy MBS services, all ages

People often have incorrect perceptions of their cancer risk and the benefits of interventions such as screening and surveillance to detect GI cancer.^{24,25} These perceptions can influence their preference and demand for investigations, even when their risk of cancer is low.²⁶

Access to services and number of clinicians providing services

Access to clinicians may influence the likelihood of people seeking care and the rates of repeat colonoscopy. The practice styles of individual clinicians may be more likely to affect rates in areas with fewer clinicians, such as rural and regional locations, than in areas with more clinicians.

Availability and affordability of services may also influence patterns of use. Ability to pay out-of-pocket costs for services is likely to be lower in areas of socioeconomic disadvantage, and access is likely to be more difficult in areas with fewer services. Open-access endoscopy services, in which GPs are able to request colonoscopy without specialist review, may also influence patterns of use.

Financial incentives

Greater remuneration for providing a service rather than a consultation may lead to variation and over-servicing in some areas.

Promoting appropriate care

More must be done to improve the consistent application of the national guidelines on bowel cancer screening and surveillance. The Atlas shows a pattern of repeat colonoscopy use that is not consistent with the prevalence of disease, indicating possible overuse in some areas and underuse in others. Repeating the procedure in people who are unlikely to benefit puts them at risk of procedural harms and may reduce opportunities for people who are at high risk of bowel cancer and more in need of the procedure. It also results in inconvenience, cost and confusion to the individual and the health system.

A concerted focus by clinicians, medical societies and colleges, and health service organisations across Australia to implement the *Colonoscopy Clinical Care Standard*³ is needed to drive improvements in the appropriate use of colonoscopy, reduce inappropriate short-interval repeat colonoscopies and free up services for people at high risk of bowel cancer.

The *Colonoscopy Clinical Care Standard* aims to ensure colonoscopies are used appropriately and performed safely, and is mandated as part of the NSQHS Standards for the accreditation of hospitals and day procedure services performing colonoscopy in Australia.^{3,12} To improve the follow-up and reporting of a colonoscopy, it recommends that the clinician who performs the colonoscopy communicates in writing the reason for the colonoscopy, its findings, any histology results, and recommendations for management to the person having the procedure, the GP, and any other relevant clinicians, and documents this in the facility records. It recommends that, if surveillance colonoscopy is required, it must be consistent with the intervals in national evidence-based guidelines.

Health service organisations could improve the implementation of the *Colonoscopy Clinical Care Standard*³ by ensuring that credentialing requirements for clinicians performing colonoscopy include a clinical audit against the clinical care standard, and that they provide audit results to the hospital's clinical review meetings and re-credentialing committee. Resources for colonoscopists to support implementation include a colonoscopy report template and a template for follow-up letters to GPs and patients (see Resources).

The low rates of short-interval repeat colonoscopies in disadvantaged remote areas are concerning, because they suggest that people at high risk of bowel cancer could be missing out on appropriate surveillance. These low rates are consistent with participation rates reported in the NBCSP.⁷ Strategies to improve participation in the NBCSP and access to colonoscopy services for people living in remote areas are a priority.

Unwarranted variation in repeat colonoscopy could be addressed in the following ways.

Quality colonoscopy and clinical audit

Recertification of ongoing competency is now mandatory for all practitioners working in health service organisations that are assessed against the NSQHS Standards.¹² Only colonoscopists who meet the certification and recertification standards can perform colonoscopy independently in Australia. The quality indicator together with the standard for reporting should reduce the proportion of repeat colonoscopies performed because of uncertainty about the quality of another clinician's colonoscopy.

Clinical audit could be used more widely to support decision-making about repeat colonoscopies. Audits in this area could also be part of continuing education requirements for clinicians.

Structured referral forms and checklists outlining the appropriate reasons for, and frequency of, repeat colonoscopy for greatest benefit, as recommended in the *Colonoscopy Clinical Care Standard*³ and national guidelines, could aid assessment of requests that do not meet guideline-recommended intervals.

Clinician education

Educational programs for clinicians could improve the appropriateness of requests for repeat colonoscopies. Improving clinician familiarity with guidelines, with the evidence base for recommended surveillance intervals and with the consequences of overuse of colonoscopy could better equip them to manage requests for performing colonoscopy earlier than the guidelines recommend.

Consumer education and reassurance

Informing and reassuring people of their risk of developing bowel cancer, and that the rate of progression from polyp formation to bowel cancer is generally slow may reduce demand for more frequent surveillance. Improving a person's understanding about their cancer risk is important to reduce anxiety and dispel myths about cancer. Interactive tools that identify a person's cancer risk – such as the Australian Institute of Health and Welfare cancer summary data tool (see 'Resources' on page 282) – may aid understanding.⁸

Integration of data about cancer incidence and lifestyle into healthcare pathways and consumer resources could help prompt these discussions between consumers and clinicians.

Reducing risk factors

Wider consumer awareness about risk factors and the impact of lifestyle on bowel cancer risk is needed. Bowel cancer incidence could be significantly reduced with successful modification of the key population attributable risks – that is, addressing diet (21.8%), physical inactivity (16.5%), being overweight or obese (12.5%), smoking (7.4%) and alcohol use (5.5%).^{7*} Public health initiatives to address risk factors should be targeted to areas with a high prevalence of these.

Educating consumers on ways they can reduce their risk of bowel cancer and improve their general health should be an integral part of colonoscopy surveillance, and may reduce requests for colonoscopies to be performed sooner than the guidelines recommend.

* Attributable burden from multiple risk factors cannot be combined or added together due to the complex pathways and interactions between risk factors.

Repeat colonoscopy MBS services, all ages

Triage systems

Many states and territories are introducing evidence-based triage systems for prioritising and allocating people for gastroscopy and colonoscopy, with the aim of reducing variation in use of these procedures:

- Victorian health services require clinicians to refer people for colonoscopy according to the categorisation guidelines²⁷
- Tasmania has adopted the Victorian categorisation guidelines and formed a statewide endoscopy network to monitor the quality of its services²⁸
- New South Wales has developed categorisation guidelines to support the appropriate use of colonoscopy across all healthcare settings²⁹
- Queensland and Western Australia have introduced clinical prioritisation criteria for many clinical areas, including gastroenterology, to triage patients referred to public specialist outpatient services.³⁰⁻³²

Wider use of such systems could result in more appropriate prioritisation of colonoscopy, as well as gastroscopy.

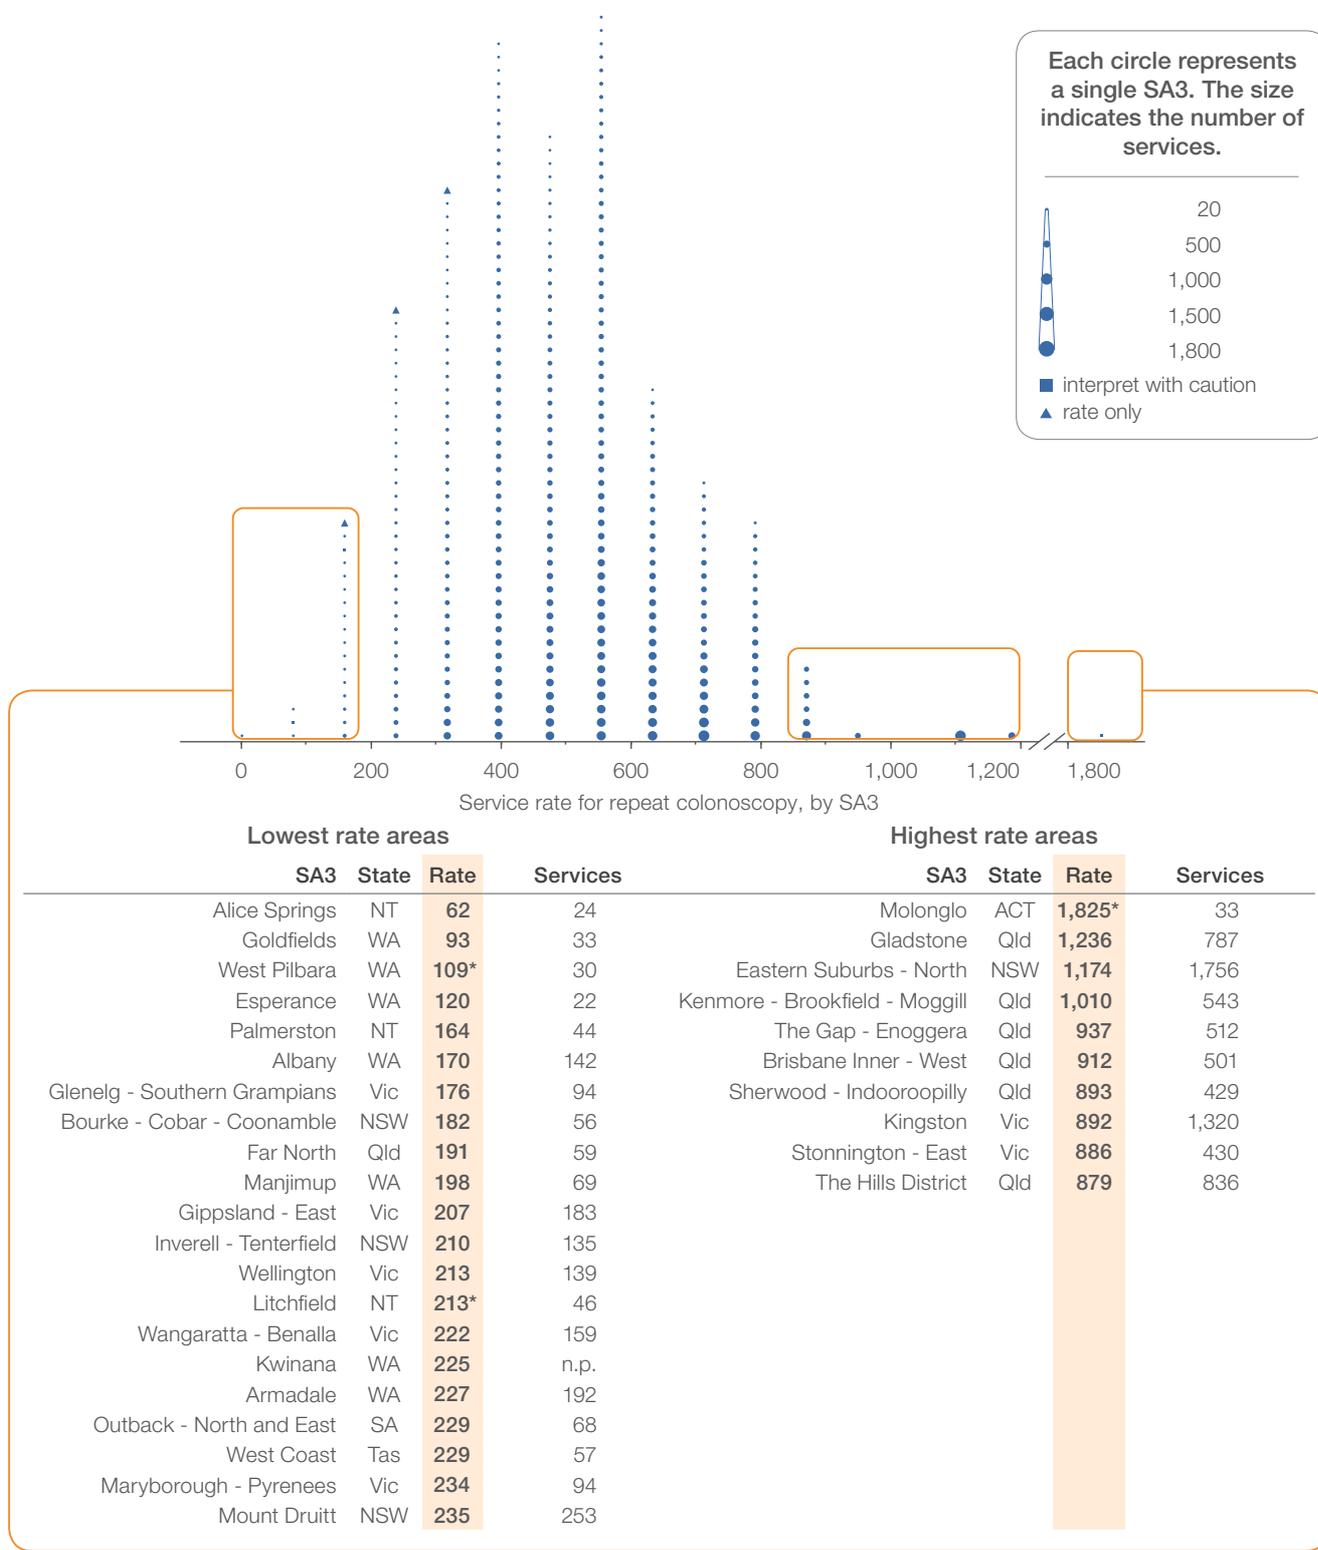

Promoting existing initiatives

As part of the Choosing Wisely Australia initiative, the Gastroenterological Society of Australia made the following recommendation in 2016, to promote the appropriate use of surveillance colonoscopy³³:

- Do not repeat colonoscopies more often than recommended by the National Health and Medical Research Council–endorsed guidelines.

Rates by local area

Australian initiatives

Information in this chapter will complement work already underway to prevent inappropriate repeat colonoscopy in Australia. At a national level, this work includes:

- Australian Commission on Safety and Quality in Health Care, *Colonoscopy Clinical Care Standard*³
- Gastroenterological Society of Australia, Choosing Wisely recommendation 1: Do not repeat colonoscopies more often than recommended by the National Health and Medical Research Council–endorsed guidelines.³³

Many state and territory initiatives also aim to improve colonoscopy use, including:

- Clinical Priority Category: Colonoscopy²⁹, Agency for Clinical Innovation, New South Wales
- *Colonoscopy Categorisation Guidelines*, Victoria³⁴
- *Endoscopy Action Plan*, Queensland³⁵
- Clinical prioritisation criteria: endoscopy³⁶ and Clinical prioritisation criteria: gastroenterology³⁰, Queensland
- *Referral Guidelines: Direct access gastrointestinal endoscopic procedures*, Western Australia³¹
- *Urgency Categorisation and Access Policy for Public Direct Access Adult Gastrointestinal Endoscopy Services*, Western Australia³²
- Statewide endoscopy care network, which monitors and assesses the quality of endoscopy services, Tasmania.²⁸

5.3 Repeat gastroscopy MBS services, all ages

Why is this important?

Gastroscopy is used to investigate or treat conditions affecting the upper gastrointestinal (GI) tract. It can also be used to monitor conditions affecting the upper GI tract that lead to cancer in certain high-risk groups.¹

Differences in use of gastroscopy for monitoring were identified as a possible reason for the substantial variation seen in hospitalisations for gastroscopy reported in the *Third Australian Atlas of Healthcare Variation*.² There are very few clinical reasons for repeating a gastroscopy after a period of less than three years. Guidelines recommend repeating gastroscopy at three to five years to monitor for signs of cancer for most people with Barrett's oesophagus, the most common condition that may require surveillance.³

The fourth Atlas examines rates of gastroscopy that are repeated within two years and 10 months of an earlier gastroscopy, using Medicare Benefits Schedule (MBS) data.

What did we find?

In 2018–19, there were almost 88,000 MBS-subsidised services for repeat gastroscopy performed within two years and 10 months in people of all ages.

The rate in the area with the highest rate was **14.9 times as high** as the rate in the area with the lowest rate. Rates were markedly higher in major cities than elsewhere. Rates increased with socioeconomic advantage everywhere apart from outer regional areas.

What can be done?

Development and application of national guidance on the appropriate use of gastroscopy are priorities. The guidelines should include guidance on when it is appropriate to repeat the procedure.

Integration of data about cancer incidence and lifestyle into healthcare pathways and resources could promote discussion between clinicians and patients about the low risk of upper GI cancer for most people and reduce inappropriate requests for the procedure.

Better ways to identify people at high risk of progression to upper GI cancers are needed to improve rates of cancer detection and minimise low-value care. Educating people about the lifestyle measures that can be taken to reduce upper GI cancer risk could also reduce inappropriate repeat gastroscopy.

Repeat gastroscopy MBS services, all ages

Context

This item examines rates of MBS-subsidised services for repeat gastroscopy performed within two years and 10 months of an earlier gastroscopy for people of all ages in Australia in 2018–19.

What is gastroscopy?

Gastroscopy, also known as an upper GI endoscopy, is the examination of the upper part of the GI tract, using a small, flexible tube with a camera on the end, called an endoscope.⁴ It can also include a biopsy, if needed. The procedure requires an empty stomach for a safe and accurate examination. It is usually quick to perform, taking up to about 15 minutes.^{1,4}

When does a gastroscopy need to be repeated?

Gastroscopy is used to investigate, treat or monitor certain upper GI symptoms or diseases.

The most common reasons to repeat a gastroscopy are¹:

- Monitoring (surveillance) of conditions that can increase the risk of upper GI cancer or bleeding in high-risk groups – for example, Barrett's oesophagus, gastrointestinal metaplasia (GIM) and oesophageal varices
- Investigation of new signs and symptoms, such as bleeding
- Confirmation that a stomach ulcer is healing.

Gastroscopy may be repeated within one to two years of a previous gastroscopy in people with coeliac disease to monitor response to treatment with a gluten-free diet, although there is uncertainty about its benefit.⁵⁻⁸

A repeat gastroscopy is also recommended to treat upper GI conditions detected in an earlier gastroscopy, such as bleeding, some upper GI cancers, or a narrowed oesophagus (oesophageal stricture) that may be causing difficulty swallowing. However, gastroscopies repeated for treatment (therapeutic gastroscopy) are not included in this data item.

A small proportion of people who have a gastroscopy require a repeat within three years. Many people who have a gastroscopy do not need a further one because they have a negative result or a further investigation is of no benefit.⁹ A minority of people may require a repeat gastroscopy for surveillance of an upper GI condition or for the reasons noted above. However, of these, only a small number are likely to need one within three years if guidelines are followed.

Barrett's oesophagus is a chronic upper GI condition in which the cells change in the lining of the oesophagus. It requires monitoring with gastroscopy because it can lead to oesophageal cancer in some people. It affects about 5% of the general population.¹⁰ Barrett's oesophagus is more common in men, people aged 55 years and over, and people with chronic uncontrolled gastro-oesophageal reflux disease (GORD).¹⁰⁻¹²

Guidelines recommend that people with Barrett's oesophagus undergo repeat gastroscopy every three to five years, with more frequent surveillance if risk factors are present.^{3,11,13,14} Although this is recommended practice, there is uncertainty about the effectiveness and value of gastroscopic surveillance for people at low risk of developing cancer. The evidence base for surveillance is weak, except in high-risk groups.¹⁵⁻¹⁷

Although people with Barrett's oesophagus have up to 50 times the risk of developing oesophageal cancer of the general population, the absolute risk of progression to cancer in most people is very low.^{3,12} Population-based studies estimate that the incidence of oesophageal cancer for people with Barrett's oesophagus is 0.22% per year.¹⁸ People with Barrett's oesophagus are more likely to succumb to other conditions, such as coronary artery disease, before developing oesophageal cancer.¹⁹ As well, the vast majority of people who develop oesophageal cancer have no previous diagnosis of Barrett's oesophagus.³ For these reasons, the anxiety associated with surveillance may outweigh the chance of detecting cancer for people with Barrett's oesophagus who are at low risk of developing upper GI cancer, and so they may choose not to participate in gastroscopic surveillance.^{11,20,21}

Similarly, in people with GIM – a condition that can lead to stomach cancer – the annual risk of progression to cancer is very low, with a Dutch study reporting estimates of 0.25% per year.²² United Kingdom guidelines suggest surveillance with gastroscopy every three years²³, whereas United States guidelines promote participation in shared decision making instead.²⁴

Use of gastroscopy for population-based screening for upper GI cancer is not recommended because of the low chance of diagnosing serious disease.

Why examine repeat gastroscopy?

The Gastroenterology Clinical Committee of the Medicare Benefits Schedule Review Taskforce reviewed numbers of repeat gastroscopies per patient.²⁵ It noted that more than 40% of people who had a gastroscopy between 2008–09 and 2014–15 had a repeat gastroscopy within three to five years. The number of repeat gastroscopies ranged from two to 51 per patient. The rates were higher than expected, given the taskforce’s estimation of rates of recurrent bleeding.²⁵

The *Third Australian Atlas of Healthcare Variation* examined rates of hospitalisation for gastroscopy and found that the rate in the area with the highest rate was 7.4 times as high as the rate in the area with the lowest rate.² Rates were higher in major cities and inner regional areas than elsewhere, and generally lower in areas with more socioeconomic disadvantage. Patterns of gastroscopy use did not reflect the prevalence of risk factors for, or burden of, upper GI cancer in Australia. Differences in clinical opinion on the value of gastroscopy for surveillance of people with Barrett’s oesophagus and other upper GI conditions were identified as a possible reason for variation.²

This Atlas examines variation in rates of MBS-subsidised short-interval repeat gastroscopy services performed in the same person. The interval of two years and 10 months was chosen to exclude services to people who present early for their three-yearly gastroscopy for surveillance of Barrett’s oesophagus or other conditions such as GIM.

About the data

Data are sourced from the MBS dataset. This dataset includes information on MBS claims processed by Services Australia. It covers a wide range of services (attendances, procedures, tests) provided across primary care and hospital settings.

The dataset does not include:

- Services for publicly funded patients in hospital
- Services for patients in outpatient clinics of public hospitals
- Services covered under Department of Veterans’ Affairs arrangements.

The dataset does not allow analysis by Aboriginal or Torres Strait Islander status.

Rates are based on the number of MBS-subsidised services for repeat gastroscopy per 100,000 people of all ages, age and sex standardised, in 2018–19.

Because a record is included for each service rather than for each patient, patients who received the service more than once in the financial year will be counted more than once.

In the patient count analysis, patient counts reflect the number of unique patients, regardless of the number of services the patient may have received in the year.

The analysis and maps are based on the patient’s postcode recorded in their Medicare file and not the location of the service.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

Repeat gastroscopy MBS services, all ages

What do the data show?

Magnitude of variation

In 2018–19, there were 87,933 MBS-subsidised services for repeat gastroscopy performed within two years and 10 months, representing 314 services per 100,000 people of all ages (the Australian rate).

The number of MBS-subsidised services for repeat gastroscopy across 321* local areas (Statistical Area Level 3 – SA3) ranged from 61 to 908 per 100,000 people. The rate was **14.9 times as high** in the area with the highest rate compared with the area with the lowest rate. The number of MBS-subsidised services for repeat gastroscopy varied across states and territories, from 114 per 100,000 people in the Northern Territory to 353 in Queensland (Figures 5.20–5.23).

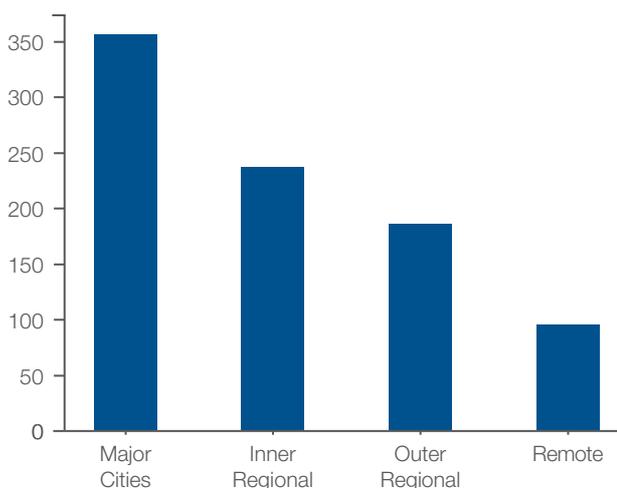

After the highest and lowest 10% of results were excluded and 257 SA3s remained, the number of MBS-subsidised services per 100,000 people was 3.1 times as high in the area with the highest rate compared with the area with the lowest rate.

Analysis by remoteness and socioeconomic status

Rates for MBS-subsidised services for repeat gastroscopy were markedly higher in major cities than elsewhere. The rate for major cities was 3.7 times as high as the rate for remote areas (Figures 5.18 and 5.24).

Rates decreased with socioeconomic disadvantage in major cities, and inner regional and remote areas. Overall, the rate in the highest socioeconomic group was 1.6 times as high as the rate in the lowest (Figures 5.19 and 5.24).

Figure 5.18: Number of MBS-subsidised services for repeat gastroscopy per 100,000 people of all ages, age and sex standardised, by remoteness of patient residence, 2018–19

The data for Figures 5.18 and 5.19 are available at safetyandquality.gov.au/atlas

* There are 340 SA3s. For this item, data were suppressed for 19 SA3s due to a small number of services and/or population in an area, or potential identification of individual patients, practitioners or business entities.

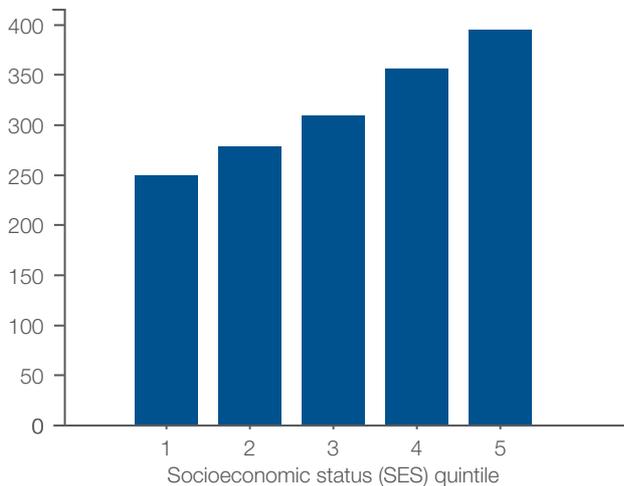

Notes:

Some SA3 rates are more volatile than others. These rates are excluded from the calculation of the difference between the highest and lowest SA3 rates in Australia.

For further detail about the methods used, please refer to the Technical Supplement.

Figure 5.19: Number of MBS-subsidised services for repeat gastroscopy per 100,000 people of all ages, age and sex standardised, by socioeconomic area of patient residence, 2018–19

Analysis by number of people who had at least one repeat gastroscopy

In 2018–19, there were 81,893 people who had at least one repeat MBS-subsidised service for gastroscopy, representing 292 people per 100,000 people of all ages.

The data and graphs for analysis by number of people who had at least one repeat gastroscopy, and for analysis by Primary Health Network are available at safetyandquality.gov.au/atlas

Interpretation

There is wide variation in repeat gastroscopy use. Rates were higher in major cities and in areas with socioeconomic advantage than elsewhere.

These findings are consistent with those in the third Atlas, which examined hospitalisations for gastroscopy.

Variation in rates of repeat gastroscopy is likely to be due to geographical differences in the factors discussed below.

Variation between areas may not directly reflect the practices of the clinicians who are based in these areas. The analysis is based on where people live rather than where they obtain their health care. People may travel outside their local area to receive health care.

Clinical decision-making

Variation in adherence with available clinical guidelines may influence rates of repeat gastroscopy.

A high proportion of repeat gastroscopies are performed earlier than intervals recommended in guidelines.²⁶⁻²⁸ According to a 2012 multi-centre study in the United States of people with Barrett’s oesophagus at low risk of progression to oesophageal cancer, 65% were recommended a repeat gastroscopy earlier than the recommended three to five year interval, resulting in a mean of 2.3 excess endoscopies per person.²⁶ A more recent study conducted in 2019, also in the United States, found that 30% of people had a repeat gastroscopy too soon.²⁸ A United States retrospective analysis of data from a registry of patients with Barrett’s oesophagus reported that less than 16% of people had gastroscopy repeated at the interval recommended by guidelines.²⁷

Notes:

Areas with a low SES (=1) have a high proportion of relatively disadvantaged people. Areas with a high SES (=5) have a low proportion of relatively disadvantaged people.

For further details about the methods used, please refer to the Technical Supplement.

Repeat gastroscopy MBS services, all ages

Differences in clinical opinion on management where the evidence is unclear may contribute to variation. For example, although surveillance is recommended for people with Barrett's oesophagus, whether it is beneficial is unclear, particularly in low-risk groups.¹⁵⁻¹⁷ A multi-centre randomised controlled trial is currently examining the impact of two-yearly surveillance on outcomes such as overall survival, cancer-specific survival, and stage of oesophageal cancer at diagnosis in people with Barrett's oesophagus in low-risk groups. The results will help determine who may benefit most from surveillance.²⁹

Difficulties in keeping up to date with evidence may also influence rates.³⁰

Fear of litigation for not investigating symptoms may influence clinicians' decisions about when and how frequently to repeat a gastroscopy for the same person, particularly if they are unaware of current recommendations, or evidence about the incidence of upper GI cancers or risk of progression to significant disease. The risk of GORD progressing to Barrett's oesophagus is low, as is the risk of Barrett's oesophagus progressing to oesophageal cancer.³

Concerns about late diagnosis and subsequent litigation, as well as few disincentives for over-testing, may also contribute to overuse.³⁰

Consumer expectations

Consumer expectations, perception of cancer risk, and anxiety about developing oesophageal cancer have been highlighted as potentially driving overuse of gastroscopic surveillance.^{31,32}

People often have incorrect beliefs about their cancer risk; for example, people with Barrett's oesophagus often greatly overestimate their risk of developing oesophageal cancer.^{31,33,34} This can influence their perception about the benefits of interventions such as surveillance to detect upper GI cancer, and their preference and demand for investigations, even when their risk of cancer is low.¹¹

Access to services and number of clinicians providing services

Access to clinicians may influence the likelihood of people seeking care and the rates of repeat gastroscopy. The practice styles of individual clinicians may be more likely to affect rates in areas with fewer clinicians, such as rural and regional locations, than in areas with more clinicians.

Availability and affordability of services may also influence patterns of use. Ability to pay out-of-pocket costs for gastroscopy is likely to be lower in areas of socioeconomic disadvantage, and access is likely to be more difficult in areas with fewer services. Open-access endoscopy services, where general practitioners are able to request gastroscopy without specialist review, may also influence patterns of use.

Financial incentives

Greater remuneration for providing a service rather than consultation may lead to variation and over-servicing in some areas.

Promoting appropriate care

Inappropriate use of gastroscopy for monitoring, such as frequent use in people with very low risk of upper GI cancer, contributes to low-value care and can reduce access to the procedure for people who are most in need. Adherence to the recommended intervals for repeating a gastroscopy ensures that the benefits of the procedure outweigh the risk of procedural harms and costs to individuals.

Unwarranted variation in repeat gastroscopy could be addressed in the following ways:

Guideline and resource development

Development of national guidance to support appropriate use of gastroscopy services is a priority. These should incorporate the current guidelines on the diagnosis and management (including surveillance) of Barrett's oesophagus.³ This is consistent with recommendations made by the

Medicare Benefits Schedule Review Taskforce in 2015 to develop guidelines that cover when a repeat gastroscopy is clinically appropriate.²⁵ The guidelines could be used to assess appropriateness of referrals and for clinical audit of clinicians' practices.

Integration of data on cancer incidence and lifestyle into healthcare pathways, training guidelines, and specialist and consumer resources could also support appropriate use of repeat gastroscopy.

Consumer education and reassurance

Informing people about the role of gastroscopy, and reassuring them that their risk of developing upper GI cancer is very low may reduce demand for gastroscopy or repeating gastroscopy earlier than guidelines recommend. Interactive tools that identify a person's cancer risk – such as the Australian Institute of Health and Welfare cancer summary data tool (see 'Resources' on page 298) – may help clinicians when having conversations with their patients about the risk of upper GI cancer.³⁵

Reducing risk factors

Improved consumer awareness of risk factors for GORD and upper GI cancers, and of making lifestyle changes to reduce risk factors, should be the focus for people presenting earlier than the recommended intervals for gastroscopic surveillance. Improving a person's understanding about their cancer risk – particularly in people without additional risk factors for upper GI cancer – is important to reduce anxiety and dispel myths about cancer.³³

Public health initiatives that address risk factors for GORD and upper GI cancer – such as smoking, obesity, excessive alcohol consumption, sedentary lifestyle or uncontrolled symptoms of GORD – should be targeted to areas with a high prevalence of these risk factors before repeating gastroscopy earlier than guidelines recommend.³³ For example, smoking cessation reduces the risk of upper GI cancers – people with Barrett's oesophagus who smoke are twice as likely to progress to oesophageal cancer as people who do not.^{12,36}

Clinical audit and clinician education

Clinical audit is a tool that could be used more widely to support appropriate use of repeat gastroscopy for monitoring upper GI tract cancer.

Guidelines are available outlining which people are most at risk of developing upper GI cancer and how frequently gastroscopic surveillance should be performed. Clinical audit against these guidelines could help determine the value of surveillance and whether it can be stopped, particularly in people at low risk, to achieve more effective use of healthcare resources. Audits in this area could also form part of continuing education requirements for clinicians.

Structured referral forms and checklists outlining appropriate reasons and frequency of repeat gastroscopy for greatest benefit could support appropriate requests. Using guidelines to assess the appropriateness of requests against recommended surveillance intervals could also improve use of healthcare resources.

Educational programs for clinicians could improve the appropriateness of requests for repeat procedures. Education could cover the:

- Conditions that require gastroscopic surveillance, and the timing of surveillance for greatest benefit
- Low prevalence of conditions that require gastroscopic surveillance, such as Barrett's oesophagus, and the low risk of progression to significant disease unless other risk factors are present
- Low likelihood that repeating gastroscopy earlier than guidelines recommend will diagnose significant upper GI disease for most people.

Repeat gastroscopy MBS services, all ages

Appropriate prioritisation of services

Health service organisations need to examine the volume of gastroscopies that may be tying up resources needed to perform colonoscopies. People who need a colonoscopy for a positive faecal occult blood test should be prioritised over those having repeat gastroscopies earlier than recommended, especially when the likelihood of the findings changing management is low – for example, in people without additional risk factors for developing upper GI cancer. Better use of resources according to clinical need would improve the likelihood of diagnosing significant disease and reduce delays in diagnosis.

Triage systems

Many states and territories are introducing evidence-based triage systems for prioritising and allocating people for gastroscopy and colonoscopy, with the aim of reducing variation in use of these procedures:

- Victorian health services require clinicians to refer people for gastroscopy according to the categorisation guidelines – the guidelines specify the appropriate gastroscopic surveillance intervals for people with Barrett's oesophagus³⁷
- Tasmania has adopted the Victorian categorisation guidelines and formed a statewide endoscopy network to monitor the quality of its services³⁸
- Queensland and Western Australia have introduced clinical prioritisation criteria for many clinical areas, including gastroenterology, to triage patients referred to public specialist outpatient services.³⁹⁻⁴¹

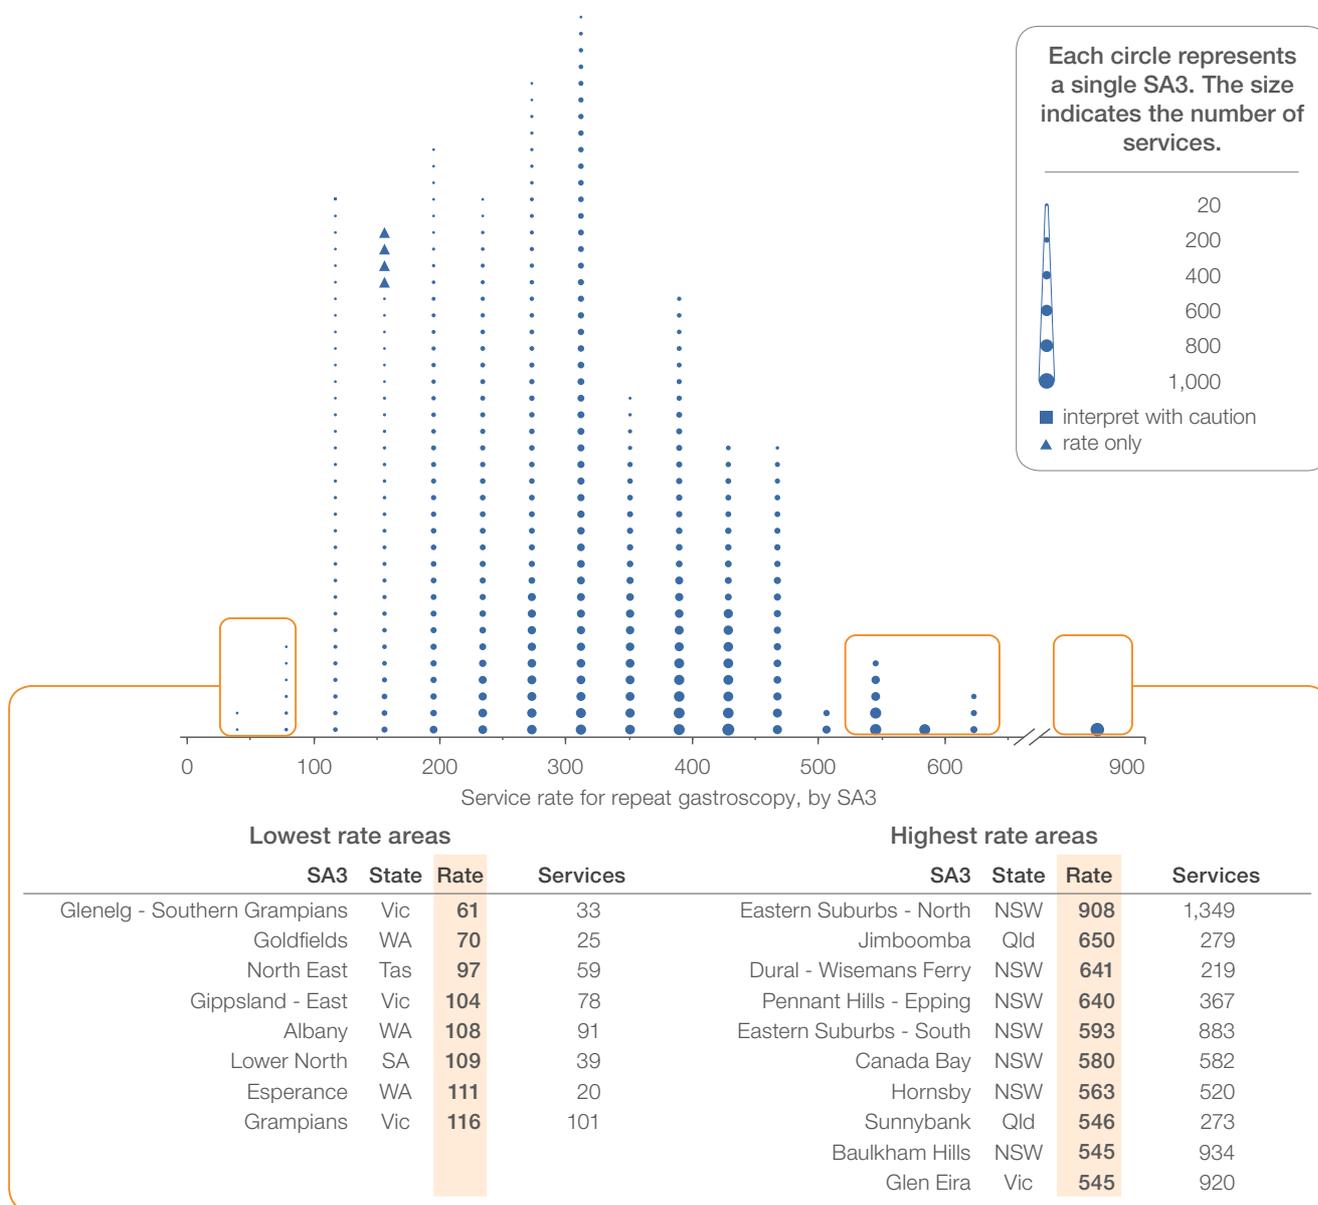

Wider use of these triage systems could result in more appropriate prioritisation of repeat gastroscopy.

Promotion of existing initiatives

In 2016, the Gastroenterological Society of Australia recommended, as part of Australia's Choosing Wisely campaign, that gastroscopy for people with Barrett's oesophagus should be questioned by people if recommended sooner than three years after their last gastroscopy.⁴² This is consistent with the Choosing Wisely campaign in the United States. People with Barrett's oesophagus who have no abnormal cells present have a very low risk of developing oesophageal cancer. In these people, it is not necessary to examine the oesophagus more frequently than every three years because, if cellular changes occur, they do so very slowly. Recommendation 5 states: Do not perform a follow-up endoscopy less than three years after two consecutive findings of no dysplasia from endoscopies with appropriate four quadrant biopsies for patients diagnosed with Barrett's oesophagus.

Rates by local area

Figure 5.20: Number of MBS-subsidised services for repeat gastroscopy per 100,000 people of all ages, age and sex standardised, by Statistical Area Level 3 (SA3) of patient residence, 2018–19

Notes:

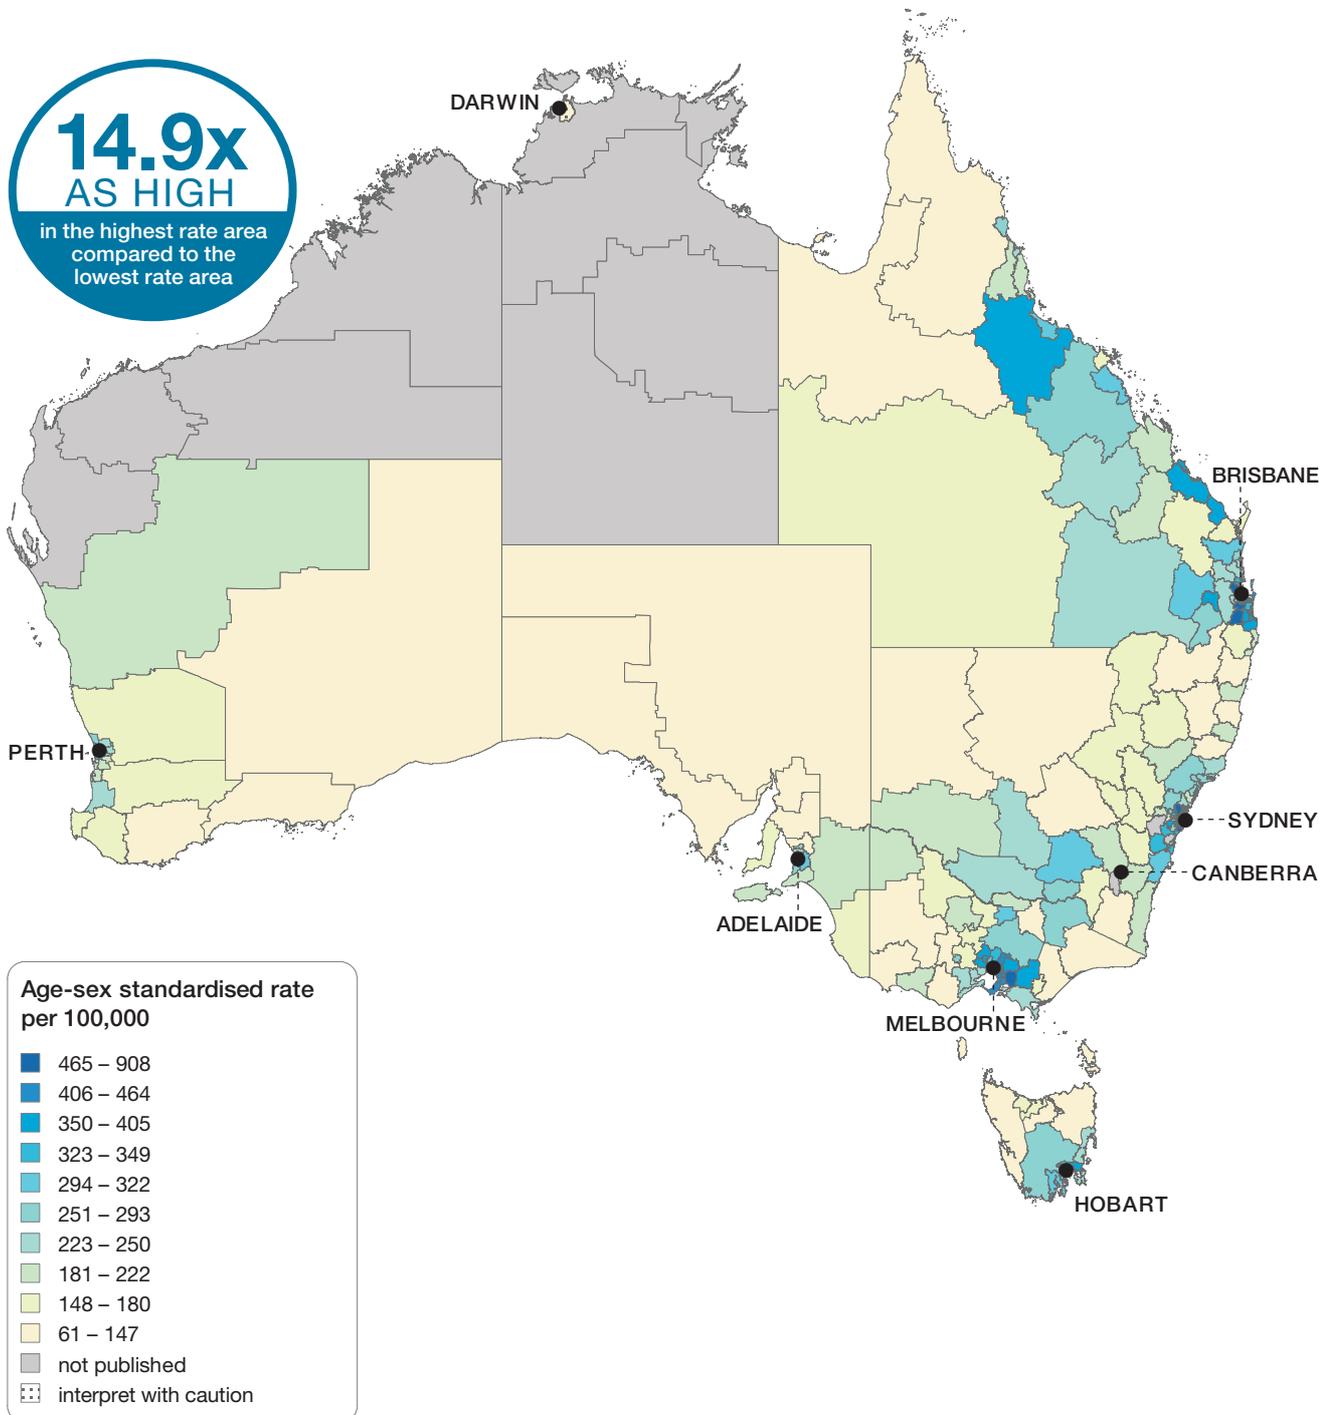

Squares (■) indicate rates that are considered more volatile than other published rates and should be interpreted with caution. Triangles (▲) indicate SA3s where only rates are published. The numbers of services are not published for confidentiality reasons. For further detail about the methods used, please refer to the Technical Supplement.

Australian initiatives

Information in this chapter will complement work already underway to prevent inappropriate repeat gastroscopy in Australia. At a national level, this work includes:

- Gastroenterological Society of Australia, Choosing Wisely recommendation 5: Do not perform a follow-up endoscopy less than three years after two consecutive findings of no dysplasia from endoscopies with appropriate four quadrant biopsies for patients diagnosed with Barrett's oesophagus.⁴²

Many state and territory initiatives are also in place to improve gastroscopy use, including:

- *Upper Gastrointestinal Endoscopy Categorisation Guidelines for Adults*, Victoria³⁷
- *Endoscopy Action Plan*, Queensland⁴⁶
- Clinical prioritisation criteria: endoscopy⁴⁷ and Clinical prioritisation criteria: gastroenterology³⁹, Queensland
- *Referral Guidelines: Direct access gastrointestinal endoscopic procedures*, Western Australia⁴⁰
- *Urgency Categorisation and Access Policy for Public Direct Access Adult Gastrointestinal Endoscopy Services*, Western Australia⁴¹
- State-wide endoscopy care network, which monitors and assesses the quality of endoscopy services, Tasmania.³⁸

Chapter 6

Medicines use in older people

At a glance

Polypharmacy is the concurrent use of multiple medicines. It is common in older people because they are more likely to have chronic diseases that are managed with medicines. Although polypharmacy may be appropriate, it can increase the risk of harm from medicines.

The Atlas found that, in 2018–19, the rate of people aged 75 years and over dispensed five or more medicines was about six times higher in the local area with the highest rate than in the area with the lowest.* Almost 40% of people aged 75 years and over were dispensed five or more medicines. Rates of polypharmacy were higher in major cities than elsewhere, and rates increased with socioeconomic disadvantage, except in remote areas.

Residential Medication Management Review (RMMR) and Home Medicines Review (HMR) are two types of medicine reviews available to people living in aged care facilities or at home. The reviews aim to help people to get the maximum benefit from their medicines and prevent medicine-related harm.

The Atlas found that, in 2018–19, the rate of people aged 75 years and over who had at least one Medicare Benefits Schedule–subsidised service for an RMMR or HMR was almost 12 times higher in the

local area with the highest rate than in the area with the lowest rate.* About 5.4% of people had a review.

Interventions for identifying people at risk of harm from polypharmacy, such as frail people and those with multiple morbidities, are needed. System changes are needed to improve access to RMMR and HMR services for these at-risk groups. Initiatives to improve uptake of pharmacist recommendations may improve the effectiveness of the review services.

Proton pump inhibitor (PPI) medicines are effective for gastro-oesophageal reflux disease. They are commonly used in older people, often at higher doses or long term without reassessing need. Older people may be especially susceptible to harms from long-term use.

The Atlas found that, in 2018–19, the rate of dispensing of PPI medicines to people aged 75 years and over was about six times higher in the local area with the highest rate than in the area with the lowest.* Almost half people aged 75 years and over had at least one prescription dispensed for a PPI medicine.

Targeted interventions that prompt clinicians to regularly review the need for PPI medicines in older people are needed.

* After standardising to remove age and sex differences between populations.
The Fourth Australian Atlas of Healthcare Variation

Recommendations

The Commission consulted widely, but is solely responsible for making the recommendations; as such, the recommendations may not reflect the views of all contributors to the Atlas.

6a. The Commission, in collaboration with the Australian Government Department of Health, the Aged Care Quality and Safety Commission, NPS MedicineWise and relevant groups, to develop nationally consistent:

-
- i. Guidance for people taking multiple medicines
-
- ii. Guidance about the communication of reports to medical practitioners from Residential Medication Management Reviews and Home Medicines Reviews
-
- iii. Measures for aged care homes to compare the percentage of residents who have received Residential Medication Management Reviews and the percentage of pharmacists' recommendations, in line with the Commonwealth's development of the National Aged Care Mandatory Quality Indicator Program
-
- iv. Guidance for the establishment, governance, composition and operation of Medication Advisory Committees within aged care homes.
-

6b. The Australian Government Department of Health to investigate ways of collecting patient-level data on the supply of Pharmaceutical Benefits Scheme medicines through the S100 Remote Area Aboriginal Health Services Program to gather accurate information about the use of medicines in rural and remote Aboriginal communities.

6.1 Polypharmacy, 75 years and over

Why is this important?

Polypharmacy is defined by the World Health Organization (WHO) as the concurrent use of five or more medicines.¹ Polypharmacy is common in older people because they often have several chronic conditions requiring multiple medicines to prevent or control symptoms. About two-thirds of Australians aged 75 years and over are taking five or more medicines, including over-the-counter and complementary medicines.²

Polypharmacy may be necessary and appropriate for some people; however, there are risks associated with multiple medicines use.¹ Older people are more vulnerable to harms from polypharmacy because of increased frailty and age-related changes that alter the way their bodies respond to medicines.¹

Monitoring polypharmacy is recognised in the WHO's third Global Patient Safety Challenge: Medication without Harm as a way of identifying people at risk of medicine-related harm and who may benefit from a medicines review.¹ The fourth Atlas uses Pharmaceutical Benefits Scheme (PBS) prescription dispensing data to examine rates of polypharmacy for people aged 75 years and over.

What did we find?

In 2018–19, about 40% of people aged 75 years and over were dispensed five or more different medicines. Polypharmacy was **6.4 times as high** in the area with the highest rate as in the area with the lowest rate.

Rates of polypharmacy were higher in major cities than elsewhere. Areas with the most socioeconomic disadvantage had the highest rates of polypharmacy, except for remote areas.

What can be done?

We can:

- Implement interventions to identify people at risk of harm from polypharmacy, such as frail people and those with several chronic conditions, to prompt the timely review of their medicines; this could include increased monitoring of polypharmacy
- Raise awareness among consumers and clinicians about harms associated with multiple medicines use, and about lifestyle changes that can reduce the need for some medicines
- Support older people to keep an up-to-date medicines list
- Include information about deprescribing in medicines product information.

Polypharmacy, 75 years and over

Context

This item examines the rate of polypharmacy for people aged 75 years and over in Australia in 2018–19.

What is polypharmacy?

Polypharmacy is the use of multiple medicines to prevent or treat medical conditions. It is commonly defined as the concurrent use of five or more medicines by the same person. This definition is used by WHO and the Organisation for Economic Co-operation and Development.^{1,3} Medicines include prescription, as well as over-the-counter and complementary medicines.¹

This Atlas examines polypharmacy for people aged 75 years and over using prescription dispensing data from the Pharmaceutical Benefits Scheme (PBS). Over-the-counter and complementary medicines are not in the dataset and so are not counted. This means that Atlas findings are likely to be a conservative measure of polypharmacy in Australia.

Why examine polypharmacy in people aged 75 years and over?

Monitoring polypharmacy is one of the three key actions recommended in the WHO's third Global Patient Safety Challenge: Medication without Harm, to reduce the global burden of harm associated with medicine use.^{1,4} Monitoring polypharmacy also underpins recommendations in Australia's Choosing Wisely initiative, which advises to not prescribe additional medicines to people already taking five or more medicines without a comprehensive review of their medicines to ensure all are necessary.⁵

Polypharmacy is common in older people because they are more likely to be living with several chronic conditions, requiring medicines to prevent or control symptoms.^{6,7} About 80% of Australia's population aged 65 years and over have one or more chronic conditions, and over half (51%) have two or more.⁶ Because people become more sensitive to the effects of medicines as they age, the consequences of polypharmacy tend to be more serious in older people.⁸⁻¹⁰

Polypharmacy is associated with an increased risk of adverse drug reactions, interactions with other medicines and increased likelihood of not taking medicines as prescribed.^{1,11-14} Errors associated with prescribing and monitoring medicines are more likely in older people, and the likelihood increases with the number of medicines taken.¹ The more medicines prescribed, the more complex medicine regimens become, which increases the risk of errors such as taking the wrong medicine or dose, missing a dose or taking it at the wrong time.^{1,15} Polypharmacy is also associated with harms including delirium and falls^{10,12,16}, hospitalisation¹¹, reduced quality of life¹⁷ and premature morbidity and mortality.^{12,16}

Polypharmacy may be appropriate when medicines are prescribed according to the best available evidence, and use for that person has been optimised to reduce the risk of medicine-related harm.^{1,14,17} For these reasons, definitions of polypharmacy are shifting from numeric thresholds – such as the use of five or more medicines – to emphasise the clinical appropriateness of polypharmacy.^{1,17} However, there are risks associated with using multiple medicines, even when each medicine on its own is appropriate.^{1,11,18} The benefits gained from each additional medicine are likely to be reduced when people take multiple medicines, and the risk of medicine-related harm increases.¹⁹

Polypharmacy is associated with an increased use of medicines that are considered potentially inappropriate in older people – where the risks of their use outweigh the benefits.^{12,20-23} Medicines considered potentially inappropriate in older people are best avoided or used extremely cautiously, with monitoring to ensure the benefits of taking the medicine outweigh the possible harms.

Examples of medicines considered potentially inappropriate in older people include²⁴:

- Medicines that cause sedation, dizziness and confusion, such as opioids, antipsychotics, anticholinergics, antidepressants and medicines for anxiety – these can increase the risk of confusion, falls or delirium
- Long-acting non-steroidal anti-inflammatory drugs – these are associated with increased risk of kidney failure, gastrointestinal bleeding and cardiac effects in older people
- Medicines that are removed from the body by the kidneys – reduced kidney function in older people can allow these to accumulate in the body and cause toxicity.

Prescribing medicines when they are no longer needed is common in older people and contributes to polypharmacy. A study of veterans in the United States found that 60% of people taking five or more medicines were taking one or more medicines that were no longer needed.²⁵

A prescribing cascade can exacerbate polypharmacy. This occurs when additional medicines are prescribed to treat the adverse effects caused by other medicines but misinterpreted as symptoms of a new condition.²⁶ Older people are at higher risk of experiencing prescribing cascades. This is because they often have several medical conditions that are treated by different clinicians. Clinicians may focus on managing a single disease state without considering the patient's other conditions and treatments.

Rates of polypharmacy in older people in Australia

Prevalence of polypharmacy in different Australian healthcare settings has been reported to range between 43% and 95%, with higher estimates for people in hospital and aged care homes.

A national census in 2012, which explored the use of prescription, over-the counter, and complementary medicine use in Australians aged 50 years and over living at home, found that 43% took five or more medicines.² The number of people taking five or more medicines increased with age, with two out of three Australians aged 75 years and over taking five or more medicines.

A study of Australians aged 70 years and older (average age 81.3), who had been admitted to hospital between July 2005 and May 2010, found that 75% of people took five or more medicines.⁷ In Australian aged care homes, up to 95% of residents are reported to take five or more medicines.^{27,28}

An analysis of PBS dispensing data found that, between 2006 and 2017, the prevalence of taking five or more medicines increased by 9% (from 33% to 36%) in Australians aged 70 years and over.²⁹ The prevalence among those aged 80–84 years and 85–89 years was 44% and 46%, respectively, in 2017.

Although many studies have described polypharmacy in Australia, the maps and graphs in this Atlas provide a novel way of analysing the issue and highlighting the areas and groups that may be more at risk of experiencing harm from polypharmacy.

Polypharmacy, 75 years and over

About the data

Data are sourced from the PBS dataset, which includes all prescriptions dispensed under the PBS and the Repatriation Pharmaceutical Benefits Scheme (RPBS), including under copayment prescriptions.

Data used in this report exclude doctors' bag items and any programs with alternative supply arrangements (section 100 of the *National Health Act 1953*) in which patient-level details are not available, such as direct supply to remote Aboriginal health services.

The PBS and RPBS do not cover medicines supplied to public hospital inpatients, over-the-counter medicines or private prescriptions.

The dataset does not allow analysis by Aboriginal and Torres Strait Islander status.

Rates are based on the number of people dispensed five or more different medicines per 100,000 people aged 75 years and over in 2018–19.

To be counted, a medicine must have had four or more prescriptions dispensed for it in the year. Medicines are counted as distinct if the Anatomical Therapeutic Chemical codes differ at the fourth level.

Patient count analysis reflects the number of unique patients that qualify according to the polypharmacy specification.

The analysis and maps are based on the patient's post code recorded in their Medicare file and not the location of the prescriber or the dispensing pharmacy.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

Some data have been suppressed to manage volatility and confidentiality. This process takes into account the Australian Government Department of Health's requirements for reporting PBS data (see the Technical Supplement). Data suppression for this item has been notably marked for remote areas of the Northern Territory. This is indicated on the maps in grey. Reporting for the Northern Territory was possible at a territory level.

What do the data show?

Magnitude of variation

In 2018–19, 690,516 people were dispensed five or more medicines, representing 40,226 people per 100,000 people aged 75 years and over (the Australian rate).

The number of people dispensed five or more medicines across 328* local areas (Statistical Area Level 3 – SA3) ranged from 11,206 to 72,059 per 100,000 people. The rate was **6.4 times as high** in the area with the highest rate compared to the area with the lowest rate. The number of people varied across states and territories, from 25,058 per 100,000 people in the Northern Territory to 41,446 in New South Wales. (Figures 6.2–6.5).

After the highest and lowest 10% of results were excluded and 264 SA3s remained, the number of people dispensed five or more medicines per 100,000 people was 1.4 times as high in the area with the highest rate compared to the area with the lowest rate.

* There are 340 SA3s. For this item, data were suppressed for 12 SA3s due to a small number of prescriptions dispensed and/or population in an area. Some SA3 rates are more volatile than others. These rates are excluded from the calculation of the difference between the highest and lowest SA3 rates in Australia.

For further detail about the methods used, please refer to the Technical Supplement.

Analysis by remoteness and socioeconomic status

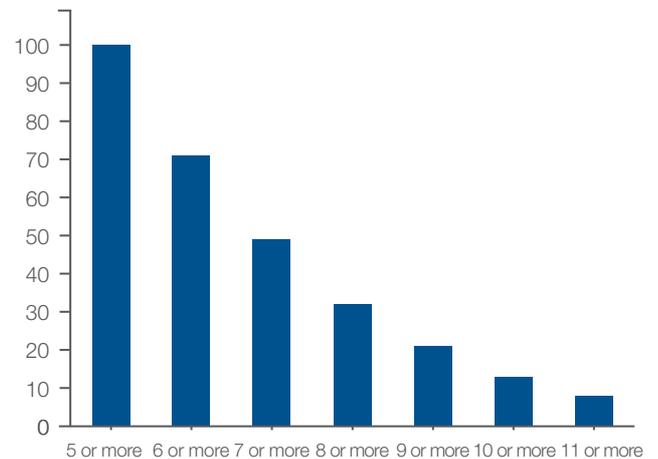

Rates of polypharmacy were higher in major cities and inner regional areas than in outer regional areas and remote areas. With the exception of remote areas, areas with the most disadvantage had the highest rates for polypharmacy compared to all other socioeconomic groups in the same remoteness category (Figure 6.6).

Analysis by number of medicines for people with polypharmacy

In 2018–19, of the 690,516 people with polypharmacy aged 75 years and over, 49% had seven or more medicines dispensed and 8% had 11 or more medicines dispensed (Figure 6.1).

The data and graphs for Figures 6.1, analysis by Primary Health Network (PHN), analysis by PHN and age group, and analysis by numbers of medicines for each age group, are available at safetyandquality.gov.au/atlas

Figure 6.1: Percentage of people by the number of medicines dispensed, for patients with polypharmacy aged 75 years and over, 2018–19

The data for Figure 6.1 are available at safetyandquality.gov.au/atlas

Polypharmacy, 75 years and over

Interpretation

The Atlas findings indicate that about 40% of people aged 75 years and over were taking five or more different medicines on an ongoing basis in 2018–19. The data do not allow assessment of the appropriateness of polypharmacy.

Variation in rates of polypharmacy in people aged 75 years and over are likely to be due to the geographical differences in the factors discussed below.

Variation between areas may not directly reflect the practices of the clinicians who are based in these areas. The analysis is based on where people live rather than where they obtain their health care. Patients may travel outside their local area to receive health care.

Possible reasons for variation in rates of polypharmacy

Rates of underlying disease, social determinants of health and lifestyle factors

Areas with higher rates of chronic disease or people living with several chronic conditions are expected to have higher rates of polypharmacy. The higher rates of polypharmacy observed in socioeconomically disadvantaged areas may reflect a higher prevalence of multimorbidities (having several chronic conditions), and lifestyle factors that increase the risk of chronic disease. These factors include obesity, smoking, poor diet and alcohol intake. People living in disadvantaged areas may be restricted in their ability to afford, choose or find healthier lifestyle options, exacerbating rates of polypharmacy.¹

Number of prescribers and dispensing pharmacies

The number of prescribers involved in a person's care may contribute to variation in rates of polypharmacy. One clinician rarely has oversight of prescribing a person's medicines, because different specialists provide care for different conditions. The number of medicines prescribed is known to increase with the number of prescribers involved in a person's care.³⁰

It is unclear whether digital health systems (such as My Health Record) that can sort and centralise a person's medicines information affect rates of polypharmacy.

The number of pharmacies where people obtain their medicines may also contribute to the variation seen. Having medicines dispensed at the same pharmacy gives the pharmacist an awareness of a patient's dispensing history, which may allow pharmacists and pharmacy staff to identify people taking multiple medicines who might benefit from a medicines review.

Age and location of aged care homes

Areas with more aged care homes are likely to have higher rates of polypharmacy because residents of aged care homes generally take more medicines than people of the same age living in their own home.^{2,29} Because Atlas data are age and sex standardised – to control for differences in population structures between areas – variation in rates between areas cannot be explained solely by the proportion of older people in an area.

Clinical decision making and access to care

Variation in rates may be influenced by different prescribing practices of clinicians. Many clinical guidelines are based on research in adults aged under 65 years with a single disease state. Application of these guidelines to older people with multimorbidity has been found to exacerbate polypharmacy.^{1,18}

The number of clinicians providing services in the area, and the ability to see a specific clinician, may influence the likelihood of people seeking care. The practice styles of individual clinicians may be more likely to affect rates in areas with fewer clinicians, such as rural and regional locations, than in areas with more clinicians.

Promoting appropriate care

Reducing the risk of harms from polypharmacy in older people requires a multifaceted and collaborative approach with a variety of strategies and interventions to support appropriate medicines use.^{14,31,32}

Strategies should aim to improve health outcomes, increase engagement with consumers, and promote appropriate use of healthcare resources.¹

Australia's response to the WHO Global Patient Safety Challenge: Medication without Harm, proposes four priority actions to reduce harms from polypharmacy and the use of potentially inappropriate medicines⁴:

- Broad and consistent implementation of evidence-based primary care programs for medication reconciliation and review services
- Consumer communications to raise awareness of programs aimed at improving consumer ability to manage their medicines
- Broad and complete implementation of the National Safety and Quality Health Service (NSQHS) Standards Medication Safety Standard in health service organisations
- Broad implementation of medicines review and promotion of deprescribing best practice throughout Australia's health system.

Initiatives supporting these actions are discussed below.

Medication management review

A comprehensive and structured review of a person's medicines is key to identifying whether polypharmacy is appropriate. Studies examining the appropriateness of polypharmacy in older Australians have found that one in five people are taking a medicine considered potentially inappropriate when use should generally be avoided³³, increasing to half in those living in aged care facilities.^{34,35}

Medication management reviews (also known as medicines reviews) are effective in minimising harms from polypharmacy and improving the safe use of medicines.¹ Services in Australia include home medicines review (HMR), residential medication management review (RMMR), in-pharmacy medicine checks (MedsCheck) and medicine reviews as part of multidisciplinary care plans.³⁶ Further detail about HMR and RMMR are available in Chapter 6.2. There are also specific programs that focus on improving medicines use in the Australian veteran community.³⁷ Medicines review is also a requirement for all health service organisations under the NSQHS Standards.³⁸

Shared decision making

Partnering with consumers and their families or carers in shared decision making and empowering people to have a more active role in their care are key strategies for minimising harms from polypharmacy.^{38,39}

Discussions between consumers and clinicians about the benefits and risks of medicines before prescriptions are issued, and an assessment of the person's perspective on their health and their need to take multiple medicines, may lead to fewer medicines being prescribed.¹⁶

Consumers may be more receptive to stopping medicines when they have a greater understanding of the risks of continuing their medicine, particularly if a medicine has limited expected benefit or is no longer of benefit.^{40,41} About 90% of Australians have reported they would be willing to stop taking one or more of their medicines if their clinician thought it was appropriate to do so.⁴²

Polypharmacy, 75 years and over

Medicines lists

Supporting people to know what medicines they are taking can help minimise harms from polypharmacy.

Tools such as the NPS MedicineWise Medicines List (see 'Australian initiatives' on page 318) can help people to take an active role in managing their medicines and improve communication with their clinicians. Medicines lists can improve a person's understanding and adherence to medicines regimens¹², and are useful at transitions of care for ensuring the accurate transfer of medicines information and minimising unintended medicine changes.³⁸ Smartphone apps to store a person's medicines information may also be useful, but further evaluation is required to determine their benefits.¹⁶ A limitation of technology-based tools like smartphone apps currently identified is that older people, who are the main target for interventions to reduce harm from polypharmacy, are the least likely to use them.

Digital systems such as My Health Record may also help with maintaining lists and allow better identification of people who may benefit from a medicines review.

Over-the-counter and complementary medicines were not included in the Atlas analysis. However, they are commonly used by older people^{2,6,43} and contribute to polypharmacy.^{2,44} GPs and pharmacists should routinely ask about use of over-the-counter and complementary medicines and record them as part of a patient's medication history.² Patients should be encouraged to record them as part of their medicines list.

Lifestyle factors

Addressing lifestyle factors that increase the risk of chronic disease or experiencing symptoms may reduce the need for medicines use that can contribute to polypharmacy.¹

Lifestyle factors should be discussed with people when considering medicines use or undertaking a medication review. This is especially important in

areas that have a higher prevalence of risk factors for chronic disease, such as areas with higher socioeconomic disadvantage.¹⁹

Medication reconciliation at transitions of care

More than 50% of medication errors occur at transitions of care – when people move from one healthcare setting to another.⁴⁵ The probability of such errors increases with the number of medicines prescribed.²

Medication reconciliation is the process of working with patients and their carers to develop an accurate medicines history in order to ensure the accurate transfer of information about their medicines, and is an effective way of minimising harms from polypharmacy.^{1,4,38} It can reduce discrepancies and medication errors during transitions of care by 50–94%³⁸, with most success seen in high-risk populations such as older people experiencing polypharmacy.^{1,46} It is a requirement for all Australian health service organisations under the NSQHS Standards.³⁸

Guideline adaptation and comorbidities

Developing guidelines that take into account multimorbidity in older people could help reduce complex medicine regimens and minimise harms from polypharmacy.¹⁷ Evidence-based guidelines commonly recommend treatments for a single disease state. Lack of guidance on the management of multimorbidity can be a driver of polypharmacy.¹

Deprescribing

Deprescribing is the supervised process of reducing or stopping medicines that may no longer be of benefit or may be causing harm.^{34,47} Deprescribing can reduce the number of medicines taken by frail older people living in aged care homes with no harm to clinical outcomes.¹⁵ It may also reduce medicine complications such as the number of falls experienced by older people.^{34,48}

Initiatives need to address the known barriers to deprescribing. Examples include clinician reluctance to deprescribe because of clinical complexity, incomplete information on the rationale for the medicines, ambiguous or frequently changing care goals, uncertainty about the harms of continuing or stopping medicines, a perception that it is the responsibility of another clinician to deprescribe medicines, and lack of a defined process for deprescribing.⁴⁹⁻⁵³ Patients may be reluctant to stop their medicines because they are worried about their symptoms returning, or they are confused, having been told previously that they needed them. Opinions of their family members or information from other sources, such as the media, may also be influencing factors.⁴⁰

The National Strategic Plan to Improve the Quality Use of Medicines in Older Adults³⁴ recommends that all Australian Approved Product Information (PI) leaflets for prescribing medicines and all Consumer Medicines Information (CMI) leaflets include information on 'cessation' or 'deprescribing'. An analysis of Australian Approved PI leaflets for the 99 most commonly dispensed medicines in 2015 found that only a quarter provided guidance on how to discontinue use.⁵⁴ Consumer testing showed that CMI leaflets with information about stopping medicines have been positively received by Australians aged 65 years and over.⁵⁵

Active ingredient prescribing

Inconsistency in the way medicines are described can cause confusion for patients, who may inadvertently take multiple doses of the same active ingredient if it is prescribed under different brand names. The risk is increased in older people and those who take many medicines.⁵⁶ To reduce these risks and support people to better understand their medicines, prescriptions supplied under the PBS from February 2021 must describe the medicine by its active ingredient, and not the brand name.⁵⁶

Electronic decision support tools

Electronic decision support tools may be useful in minimising harms from polypharmacy in older people.^{57,58} The Goal-directed Medication review Electronic Decision Support System provides clinical decision support to clinicians conducting medication reviews, and has shown to be useful when conducting an HMR.⁵⁸ Research is continuing to examine the effect of the system on clinical outcomes.⁵⁹

Monitoring of polypharmacy

Monitoring rates of polypharmacy can identify people who may have an increased risk of medicine-related harm. It can prompt a medicines review to ensure that prescribed medicines are appropriate for that person.⁴ This approach has been used successfully in aged care homes in Victoria, through the development of a quality indicator that reports on the proportion of residents using nine or more medicines.⁴

Australia's National Indicators for Quality Use of Medicines in Australian Hospitals 2014 can be used for monitoring safe and appropriate medicines use.⁶⁰ Another set of indicators has been proposed for use in Australian hospitals by the New South Wales Therapeutic Advisory Group. These indicators identify people at high risk of medicine-related harm, including inappropriate polypharmacy.⁴

People are often discharged from hospital with more medicines than they were previously taking; this is especially common in older people.^{7,61} Monitoring rates of polypharmacy at the time of hospital discharge could help identify people who may be at risk of medicine-related harm and may benefit from a medication review.

The correlation between rates of polypharmacy and rates of medication management reviews (MMRs, reported in Chapter 6.2) could also be a useful indicator. Areas with high rates of polypharmacy but low rates of MMRs should be further investigated.

Polypharmacy, 75 years and over

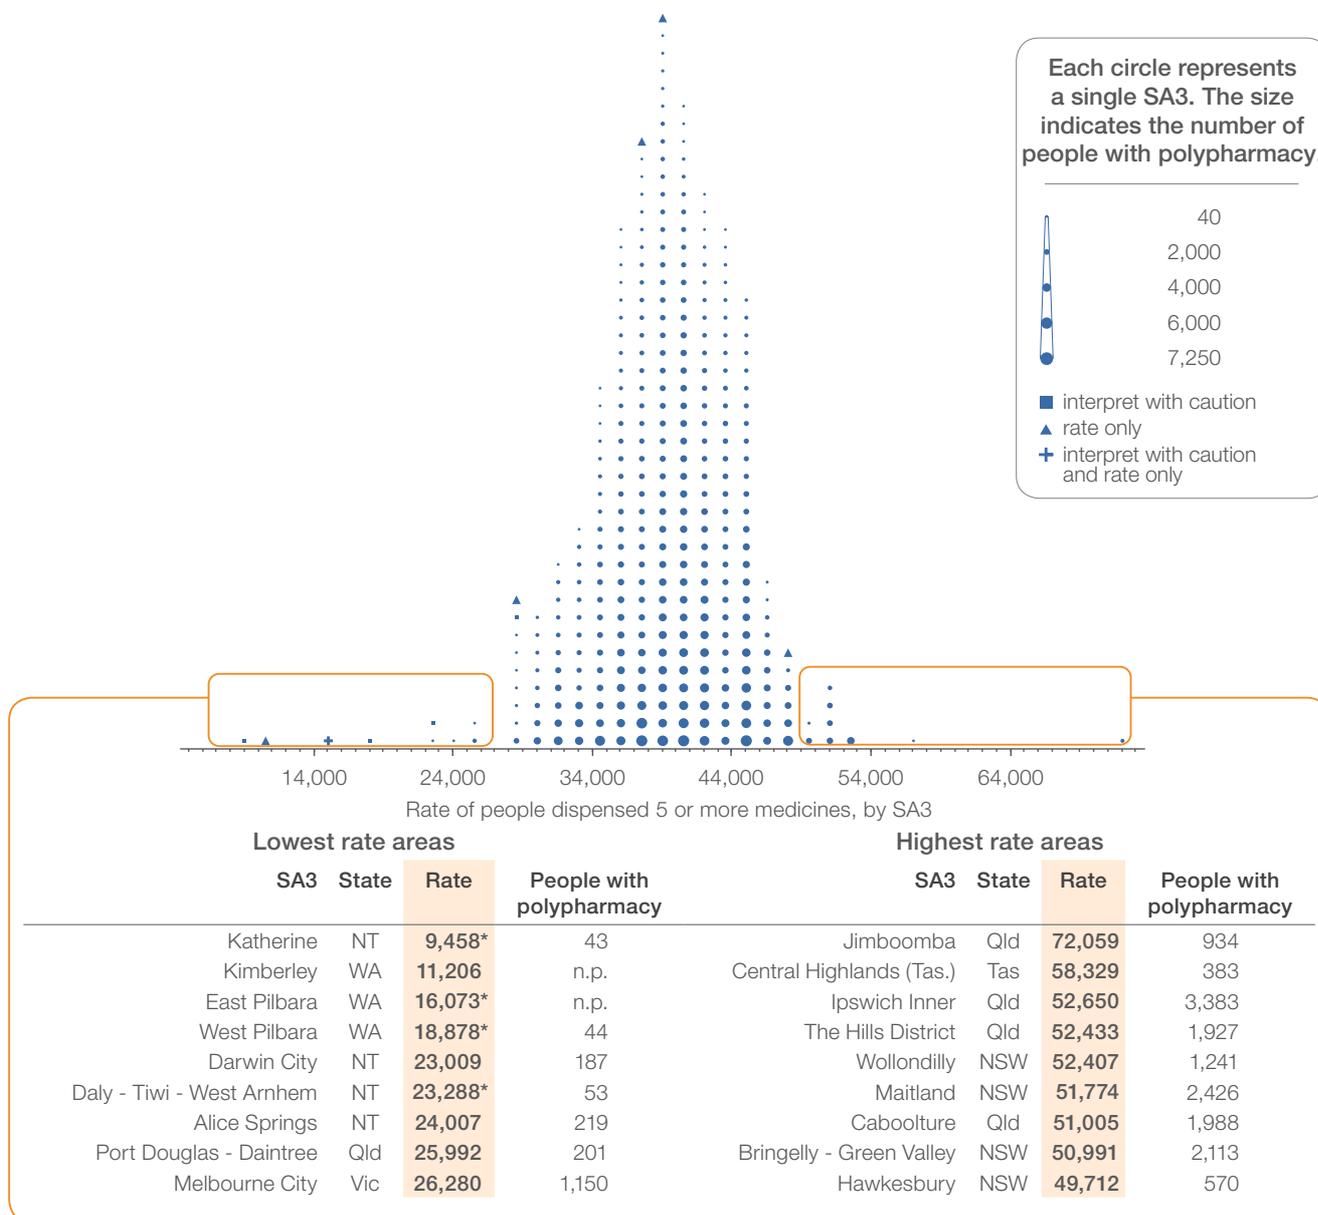

Promoting existing initiatives

Recommendations have been made as part of the Royal Australasian College of Physicians EVOLVE program and Australia's Choosing Wisely initiative to minimise harms associated with polypharmacy. These focus on^{5,62}:

- The importance of recognising and avoiding prescribing cascades
- Reducing the use of medicines when more effective non-pharmacological management strategies are available
- Stopping medicines when they are no longer of benefit
- Conducting a comprehensive review of existing medicines before prescribing further medicines in people who are already taking five or more.

Rates by local area

Australian initiatives

The information in this chapter will complement work already under way to minimise harms from polypharmacy in Australia. At a national level, this work includes:

- NHMRC Cognitive Decline Partnership Centre, University of Sydney, Australian Deprescribing Network, NPS MedicineWise, development of recommendations for a national strategic plan to reduce inappropriate polypharmacy³⁴
- NPS MedicineWise, Keeping a medicines list⁶⁹, nps.org.au/consumers/keeping-a-medicines-list
- Society of Hospital Pharmacists of Australia, Standard of practice in geriatric medicine for pharmacy services⁷⁰
- The Veterans MATES program, funded by the Australian Government Department of Veteran's Affairs³⁷, veteransmates.net.au/
- EVOLVE⁶² and Choosing Wisely Australia⁵ – includes advice about recognising and avoiding prescribing cascades, deprescribing medicines when they are no longer needed, and not prescribe medicines to people already taking five or more medicines without first undertaking a comprehensive review to ensure use of all medicines is necessary
- National Aged Care Mandatory Quality Indicator Program – quality indicator requiring that, from 1 July 2021, all Commonwealth-subsidised residential aged care facilities are to report on polypharmacy as part of optimising medicines use.⁷¹

Many state and territory initiatives are also in place, including:

- Deprescribing guides and resources for clinicians and consumers, developed by a translational research project team lead by Prof Sarah Hilmer, available from NSW Therapeutic Advisory Group website⁷², nswtag.org.au/deprescribing-tools/
- Resource Kit for Measuring Strategies to Reduce Harm from Polypharmacy in Australian Hospitals: QUM Indicators, Patient Reported Experience Measures and Risk Stratification Tools, NSW Therapeutic Advisory Group⁷³, nswtag.org.au/polypharmacy-qum-indicators-and-resources/
- The Goal-directed Medication review Electronic Decision Support System; tools include the Goals of Care Management Tool, the Drug Burden Index Calculator, and the revised Patients' Attitudes Towards Deprescribing questionnaire⁷⁴
- Polypharmacy in older inpatients elearning module, Health Education and Training Institute, NSW⁷⁵, heti.nsw.gov.au/education-and-training/courses-and-programs/polypharmacy-in-older-inpatients-
- The Statewide Frailty Initiative, Agency for Clinical Innovation, NSW⁷⁶
- Managing medicines, Primary Health Tasmania⁷⁷, primaryhealthtas.com.au/for-health-professionals/programs/managing-medicines/
- Standardised Care Process for Polypharmacy Management in Residential Aged Care, Department of Health and Human Services, Victoria⁵⁶, health.vic.gov.au/ageing-and-aged-care/residential-aged-care/safety-and-quality/improving-resident-care/standardised-care-processes
- Quality indicator to monitor the proportion of residents using nine or more medicines, Department of Health and Human Services, Victoria⁷⁸, health.vic.gov.au/about/publications/policiesandguidelines/section-3-indicator-4-use-of-nine-or-more-medicines
- Improving medication reconciliation in community settings pilot, Pharmacy Guild of Victoria.⁷⁹

6.2 Medication management reviews, 75 years and over

Why is this important?

A medication management review (MMR) is a comprehensive, structured assessment of a person's medicines. It aims to help people get the most benefit from their medicines and minimise their risk of experiencing medicines-related harm.^{1,2}

Residential Medication Management Review (RMMR) and Home Medicines Review (HMR) are types of MMR for people living in an aged care facility, or at home, respectively, who are at risk of experiencing a medicines-related problem.

Most people who receive RMMRs and about half of those who receive HMRs are aged 75 years and over.³ Many older people have several chronic diseases and need to take multiple medicines (polypharmacy) to manage them.⁴ However, polypharmacy, frailty and age-related changes in the way the body responds to medicines increase the risk of medicines-related harm in older people.

RMMRs and HMRs are effective at detecting and resolving a variety of medicines-related problems^{5,6}, but the appropriate rate of MMR services for older people is unclear.

The fourth Atlas examines rates of people aged 75 years and over who had at least one Medicare Benefits Schedule (MBS)-subsidised service for an RMMR or HMR in Australia, in 2018–19.

What did we find?

About 5.4% of people aged 75 years and over had at least one MBS-subsidised service for an RMMR or HMR in 2018–19. The rate was **11.7 times as high** in the area with the highest rate compared to the area with the lowest rate.

Rates were generally higher in major cities than in other areas. Rates generally increased with socioeconomic disadvantage in major cities and outer regional areas. Patterns were similar to those of polypharmacy in many areas, suggesting appropriate targeting of MMRs in some but not in all areas.

What can be done?

RMMRs are recommended for new residents in aged care facilities, and for existing residents after changes in clinical condition or medicines.^{7–9} System changes are needed to drive implementation of these recommendations across aged care facilities.¹⁰

Recent changes to funding arrangements to improve access to RMMR and HMR services in rural and remote areas should be evaluated for their effectiveness.¹¹

Initiatives to improve medical practitioner uptake of pharmacist recommendations following MMRs should be a priority. One such initiative is the development of medication review indicators for aged care facilities.

Medication management reviews, 75 years and over

Context

This item examines the rate at which people aged 75 years and over obtained at least one MBS-subsidised service for an MMR (RMMR or HMR) in Australia in 2018–19.

What is a medication review?

An MMR – also known as a medication management review or medicines review – is a comprehensive and structured assessment of a person’s medicines. The aim of an MMR is to help people get the maximum benefit from their medicines and to prevent medicine-related harm.^{1,2}

This item examines rates of two types of MMR services that are funded under the MBS and dedicated Australian Government programs¹²:

- Residential Medication Management Review (RMMR)* – available to people living in an eligible Australian Government-funded aged care facility
- Home Medicines Review (HMR)[†], also known as Domiciliary Medication Management Review – available to people living in their own home.

RMMR and HMR services have been available to Australians since 1997 and 2001 respectively.^{13,14} They are effective in detecting medicine-related problems^{5,6} and are commonly conducted for older people because older people have high rates of medicine-related problems and are particularly vulnerable to harms from medicines.^{15–18} About 86% of all RMMRs and about half of all HMRs were for people aged 75 years and over in 2018–19.³

Use of multiple medicines (polypharmacy) is common among older people. This is largely because the prevalence of chronic diseases that are managed with medicines increases with ageing.^{4,15,19} About two-thirds of Australians aged 75 years and over living at home are taking five or more medicines.¹⁶ In residential aged care facilities, up to 95% of residents take five or more medicines, with 25% taking 10 or more.²⁰

Older people often need to take many medicines, but are very susceptible to harms from medicines because of frailty and age-related changes in the way their bodies respond to medicines.²¹ Polypharmacy increases the risk of medication-related harm, and leads to increased hospital admissions.⁴ There are also risks associated with specific medicines that can be especially harmful for older people.^{4,21}

Over half the people living in aged care facilities are prescribed medicines that are considered potentially inappropriate in older people, and for which use should be avoided if possible.^{21,22}

Rules and guidelines for conducting RMMR and HMR

RMMR and HMR services are carried out in a collaborative and structured way involving the patient, their medical practitioner (usually a general practitioner [GP]), an accredited pharmacist and sometimes carers and other clinicians. There are three key steps involved in conducting a review^{1,23,24}:

1. Based on criteria for a review and risk factors for medicines-related harm, a medical practitioner identifies and assesses whether a patient will benefit from an MMR. With the patient’s consent, the practitioner refers them to an accredited pharmacist – that is, a pharmacist who has undergone the required training in this area – to conduct the review.
2. The accredited pharmacist conducts the review together with the patient, and consults with other people such as carers and other members of the healthcare team. The pharmacist assesses the risks and benefits of each medicine, the complexity of the regimen and how the person is managing their medicines. They identify ways to resolve any medicine-related problems, and make recommendations about ongoing therapy in a report, which they send to the referring medical practitioner.
3. The referring practitioner reviews the report with the patient. The report forms the basis of an agreed-upon medicines management plan.

* MBS item numbers 903 and 249

† MBS item numbers 900 and 245

Several rules and guidelines ensure that RMMR and HMR services are appropriately provided to people who may benefit from them while avoiding inappropriate reviews. These rules include the MBS criteria for medical practitioners^{7,25}, the RMMR and HMR program rules for accredited pharmacists^{23,24}, and other guidelines.^{1,8,26,27} The rules set out how to identify whose medicines to review, and how and how often to perform reviews, which can affect rates of RMMR and HMR services.^{5,6}

A person's need for an HMR is assessed according to a variety of risk factors for medicines-related harm or suboptimal use, such as whether they²⁵:

- Are taking five or more medicines regularly
- Are taking more than 12 doses of medicine per day
- Are taking medicines that have a small difference between doses that are safe and doses that can be harmful (narrow therapeutic index)
- Are attending different doctors
- Have been discharged from a facility or hospital in the last four weeks
- Have difficulty managing their medication regimens because of literacy or language difficulties, physical difficulties – such as poor dexterity or impaired sight – or cognitive difficulties – such as confusion or dementia
- Are managing significant changes made to their medicines in the last three months
- Are experiencing symptoms suggestive of an adverse drug reaction
- Are displaying suboptimal responses to treatment with their medicines
- Are suspected of having problems with adhering to their medicines or problems managing medicine-related therapeutic devices – for example, inhalers for asthma.

A person's need for an RMMR is based on whether they are⁷:

- A new resident to an aged care facility
- An existing resident who has had a significant change in their medical condition or medicines.

It is recommended that new residents of an aged care facility receive an RMMR as soon as possible after admission, and that it is completed within four weeks.⁷ Under the program rules, a patient cannot receive another RMMR or HMR from a pharmacist within 24 months of an initial review. However, they can be referred by a medical practitioner within that period if there is a clinical need – for example, if there has been a change in their clinical condition or their medicines. Since April 2020, a patient can also receive two follow-up services to deal with any medicine-related problems identified at the initial RMMR or HMR.^{11,23,24}

Medical practitioners' services are claimed through the MBS item numbers examined in this report. Medical practitioners can refer a person within 12 months of an earlier RMMR or HMR or at any time if there is a clinical need.^{7,25} The HMR program had a cap of 20 HMR services per month per accredited pharmacist until March 2020, when the cap was increased to 30; there is no cap for RMMR services.^{11,23,24}

Other types of MMRs

RMMRs and HMRs are not the only types of medication reviews that patients may be offered. Medication reviews are conducted by all hospitals and other health services as a requirement under the National Safety and Quality Health Service Standards.²⁸ Some health services also offer hospital outreach medication review services to improve medicines management during transitions of care to the community following a hospital stay.²⁹ GPs may conduct a medication review as part of a general consultation or chronic disease management service.³⁰ Community pharmacists may also conduct medication reviews outside of the HMR and RMMR arrangements. Examples include pharmacist services contracted by aged care facilities, and in-pharmacy MedsCheck and Diabetes MedsCheck services.²

Medication management reviews, 75 years and over

Effectiveness of RMMR and HMR

RMMRs and HMRs are effective in detecting medicine-related problems in older people.^{5,6,31-33} Up to 98% of older people in Australian studies have at least one medicine-related problem detected at the time of a medicines review, with most having three^{20,34-37}, and some as many as five.³⁵ In Australian residential aged care facilities, over 95% of residents have at least one medicine-related problem detected at the time of review.^{9,21,38-42} On average, three to four problems are identified per resident at the time of review.^{21,43} The problems most commonly identified at the time of an RMMR or HMR are^{20,31,32,43}:

- Inappropriate prescribing of medicines
- Prescribing of medicines that are no longer needed
- Not prescribing a medicine that is needed
- Failure to adhere to medicines regimens
- Lack of laboratory monitoring
- Adverse reactions to medicines.

HMRs can reduce the number of medicines prescribed^{6,44}, improve appropriateness of prescribing⁶, and improve a person's understanding and adherence to medicines^{6,32} and their confidence in managing their medicines.^{6,13} RMMRs are effective in identifying and stopping medicines that are known to cause sedation and increase the risk of falls.⁵ Like HMRs, they are effective in improving the appropriateness of prescribing and reducing the number of medicines prescribed.⁵

In studies of Australian war veterans, HMRs delayed hospitalisation in certain patient groups, such as people with heart failure and people taking warfarin.^{45,46}

Improvements in management of chronic diseases, such as diabetes, have been shown when other types of medication reviews are conducted by pharmacists in community settings such as GP clinics, community pharmacies, and outpatient and specialist clinics.⁴⁷

More research is needed to find out whether and how RMMRs and HMRs improve quality of life and reduce risk of hospital admissions associated with adverse medicine events – for example, by preventing a drug interaction that could lead to clinical deterioration.^{5,6,44,48,49}

Factors influencing effectiveness of RMMR and HMR

GPs' uptake of recommendations to resolve medicine-related problems identified during reviews is variable. For example, the extent of collaboration between the GP and the pharmacist conducting the review affects acceptance and implementation of recommendations.^{48,50}

The likelihood of accepting and implementing recommendations from HMRs has been reported to range between 17% and 86%⁵⁰, despite recommendations being based on evidence.¹

Similar variability has been reported in studies examining the impact of RMMR, with 45% to 84% of recommendations accepted by GPs in a recent Australian systematic review.⁴³

Rates of RMMR and HMR in Australia

A large-scale study in New South Wales of Pharmaceutical Benefits Scheme concession card holders examined HMR use in people aged 45 years and over between 2009 and 2014.⁵¹ In this study, 5.2% of people aged 75 years and over had at least one HMR. Even in groups associated with high-risk prescribing, rates were still generally below 10%. Rates increased with age, and were higher in people receiving more medicines and in people who had recently been discharged from hospital.⁵¹ Higher rates of HMR were found in smokers, people with obesity, and people with diabetes and broader health issues such as impaired physical functioning.⁵¹ Living in a rural or remote area, having a lower level of education, and lower household income were also associated with higher rates of HMR services.⁵¹

Earlier studies of HMR conducted in older Australians reported participation rates ranging from 3.6% to 5.5%.⁵²⁻⁵⁴ Rates increased with age and were higher in women, people taking more medicines, people who had more visits to a GP, people who had had a previous review, and people who had had a hospital admission. Rates were lower in people who used more dispensing pharmacies, had more specialist visits, and were at greater socioeconomic advantage.⁵²

Studies of Australian aged care facilities found that less than half of residents received a RMMR in 2013–14.⁵⁵⁻⁵⁶ Less than 22% of new residents received a timely RMMR between 2012–2015 in a study of residents in aged care homes.⁵⁷

Why map rates of RMMR and HMR?

RMMRs and HMRs can detect and resolve medicine-related problems and improve medicines use in older people, but uptake of services has stabilised despite Australia's ageing population.^{5,6,51,57} Appropriate rates for RMMR and HMR services are unclear. Mapping rates of MMR is one way of exploring the appropriate use of these services.

About the data

Data are sourced from the MBS dataset. This dataset includes information on MBS claims processed by Services Australia. It covers a wide range of services (attendances, procedures, tests) provided across primary care and hospital settings.

The dataset does not include:

- Services for publicly funded patients in hospital
- Services for patients in hospital outpatient clinics where claims are not made to the MBS
- Services covered under the Department of Veterans' Affairs arrangements.

The dataset does not allow analysis by Aboriginal and Torres Strait Islander status.

The dataset includes the MBS claims for RMMR or HMR services provided by medical practitioners. These claims are made after the accredited pharmacist conducts the review and the medical practitioner discusses it with the patient. Claims made by accredited pharmacists for conducting the review are funded under the Community Pharmacy Agreement, which is a separate dataset.

Rates are based on the number of people who had at least one MBS-subsidised service for a medication management review (RMMR or HMR) per 100,000 people aged 75 years and over in 2018–19. Patient counts reflect the number of unique patients, regardless of the number of services a patient may have received in the year.

The analysis and maps are based on the patient's postcode recorded in their Medicare file and not the location of the service.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

Medication management reviews, 75 years and over

For all MBS items in the Atlas, some data have been suppressed to manage volatility and confidentiality. This process takes into account the Australian Government Department of Health's requirements for reporting MBS data (see the Technical Supplement). Data suppression for this item has been extensive, and affects all of the Northern Territory, and remote areas of Western Australia and Queensland. Reporting for the Northern Territory was possible at the territory level. Most local areas (Statistical Area Level 3 – SA3) were suppressed to prevent identification of the provider (practitioner or business entity). This is indicated on the maps in grey.

What do the data show?

Magnitude of variation

In 2018–19, 96,533 people aged 75 years and over had at least one MBS-subsidised service for a medication management review (RMMR or HMR), representing 5,392 people per 100,000 people aged 75 years and over (the Australian rate).

The number of people who had at least one MBS-subsidised service for a medication management review (RMMR or HMR) across 314* local areas (Statistical Area Level 3 – SA3) ranged from 1,618 to 19,006 per 100,000 people aged 75 years and over. The rate was **11.7 times as high** in the area with the highest rate compared to the area with the lowest rate. The number of people varied across states and territories, from 1,224 per 100,000 people in Northern Territory to 7,037 per 100,000 people in Tasmania. (Figures 6.7–6.10).

After the highest and lowest 10% of results were excluded and 252 SA3s remained, the number of people per 100,000 people was 2.0 times as high in the area with the highest rate compared to the area with the lowest rate.

Analysis by remoteness and socioeconomic status

Rates for medication management reviews were generally higher in major cities than elsewhere. Rates generally increased with socioeconomic disadvantage in major cities and in outer regional areas. There was unclear patterning elsewhere (Figure 6.11).

Analysis by age group

In 2018–19, 45,592 people aged 75–84 years had at least one medication management review, representing 3,896 people per 100,000 people (the Australian rate for this age group).

In 2018–19, 49,665 people aged 85 years and over had at least one medication management review, representing 10,180 people per 100,000 people (the Australian rate for this age group).

Data and graphs for analysis by age group and analysis by Primary Health Network are available at safetyandquality.gov.au/atlas

* There are 340 SA3s. For this item, data were suppressed for 26 SA3s due to one or more of a small number of services or population in an area, or potential identification of individual patients, practitioners or business entities. Some SA3 rates are more volatile than others. These rates are excluded from the calculation of the difference between the highest and lowest SA3 rates in Australia.

For further detail about the methods used, please refer to the Technical Supplement.

Interpretation

The Atlas found that about 5.4% of people aged 75 years and over had at least one MBS-subsidised MMR in 2018–19. This equates to about 1 in 7 people aged 75 years and over with polypharmacy (people dispensed five or more medicines) receiving an MMR in the year. While not all people with polypharmacy may need an MMR and some people with polypharmacy may receive a medication review that is not counted in MBS data, this ratio may be helpful in monitoring changes in MMR use. MBS statistics for the same period show that 62.5% of MBS-subsidised MMR services processed for people aged 75 years and over were RMMRs and the remaining 37.5% were HMRs.³

Rates for medication management reviews were higher in major cities, which raises concern about access in other areas, a finding previously highlighted in HMR program evaluations.⁶⁴ Data suppression was extensive in remote areas and must be considered in the interpretation of the findings.

Rates were higher in socioeconomically disadvantaged areas of major cities, which is consistent with previous Australian research and suggests appropriate targeting of MMRs in these areas.^{6,52}

Possible reasons for variation in rates of MMR

Variation between areas may not directly reflect the practices of the clinicians who are based in those areas. The analysis is based on where people live rather than where they obtain their health care. Patients may travel outside their local area to receive health care.

Variation in rates is likely to be due to the geographical differences in the factors discussed below.

Patient need

Variation is warranted when it reflects patient need. Nationally, higher rates of MMR were seen in people aged 85 years and over than in people aged 75–84 years, which is consistent with higher polypharmacy rates seen in the older age group.

Because the data are age and sex standardised – to control for differences in population structures between areas – variation in rates cannot be explained by higher proportions of older people. However, areas with aged care homes would be expected to have higher rates than areas without, given the higher numbers of RMMRs compared to HMRs.³

Areas with higher rates of underlying chronic disease are expected to have higher rates of polypharmacy. Higher rates of MMR are likely in these areas, given MMRs are recommended for people taking five or more medicine.^{7,25} High rates of MMRs observed in some disadvantaged areas may reflect the prevalence of multimorbidities and risk factors for chronic disease in these areas.

Access to services

The number of clinicians providing services in the area, and the ability to see a specific clinician, may influence the likelihood of people seeking care and therefore rates of MMR. The practice styles of individual clinicians may be more likely to affect rates in areas with fewer clinicians, such as rural and regional locations, than in areas with more clinicians.

In particular, the number of accredited pharmacists providing MMRs, and ease of access to them, may affect rates. This may be an issue in rural and remote areas, where there may be fewer accredited pharmacists available to provide services compared to major cities.^{6,13,58}

Medication management reviews, 75 years and over

The program rules for MMR services may also affect access.^{5,6} The program cap of 20 (now 30) HMR services per month per accredited pharmacist may disproportionately affect participation rates in rural areas because there are fewer accredited pharmacists in these areas.⁶ Differences in providers' perceptions of the program rules (for example, that the rules are stringent) could also influence rates in some areas.^{5,6} The 24-month restriction on patients receiving another review and introduction of a 30-day deadline to submit claims had an immediate and lasting influence on overall rates of RMMR when introduced in 2014.⁵

Knowledge of MMR processes by clinicians, as well as time taken to generate referrals, previous experience with referrals and the strength of working relationships between medical practitioners and accredited pharmacists may influence rates of MMRs.^{51,59}

Rates of MMRs may also be influenced by rates of other medication reviews conducted in the community, such as reviews conducted by GPs (for example, as part of routine consultations, or as part of a health assessment for people aged 75 years and over³⁰, or as part of a chronic disease management plan), and medication reviews conducted by community nurses and community pharmacists outside the RMMR and HMR programs.

Clinical decision-making

Variation in medical practitioners' views on the benefits of MMRs is a likely contributor to the variation seen.^{13,59}

Most GPs are supportive of MMR services^{59,60}, with general agreement that they reduce inappropriate polypharmacy and potentially improve medicine safety, as well as a person's understanding of and adherence to medicines regimes.^{31,60} GPs have also reported that MMRs provide helpful insights into all the medicines a person is taking – including complementary and over-the-counter medicines.⁶⁰

However, not all GPs are convinced of their value.^{13,59} Some believe they don't offer any new insights about a person's medicines or provide clinically significant recommendations.⁵⁹ The complexity of the process, time constraints, and the volume of paperwork associated with reviews, as well as inconsistencies in the format and quality of reports generated by pharmacists have been cited by GPs as barriers to participation in MMR services.^{13,60,61}

Consumer awareness

Consumer awareness of MMR services, their level of comfort in having a pharmacist visit them at home and their attitude towards medication reviews may affect rates.

A study of older people living in regional Australia taking five or more different medicines showed 15% were aware of HMR services.⁶² Reasons for lack of awareness included not being informed about the services by GPs or pharmacists, and not seeing leaflets or advertising material relating to HMRs.

Not knowing the pharmacist who is providing the service has been reported by GPs as a barrier for people when deciding whether to participate in an HMR, as they feel uncomfortable having a stranger in their home conducting the review.⁶⁰

The level of concern a person has about their medicine may influence rates. In one Australian study, people aged 75 years and over at high risk of medicine-related harm were least likely to worry about their medicines and participate in an MMR.⁶³

A clinician's ability to be clear about the benefits of MMRs may also influence whether a person will have a review.^{13,59}

People's attitudes towards MMR may affect rates. Some people associate a sense of independence with managing their own medicines, and so they may perceive an MMR as a sign of losing independence.¹³

Promoting appropriate care

System changes are needed to improve access to MMRs for older people who are at risk of medicine-related harm and likely to benefit from a review.

RMMRs are recommended for new residents on admission to aged care facilities and existing residents after changes in their clinical condition or medicines.⁷⁻⁹ However, compliance to this recommendation is poor. A national study of 143,676 people aged 65 years and over who first entered permanent residential aged care in Australia between January 2012, and December 2015 found that 21.5% received an RMMR within 90 days. In only 6.2% of the aged care facilities did more than 50% of new residents receive a timely RMMR.⁵⁷

The recommendation for use of RMMR was reiterated in the 2017 review of national aged care quality regulatory processes⁹ and in the 2021 final report on the Royal Commission into Aged Care Quality and Safety.¹⁰ More needs to be done to implement the recommendation.

Other priorities to improve the appropriate use of MMRs include:

- Improving access to MMR services in rural and remote areas
- Improving medical practitioner uptake of pharmacist recommendations following MMRs.

To deal with these concerns, regulatory changes to the RMMR and HMR programs were introduced in early 2020.^{11,23,24} Key changes included expanding referral of RMMRs and HMRs to medical practitioners other than GPs, increasing the number of HMR services accredited pharmacists can provide from 20 to 30 per month, and allowing up to two services after an initial review for follow-up of recommendations made in the pharmacist's initial report. Improving access to RMMR or HMR following a hospital stay may also reduce medicine-related problems, especially within the first 10 days of discharge from hospital.^{13,14} Frameworks have been developed to support medical practitioners in hospital to identify and refer people at high risk of medicine-related

harm following a hospital stay for an RMMR or HMR.⁶⁴ These changes must be evaluated for their effectiveness.

Audit and monitoring

The development of medication review indicators for aged care facilities could help support the appropriate use of RMMR. Indicators could measure the proportion of people taking five or more medicines who receive a review⁹, the percentage of people who receive a timely review on admission to an aged care facility, or the percentage of pharmacist recommendations that are acted on.

Improving collaboration between pharmacists and GPs

Team-based models of general practice that include pharmacists could improve collaboration between GPs and pharmacists and increase the likelihood that a pharmacist's recommendations are acted upon. While these models are well established internationally, more research regarding their effectiveness in the Australian is needed.⁶⁵

Good working relationships between GPs and pharmacists conducting reviews have been found to influence uptake of MMR services by GPs. Some have reported that the role of HMR may be limited in major cities by a lack of opportunity to build relationships between GPs and pharmacists.⁵⁹ GPs that interact with pharmacists throughout the review process are more likely to initiate reviews and implement recommendations than those who do not, highlighting the importance of collaboration.^{48,50} Australian research has shown that greater collaboration between GPs and pharmacists conducting HMRs can improve management or resolve up to 81% of identified medicine-related problems.³¹ Changes to RMMR and HMR programs that allow pharmacists to conduct two follow-up reviews could improve collaboration between GPs and pharmacists.

Medication management reviews, 75 years and over

Use of evidence based-tools to support reviews

Electronic decision support tools have been found to be an important adjunct in clinical decision-making for pharmacists conducting MMRs.⁶⁶ However a person's individual needs and preferences for treatment must also be taken into account by the pharmacist or reviewer when assessing recommendations generated by these tools.⁶⁷

The Goal-directed Medication review Electronic Decision Support System provides clinical decision support to clinicians conducting medication reviews, and has been shown to be useful when conducting an HMR.⁶⁸ Research is continuing to examine the effect of the tool on clinical outcomes.⁶⁹

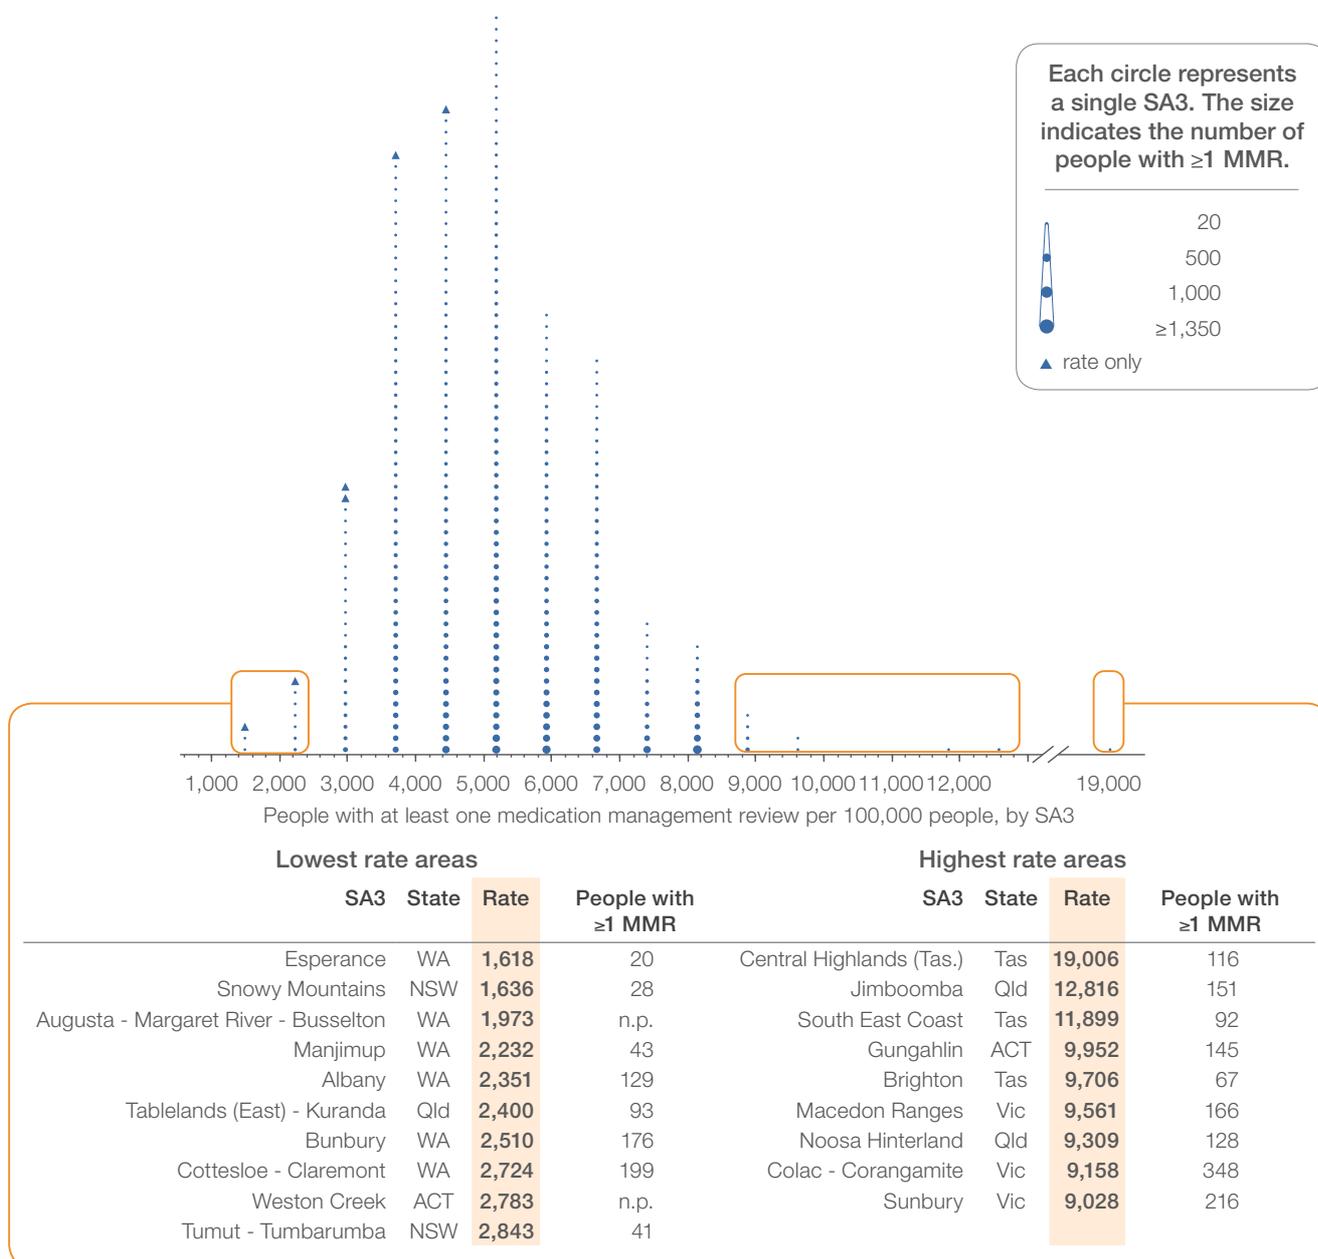

Tools to support simplification of medicine regimens for residents of aged care facilities have also been developed and validated.⁷⁰ The MRS GRACE Tool helps pharmacists identify how to reduce the complexity of a resident's regimen. The tool has been shown to be especially useful in those taking five or more medicines a day. In two-thirds of residents, medicines can be taken in a simpler way without changing the goals of therapy. High rates of acceptance and implementation of recommendations have been found, with some recommendations – such as reducing the number of medicine times – implemented in 62% of residents, as well as sustained results 12 months later at follow-up.⁷¹

Consumer awareness

Improved consumer awareness about programs aimed at improving their ability to manage their medicines and the benefit of MMR services could support uptake⁶², particularly of HMRs. Consumer research has found that people are more likely to participate in a review if they understand the reasons for having one, and their GP thinks it will be beneficial.^{13,59}

Rates by local area

Figure 6.7: Number of people who had at least one MBS-subsidised service for a medication management review (MMR) per 100,000 people aged 75 years and over, age and sex standardised, by Statistical Area Level 3 (SA3) of patient residence, 2018–19

Notes:

Australian initiatives

Information in this chapter will complement work already under way in Australia regarding medication review and MMR services. At a national level this work includes:

- NPS MedicineWise, Managing your medicines – includes resources to getting an HMR and supporting patients with keeping a medicines list⁷⁵, nps.org.au/consumers/managing-your-medicines
- Society of Hospital Pharmacists of Australia. Hospital-initiated medication reviews (HIMR)⁶⁴
- The Veterans MATES program, funded by the Australian Government Department of Veteran's Affairs⁷⁶, veteransmates.net.au/

Many state and territory initiatives are also in place to improve medication review and support uptake of MMR services, including:

- The Goal-directed Medication review Electronic Decision Support System tools include the Goals of Care Management Tool, the Drug Burden Index Calculator, and the revised Patients' Attitudes Towards Deprescribing questionnaire⁷⁷
- Consumer information leaflet – *Rethink your medications*⁷⁸, Primary Health Tasmania, primaryhealthtas.com.au/wp-content/uploads/2018/06/Rethinking-Your-Medications-consumer-brochure.pdf
- *Standardised Care Process for Polypharmacy Management in Residential Aged Care*, Department of Health and Human Services, Victoria⁵⁴, health.vic.gov.au/ageing-and-aged-care/residential-aged-care/safety-and-quality/improving-resident-care/standardised-care-processes

6.3 Proton pump inhibitor medicines dispensing, 75 years and over

Why is this important?

Proton pump inhibitor (PPI) medicines are one of the most commonly used medicines in Australia, particularly among older people. PPI medicines are highly effective in managing gastro-oesophageal reflux disease (GORD), but are often used long term without reassessment of need. Older people may be particularly susceptible to harms from long-term use. These harms include unnecessary complexity in medicine regimens, unnecessary costs and possible rare but serious adverse effects.

The *Third Australian Atlas of Healthcare Variation* found substantial variation in rates of PPI medicine use in people aged 18 years and over.

The fourth Atlas examines PPI medicine dispensing in people aged 75 years and over.

What did we find?

In 2018–19, more than 7.1 million Pharmaceutical Benefits Scheme (PBS) prescriptions were dispensed for a PPI medicine for people aged 75 years and over.

The rate was **5.9 times as high** in the area with the highest rate as in the area with the lowest rate.

Almost half (47%) of people aged 75 years and over had at least one PBS prescription dispensed for a PPI medicine; more than one-third (38%) had at least four prescriptions dispensed in the year, suggesting long-term PPI medicine use.

There was substantial variation in rates of dispensing of high-dose PPI medicines between Primary Health Networks (PHNs). The rate was 6.1 times as high for the PHN with the highest rate as for the PHN with the lowest rate.

What can be done?

Increased PBS restrictions for prescribing PPI medicines for GORD, introduced in May 2019, should help to reduce inappropriate long-term use, particularly of high-dose PPI medicines.

Interventions that actively engage clinicians and encourage them to regularly review the need for PPI medicines in older people remain a priority. A greater focus is needed on educating people at every suitable opportunity about lifestyle measures that can be taken to reduce reflux. Improved consumer awareness of the appropriate timing of PPI medicine dosing may also improve the effectiveness of treatment and reduce the need for higher doses or long-term use.

Proton pump inhibitor medicines dispensing, 75 years and over

Context

This item examines PPI medicine dispensing for people aged 75 years and over in Australia in 2018–19.

PPIs are a group of medicines that reduce stomach acid production.¹ They reduce the potential for reflux of stomach acid into the oesophagus, and promote healing of inflammation and ulcers in both the oesophagus and the stomach. PPI medicines available in Australia include omeprazole, pantoprazole, lansoprazole, rabeprazole and esomeprazole.^{2,3} They are available by prescription; some are also available as over-the-counter medicines in lower strengths and pack sizes.

PPI medicines are one of the most commonly dispensed medicines for older people.⁴ They are most often used to manage GORD.⁵ They are also used in people at high risk of gastrointestinal bleeding who need to take medicines such as non-steroidal anti-inflammatory drugs (NSAIDs), which can increase this risk.^{3,5,6}

GORD affects about 11% of Australian adults and rates of disease do not significantly change with age.^{7,8} People with GORD have frequent symptomatic reflux on two or more days of the week, or reflux that is severe enough to affect their quality of life.⁹ PPI medicines, accompanied by lifestyle modifications, are recommended as first-line treatment for GORD because they provide fast symptom relief and are more effective than less potent acid-suppression medicines.^{2,3,10,11}

Guidelines for treating GORD recommend starting with a standard-strength PPI medicine for 4–8 weeks. A 'step-up' approach to a higher dose is recommended only if symptoms are severe.^{2,3,11} If symptoms are well controlled after initial treatment, treatment can be 'stepped down' to a lower dose or stopping altogether can be tried.^{2,3} More than two-thirds of people may be able to stop taking PPI medicines altogether, without their symptoms returning, after an initial course of treatment; gradual tapering of the dose is the most successful, particularly if the initial dose was high.^{12,13}

Despite guideline recommendations, research suggests that many older people treated for GORD continue to take a PPI medicine long term without reassessment of need.^{14–16} The issue highlights the importance of discussion with people at the time of prescribing PPI medicines about the natural course of GORD, and the role of lifestyle changes in reducing reflux symptoms long term. Lifestyle measures, such as modifying diet, losing weight and stopping smoking, are an essential part of GORD treatment because they reduce reflux and reduce the risk of oesophageal cancer.³

Guidelines also recommend PPI medicines for people at high-risk of GI bleeding who need ongoing treatment with NSAIDs, including low-dose aspirin for management of cardiovascular disease.^{3,6} Older age is a risk factor for GI bleeding from NSAID use³, and so PPI medicines are prescribed in older people for the duration of NSAID use to reduce this risk.^{3,6} Bleeding risk can also be reduced by taking other measures; for example, using the least potent NSAID for the shortest duration possible, or treating other risk factors such as *Helicobacter pylori* (*H. pylori*) infection, if present.^{17,18}

PPI medicines also have a role in treating mild to intermittent reflux. About 15–20% of adults experience reflux on an intermittent basis.⁹ Symptoms can often be managed with the lifestyle modifications described above. If acid suppression treatment is needed, guidelines recommend an antacid or, if needed, a more potent medicine, such as a histamine 2 receptor antagonist (H² antagonist) or a PPI medicine.^{3,11,19} Over-the-counter PPI medicines are available for treating mild to intermittent reflux, however rates of their use are not readily available.

Previous Atlas findings on PPI medicine use

The *Third Australian Atlas of Healthcare Variation* mapped PBS dispensing of PPI medicines for people aged 18 years and over.²⁰ More than 21 million PBS prescriptions for PPI medicines were dispensed in Australia in 2016–17. The dispensing rate was 5.0 times as high in the area with the highest rate as in the area with the lowest rate. Dispensing rates were also higher in areas with socioeconomic disadvantage

in major cities, and in inner and outer regional areas. Overall, 15% of the adult population had a least one prescription for a PPI medicine dispensed during the year.

Why revisit this topic for people aged 75 years and over?

Concerns about high rates of PPI medicine dispensing and potentially inappropriate long-term use have been expressed for years.²¹ Recent Australian research has shown that older people are substantially higher users of PPI medicines than younger adults.¹⁴ This pattern is also seen in many comparable countries, such as New Zealand, the United Kingdom, the United States and Canada.²²⁻²⁸ Concerns have also been raised about the long-term use of PPI medicines in older people without a clear indication.^{14,29,30}

In a population study, rates of PPI medicine use per 100 people in Australia were 42.2 for people aged 75–84 years and 42.8 for people aged 85 years and over, compared with 12.5 for the whole population, between 2013 and 2016.¹⁴ Of people aged 75 years and over who started treatment with a PPI medicine, 42% continued to take it for longer than 12 weeks, and 31% took it for more than 12 months, either intermittently or continuously. The study also found that a substantial proportion of people who continued to take a PPI medicine after 12 weeks did so at the dose they were started on. PPI medicines were more commonly prescribed in people who were taking more medicines than in those who were taking fewer.

An Australian study of 41,000 veterans (average age of 79 years) prescribed PPI medicines for GORD found that more than two-thirds did not have their therapy reduced or stopped after eight weeks of treatment, as recommended in guidelines. Thirty-eight percent continued PPI medicines for one year.¹⁵

Similar trends have been observed in Australian aged care homes. Half to three-quarters of residents have been found to take PPI medicines for durations longer than recommended.^{16,31,32} Rates of PPI medicine use are also higher among residents who take more medicines than among those taking fewer.³³

Although PPI medicines have a good safety profile, there are concerns about potential harms associated with long-term use in older people, prompting an increased focus on regularly reviewing the need for these medicines.⁶ Long-term use has been linked to an increased risk of hip fracture.³⁴ PPI medicines alter the gut microbiome, and there is some evidence that this may increase the risk of type 2 diabetes, as well as infections with *Clostridium difficile* and other pathogens.^{35,36} PPI medicines can also increase the risk of vitamin B₁₂ deficiency and kidney complications.^{6,10,37,38}

Older people may be more susceptible to these harms than younger people because of increased frailty and age-related physiological changes that alter the way that their bodies respond to medicines.^{31,39} Many older people also have multiple conditions requiring treatment with multiple medicines, which also increases their risk of medicine-related harm.³¹ Although the absolute risk of these adverse effects is low, the population impact may be high because of the number of older people taking PPI medicines.¹⁶

PBS changes

On 1 May 2019, restrictions on PPI medicines came into effect that aim to improve the appropriateness of their use. These changes aim to reduce unwarranted long-term use, particularly high-dose use among older people.^{40,41} Key changes include the reclassification of doses, increased restrictions on high-dose and standard-dose PPI medicines for GORD, changes to the number of repeat prescriptions and the addition of new item numbers for standard doses.

Proton pump inhibitor medicines dispensing, 75 years and over

About the data

Data are sourced from the PBS dataset, which includes all prescriptions dispensed under the PBS and the Repatriation Pharmaceutical Benefits Scheme (RPBS), including under co-payment prescriptions.

Data used in this report exclude doctors' bag items and any programs with alternative supply arrangements (section 100 of the *National Health Act 1953*) where patient level details are not available, such as direct supply to remote Aboriginal health services.

The PBS and RPBS do not cover medicines supplied to public hospital inpatients, over-the-counter medicines or private prescriptions.

The dataset does not allow analysis by Aboriginal and Torres Strait Islander status.

Rates are based on the number of prescriptions dispensed for PPI medicines per 100,000 people aged 75 years and over in 2018–19, unless otherwise indicated. For defined daily dose (DDD), the rate is calculated per 1,000 people per day. Patient counts reflect the number of unique patients, regardless of the number of prescriptions the patient may have received in the year.

The data do not include PPI medicines in fixed-dose combinations with antibiotics.

The analysis and maps are based on the patient's postcode recorded in their Medicare file and not the location of the prescriber or the dispensing pharmacy.

Rates are age and sex standardised to allow comparisons between populations with different age and sex structures.

Some data have been suppressed to manage volatility and confidentiality. This process takes into account the Australian Government Department of Health's requirements for reporting PBS data (see the Technical Supplement). Data suppression for this item (indicated on the maps in grey) has been particularly marked for remote areas of the Northern Territory.

What do the data show?

Magnitude of variation

In 2018–19, there were 7,114,281 PBS prescriptions dispensed for PPI medicines to people aged 75 years and over, representing 418,360 prescriptions per 100,000 people aged 75 years and over (the Australian rate).

The number of prescriptions dispensed for PPI medicines across 328* local areas (Statistical Area Level 3 – SA3) ranged from 131,393 to 777,098 per 100,000 people aged 75 years and over. The rate was **5.9 times as high** in the area with the highest rate compared with the area with the lowest rate. The number of prescriptions dispensed for PPI medicines varied across states and territories, from 257,216 per 100,000 people aged 75 years and over in the Northern Territory to 462,138 in Tasmania (Figures 6.12–6.15).

After the highest and lowest 10% of results were excluded, 264 SA3s remained. The number of prescriptions per 100,000 people aged 75 years and over was **1.4 times as high** in the SA3 with the highest rate compared with the SA3 with the lowest rate.

Analysis by remoteness and socioeconomic status

Rates for PBS prescriptions for PPI medicines for people aged 75 years and over were higher in inner regional areas than elsewhere. Rates increased with socioeconomic disadvantage (Figure 6.16).

* There are 340 SA3s. For this item, data were suppressed for 12 SA3s due to a small number of prescriptions dispensed and/or population in an area. Some SA3 rates are more volatile than others. These rates are excluded from the calculation of the difference between the highest and lowest SA3 rates in Australia.

For further detail about the methods used, please refer to the Technical Supplement.

Analysis by people dispensed at least one prescription for a PPI medicine by state and territory

In 2018–19, the number of people aged 75 years and over dispensed at least one PPI medicine prescription was 794,861, representing 47% of people aged 75 years and over in Australia.

Analysis by people dispensed at least four prescriptions for a PPI medicine by state and territory

In 2018–19, the number of people aged 75 years and over dispensed at least four prescriptions for a PPI medicine was 639,243, representing an average of 38% of people aged 75 years and over in Australia.

The data and graphs for the following are available at safetyandquality.gov.au/atlas

- Analysis by people dispensed at least one prescription for a PPI medicine
- Analysis by people dispensed at least four prescriptions for a PPI medicine
- Analysis by defined daily dose
- Analysis by Primary Health Network.

Analysis by dose (high, standard and low*) and PHN

The number of prescriptions dispensed for **high-dose** PPI medicines varied across PHNs, from 15,746 per 100,000 people aged 75 years and over in the Northern Territory to 96,557 in Tasmania. The rate was 6.1 times as high for the PHN with the highest rate as for the PHN with the lowest rate.

The number of prescriptions dispensed for **standard-dose** PPI medicines varied across PHNs, from 205,806 per 100,000 people aged 75 years and over in the Northern Territory to 403,499 in Murrumbidgee. The rate was 2.0 times as high for the PHN with the highest rate as for the PHN with the lowest rate.

The number of prescriptions dispensed for **low-dose** PPI medicines varied across PHNs, from 22,303 per 100,000 people aged 75 years and over in South Western Sydney to 55,928 in Western Queensland. The rate was 2.5 times as high for the PHN with the highest rate as for the PHN with the lowest rate. (Figure 6.17).

Interpretation

Variations in rates of PPI medicine dispensing in people aged 75 years and over are likely to be due to the geographical differences in the factors discussed below.

Variation between areas may not directly reflect the practices of the clinicians who are based in these areas. The analysis is based on where people live rather than where they obtain their health care. Patients may travel outside their local area to receive health care.

Rates of underlying disease

Variation is warranted and desirable when it reflects variation in the underlying need for care. The higher PPI medicine dispensing rates seen in socioeconomically disadvantaged areas in the Atlas may reflect the prevalence of GORD and its risk factors (such as obesity, smoking, poor diet and alcohol intake), which are more common among people with lower levels of education and higher socioeconomic disadvantage.^{4,42}

The prevalence of arthritis and rates of NSAID use to manage symptoms may also contribute to variation in PPI medicine dispensing.³ PPI medicines are used to reduce the risk of gastrointestinal bleeding for people who need ongoing treatment with an NSAID and are at high risk of gastrointestinal bleeding. Almost half (49%) of people aged 65 years and over have arthritis, according to self-reported data.⁴³

* According to definitions introduced by the Pharmaceutical Benefits Advisory Committee in May 2019.

Proton pump inhibitor medicines dispensing, 75 years and over

Use of low-dose aspirin may also contribute to variation in PPI medicine use. PPI medicines are also often prescribed to prevent gastrointestinal bleeding associated with medicines other than NSAIDs and low-dose aspirin, although this practice is not well supported by evidence.¹⁴

The prevalence of untreated *H. pylori* infection and rates of peptic ulcer disease may affect rates of PPI medicine dispensing. Infection rates, which increase the risk of peptic ulcer disease, are higher in older people. Rates of people with untreated *H. pylori* infection starting on an NSAID may also affect PPI dispensing. For people taking an NSAID, *H. pylori* infection increases the risk of peptic ulcer disease by up to 3.5 times, compared with no infection.¹⁷

Clinical decision-making

Variation in adherence to guidelines is likely to influence patterns of use, particularly adherence to recommendations to assess ongoing need for a PPI medicine.

Clinician and consumer willingness to discuss the natural history of reflux, the risks and benefits of treatment, and approaches to addressing lifestyle factors such as obesity and diet may influence PPI medicine use. Some people with uncomplicated GORD may be using PPI medicines long-term without attempting to step down to a lower dose or a less potent medicine, or to cease altogether. This may be due to concerns about symptoms re-emerging, or because the clinician and consumer have not discussed other treatment strategies, so that they may not be aware that it is possible to stop taking PPI medicines.

Taking PPI medicines at an inappropriate time of day may lead to variation in effectiveness of the medicines and how well reflux symptoms are controlled. Some people may not be aware that PPI medicines are most effective after a prolonged fast and should be taken at least half an hour before the first meal of the day.^{2,3} Poor packing of PPI medicines in dose administration aids may contribute to this problem.

Variation may also reflect lack of transfer of information when people are discharged from hospital or move between other healthcare settings. Important information includes what a PPI medicine was prescribed for and when it should be reviewed or stopped. Medicines that are continued without clear instructions about when they should be reviewed or stopped can have downstream effects on ongoing prescribing and contribute to unnecessary medicine use.⁴⁴

Access to medical care

Access to general practitioners and gastroenterologists may influence the likelihood of consumers seeking care for GORD, and therefore affect rates of PPI medicine use.

Variation in rates of PPI medicine dispensing between areas may also be influenced by the number of clinicians providing services to people living in the area. The practice styles of individual clinicians may be more likely to affect rates in areas with fewer clinicians, such as rural and regional locations, than in areas with more clinicians.

Uptake of PBS changes

Regulatory changes to the PBS listings for PPI medicines made in May 2019 – at the end of the data collection period for this Atlas – might be expected to have more impact on rates in areas in which adherence to guidelines has been low. However, the effect on findings is probably small because the changes applied only to new PBS prescriptions dispensed from this date.

Over-the-counter use of PPI medicines

Australians are high consumers of over-the-counter medicines.⁴³ Ability to afford over-the-counter medicines may have contributed to the lower rates of PPI medicine dispensing in areas of socioeconomic advantage. However, most people aged 75 years and over have a concession or pension card, so the effect of this may be small.

Addressing variation

Regulatory changes

Changes to the PBS restrictions, dose classifications and number of repeat prescriptions for PPI medicines came into effect in Australia in May 2019.⁴⁰ These changes followed advice from the Drug Utilisation Sub Committee of the Pharmaceutical Benefits Advisory Committee that, given guideline recommendations and the prevalence of GORD in Australia, high-dose PPI medicines appear to be overprescribed for long periods, particularly in older people.^{40,41} The changes aim to encourage clinical review of PPI medicines and reduce inappropriate long-term use, particularly of high-dose PPI medicines. The effect of these regulatory changes is yet to be evaluated.

Reviewing the need for PPI use

Australia's National Indicators for Quality Use of Medicines in Australian Hospitals 2014 can be used to monitor safe and appropriate medicines use.⁴⁵ An indicator to measure long-term PPI medicine use may be helpful in identifying people who would benefit from ceasing therapy (deprescribing).

Employing pharmacists in general practice clinics as part of a team-based model of care may increase access to medicine review and education services. These models are well established internationally, and further research on their effectiveness in the Australian healthcare system is needed.⁴⁶

Consumer and clinician education

Multifaceted national education campaigns that focus on reviewing the need for PPI medicines and actively stepping down or deprescribing when the medicine is no longer needed appear to have the most success in improving PPI medicine use, particularly in the veteran population.⁴⁷⁻⁴⁹

Recent campaigns conducted in the wider Australian population have had limited success, despite being multifaceted and including strategies for actively engaging clinicians.⁵⁰

Interventions that focus on knowledge translation, and engagement of clinicians and consumers are likely to be more successful in improving PPI medicine use than others.⁴⁹

Education and awareness campaigns for health professionals that include reminders to review PPI medicines at the point of care may reduce use by people who do not have a clear reason to be taking a PPI medicine long term.⁵¹

Lifestyle factors

Educating people about addressing lifestyle factors that may trigger symptoms is an important part of GORD treatment. Having a poor diet – particularly a diet high in fat – as well as smoking and being overweight, can exacerbate symptoms and increase the risk of oesophageal cancer. Weight loss has particularly been shown to reduce the symptoms of GORD.^{52,53} In women, a 3.5 kg/m² reduction in body mass index can result in nearly a 40% reduction in the risk of having frequent GORD symptoms.⁵⁴ Addressing these risk factors for GORD has the added benefit of improving health in general.^{3,9,10}

Optimising effectiveness of PPI medicines

Educational and other initiatives that target the importance of taking PPI medicines on an empty stomach may improve medicine effectiveness and reduce dose increases. Strategies that improve clinician uptake of guideline recommendations for *H. pylori* testing and treatment may help reduce variation in PPI medicine use. Routine *H. pylori* testing and, if needed, treatment, before prescription of NSAIDs may also reduce the risk of peptic ulcer.¹⁷

Proton pump inhibitor medicines dispensing, 75 years and over

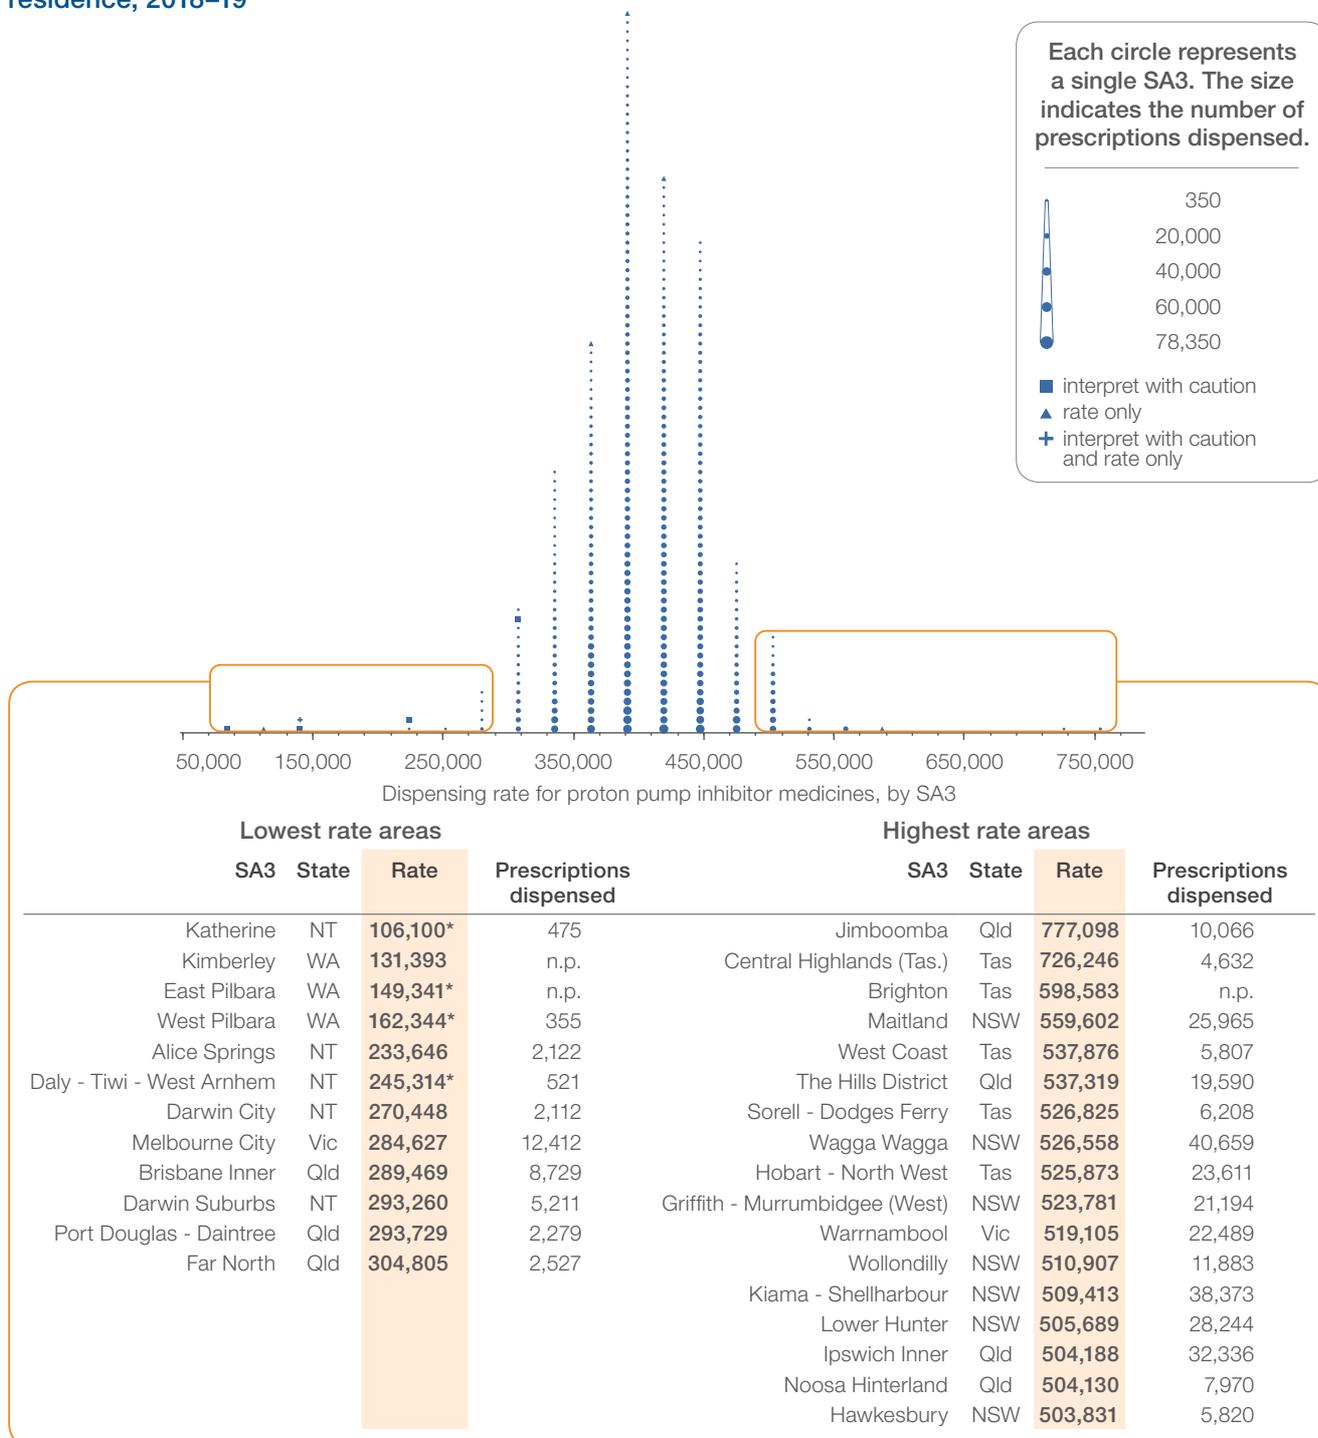

Other initiatives

As part of the Choosing Wisely Australian initiative⁵⁵, the Gastroenterological Society of Australia (GESA) and the Royal Australian College of General Practitioners (RACGP) made two recommendations in 2015 and 2016, to promote appropriate PPI medicine prescribing:

- Do not use PPI medicines long term in people with uncomplicated disease without regular attempts at reducing dose or ceasing therapy
- Do not continue prescribing long-term PPI medicines to people without attempting to reduce the medicine to the lowest effective dose or cease the therapy altogether.

Rates by local area

Figure 6.12: Number of PBS prescriptions dispensed for proton pump inhibitor medicines per 100,000 people aged 75 years and over, age and sex standardised, by Statistical Area Level 3 (SA3) of patient residence, 2018–19

Notes:

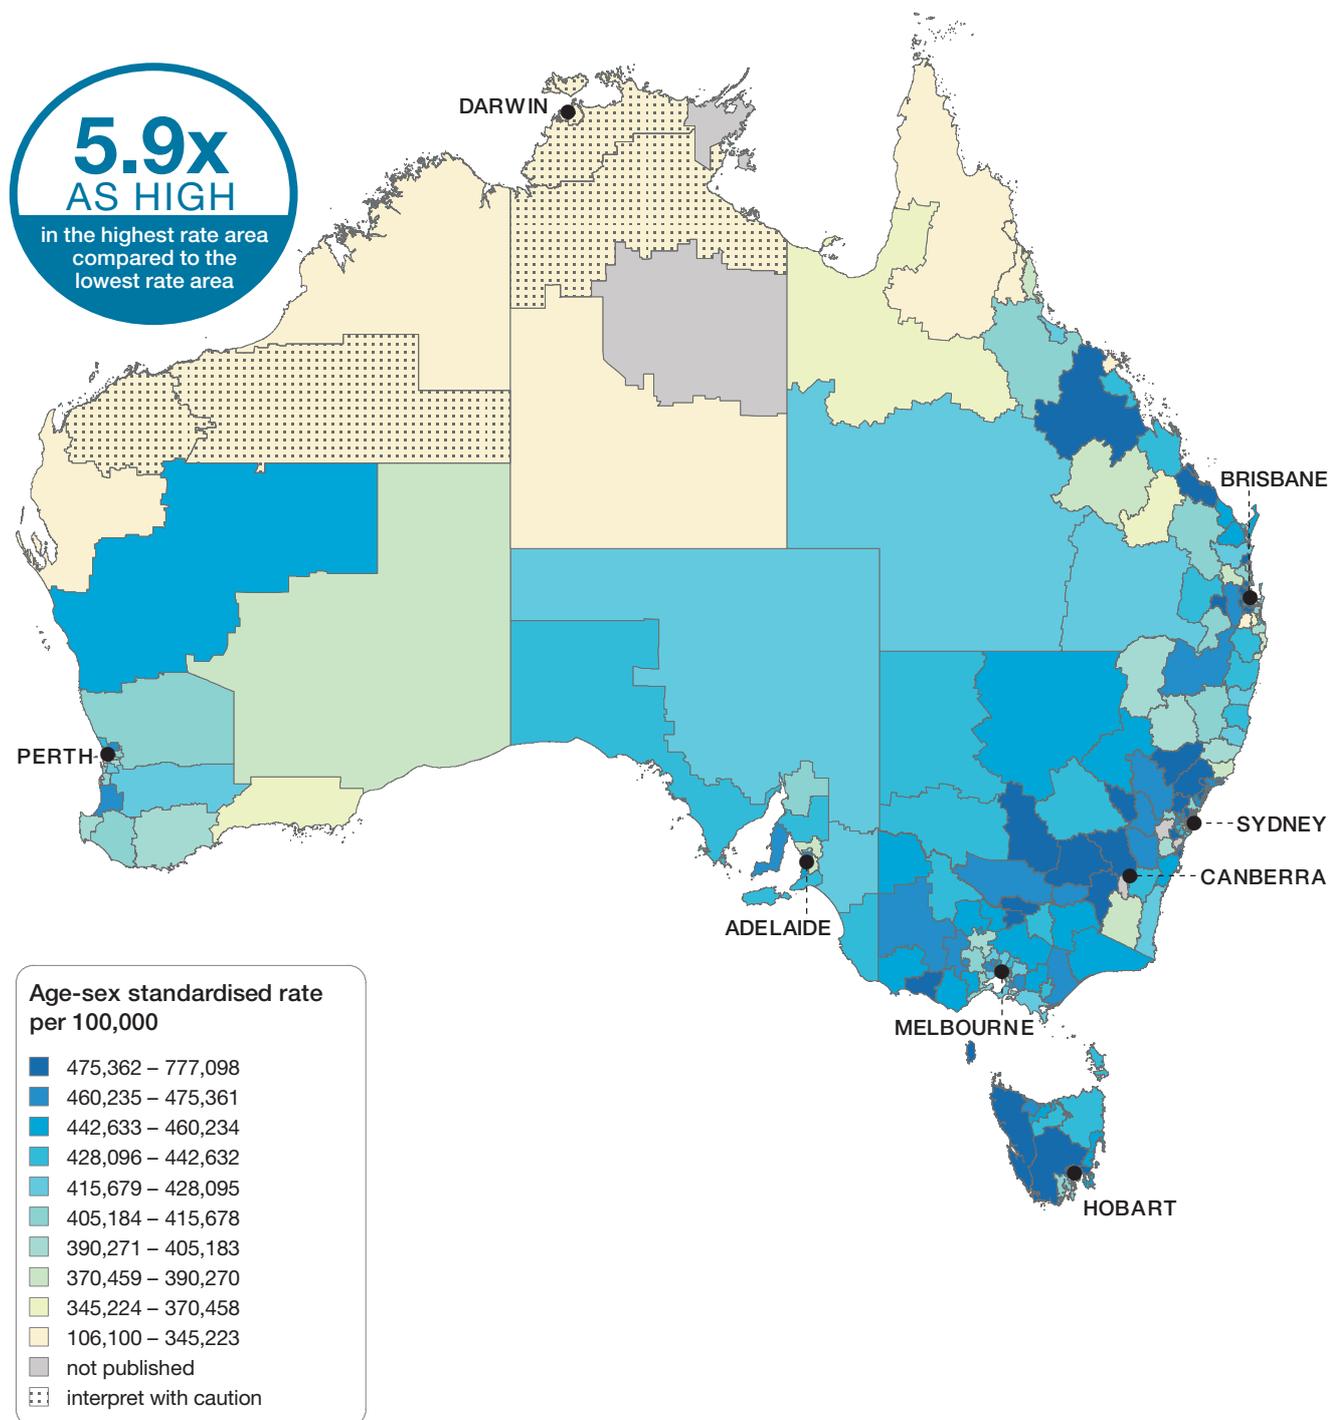

Squares (■) and asterisks (*) indicate rates that are considered more volatile than other published rates and should be interpreted with caution. Australian initiatives

Information in this chapter will complement work already underway to improve PPI medicine use. At a national level this work includes:

- Veterans' MATES, Australian Government Department of Veterans' Affairs, initiatives to improve PPI medicine use⁵⁶
- RACGP and Choosing Wisely Australia, Recommendation 1: Do not use proton pump inhibitors (PPIs) long term in patients with uncomplicated disease without regular attempts at reducing dose or ceasing⁵⁸
- GESA and Choosing Wisely Australia, Recommendation 3: Do not continue prescribing long-term proton pump inhibitor (PPI) medication to patients without attempting to reduce the medication down to the lowest effective dose or cease the therapy altogether.⁵⁵

Many state and territory initiatives are also in place to improve appropriateness of prescribing PPI medicines, including:

- *A Guide to Deprescribing Proton Pump Inhibitors*¹⁸, Tasmania
- Deprescribing resources for clinicians and consumers, developed by a translational research project team lead by Professor Sarah Hilmer, to support deprescribing in older hospital patients, New South Wales.⁵⁹

Technical supplement

Introduction

This is the *Fourth Australian Atlas of Healthcare Variation* in a series providing statistics at a local level identifying variation across Australia for a number of health indicators. Statistics in the Atlas are presented in the form of maps, graphs and tables. This technical supplement provides information on the methods used for data extraction and analysis, for presentation in the maps and graphs. Activity rates are presented by local areas using Statistical Area Level 3 (SA3) geography defined by the Australian Bureau of Statistics (ABS), as well as Primary Health Network (PHN) areas defined by the Australian Government Department of Health, at state and territory, and national levels.

The Australian Commission on Safety and Quality in Health Care and the Australian Institute of Health and Welfare (AIHW) developed the specifications for each indicator. These can be found on the AIHW Metadata Online Registry (METeOR) at meteor.aihw.gov.au/content/index.phtml/itemId/723541

The specifications include details such as:

- The data source
- The relevant population
- Inclusions and exclusions (description of items included and excluded, and relevant data source codes)
- The numerator (what is being measured) and denominator (in what population)
- Computation (the calculation that shows how the numerator and denominator relate)
- Disaggregation (the way the data are analysed and presented)
- Data suppression rules (rules that set out what cannot be presented for reasons of confidentiality and/or reliability).

Technical supplement

Four data sources were used in the Atlas:

- Medicare Benefits Schedule (MBS)
- National Hospital Morbidity Database (NHMD)
- National Perinatal Data Collection (NPDC)
- Pharmaceutical Benefits Scheme (PBS).

Analyses are based on the place of usual residence of the patient (patient residence) and not the location of the hospital, clinic or pharmacy where the service was provided. If the patient residence was unknown or invalid, or could not be allocated to an SA3, PHN, or state or territory, the record was included in the total for Australia only.

For MBS and PBS data, the Medicare enrolment postcode is used as a proxy for the patient residence because it corresponds to most people's usual residence. The postcode of the dispensing pharmacy was substituted if the enrolment postcode was unknown or invalid.

Records with unknown or invalid age or sex were excluded from NHMD, MBS and PBS data because they could not be age and sex standardised (see 'Analysis methods'). NPDC data are not standardised, as a result of small numbers.

The AIHW conducted the data extraction and analysis, and presentation of the data in maps and graphs. Analyses in this report have not been adjusted to account for the under-identification of Aboriginal and Torres Strait Islander people in the data sources used. Data by Aboriginal and Torres Strait Islander status should be interpreted with caution because Aboriginal and Torres Strait Islander people are under-enumerated in health data, and there is variation in the under-enumeration among states and territories, and among datasets.

1. Medicare Benefits Schedule data

MBS data are a by-product of the assessment of claims for Medicare benefits by Services Australia, and are provided to the Australian Government Department of Health. The MBS data in this report comprise hospital and non-hospital services provided in financial year 2018–19 for claims processed up to and including 29 February 2020. A service includes any claims resulting in the payment of a Medicare benefit. Bulk-billing incentives and 'top-up' services are excluded from service counts as they are not attendances or procedures in their own right.

MBS data do not include:

- Services provided free of charge to public patients in hospitals
- Services that qualify for a benefit under the Department of Veterans' Affairs National Treatment Account
- Services provided under an entitlement, such as services covered by third-party or workers compensation, where an interim benefit has not been paid, or services provided to repatriation beneficiaries or defence personnel
- Services provided for insurance or employment purposes
- Health screening services, except for services as directed by the minister.

Some Australian residents may access medical services through other arrangements, such as salaried doctor arrangements. As a result, MBS data may underestimate the use of services by some members of the community.

Under Medicare, 'eligible persons' are persons who reside permanently in Australia. This includes New Zealand citizens and holders of permanent residence visas. Applicants for permanent residency may also be eligible, depending on their circumstances. In addition, overseas visitors from countries with which Australia has a reciprocal healthcare agreement might also be entitled to benefits under MBS arrangements.

For some patients, the total count for the services in question may be zero or negative (for example, due to cheque cancellations; see meteor.aihw.gov.au/content/index.phtml/itemId/601800). In these cases, all records of the patient are excluded from the analyses.

A patient's age calculated in MBS data is their age in years on the date the service was provided to them.

2. National Hospital Morbidity Database

The NHMD is a comprehensive dataset containing records for all episodes of admitted patient care from almost all hospitals in Australia. This includes all public and private acute and psychiatric hospitals, freestanding day hospital facilities, and alcohol and drug treatment centres. Hospitals operated by the Australian Defence Force and corrections authorities, and hospitals in Australia's offshore territories are not in scope, but some are included. The data elements included in the NHMD are based on the Admitted Patient Care National Minimum Data Set (APC NMDS). The NHMD includes episodes for admitted patients discharged (separated) between 1 July and 30 June for each financial year.

Data are collected at each hospital from patient administrative and clinical record systems, and forwarded to the relevant state or territory health authorities. The data are provided to the AIHW for national collation annually.

The counting unit for the NHMD is a 'separation'. Separation refers to an episode of admitted patient care, which can be a total hospital stay (from admission to discharge, transfer or death) or a portion of a hospital stay, beginning or ending in a change in the type of care (for example, from acute care to rehabilitation). In this report, separations are referred to as 'hospitalisations'.

A record is included for each hospitalisation, not for each patient. Patients hospitalised more than once in the financial year have more than one record in the NHMD.

The NHMD does not include non-admitted patient care provided in outpatient clinics or emergency departments. If patients in these settings are admitted to hospital subsequently, the care provided to them as admitted patients is included in the NHMD.

Records for which the overall nature of care was 'newborn care with unqualified days only', 'posthumous organ procurement' or 'hospital boarder' were excluded from the analysis.

A patient's age calculated in NHMD data is their age in years on the date they were admitted to hospital.

NHMD data in this report comprise hospitalisations in:

- 2014–15 to 2017–18 for potentially preventable hospitalisations
- 2012–13 to 2017–18 for lumbar spinal surgery
- 2012–13, 2015–16 and 2017–18 for tonsillectomy and myringotomy.

The specifications developed for the potentially preventable hospitalisations are based on the nationally agreed specification, National Healthcare Agreement: PI 18 – Selected potentially preventable hospitalisations, 2021 (meteor.aihw.gov.au/content/index.phtml/itemId/725793).

For potentially preventable hospitalisations, data for New South Wales for 2017–18 in this report may not align with the data published by New South Wales because of changes in admission practices in New South Wales public hospitals in 2017.

For lumbar spinal surgery, the annual number of hospitalisations is not sufficient for reliable reporting at a local level. Three years of data (2012–13 to 2014–15 and 2015–16 to 2017–18) are combined. In this case, rates are based on the number of hospitalisations over three years and the summed population over three years. This method differs from the calculation of an average annual rate. However, the rates from both methods will generally be the same, or very similar, particularly for areas with low proportional population change between years.

Technical supplement

For lumbar spinal surgery, tonsillectomy and myringotomy, some private hospitals in Tasmania admit public patients under a contractual arrangement. There is a small over-count of hospitalisations for these procedures in Tasmania because hospitalisations were recorded by both contracting hospital and contracted hospital.

More information on the APC NMDS for 2012–13 to 2017–18 is available at:

- meteor.aihw.gov.au/content/index.phtml/itemId/466132 (2012–13)
- meteor.aihw.gov.au/content/index.phtml/itemId/491555 (2013–14)
- meteor.aihw.gov.au/content/index.phtml/itemId/535047 (2014–15)
- meteor.aihw.gov.au/content/index.phtml/itemId/588909 (2015–16)
- meteor.aihw.gov.au/content/index.phtml/itemId/612171 (2016–17)
- meteor.aihw.gov.au/content/index.phtml/itemId/641349 (2017–18).

The data quality statements for the NHMD for 2012–13 to 2017–18 are available at:

- meteor.aihw.gov.au/content/index.phtml/itemId/568730 (2012–13)
- meteor.aihw.gov.au/content/index.phtml/itemId/611030 (2013–14)
- meteor.aihw.gov.au/content/index.phtml/itemId/638202 (2014–15)
- meteor.aihw.gov.au/content/index.phtml/itemId/723825 (2015–16)
- meteor.aihw.gov.au/content/index.phtml/itemId/724186 (2016–17)
- meteor.aihw.gov.au/content/index.phtml/itemId/724188 (2017–18).

Components of NHMD analysis

Diagnoses and procedures

Hospital diagnosis and procedure data in this report were reported to the NHMD by states and territories using several editions of the *International Statistical Classification of Diseases and Related Health Problems, Tenth Revision, Australian Modification* (ICD-10-AM), incorporating the *Australian Classification of Health Interventions* (seventh edition for 2012–13, eighth edition for 2013–14 and 2014–15, ninth edition for 2015–16 and 2016–17, and 10th edition for 2017–18).

The comparability of the coded diagnosis and procedure data can be affected by variations in the quality of the coding, and by state-specific coding standards. This should be taken into account when comparing across states and territories.

Aboriginal and Torres Strait Islander status

For NHMD data, hospitalisations for Aboriginal and Torres Strait Islander people are compared with hospitalisations for other Australians. Other Australians comprise people who were reported as not of Aboriginal and/or Torres Strait Islander origin, and people for whom information on Aboriginal and Torres Strait Islander status was not reported.

In 2011–12, an estimated 88% of Aboriginal and Torres Strait Islander patients were correctly identified in public hospital admission records. The estimated completeness of Aboriginal and Torres Strait Islander identification (with 95% confidence intervals) for public hospitals was 80% (76–83%) in New South Wales, 78% (71–84%) in Victoria, 87% (84–91%) in Queensland, 91% (85–95%) in South Australia, 96% (92–98%) in Western Australia, 64% (53–74%) in Tasmania, 98% (96–99%) in the Northern Territory and 58% (46–69%) in the Australian Capital Territory. It is not known to what extent Aboriginal and Torres Strait Islander patients might be under-identified in private hospital admission records.

There were wide variations in correct identification of Aboriginal and Torres Strait Islander patients by remoteness: estimates ranged from 77% (72–81%) in major cities to 99% (96–100%) in very remote areas. For more information, see *Indigenous Identification in Hospital Separations Data: Quality report* at aihw.gov.au/publication-detail/?id=60129543215

Patient funding status

Apart from potentially preventable hospitalisations, NHMD data are presented separately for hospitalisations according to the funding status of the patient. This reflects the funding arrangements for the patient's hospitalisation, not the sector of the hospital to which they were admitted. Hospitalisations were categorised by funding status of patients – public or private – based on three data elements:

- 'Source of funding' (meteor.aihw.gov.au/content/index.phtml/itemId/649391)
- 'Patient election status' (meteor.aihw.gov.au/content/index.phtml/itemId/326619)
- 'Hospital sector' (meteor.aihw.gov.au/content/index.phtml/itemId/269977).

Hospitalisations for publicly funded patients comprise those for whom the patient funding source was:

- Health service budget (not covered elsewhere)
- Health service budget (due to eligibility under a reciprocal healthcare agreement)
- Health service budget (no charge raised as a result of a hospital decision) AND in a public hospital
- Other hospital or public authority (contracted care) AND a patient election status of 'public' (regardless of hospital sector).

Hospitalisations for privately funded patients comprise those for whom the patient funding source was:

- Health service budget (no charge raised as a result of a hospital decision) AND in a private hospital
- Other hospital or public authority (contracted care) AND a patient election status of 'private' (or not reported)

- Department of Veterans' Affairs
- Department of Defence
- Correctional facility
- Private health insurance
- Workers compensation
- Motor vehicle third-party personal claim
- Other compensation (for example, public liability, common law, medical negligence)
- Self-funded
- Other funding source
- Not known.

For 2016–17, there were data quality issues relating to the recording of patient funding source for patients admitted to private hospitals in the Australian Capital Territory. Data for these private hospitals for 2016–17 were excluded from analysis by patient funding status for the lumbar spinal surgery indicators.

Condition onset flag

For the lumbar spinal surgery indicators, records with infections not noted as arising during the episode of admitted patient care are excluded. There is some variation between states and territories in the overall proportion of records for which a condition was reported as arising during the episode of care. Differences in the types of patients treated by states and territories may account for some of this variation. However, the variation may indicate that there are differences in the allocation of condition onset flag values (meteor.aihw.gov.au/content/index.phtml/itemId/651997). There are also differences in the quality of the provided condition onset flag over time. Overall, the provision of condition onset flag data has improved since 2013–14, particularly for private hospitals.

Technical supplement

Further information on the quality of the coded diagnosis and procedure data, Aboriginal and Torres Strait Islander status data, and condition onset flag data at the state and territory level is available in *Australian Hospital Statistics 2012–13* at aihw.gov.au/reports/hospitals/australian-hospital-statistics-2012-13 and *Admitted Patient Care: Australian hospital statistics* reports at aihw.gov.au/reports/hospitals/admitted-patient-care-2017-18/report-editions (2013–14 to 2017–18).

3. National Perinatal Data Collection

The NPDC collects data about births in Australia, including births in hospitals, birth centres and the community (such as home births). All live births and stillbirths of at least 20 weeks gestation or at least 400 grams birth weight are included, except in Victoria and Western Australia, where births are included if gestational age is at least 20 weeks or, if gestation is unknown, birth weight is at least 400 grams. NPDC data in this report relate to births that occurred in the calendar year 2017.

NPDC data are based on births reported to the perinatal data collection in each state and territory. Midwives and other birth attendants, using information obtained from mothers and from hospital or other records, complete notification forms for each birth. Each state or territory provides a standard de-identified extract to the AIHW annually to form the NPDC. The data elements in the NPDC include the Perinatal National Minimum Data Set (Perinatal NMDS), the Perinatal National Best Endeavours Data Set (Perinatal NBEDS) and additional data elements. More information on the Perinatal NMDS and NBEDS for 2017 is available at meteor.aihw.gov.au/content/index.phtml/itemId/517456 and meteor.aihw.gov.au/content/index.phtml/itemId/654975, respectively.

Additional data elements are at different stages of standardisation. Some have national data standards but have not been implemented in the Perinatal NMDS or NBEDS, while others do not have common definitions for collecting the data.

The data quality statement for the NPDC for 2017 is available at meteor.aihw.gov.au/content/index.phtml/itemId/716326

Both ‘main indication for caesarean section’ (meteor.aihw.gov.au/content/index.phtml/itemId/695698) and ‘main indication for induction of labour’ (meteor.aihw.gov.au/content/index.phtml/itemId/655515) have been collected as voluntary non-standard data elements in the NPDC. Indication for caesarean section was revised and added to the Perinatal NBEDS from 2014 onwards, and indication for induction from 2015 onwards. There are differences in definitions and methods used for data collection of these data elements across states and territories; for this reason, data are not comparable across states and territories.

The reason for a method of birth (caesarean section or induction of labour) is not necessarily related to the reason for early birth. Data on the latter are not available.

In Australia:

- Clinical indications for early birth, such as fetal compromise, were not always recorded as the main indication for caesarean section when the decision to perform a caesarean section was pre-planned in the antenatal period
- Clinical events such as pre-labour rupture of membranes, which may lead to an unplanned early caesarean section, were not always recorded when the decision to perform a caesarean section was pre-planned in the antenatal period.

‘Without medical or obstetric indication’ includes the following reasons for caesarean section:

- Previous caesarean section
- Previous severe perineal trauma
- Previous shoulder dystocia
- Maternal choice in the absence of any obstetric, medical, surgical or psychological indication.

'Without medical or obstetric indication' includes the following reasons for induction of labour:

- Administrative or geographical indication
- Maternal choice in the absence of any obstetric, medical, fetal, administrative or geographical indication.

In the case of multiple births, gestational age and method of birth are based on the first-born baby.

Analysis was by place of usual residence of the mother and excluded Australian non-residents, residents of external territories, and records in which place of usual residence was not stated.

Components of NPDC analysis

Aboriginal and Torres Strait Islander status

For NPDC data, data for Aboriginal and Torres Strait Islander women are compared with data for non-Indigenous Australian women. Non-Indigenous Australian women comprise women who were reported as not of Aboriginal and/or Torres Strait Islander origin. Women for whom information on Aboriginal and Torres Strait Islander status was not reported were excluded from the analysis.

Data collection methods for Aboriginal and Torres Strait Islander status of the mother may vary between states and territories. In 2017, information on Aboriginal and Torres Strait Islander status was provided for nearly all mothers (99.7%) who gave birth. However, no formal assessment of the quality of Aboriginal and Torres Strait Islander identification in NPDC data has been undertaken. For more information, see *Australia's Mothers and Babies 2017: In brief*, available at aihw.gov.au/reports/mothers-babies/australias-mothers-and-babies-2017-in-brief

Patient funding status

For NPDC data, patient funding status was determined using the additional data element 'admitted patient elected accommodation status'. Public patients are those for whom the admitted patient's (mother's) elected accommodation status was 'public'. Private patients are those for whom the admitted patient's elected accommodation status was 'private'.

Women who gave birth at home or in birth centres attached to hospitals were excluded from the analysis. The specification for this data element is only for births in hospitals.

Some private hospitals in Western Australia admit public patients. The number of women who elected private status might be lower than the number of women admitted to private hospitals. For some records, mainly those related to giving birth before admission, admitted patient elected accommodation status was missing.

For Tasmania, the majority of private hospitals were unable to collect data for indication for caesarean section and indication for induction according to revised specifications introduced from 1 July 2015; this may affect women with an admitted patient elected accommodation status of both public and private. Data have been mapped to the new specifications where possible. Data for public hospitals were collected according to the new specifications.

Caution must be exercised when interpreting these data for Western Australia and Tasmania.

Technical supplement

4. Pharmaceutical Benefits Scheme data

The Australian Government subsidises the cost of a wide range of prescription medicines through two separate schemes: the PBS and the Repatriation Pharmaceutical Benefits Scheme (RPBS). Claims for reimbursement for the supply of PBS- or RPBS-subsidised medicines are submitted by pharmacies through Services Australia for processing, and are provided to the Australian Government Department of Health. Subsidies for prescription medicines are available to all Australian residents who hold a current Medicare card, and overseas visitors from countries with which Australia has a reciprocal healthcare agreement. Patients pay a contribution to the cost of the medicine (co-payment), and the Australian Government covers the remaining cost.

The PBS data in this report are from records of prescriptions dispensed in 2018–19 under the two schemes, where either:

- The Australian Government paid a subsidy
- The prescription was dispensed at a price less than the relevant patient co-payment (under co-payment prescriptions) and did not attract a subsidy.

The PBS data cover all prescriptions dispensed by approved suppliers, including community pharmacies, public and private hospital pharmacies, and dispensing doctors.

The PBS does not cover:

- Over-the-counter purchases (non-prescription)
- Private prescriptions (prescriptions that are not eligible for subsidy under the PBS – for example, prescriptions for medicines that are not listed on the PBS)
- Medicines supplied to admitted patients in public hospitals; however, prescriptions to patients on discharge and non-admitted patients in most states and territories are in scope, except in New South Wales and the Australian Capital Territory.

Patient categories of ‘general’, ‘concessional’, ‘repatriation’ and ‘unknown’ are included (meteor. aihw.gov.au/content/index.phtml/itemId/604103). Doctor’s bag medicines (supply of medicines free to patients for emergency use) and medicines dispensed through alternative arrangements where the patient cannot be identified, such as direct supply to Aboriginal health services, are excluded.

Provision of some medicines may be under-represented in remote areas, particularly in the Northern Territory, that have a high proportion of Aboriginal and Torres Strait Islander people who access medicines through Aboriginal health services.

The number of prescriptions represents the total number of times that a prescribed medicine is supplied to a patient. Prescriptions can be written either as one-off (original with no repeats) or original with repeats. When an original prescription and all the repeats were supplied at the one time, the total number of prescriptions (original and repeats) was counted.

For individual prescriptions where the quantity dispensed varied from the listed maximum quantity, no adjustment was made for increased or reduced quantity supplied. The supply was counted as one prescription.

A patient’s age calculated in PBS data is their age in years on the date the medicine was supplied to them.

Polypharmacy is based on PBS prescriptions. It is defined as five or more prescriptions for medicines with different Anatomical Therapeutic Chemical (ATC) codes at the fourth level (for example, A10BA), with each medicine dispensed at least four times in the year. Combination medicines (for example, amiloride/hydrochlorothiazide) are counted as one medicine.

The ATC classification is a classification system for medicines maintained by the World Health Organization (WHO). The ATC classification groups medicines according to the body organ or system on which they act, and their therapeutic and chemical characteristics. More information on the ATC classification system can be found at whocc.no/atc/structure_and_principles

For proton pump inhibitor medicines, medicines that are purchased over the counter without a prescription are out of scope. On 1 May 2019, changes were made to improve the appropriate prescribing of prescription medicines. Medicines were changed from dose category of highest, high and low, to high, standard and low. Esomeprazole 40 mg is in the high dose category; esomeprazole 20 mg, lansoprazole 30 mg, omeprazole 20 mg, pantoprazole 40 mg and rabeprazole 20 mg are in the standard dose category; and lansoprazole 15 mg, omeprazole 10 mg, pantoprazole 20 mg and rabeprazole 10 mg are in the low dose category. More information on the changes is available at nps.org.au/radar/articles/proton-pump-inhibitors-pbs-changes-may-2019

Defined daily dose

Defined daily dose (DDD) is the average maintenance dose per day for a medicine used for its main indication in adults, defined by the WHO. DDDs are assigned to medicines by the WHO Collaborating Centre for Drug Statistics Methodology. Using DDDs allows comparisons of medicine dispensing independent of price, preparation and quantity per prescription. Medicine dispensing expressed in DDDs per thousand people per day (DDD/1,000/day) allows data for medicines with differing daily doses to be aggregated. However, the DDD is only a unit of measurement and does not necessarily reflect the recommended or average prescribed dose. DDDs are not established for all medicines. More information on DDD is available at who.int/medicines/regulation/medicines-safety/toolkit_ddd/en

Combination medicines

Combination medicines are medicines with multiple active ingredients. The Australian Government Department of Health and WHO differ in their methods for assigning DDDs. The WHO method takes account of the main ingredient only (whocc.no/ddd/definition_and_general_considera/#DDD), whereas the Department of Health method takes account of each ingredient. The WHO method is used for this report to allow international comparisons, and DDDs/1,000/day in this report may not align with those in the *Australian Statistics on Medicines* report, available at pbs.gov.au/info/statistics/asm/australian-statistics-on-medicines

DDD are the WHO-assigned DDDs as at January 2019. Information on DDD assignment to medicines is available at whocc.no/atc_ddd_index

5. Analysis methods

Australian population

Most indicators use an estimated resident population from the ABS in the denominator. The exception is early planned births, for which the denominator is number of women who gave birth, from the NPDC.

The ABS produces estimates for the overall Australian population for two time points each year – 30 June and 31 December – at state and territory level. Estimates at 31 December are not available for lower geography levels (such as SA3), and Aboriginal and Torres Strait Islander people. Estimates as at 30 June are appropriate for use when calculating rates based on calendar year data, but they are not appropriate for use when calculating rates based on financial year data. In such instances, estimates for 31 December (the midpoint of the financial year) are needed.

Technical supplement

Population estimates as at 31 December in the relevant year were used as the denominator for indicators based on NHMD data for 2012–13 to 2017–18. For example, population estimates as at 31 December 2017 were used for 2017–18. Where three years of data were combined (for example, 2015–16, 2016–17 and 2017–18), the denominator was the sum of the population estimates as at 31 December 2015, 31 December 2016 and 31 December 2017. Population estimates as at 31 December were calculated as the average of the 30 June population estimates before and after the relevant December.

Population estimates as at 30 June 2018 were used as the denominator for indicators based on MBS and PBS data for 2018–19. ABS population estimates as at 30 June 2019 were not available for calculation of the 31 December population estimates in 2018 at the time the analysis was done.

Aboriginal and Torres Strait Islander status

The population estimates for Aboriginal and Torres Strait Islander people were based on the population estimates from the 2016 Census. For 2016 and earlier, population estimates (2016) and backcast estimates were used. For 2017 onwards, series B population projections were used. More information on series B is available at abs.gov.au/statistics/people/aboriginal-and-torres-strait-islander-peoples/estimates-and-projections-aboriginal-and-torres-strait-islander-australians/latest-release#frequently-asked-questions

The population estimates for non-Indigenous people (other Australians) were derived by subtracting the population estimates for Aboriginal and Torres Strait Islander people from the Australian population estimates.

Derived populations

The population estimates for the tonsillectomy and myringotomy (17 years and under) and lumbar spinal surgery (18 years and over) indicators require separate male and female estimates for Aboriginal and

Torres Strait Islander people in the two age groups 15–17 years and 18–19 years. These have not been published by the ABS and were derived based on the combined-sex population estimates for Aboriginal and Torres Strait Islander people, and the 2016 Census counts of Aboriginal and Torres Strait Islander males and females:

- The sex ratios for Aboriginal and Torres Strait Islander people were calculated using the 2016 Census counts of Aboriginal and Torres Strait Islander males and females for each age between 15 and 19, in each state and territory
- The sex ratios were applied to the population estimates for Aboriginal and Torres Strait Islander people to calculate Aboriginal and Torres Strait Islander males and females for each age between 15 and 19, in each state and territory
- The corresponding population estimates for non-Indigenous people were calculated by subtracting the population estimates for Aboriginal and Torres Strait Islander people from the Australian population estimates.

People aged 15–17 years were placed in their own age group, and people aged 18–19 years were placed in the 18–24-year age group.

Age and sex standardisation

This report presents age- and sex-standardised rates, except for the early planned birth indicator, which is presented with percentages. Age and sex standardisation is a method to remove the influence of age and sex when comparing populations with different age and sex structures. For this report, the Australian estimated resident population as at 30 June 2001 was used as the standard population. Some indicators used specific age ranges. In these cases, only the relevant age groups were included in age- and sex-standardisation calculations. Standardised rates based on different age groups and/or standard populations are not directly comparable.

Five-year age groups were used (except for the special cases of the 15–17-year and 18–24-year age groups described above). The age group of 65 years and over was the highest used in standardisation for Aboriginal and Torres Strait Islander status analysis, and 85 years and over was the highest age group used in other analyses. These age groups were adjusted for specific age ranges.

The age and sex standardisation method was adapted from the general age standardisation formula for populations, available at meteor.aihw.gov.au/content/index.phtml/itemId/327276

Geography levels

This report presents data based on the ABS Australian Statistical Geography Standard (ASGS) 2016 SA3 geography, which incorporates the Territory of Norfolk Island for the first time. There are 340 spatial SA3s, covering Australia without

gaps or overlaps. SA3s generally have a population of 30,000–130,000 people, and comprise clusters of whole SA2s (meteor.aihw.gov.au/content/index.phtml/itemId/659727). These areas were grouped by PHN area, state or territory, remoteness and socioeconomic status to assist comparisons. For more information on ASGS 2016, see meteor.aihw.gov.au/content/index.phtml/itemId/659352

Allocation to an SA3 was based on the patient’s residence, not the place where they received the service. The geographical data that were used to allocate the number of events (hospitalisations, services, prescriptions, DDDs and patients) to an SA3 level varied depending on the data source (Table 1).

Table 1: Geographical data used to allocate an SA3

Data source	Data on geographic location
MBS data	Postcode
NHMD	<p>SA2, when available; otherwise, SA2 was derived from Statistical Local Area* (SLA) or postcode.</p> <p>Between 2012–13 and 2016–17, New South Wales provided SLA instead of SA2, and all other states and territories provided SA2 for most records. In 2017–18, all states and territories provided SA2 for all records. SA2s were derived as follows.</p> <p>For 2012–13:</p> <ul style="list-style-type: none"> • SA2 was mapped from SLA for all New South Wales records • SA2 was mapped from postcode for some South Australian and some Northern Territory records. <p>For 2013–14:</p> <ul style="list-style-type: none"> • SA2 was mapped from SLA for all New South Wales records • SA2 was mapped from postcode for some Victorian records. <p>For 2014–15:</p> <ul style="list-style-type: none"> • SA2 was mapped from SLA for all New South Wales records and some Victorian records. <p>For 2015–16 and 2016–17:</p> <ul style="list-style-type: none"> • SA2 was mapped from SLA for all New South Wales records and some Victorian records; where mapping could not be undertaken on SLA, postcode was used.
NPDC	Not applicable; data are presented by state or territory of mother’s residence
PBS data	Postcode

* This is the geographic area defined in the ABS Australian Standard Geographical Classification (the classification used before the ASGS).

Technical supplement

NHMD

For 2012–13 to 2016–17, SA2s in the NHMD were collected using the ASGS 2011. For 2017–18, the ASGS 2016 was used. The accuracy of the information on geography (SA2 or other) could vary across and within states and territories, depending on the methods of allocation used by the hospital and the level of detail on the patient’s address captured at the service level.

When Statistical Local Area (SLA) or postcode was used, ABS correspondences were used to identify the corresponding SA2 2011 (2012–13 to 2016–17) or SA2 2016 (2017–18). Where a geographic unit overlapped SA2 boundaries, records were randomly allocated to the SA2s, according to the proportion of the unit (postcode or SLA) population in the SA2s. This is standard practice for the NHMD. Because of the random allocation, individual records in SA2s might not be accurate or reliable; however, the overall distribution of records by SA2 is considered useful.

For 2012–13 to 2016–17, the SA2 2011 was aggregated to SA3 2011. The number of hospitalisations at SA3 2011 was mapped to SA3 2016 using an ABS correspondence. Where an SA3 2011 overlapped SA3 2016 boundaries, the number of hospitalisations was apportioned across the SA3s 2016, according to the proportion of the population of SA3 2011 in the SA3s 2016.

Time series

Data were re-run for selected hospitalisation indicators presented in the first and second Atlases for the time-series analyses in this Atlas to allow robust comparison of rates over time. Since the first Atlas was published, in November 2015, there have been a number of minor changes to data specifications, updates to NHMD datasets and changes to improve data analysis, as listed in Table 2. This means that some fourth Atlas results for a given year may differ from those reported in previous Atlases. The results reported in this Atlas should be used for monitoring change over time.

MBS and PBS data

For the MBS and PBS data, an ABS correspondence was used to map postcode to SA3 2016. Where a postcode overlapped SA3 boundaries, the number of events was apportioned across the SA3s, according to the proportion of the postcode population in the SA3s. The overall distribution of events by SA3 is considered to be statistically representative of the split population.

The number of patients was determined at the Australian level. In some cases, patients can have multiple records, with different postcodes recorded. Where this occurred, the patient count was apportioned across the postcodes, according to the proportion of the patient’s services or prescriptions in that postcode. The number of patients at postcode level was mapped to SA3 2016 using the same process as above.

Table 2: Changes in analysis methods for time series of hospitalisation indicators

Atlas	Age standardised	Age and sex standardised	Postcode to SA3	SA2 to SA3	ASGS 2011	ASGS 2016	Population estimate
1	✓		✓		✓		30 June
2		✓		✓	✓		30 June
3		✓		✓		✓	30 June
4		✓		✓		✓	31 December*

* Estimated from average of 30 June estimated residential populations from the relevant years.

Primary Health Network areas

PHNs connect health services across a specific geographic area so that patients, particularly those needing coordinated care, have access to a range of services, including primary healthcare services, secondary healthcare services and hospital services. There are 31 PHN areas that cover the whole of Australia.

The number of events at SA3 2016 level was mapped to a PHN area (2017) using an ABS correspondence. The correspondence reflects the reconstructed PHN boundaries based on the ASGS 2016 and the 2011 Census population data (as the weighting unit). Where an SA3 overlapped PHN boundaries, the number of events was apportioned across the PHN areas, according to the proportion of the SA3 population in the PHN areas.

Tasmania, the Australian Capital Territory and the Northern Territory have only one PHN area each. PHN rates may differ from state or territory rates because:

- For the MBS and PBS data, populations are sourced from different data
- For the NHMD, populations and hospitalisations are sourced from different data – PHN hospitalisations are based on SA3 of patient residence, whereas state or territory hospitalisations are based on state or territory of patient residence, including records where the SA3 may not be known.

Post office boxes

For indicators based on MBS and PBS data, six post office box postcodes in major cities were excluded from analyses by SA3, PHN area, remoteness and socioeconomic status. This is because it is difficult to estimate the place of patient residence in these cases. However, these post office box postcodes were included in analyses by state and territory, and at national level.

The following post office box postcodes were excluded:

- 2001 Sydney
- 2124 Parramatta
- 3001 Melbourne
- 4001 Brisbane
- 5001 Adelaide
- 6843 Perth.

Remoteness and socioeconomic analysis

SA3s were grouped into remoteness categories and socioeconomic quintiles based on the ASGS 2016 and the ABS Socio-Economic Indexes for Areas (SEIFA) 2016, respectively. Data by SA3 were assigned to remoteness and socioeconomic groups using this method of grouping. As a result of the method used, national data by remoteness and socioeconomic status in this report may differ slightly from equivalent data calculated using the geographic unit (postcode, SLA or SA2) recorded on the individual records. However, it is expected that the overall patterns would be similar. For more information on SEIFA 2016, see meteor.aihw.gov.au/content/index.phtml/itemId/695778

Derived remoteness categories

The ASGS 2016 remoteness categories divide Australia into broad geographic regions that share common characteristics of remoteness for statistical purposes. These categories divide each state and territory into several regions based on their relative access to services.

The following remoteness categories are used:

- Major cities
- Inner regional
- Outer regional
- Remote
- Very remote.

Technical supplement

The ABS publishes a remoteness category for each SA1, available at abs.gov.au/AUSSTATS/abs@.nsf/DetailsPage/1270.0.55.005July%202016?OpenDocument. SA1 population was allocated to a remoteness category using the correspondence SA1 to remoteness area, and remoteness category was allocated to an SA3 using the hierarchy of SA1 to SA3 (meteor.aihw.gov.au/content/index.phtml/itemId/659750). The total population in each remoteness category was calculated for each SA3. The remoteness category with the largest population was selected for the SA3.

Derived socioeconomic quintiles

There are four indexes in SEIFA 2016, and the Index of Relative Socio-Economic Disadvantage (IRSD) 2016 was used for socioeconomic analysis. IRSD 2016 ranks areas in Australia according to relative socioeconomic disadvantage. The index is based on information collected in the 2016 Census on different aspects of disadvantage, such as low income, low educational attainment and high unemployment.

A low score indicates a high proportion of relatively disadvantaged people in an area. For example, an area could have a high proportion of people without educational qualifications or working in low-skill occupations. In contrast, a high score indicates a low proportion of relatively disadvantaged people in an area. It is important to note that the index reflects the overall socioeconomic position of the population in an area, and that the socioeconomic position of individuals in that area may vary.

The ABS publishes an index value for each SA1, available at abs.gov.au/AUSSTATS/abs@.nsf/DetailsPage/2033.0.55.0012016?OpenDocument. SA1s are ranked according to their level of disadvantage (index value) and grouped into 10 equally populated categories (deciles), with the lowest category reflecting the 10% of areas with the greatest overall level of disadvantage. For each SA3, the deciles were combined to form quintiles, and the number of SA1s in each quintile was calculated. The quintile with the largest number of SA1s was selected as the quintile for the SA3.

Table 3: Number* of SA3s by combined remoteness categories and socioeconomic quintiles

Remoteness	Socioeconomic quintile				
	1 (Low)	2	3	4	5 (High)
Major cities	29	22	35	41	63
Inner regional	37	23	11		11 [†]
Outer regional	27	10		10 [†]	
Remote and very remote	10		9 [†]		

* Two SA3s (Blue Mountains – South, and Illawarra Catchment Reserve) were not included because the population in these areas was too small for them to be assigned a socioeconomic quintile.

† Numbers are between columns where adjacent socioeconomic quintiles were combined.

Combining remoteness and socioeconomic quintiles

When remoteness categories and socioeconomic quintiles are combined, there are 25 combinations to which SA3s can be assigned. Some categories and quintiles were combined to ensure that each of the final 14 combinations contained at least six SA3s for comparison purposes (Table 3).

In this report, the SA3s in the combined 'remote' and 'very remote' areas are labelled 'remote'. The SA3s with the most overall disadvantage are labelled 'low SES (1)', and the SA3s with the least overall disadvantage are labelled 'high SES (5)'. Where socioeconomic quintiles are combined (for example, quintiles 4 and 5), the SA3s with the least overall disadvantage are labelled 'higher SES' (for example, 4+).

Suppression protocol

Rates based on small numbers of events and/or very small populations are more susceptible to random fluctuations and may not provide a reliable representation of activity in that area. For reliability reasons, areas with volatile rates were suppressed (Table 4). Data that could lead to the identification of

individual patients, providers or prescribers were also suppressed. If applicable, consequential suppression was applied to manage confidentiality.

Suppressed SA3s were marked as not published and coloured grey in maps. Data from these suppressions were included in analyses for larger geographic areas – for example, analysis by state and territory, remoteness and socioeconomic status.

Sensitivity analysis

Most data were age and sex standardised. Several SA3s in the Northern Territory were consistently suppressed because the population in one or more age and sex groups for standardisation was less than 30. The Northern Territory requested that consideration be given to relaxing this suppression rule. The AIHW developed a sensitivity analysis to investigate the volatility of the rates for the affected SA3s. For consistency, the sensitivity analysis was applied to all affected SA3s, not just those in the Northern Territory. The procedure to conduct the sensitivity analysis is summarised in Box 1.

Table 4: Rules for suppression of an area of patient residence

Data source	Numerator	Denominator	Denominator for age and sex groups
MBS data	<ul style="list-style-type: none"> Fewer than 20 Fewer than 6 services* Fewer than 6 patients* Fewer than 6 providers* One provider provided more than 85% of services* Two providers provided more than 90% of services* 	<ul style="list-style-type: none"> Fewer than 200 (medication management reviews) Fewer than 1,000 (otherwise) 	Fewer than 30
NHMD [†]	<ul style="list-style-type: none"> Fewer than 20 (single year of data) Fewer than 10 (3 years of data) 	Fewer than 1,000	Fewer than 30
NPDC	Fewer than 5*	Fewer than 100	Not applicable; data are not standardised
PBS data	Fewer than 20	Fewer than 200	Fewer than 30

* Suppression rules relate to protecting confidentiality. Suppression rules not marked with an asterisk relate to volatility.

† Additional suppression rules may apply if required by state or territory data custodians.

Technical supplement

Box 1:

Summary of sensitivity analysis

For each SA3 that was suppressed because of a small (below-threshold) denominator for one or more age and sex groups (affected SA3), the following analysis was undertaken:

1. The numerator was increased by 1 in each group with a small denominator, to generate a simulated rate
2. All rates, including the simulated rates, were rounded to whole numbers
3. All publishable rates for non-affected SA3s and the simulated rates for affected SA3s were ranked from lowest to highest and split into 10 categories (deciles)
4. All publishable rates for non-affected SA3s and the actual rates for affected SA3s were ranked from lowest to highest and split into deciles
5. The decile of the simulated rate (step 3) was compared with the decile of the actual rate (step 4)
6. Steps 1 to 5 were repeated with a decrease in the relevant numerators by 1. Negative numerators were reset to zero before generating a simulated rate.

All affected SA3s were included in the simulation simultaneously, to generate maximum differences between the deciles calculated using the simulated rates and the deciles calculated using the actual rates (the most extreme scenario). This was a conservative method compared with simulation conducted for one affected SA3 at a time.

The volatility of the actual rate for an affected SA3 was not considered to have a material impact on its decile if either of the following conditions was met in each simulation (increasing or decreasing the relevant numerators by 1):

- There was no difference in the decile for the simulated and actual rates; for example, both simulated and actual rates were in the lowest decile
- There was a difference of one decile, and the simulated rate was not on the cusp of the next decile (the decile that would make the difference become two deciles); for example, the actual rate was in the lowest decile and the simulated rate was in the second decile, and not on the cusp of the third decile.

Where the decile for an affected SA3 was considered to be robust against the volatility of the rate, the rate was published with caution, although it was considered potentially more volatile than other published rates. The rates with caution were not included in the calculation of the national magnitude of variation, and were presented with an asterisk (tables), or as squares or red rectangles (graphs) and dotted areas (maps).

Presentation of rates in Australia maps, capital city area maps and time-series graphs

Rates for SA3s were rounded to whole numbers. Rounded rates were ranked from lowest to highest and split into 10 categories (deciles). The deciles are displayed using various shades of colour, where darker colours represent higher rates and lighter colours represent lower rates. Each decile may not have the same number of SA3s if the number of publishable SA3s is not a multiple of 10. Furthermore, if there was more than one SA3 with the same rate at the boundary of a decile, SA3s with the same rate were assigned to the same decile.

Identification of areas with the highest and lowest rates

SA3s with the highest and lowest rates have been identified for all indicators with data presented by SA3. Having regard to the overall distribution of the rates, selection of SA3s was made from the histogram column by column, with the aim of identifying at least the 10 highest and lowest rate areas for SA3s. The selection of SA3s was also dependent on the width of the column in the histogram, and the choice of what width to use was somewhat arbitrary. For some indicators, fewer than 10 SA3s are listed because inclusion of the next column of the histogram would result in a list of SA3s too long for publication.

Identification of areas with consistently high and low rates

SA3s with consistently high or consistently low rates have been identified. Consistently high or consistently low is defined as those SA3s that fall in the top 10% or bottom 10% of all SA3s for all reporting years.

Glossary

Aboriginal Community Controlled Health Service	A primary healthcare service initiated and operated by the local Aboriginal community to deliver holistic, comprehensive and culturally appropriate health care to the community that controls it.
age and sex standardisation	The removal of the influence of age and sex when comparing rates between populations with different age and sex structures. The current standard population is the Australian estimated resident population as at 30 June 2001. Rates in the Atlas are expressed per 100,000 people.
best possible medication history	A list of all the medicines a patient is using at presentation. The list includes the name, dose, route and frequency of the medicine, and is documented on a specific form or in a specific place. All prescribed, over-the-counter and complementary medicines should be included. This history is obtained by a trained clinician interviewing the patient (and/or their carer) and is confirmed, where appropriate, by using other sources of medicines information.
carer	A person who provides unpaid care and support to a family member or friend who has a disability, chronic condition, terminal illness or general frailty. Includes parents and guardians caring for children.
Clinical Care Standard	A small number of quality statements that describe the care patients should be offered by health professionals and health services for a specific clinical condition or defined clinical pathway in line with current best evidence. Clinical Care Standards play an important role in delivering appropriate care and reducing unwarranted variation because they identify and define the care people should expect to be offered or receive, regardless of where they are treated in Australia. Further information is available at safetyandquality.gov.au/our-work/clinical-care-standards
clinician	A healthcare provider trained as a health professional. Includes registered and non-registered practitioners, and teams of health professionals who spend most of their time providing direct clinical care.
consumer	A person who has used, or may potentially use, health services, or is a carer for a patient using health services.
data linkage	Used synonymously with 'data integration' and 'record matching', data linking or linkage refers to the bringing together of information from more than one source that relates to the same individual or institution.

Glossary

defined daily dose (DDD)	A measurement unit created by the World Health Organization. The DDD is defined as the assumed average maintenance dose per day for a medicine used for its main indication in adults, and does not necessarily correspond to the recommended or prescribed daily dose. Therapeutic doses for individual patients and patient groups will often differ from the DDD because they will be based on individual characteristics such as age, weight, ethnic differences, type and severity of disease, and pharmacokinetic considerations. Use of DDDs allows comparisons of medicine dispensing independent of differences in price, preparation and quality per prescription. Expressing medicine dispensing in DDDs per thousand people per day (DDDs/1,000/day) allows the aggregation of data for medicines that have differing daily doses.
episode of care	A period of care in a hospital. This can be a total hospital stay (from admission to discharge, transfer or death), or a portion of a hospital stay beginning or ending in a change in type of care (for example, from acute care to rehabilitation).
health literacy	The Commission separates health literacy into two components: individual health literacy and the health literacy environment. Individual health literacy is the skills, knowledge, motivation and capacity of a person to access, understand, appraise and apply information to make effective decisions about health and health care, and take appropriate action. The health literacy environment is the infrastructure, policies, processes, materials, people and relationships that make up the health system, and affect the way in which people access, understand, appraise and apply health-related information and services. It reflects the demands and complexity of the health system and society at large.
HealthPathways	An online manual used by clinicians to help make assessment, management and specialist request decisions. Rather than being traditional guidelines, each pathway is an agreement between primary and specialist services on how patients with particular conditions will be managed in the local context.
health services	Services delivering health care, such as general practices, community health centres, medical specialists, nursing services, allied health services, public and private hospitals (including outpatient services), day procedure services, Aboriginal Community Controlled Health Services, community nursing and Hospital in the Home.
hospital	All public and private acute and psychiatric hospitals, freestanding day hospital facilities, and alcohol and drug treatment centres. Includes hospitals specialising in dentistry, ophthalmology, and other acute medical or surgical care. May also include hospitals run by the Australian Defence Force and correctional authorities, and those in Australia's offshore territories. Excludes outpatient clinics and emergency departments.
hospital admission	The administrative process of becoming a patient in a hospital.
Local Hospital Network	States and territories each have different descriptions of the governance structure providing health services. These include local health networks, Local Hospital Networks, local health districts, boards and area health services. Where the term 'Local Hospital Network' is used, it refers to the description of any of these terms as relevant to states and territories (see meteor.aihw.gov.au/content/index.phtml/itemId/491016).
Medicare Benefits Schedule (MBS)	A listing of the Medicare services subsidised by the Australian Government.
medicine	A chemical substance given with the intention of preventing, curing, controlling or alleviating disease, or otherwise improving the physical or mental welfare of people. Includes prescription, non-prescription and complementary medicines, regardless of administration route (for example, oral, intravenous, intra-articular, transdermal or intra-uterine).
My Health Record	A secure online summary of an individual's health information. Individuals can control what goes into it, and who is allowed to access it. They can choose to share their health information with doctors, hospitals and other healthcare providers.

National Hospital Morbidity Database (NHMD)	The AIHW NHMD is a compilation of episode-level records from admitted patient morbidity data collection systems in Australian hospitals. The database collects information about care provided to admitted patients in all public and private acute and psychiatric hospitals, freestanding day hospital facilities, and alcohol and drug treatment centres in Australia. Hospitals operated by the Australian Defence Force and correctional authorities, and hospitals in Australia's offshore territories are not in scope but may be included. More information is available in the Technical Supplement.
National Perinatal Data Collection (NPDC)	The AIHW NPDC is a national collection of data on pregnancy and childbirth. The data are based on births reported to the perinatal data collection in each state and territory in Australia. A standard de-identified extract is provided to the AIHW each year to form the NPDC. More information is available in the Technical Supplement.
National Safety and Quality Health Service Standards (NSQHS)	Evidence-based standards that address the major safety and quality issues that affect a large number of patients in areas where there is variation and it is known that practices can be improved. The primary aims of the NSQHS Standards are to protect the public from harm and to improve the quality of health care. They were developed by the Commission in collaboration with states and territories, technical experts, clinicians, patients and carers, and a range of other stakeholders. The NSQHS Standards (first edition) were released in 2011, and the second edition was released in 2017.
Pharmaceutical Benefits Scheme (PBS)	An Australian Government program that subsidises medicines.
population	<p>The Atlas uses population estimates as at 31 December of a reporting year for indicators based on NHMD data. The estimates are calculated as the average of the Australian Bureau of Statistics (ABS) estimated resident population (ERP) at 30 June before and after the relevant December. The ERPs for 30 June 2016 and previous time points are calculated by the ABS using a combination of census counts and other information, such as births and deaths. The ERPs for time points after 30 June 2016 are calculated by the ABS using the 30 June 2016 ERP and other information, such as births and deaths.</p> <p>The population estimates for Aboriginal and Torres Strait Islander people for 30 June 2016 were based on the 2016 Census and Census Post Enumeration Survey. Aboriginal and Torres Strait Islander population estimates for time points prior to 30 June 2016 were calculated by the ABS by applying assumed levels of mortality to the base 30 June 2016 Aboriginal and Torres Strait Islander population. Aboriginal and Torres Strait Islander projected populations for the period 2017–2031 were calculated by applying assumed levels of fertility, mortality and migration to the base 30 June 2016 Aboriginal and Torres Strait Islander population.</p> <p>The Atlas uses population estimates as at 30 June of a reporting year for indicators based on MBS and PBS data. The estimates are based on the ABS estimated resident population.</p>
primary care	The first level of care or entry point to the healthcare system, such as general practice clinics, community health practice (for example, clinics, outreach or home visiting services), ambulance services, pharmacists or services for specific populations (for example, Aboriginal or refugee health services).
Primary Health Network	Primary Health Networks connect health services across local communities so that patients, particularly those needing coordinated care, have the best access to a range of healthcare providers, including practitioners, community health services and hospitals. They work directly with general practitioners, other primary care providers, secondary care providers and hospitals. Primary Health Networks began to operate on 1 July 2015 to replace Medicare Locals.

Glossary

principal diagnosis	The diagnosis established after study to be chiefly responsible for occasioning an episode of admitted patient care, an episode of residential care or an attendance at the healthcare establishment, as represented by a code.
remoteness categories	Categories of geographical remoteness are based on the ABS Australian Statistical Geography Standard (ASGS) 2016. The ABS ASGS 2016 remoteness categories divide Australia into broad geographic regions that share common characteristics of remoteness for statistical purposes. More information is available in the Technical Supplement.
same-day hospitalisation	Occurs when a patient is admitted and separated from hospital on the same date.
secondary care	Health care for patients referred from primary health care (for example, by general practitioners). Includes care provided by hospitals and medical specialists.
separation	An episode of admitted patient care, which can be a total hospital stay (from admission to discharge, transfer or death), or a portion of a hospital stay beginning or ending in a change in type of care (for example, from acute care to rehabilitation). In the Atlas, a separation is referred to as a hospitalisation.
socioeconomic disadvantage	<p>Local areas are grouped into socioeconomic quintiles based on the 2016 Index of Relative Socio-Economic Disadvantage (IRSD) at the Statistical Area Level 1 (SA1) level. The IRSD is derived from census variables relating to disadvantage, such as low income, low educational attainment, unemployment and dwellings without motor vehicles.</p> <p>Information from the ABS Socio-Economic Indexes for Areas (SEIFA) and the IRSD was used to calculate the socioeconomic status at the SA3 level in the Atlas. SEIFA includes four summary measures created from 2016 Census information.</p> <p>The indexes can be used to explore different aspects of socioeconomic conditions by geographic areas. For each index, every geographic area in Australia is given a SEIFA number that shows how disadvantaged that area is compared with other areas. Each index summarises a different aspect of the socioeconomic conditions of people living in an area. For example, they provide more general measures of socioeconomic status than are given by measuring income or unemployment alone.</p>
Statistical Area Level 3 (SA3)	<p>A geographical area built from a whole SA2 and designed for the output of regional data, including 2016 Census data. As defined in the ABS Australian Statistical Geography Standard 2016, SA3 geography includes the territories of Jervis Bay, Cocos (Keeling) Islands, Christmas Island and Norfolk Island. The aim of SA3s is to create a standard framework for analysing ABS data at the regional level through clustering groups of SA2s that have similar regional characteristics.</p> <p>There are 340 spatial SA3s, covering the whole of Australia without gaps or overlaps. SA3s usually have a population of between 30,000 and 130,000 people. At 30 June 2016, some SA3s had populations below 30,000 and above 130,000. In the major cities, SA3s represent areas serviced by major transport and commercial hubs. They often closely align with large urban local government areas (for example, Gladstone, Geelong). In regional areas, they represent areas serviced by cities with populations of more than 20,000 people, or clusters of related suburbs around urban commercial and transport hubs within the major urban areas. In outer regional and remote areas, SA3s represent areas that are widely recognised as having a distinct identity, and similar social and economic characteristics.</p> <p>A small number of SA3s are termed 'zero SA3s'. These have small effective design populations and represent very large national parks close to the outskirts of major cities.</p>
telehealth	Health services delivered using information and communication technologies, such as videoconferencing.

Acknowledgements

Acknowledgements

Although the Atlas has been created in consultation with many individuals and organisations, the Commission is solely responsible for making the recommendations; as such, the recommendations may not reflect the views of all contributors to the Atlas.

The Commission has consulted widely including with a number of clinical colleges and societies, and gratefully acknowledges their contributions.

The Commission wishes to acknowledge the significant contribution of its advisory groups and other experts to the development of the Atlas.

Jurisdictional Advisory Group

Dr Tina (Christina) Bertilone

Senior Medical Advisor – Manager, Healthcare Quality Intelligence Unit, Patient Safety and Clinical Quality Directorate, Clinical Excellence Division at the Western Australian Department of Health

Chair: Professor Katina D’Onise

Executive Director, Prevention and Population Health Directorate, Wellbeing SA

Adjunct Professor (Practice) Alison J McMillan

Chief Nursing and Midwifery Officer, Australian Government Department of Health

Ms Di O’Kane

Director, Programs and Survey and Audit, Patient Safety and Quality Improvement Service, Queensland Department of Health

Ms Helen Rizzoli

Director, System Safety Partner, Safer Care Victoria

Associate Professor Girish Talaulikar

Clinical Director, ACT/SNSWLHD Renal Network; Associate Professor of Nephrology, Australian National University Medical School

Dr Diane Watson

Chief Executive, Bureau of Health Information, New South Wales

Dr Sara Watson

Acting Chief Medical Officer, Senior Director Clinical Excellence and Patient Safety, Department of Health, Northern Territory

Dr Liz Webber

Medical Advisor – Clinical Quality, Tasmanian Department of Health

Dr Adrian Webster

Head, Health Systems Group, Australian Institute of Health and Welfare; Adjunct Professor, Faculty of Health, University of Canberra

Primary Care Expert Advisory Group

Dr Steve Hambleton

Specialist general practitioner; past president, Australian Medical Association

Dr Liz Marles

General practitioner; past president, Royal Australian College of General Practitioners; Director, Hornsby-Brooklyn GP Unit, Hornsby Hospital, New South Wales

Dr Marguerite Tracy

General practitioner; Senior Lecturer, School of Public Health, Faculty of Medicine and Health, University of Sydney

Dr Damien Zilm

General practitioner; Chair, Western Australian General Practice Education and Training; Director, WA Primary Health Alliance (including Chair, Country Primary Health Network Council)

Potentially Preventable Hospitalisations Topic Expert Group

Consultant, Emergency Department, Royal Perth Hospital; Royal Perth Hospital Homeless Team; Clinical Lead, Baclofen Treatment program, Royal Perth Hospital

Professor John Turnidge AO

Scientific Secretary, European Committee on Antimicrobial Susceptibility Testing; Senior Medical Advisor, Australian Commission on Safety and Quality in Health Care

Professor Ian Yang

Thoracic Physician and Thoracic Program Medical Director, The Prince Charles Hospital, Metro North Hospital and Health Service; Head, Northside Clinical Unit; Professor, Faculty of Medicine, University of Queensland

Paediatric Ear, Nose and Throat Surgery Topic Expert Group

Dr Julienne Agnew

Adult and paediatric ear, nose and throat surgeon, Complete ENT, Queensland Children's Hospital, Royal Brisbane and Women's Hospital; Secretary, Australian Society of Otolaryngology Head and Neck Surgery

Associate Professor Larry Kalish

Adult and paediatric ear, nose and throat surgeon, Head of ENT Department, Concord Hospital; Clinical Associate Professor, University of Sydney

Associate Professor Kelvin Kong, Worimi

Ear, nose and throat surgeon, Hunter ENT, John Hunter Hospital, John Hunter Children's Hospital, Newcastle; Conjoint Lecturer, University of Newcastle; Conjoint Associate Professor, School of Medicine and Public Health, University of New South Wales; Honorary Associate Professor, Macquarie University

Professor Payal Mukherjee

Adult and paediatric ear, nose and throat surgeon; Clinical Associate Professor, University of Sydney; ear, nose and throat research lead, Royal Prince Alfred Institute of Academic Surgery; Chair, Royal Australasian College of Surgeons, New South Wales committee

Associate Professor Gillian Nixon

Paediatric respiratory and sleep physician, Melbourne Children's Sleep Centre, Monash Children's Hospital; Department of Paediatrics, Monash University

Medicines Use in Older People Topic Expert Group

Professor Christopher Etherton-Beer

Geriatrician; clinical pharmacologist, University of Western Australia and Royal Perth Hospital

Professor Sarah Hilmer

Clinical pharmacologist and geriatrician, Royal North Shore Hospital; Conjoint Professor of Geriatric Pharmacology, University of Sydney

Dr Amy Page

Lead Pharmacist – Rehabilitation Aged and Community Care, Alfred Health; NHMRC Early Career Fellow, Centre for Medicine Use and Safety, Monash Institute of Pharmaceutical Science, Monash University; Adjunct Senior Lecturer, School of Allied Health, University of Western Australia

Gastrointestinal Investigations Topic Expert Group

Dr Kirsty Campbell

Clinical Lead of Gastroenterology,
Royal Darwin Hospital

Dr Brian Kirkby

General, colorectal and endoscopic surgeon,
Metro North Hospital and Health Service, Queensland

Dr Tim Lyon

Senior Medical Officer, Gastroenterology,
Toowoomba Base Hospital, Queensland

Dr Suzanne Mahady

Gastroenterologist, Melbourne Health; epidemiologist,
Monash University

Associate Professor Andrew Metz

Gastroenterologist and interventional endoscopist;
Head of Endoscopy, Royal Melbourne Hospital;
Associate Professor, University of Melbourne

Dr Darren Pavey

Interventional endoscopist and gastroenterologist,
Chris O'Brien Lifehouse, Sydney; Co-Chair,
Gastroenterology Network, NSW Agency for Clinical
Innovation, NSW Health

Professor Benedict Devereaux

Professor, University of Queensland School
of Medicine; Vice President/President-elect,
Gastroenterological Society of Australia; Senior
Consultant Gastroenterologist, Royal Brisbane
and Women's Hospital

Professor Jane Andrews

Gastroenterologist and Medical Stream Lead;
Gastroenterology, General and GI Surgery,
CALHN and Clinical Professor of Medicine,
University of Adelaide

Lumbar Spinal Surgery Topic Expert Group

Dr Jeffrey Brennan

Head of Department of Neurosurgery, Royal Prince
Alfred Hospital, New South Wales

Professor Ian Harris

Orthopaedic surgeon, Liverpool Hospital; Professor of
Orthopaedic Surgery, University of New South Wales

Mr Michael A Johnson

Orthopaedic surgeon, Epworth Hospital, Richmond,
Victoria; previous Chair of Professional Development
and Standards, Australian Orthopaedic Association;
executive member, Spine Society of Australia,
Spine Registry, Co-Chair of MBS review committee

Dr Ralph Stanford

Orthopaedic surgeon, Prince of Wales Hospital,
New South Wales; Education Secretary,
Spine Society of Australia

Acknowledgements

Executive summary

This is the report of a project undertaken by the Australian Commission on Safety and Quality in Health Care (the Commission) to implement and document a process, applying the prioritisation criteria and other elements (prioritisation criteria) in the *Framework for Australian clinical quality registries**, to create a prioritised list of clinical domains for potential development of national clinical quality registries.

The *Framework for Australian clinical quality registries*, including the prioritisation criteria, was endorsed by the Australian Health Ministers' Advisory Council in September 2014. The prioritisation criteria address both clinical relevance and feasibility.

Clinical quality registries are a specific type of clinical registry. They collect longitudinal health outcome data for an eligible population and generate risk-adjusted reports on appropriateness and effectiveness of health care. The information is used to inform quality improvement. Therefore, deep engagement of all the clinicians who deliver care to the defined patient group is critical to the success of clinical quality registries. This usually requires established organisational and/or professional linkages between the relevant clinicians.

The project terms of reference required the identification of 10 to 20 clinical domains for potential national development. An initial analysis using data from the National Hospital Cost Data Collection was conducted to identify a manageable list of diseases, conditions and interventions for further analysis. The NHCDC includes mainly hospital-based cost data. Because of concerns about its adequacy for the purpose of short-listing, the approach was supplemented with an analysis of Australian Institute of Health and Welfare Burden of Disease data[†], and a survey of clinical, consumer and jurisdictional stakeholders. The objective was to identify diseases, conditions and interventions that are high cost for health service provision, represent a high BOD in the general population and/or are considered a priority for system improvement by Governments and all stakeholders.

A short-list of clinical domains was developed by grouping the diseases, conditions and interventions that were assessed as suitable for potential registry development. Short-listed diseases and interventions were assessed against a threshold criteria of: evidence-based sequence of care; the ability to identify and address variation from the evidence-based sequence of care; suitability of the domain to a clinical quality registry data collection and suitability of the clinical domain to meet the information requirements of a national registry.

The final priority list of clinical domains as set out in Figure 1 is not exhaustive. While the prioritised clinical domains could be considered by funding bodies, funders should also consider the key components of the threshold criteria, and consistency with the *Framework for Australian clinical quality registries* to independently assess the suitability of supporting registries in other clinical domains.

The ranking of the final priority list of clinical domains should be viewed as preliminary, as the comprehensive data required to objectively analyse the relative performance of all short-listed clinical domains against all prioritisation criteria was not available. For example, it was difficult to find comprehensive data to assess the priority of diseases, conditions and interventions that had significant components of care in the community.

The approach used combined the available data with collective judgement of experts, an approach that is often used where evidence or data is limited. Ultimately, it is likely that a prioritisation process of this nature will continue to rely significantly on informed but subjective assessment of the potential benefits of development by clinicians, administrators and other stakeholders.

Figure 1: Prioritised list of clinical domains*

SCORE	DOMAINS	SUMMARY
HIGHEST		
3	Ischaemic heart disease	Serious consequences of poor quality care, very high burden of disease and cost to the health system. Strong clinical support registries in this domain. Current national registries and potential to expand into non-surgical interventions in the future.
	Musculo-skeletal disorders	Serious consequences of poor quality care, very high cost and high burden of disease. A number of national registries in hip and knee procedures. Potential to expand to registries for non-surgical interventions in the future.
2.75	Major trauma	Serious consequences of poor quality care, very high burden of disease and high cost to the system. Established leadership group and national registry with incomplete capture as well as jurisdictional registries.
	Adult critical care	Serious consequences of poor quality care, very high cost to the health system and estimated high burden of disease. Very strong clinical support and leadership. National registry with close to complete coverage.
	High burden cancers	Serious consequences of poor quality care, very high cost and high burden of disease. Current national population based registers and a number of jurisdictional cancer specific registries. National registry for prostate cancer.
2.5	Stroke	Serious consequences of poor quality care, high burden of disease and moderately high cost to the system. Strong leadership and a national registry.
	Renal disease	Serious consequences of poor quality care, very high cost and moderately high burden of disease. Established leadership group for dialysis and transplantation and expand to registries in this domain.
2.25	Neonatal critical care	Serious consequences of poor quality care, high burden of disease and moderately high cost. Existing leadership group and national registry with substantial capture.
	Mental health	Serious consequences of poor quality care, very high burden of disease and very high cost. Clinical advocacy for registries but no identified leadership group or current registries. Initial registries may focus on sub-groups of patients where the entire population can be captured.
1.75	Maternity	Serious consequences of poor quality care, moderate burden of disease and high cost. Current data collections by jurisdictions and through administrative data are substantial which could be drawn on to develop clinical quality registries.
1.25	Dementia	Serious consequences of poor quality care, high burden of disease and moderate acute care costs. No current registries. Clinical advocacy for registry development in this area. Scoping study on potential to develop registry in this domain is underway.
1	Major burns	Serious consequences of poor quality care, moderate burden of disease and moderate cost. Established leadership group and national registry with incomplete patient capture.
	Diabetes	Serious consequences of poor quality care, high burden of disease and moderate cost. Clinical advocacy for the development of clinical quality registries.

Background

Clinical quality registries

Clinical registries gather information about patients' diagnoses and/or interventions. Clinical quality registries are a sub-set of this larger group. Clinical quality registries are organisations that systematically monitor the quality (appropriateness and effectiveness) of health care, within specific clinical domains, by routinely collecting, analysing and reporting health-related information.*

The information collected from clinical quality registries is used to identify benchmarks, significant outcome variance, and inform improvements in healthcare quality (see Figure 2). The defining feature of clinical quality registries is the provision of feedback to clinicians on their clinical outcomes.

The purpose of clinical quality registries in the Australian context is:

- To inform improvements in the quality of health care by routinely collecting, analysing and reporting on information about the care provided to patients and how well that care is being provided
- To provide a mechanism to feedback specific information to clinicians and providers about
 - the appropriateness of health care (whether the care delivered to patients is based on the best available evidence)
 - the effectiveness of health care (measured by the degree to which the care benefits the patient).†

This information is used to inform improvements in the healthcare system.

Further, the aims of clinical quality registries are:

- To collect longitudinal health outcome data for the entire eligible population of the clinical domain
- To generate risk-adjusted reports on the appropriateness and effectiveness of health care.

If a clinical quality registry is to support continuous quality improvement, it must provide benchmarked data to the clinicians who care for the patients in the registry population and sustain engagement of those clinicians in analysing and responding to their performance data. Within the data governance framework, reports may also be provided to jurisdictions, healthcare providers, funders, clinical colleges and researchers, to identify significant variance and to benchmark nationally and internationally. Capture of data relating to an entire patient population usually requires deep engagement of the multidisciplinary group of clinicians who care for that patient population. If a population of clinicians is large, professionally diverse and does not have strong organisational governance arrangements (e.g. via professional associations or employing organisations) it is not usually possible to establish an effective clinical quality registry. Other quality improvement methodologies such as audit may be useful in such circumstances.

Figure 2: Improvement cycle for clinical quality registries

The Framework for Australian clinical quality registries and prioritisation criteria

The Commission released the *Framework for Australian clinical quality registries* in September 2014 after endorsement by the Australian Health Ministers' Advisory Council. The *Framework for Australian clinical quality registries* specifies national arrangements under which peak clinical groups and healthcare organisations can partner with governments to monitor and report on the appropriateness and effectiveness of health care* through clinical quality registries. The *Framework for Australian clinical quality registries* comprises the following five key elements:

1. Strategic principles
2. National health information arrangements
3. National infrastructure model
4. Principles, guidelines and standards
5. Prioritisation criteria.†

Clinical quality registry prioritisation criteria are listed in Table 1. More information about the *Framework for Australian clinical quality registries* elements is included at Attachment 1. A detailed description of the application of each prioritisation criterion is provided later in this report.

Categorisation of the prioritisation criteria

The *Framework for Australian clinical quality registries* prioritisation criteria generally fall into two groups:

1. Some criteria are necessary for the successful functioning of a clinical quality registry – these were designated **threshold criteria**. These criteria were assessed with the overarching principle that the core purpose of a clinical quality registry is to improve safety and quality of care by routinely collecting, analysing and feeding back health-related information
2. Others were identified as more appropriate to use to rank the priority of clinical domains – these were designated **prioritisation criteria**. A summary of the application of the criteria as either threshold or prioritisation is provided at Table 1.

To avoid limiting the prioritisation process to domains where registries were already established, the threshold criteria were interpreted as the potential to meet the requirements. For example prioritisation Criterion 2.4 'The information requirements for a successful clinical quality registry are in place' is interpreted as 'The information requirements for a successful clinical quality registry are in place or **can be established**'. Some criteria were not suitable for assessing potential registry domains (for example, the existence of governance arrangements or resources) and were therefore not applied.

* Australian Commission on Safety and Quality in Health Care. Corporate Plan. 2015–2019. Page 10.

† Australian Commission on Safety and Quality in Health Care, [Framework for Australian clinical quality registries](#). Sydney. ACSQHC, March 2014.

Table 1: Categorisation of the prioritisation criteria

Criteria	Type	Assessment of the criteria
1.1 There are serious consequences for the patient associated with poor quality care for the clinical condition or with poor quality of the device or procedure	Prioritisation	<ul style="list-style-type: none">■ Areas of medicine where there are serious consequences for the patient if poor quality care is delivered should be prioritised for registry development as these have the greatest impacts on patient morbidity, mortality and quality of life. Sub-optimal outcomes may also result in repeat hospitalisations and increased use of healthcare resources.■ This criterion was used to rank domains in terms of priority.
1.2 An evidence-based, well executed sequence of care improves patient outcomes for the clinical condition	Threshold	<ul style="list-style-type: none">■ The core purpose of clinical quality registries is to identify and address unwarranted variation from defined sequences of care. Where no evidence-based sequence of care has been defined, registries will be unable to collect longitudinal health outcome data for the eligible patient population and generate risk-adjusted reports on the appropriateness and effectiveness of health care. In some cases, the sequence of care for a clinical condition is articulated in clinical practice guidelines. Other clinical conditions may not have clinical practice guidelines that describe the appropriate sequence of care; however a well-executed sequence of care has been shown to influence patient outcomes.■ The importance of this criterion to the utility of a clinical quality registry was confirmed by a number of workshop participants. Where no evidence of a well-executed sequence of care was found in the literature or the existence of a functional clinical quality registry (national or international) shortlisted domains were excluded from further prioritisation. Domains that do not meet this criterion may benefit from research, epidemiological or other types of registries to improve understanding of the incidence and illness trajectory of clinical conditions and develop an evidence-based sequence of care.
1.3 Unwarranted variation from this sequence of care can be identified and addressed	Threshold	<ul style="list-style-type: none">■ Some clinical conditions may have a well-defined sequence of care, but unwanted variation from this sequence of care can be difficult to identify and/or address. This can occur where a condition has a long illness trajectory; variation in presentation; patient preference affecting treatment decisions or a lack of uniformity in outcomes. Similarly, where the sequence of care for a condition involves multiple service providers across multiple settings and over a long duration, addressing unwanted variations from the sequence of care is difficult.■ The importance of this criterion to the utility of a clinical quality registry was confirmed by a number of workshop participants. Where shortlisted diseases, conditions and interventions were identified as unable to meet this criterion they were not considered further in the prioritisation process.

Criteria	Type	Assessment of the criteria
<p>1.4 The condition, device or procedure of interest is associated with a high cost to the health system</p>	<p>Prioritisation</p>	<ul style="list-style-type: none"> ■ In order to ensure care is both high quality and efficient, providers must identify and promote treatment that yields better, more cost-effective care. Conditions associated with a high cost to the health system are a priority for registry development because these registries provide a potential information source for identifying and responding to inappropriate care or inefficient use of limited resources. ■ All domains have some cost to the health system and this criterion was therefore assessed to rank the domains in terms of priority.
<p>2.1 The clinical condition is suited to clinical quality registry data collection:</p> <p>2.1.1 The relevant clinical population can be captured</p> <p>2.1.2 The clinical condition or event is able to be systematically recognised</p>	<p>Threshold</p>	<ul style="list-style-type: none"> ■ In order to be feasible, a clinical quality registry needs to have the potential to capture the relevant clinical population. Capture of data about all or the substantial majority of the population of patients included in a registry domain avoids selection bias and ensures registry outputs validly reflect quality of care. A clinical domain may define a sub-set of a larger clinical population (for example, all patients with a specified condition who are treated as inpatients), but once a registry's focus is defined it is necessary to capture the entire population within that focus for a clinical quality registry to operate effectively. ■ For a registry to be feasible the clinical condition needs to be systematically recognised. Monitoring diseases that cannot be systematically recognised at a defined point in their clinical history may generate misleading data as a result of subjective definitions of conditions or diseases and ill-defined staging criteria for disease. ■ Diseases, conditions and interventions that were not systematically recognised or where it was not possible at this time to capture the relevant clinical population were not included in further prioritisation. Improvements in diagnostics and in data collection capabilities may lead to these diseases, conditions and interventions becoming suitable for clinical quality registry development in the future.

Criteria	Type	Assessment of the criteria
2.2 There is clinician support for the clinical quality registry (or the proposed clinical quality registry)	Prioritisation	<ul style="list-style-type: none"> ■ Clinician support for the registry (or proposed registry) is essential for clinician participation in data collection and for engaging clinicians in quality improvement activities that result from data collection. Where clinicians have a sense of ownership of the registry, their supply of information, investigation of the results of data analysis and application of findings is likely to be greater. ■ It has been assumed that a committed and skilled clinical leadership group could be identified and/or developed for all clinical quality registries where there is sufficient need. This criterion was therefore not considered a threshold criterion but was used later in the prioritisation process.
2.3 The governance requirements for a successful clinical quality registry are in place	Not applied	<ul style="list-style-type: none"> ■ Registry governance must include systems and processes to protect and share data, address outliers or unexplained variance, and have a mechanism to ensure that quality of care issues are effectively addressed and escalated appropriately. The <i>Framework for Australian clinical quality registries</i> requires formal governance structures to oversee resource application, provide focus, optimise output and ensure effectiveness and accountability. ■ A number of participants highlighted the contribution of good governance to the success of clinical quality registries, and noted that the Commission is addressing governance requirements in its overall registry policy work ■ This criterion was not applied to the prioritisation process as it has been assumed that best practice policies and procedures could be implemented in all circumstances if there was clinical support for the registry. Evidence of these arrangements should be included in any assessment of the appropriateness of proposed clinical quality registries.

Criteria	Type	Assessment of the criteria
<p>2.4 The information requirements for a successful clinical quality registry are in place (or can be established):</p> <p>2.4.1 An entire population with a chronic condition or disease, or who have undergone an acute event, can be captured</p> <p>2.4.2 There is a suitable data source</p> <p>2.4.3 Clinically meaningful performance indicators can be defined</p> <p>2.4.4 There is potential for reliable risk adjustment</p>	Threshold	<ul style="list-style-type: none"> ■ As noted under Criterion 2.1, if it is not possible to identify and capture data from the relevant clinical population, a clinical quality registry will not achieve its objectives, because of inevitable selection bias ■ Complete collection of data is necessary for indicators to be adjusted for differences in casemix and so they can be used reliably to benchmark and improve performance across institutions. Collection of these data relies on clinician input and engagement of the group of clinicians that cares for the relevant patient cohort is necessary. Prioritisation Criteria 2.4.1 and 2.4.2 (similar to 2.1.1) are unlikely to be met if all the relevant clinicians are not bound together professionally and/or organisationally. ■ Clinicians who manage patients with the relevant condition or event generally need to be strongly organised within a clinical college or society and/or work within committed, participating healthcare organisations to meet these prioritisation criteria. If relevant clinical groups are large and dispersed and do not have strong and pervasive professional and/or organisational linkages, the requisite widespread commitment to complete data capture is not usually achievable. ■ Application of these prioritisation criteria led to the exclusion of a number of potential clinical domains, particularly those in which there is a large, geographically- and organisationally-dispersed non-hospital population of patients and/or clinicians ■ Improvements in data collection capabilities or professional and organisational links may lead to these domains becoming suitable for clinical quality registry development in the future.
<p>2.5 There are sufficient resources available for the sustainable operation of the clinical quality registry</p>	Not applied	<ul style="list-style-type: none"> ■ A key element in determining the feasibility of developing a new registry or maintaining current registries relates to funding. While the availability of sufficient resources is essential for ongoing clinical quality registry operations, it was assumed that this prioritisation criterion can be addressed for all potential clinical domains, if a decision was made to prioritise them. Therefore, this criterion was not considered in the prioritisation process.

The project

The project aimed to implement and document a process, applying the prioritisation criteria and other elements in the *Framework for Australian clinical quality registries*, to create a prioritised list of clinical domains for potential development of national clinical quality registries.

Clayton Utz was engaged for the initial prioritisation of the list. This process involved identifying diseases, conditions and interventions that have a high burden on the Australian healthcare system, through an indicative cost analysis using data from the NHCDC. An environment scan of the identified high cost diseases, conditions and interventions was conducted to confirm the existence of evidence-based clinical guideline(s) and assess the diseases, conditions and interventions against the prioritisation criteria provided in the *Framework for Australian clinical quality registries*.

Four consultation workshops were held for this project. Workshop participants included stakeholders with backgrounds in health care provision, health care management, consumer advocacy, government, registry science, professional leadership and peak body representation. Participants were provided with

a discussion document prior to the workshops, which described the background to the project, an initial non-prioritised list and issues for consideration.

Following the workshops, the project was expanded to include supplementation of the initial short-list of diseases, conditions and interventions identified through the NHCDC analysis with:

- An analysis of AIHW BOD data*
- An online survey of a targeted group of clinical, government and consumer stakeholders to determine their priorities for clinical quality registry development.

Once the short-list of diseases, conditions and interventions was identified, threshold criteria were applied to remove areas that were not suitable for clinical quality registry development. The Commission, with clinical input, conducted an analysis to group the remaining diseases, conditions and interventions into appropriate clinical domains. The remaining prioritisation criteria were then applied to rank the domains and develop the final prioritised list.

The prioritisation process

A flow chart of the prioritisation process is presented in Figure 3 and is followed by a detailed description of the key steps in the prioritisation process. Key steps undertaken were:

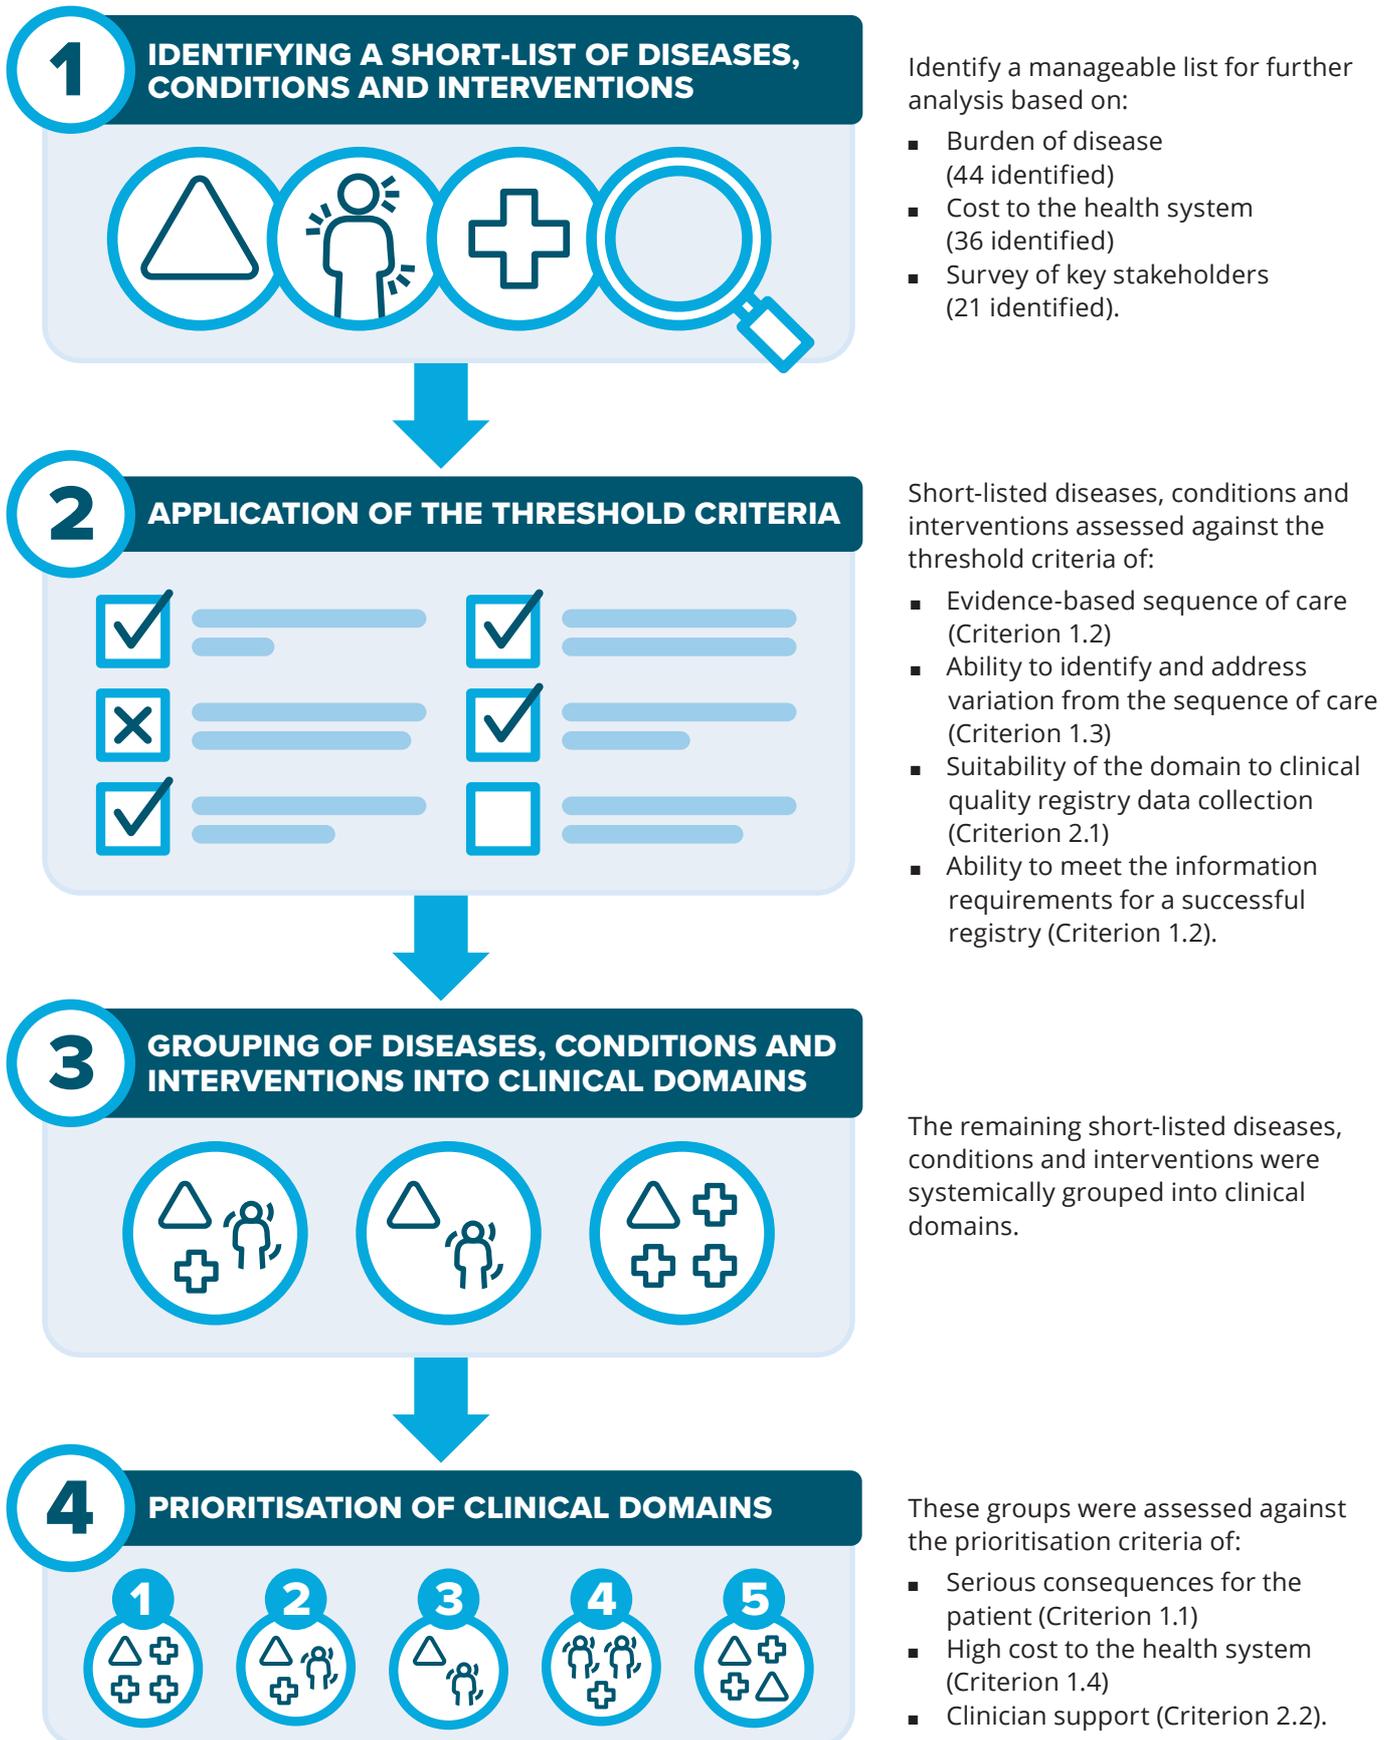

1. Shortlisting to identify a manageable list of diseases, conditions and interventions based on cost to the health system, BOD and stakeholder priority
2. Application of the threshold criteria to remove diseases, conditions and interventions that are not suitable for registry development
3. Grouping of diseases, conditions and interventions into clinical domains
4. Prioritisation of clinical domains against the remaining prioritisation criteria.

The process combines the available data with collective judgement of experts to develop a statement regarding the priorities for clinical quality registry development. Similar approaches are often used where evidence or data is limited, for example RAND/UCLA appropriateness method[†] and other Delphi based approaches.

Figure 3: Prioritisation process

1. Identifying a short-list of diseases, conditions and interventions

Cost analysis

The first step in developing a manageable list of diseases, conditions and interventions for further consideration was to conduct an indicative cost analysis using data from the NHCDC to identify diseases, conditions or interventions that have a high burden on the Australian healthcare system.

Rationale

The NHCDC was established to collate information in order to determine cost weights and relativities among (mainly) acute hospital products. These elements were then used as inputs into cost and funding models in both the public and private sectors and as a tool to compare cost efficiency. The NHCDC is now described as 'the best available national source of benchmark costs'.* However, it has limitations as follows:

- Not all hospitals are represented nor are all separations captured, although this is improving. Currently, around 92% of admitted acute public hospital activity and 60% of overnight private hospital separations are captured in the NHCDC
- Private hospital costs do not include the cost of Medicare-rebated interventions for medical services, pathology and imaging
- It has a focus on acute inpatient costs and has limited data on, for example, the costs of
 - care provided in any community setting, including pre-admission and referral costs intrinsic to an acute intervention
 - community-based care for people with serious chronic conditions
 - post-discharge care directly relevant to an acute inpatient intervention such as rehabilitation costs, which can be substantial.

There was, overall, acknowledgement by workshop participants that cost burden is an important criterion for identifying priority clinical domains for potential national investment and development. However, some workshop participants questioned the use of the NHCDC as a 'short-listing' tool, for the following reasons:

- The NHCDC categorises conditions by DRG and does not capture potentially relevant non-DRG-based clinical domains
- The NHCDC does not capture conditions that result in a high cost of care in the community, but are not associated with high hospital-based care costs
- Various examples were provided of clinical domains relevant to diseases or conditions that affect a small proportion of the Australian population and therefore are responsible for a correspondingly small proportion of overall health system costs, but for which a clinical quality registry may lead to significant quality benefits for individual patients.

A number of workshop participants also made suggestions about how a cost analysis as a principal tool for short-listing could be enhanced, including suggestions that:

- The additional cost of poor quality care is a more relevant metric than the total cost of care, for prioritisation purposes
- Rather than establishing an initial prioritised list of clinical domains based on acute hospital costs (i.e. the NHCDC) alone, the initial prioritisation process should systematically incorporate total costs (hospital and community) for all potential domains
- Various data sets could be interrogated to develop a more complete picture of system-wide costs, including the Medicare and Pharmaceutical Benefit Scheme collections, jurisdictional collections and health insurer collections
- Disease or condition-based costs could be determined from specific reviews of the literature for each potential domain.

* Independent Hospital Pricing Authority. [Strategic review of the national hospital cost data collection](#). Sydney. IHPA 2013.

The limitations of the NHDC data analysis as an initial short-listing tool are recognised. However, none of the potential data sets identified by workshop participants offers a useful tool for an initial short-listing process. While there are numerous sources of domain-specific cost data, the available data collections use diverse and often unique clinical categorisation systems. There is no comprehensive national collection of health system costs (total costs, and additional costs associated with poor quality care) or a variety of separate collections that are both accessible and categorised in a way that would enable aggregation and/or comparison of cost data across collections. It is therefore not possible to develop, *de novo*, a short-list of clinical domains based on a comprehensive analysis of costs incurred in all healthcare settings in Australia.

The concern expressed by some workshop participants about the tendency for an initial analysis based solely on the NHDC to exclude clinical domains in which patients are primarily treated in community settings is valid. However, many of the clinical domains that primarily involve community-based care are unlikely to meet other essential conditions for a successful clinical quality registry.* Specifically, if the clinicians who care for patients in a defined clinical domain are not strongly organised within a clinical college, society or association and/or do not work within committed, participating health care organisations, the relevant patient cohort is unlikely to be captured and both data capture and clinician engagement criteria are unlikely to be met. This is likely to be the case with many, but not all, conditions for which people receive the majority of their care in the community. Other types of data collection are likely to be better suited to driving quality improvement in many conditions for which care is primarily community-based. An exception applies when highly specialised care is provided by small cohorts of professionally-linked clinicians in community settings, if both the patient population and clinician group can be clearly identified and engaged.

Method

Public and private sector data from Round 17 of the NHDC (2012/13) were extracted and summed to provide an ordered list of high cost Australian refined DRGs – where each DRG represents a class of patients with similar clinical conditions requiring similar hospital services. A cut-off of \$0.1 billion was used, leading to 44 DRGs and DRG groupings being considered.

The initial scan and analysis of the NHDC identified individual and adjacent high cost DRGs. Some DRGs are broad and encompass more than one clinical population but do not represent high cost DRGs. Other clinical populations are represented in more than one or adjacent DRGs. The latter situation is true for the cancer, which usually have a specific medical or surgical DRG but rarely both, so that an estimate of the costs does not encompass the entirety of the cost of the condition.

The costs attributable to the critical care groups were estimated based upon the critical care component costs of all neonatal separations for the neonatal critical care domain and critical care costs for all other separations for the adult critical care domain.

In the first instance, trauma included only codes for multi-trauma diagnoses (DRG W). Subsequently, a wider perspective of trauma including less severe injuries (selected codes from DRGs I and X) was advanced and an adjusted cost determination for trauma was made.

* 2.1.1 – The relevant clinical population can be captured.
2.3 – The governance requirements for a successful clinical quality registry are in place.
2.4.1 – An entire population with a chronic condition or disease, or who have undergone an acute event, can be captured.
2.4.2 – There is a suitable data source.

Results

The initial analysis of the NHCDC yielded the list of high cost groups identified in Table 2.

Table 2: High cost clinical diseases, conditions and interventions

Diagnoses related group	Description	NHCDC 2012/13 costs	Total separations 2012/13	Per separation
All NHCDC critical care costs except P01Z-P67ABCD	Critical care (excluding neonatal)	\$2.40 billion	> 150,000 estimated	\$16,000
I04AB, I32ABC	Knee replacement, revision	\$1.2 billion	45,390	\$26,438
I03AB, I31AB	Hip replacement, revision	\$1.1 billion	38,838	\$28,323
O60ABC	Vaginal delivery	\$1.1 billion	202,656	\$5,428
O01ABC	Caesarean delivery	\$1.0 billion	102,007	\$9,803
I06Z, I09AB	Spinal fusion	\$0.65 billion	14,872	\$43,706
L61Z	Haemodialysis	\$0.64 billion	1.17 million	\$547
E62ABC	Respiratory infection / inflammatory	\$0.59 billion	80,176	\$7,359
U61AB	Schizophrenia disorder	\$0.59 billion	26,692	\$22,104
G46ABC, G47ABC	Gastroscopy	\$0.53 billion	239,709	\$2,211
G02AB	Major small and large bowel procedure	\$0.51 billion	22,981	\$22,192
F41AB, F42ABC	Circulatory disorder +/- acute myocardial infarction (with invasive procedure)	\$0.50 billion	89,817	\$5,567
F12AB, F17AB, F18AB	Pacemaker related	\$0.45 billion	18,860	\$26,430
R63Z	Chemotherapy	\$0.43 billion	347,290	\$1,238
P01Z - P67ABCD	Critical care costs only for neonatal admits	\$0.43 billion	Not reported	Not reported
U63AB	Major affective disorder	\$0.43 billion	22,977	\$18,714
F03AB, F04AB	Cardiac valve procedure	\$0.41 billion	8,543	\$47,993
E65AB	COAD (COPD)	\$0.40 billion	58,263	\$6,865
F01AB, F02Z	AICD related	\$0.40 billion	5,977	\$66,923
I08AB	Other hip and femur procedures	\$0.39 billion	22,528	\$17,312
B69AB, B70ABCD	TIA, stroke	\$0.39 billion	47,046	\$8,290
F05AB, F06AB	Coronary bypass	\$0.37 billion	10,365	\$35,697
F62AB	Heart failure	\$0.37 billion	46,036	\$8,037
B02ABC	Cranial procedures	\$0.36 billion	17,673	\$20,370

■ The prioritisation process

Diagnoses related group	Description	NHCDC 2012/13 costs	Total separations 2012/13	Per separation
G10AB	Hernia procedures	\$0.36 billion	70,923	\$5,076
I13AB	Humerus, other lower limb procedures	\$0.36 billion	35,087	\$10,260
H08AB	Laparoscopic cholecystectomy	\$0.36 billion	49,426	\$7,284
F72AB, F74Z	Unstable angina, chest pain	\$0.36 billion	138,845	\$2,593
R60AB, R61ABC	Lymphoma, acute and non-acute leukaemia	\$0.36 billion	42,218	\$8,527
J64AB	Cellulitis	\$0.34 billion	64,558	\$5,267
G70AB	Other digestive system disorders	\$0.33 billion	94,006	\$3,510
L63AB	Kidney and urinary tract infection	\$0.32 billion	59,643	\$5,365
G48ABC	Colonoscopy	\$0.31 billion	182,528	\$1,698
J06AB, J07AB, J14Z, J62AB	Breast condition procedure, reconstruction, breast malignancy	\$0.31 billion	60,654	\$5,111
C16Z	Lens procedures	\$0.28 billion	104,993	\$2,667
G01AB	Rectal resection	\$0.26 billion	9,728	\$26,727
G07AB	Appendicectomy	\$0.24 billion	34,812	\$6,894
F08AB	Major vascular procedure	\$0.21 billion	7,158	\$29,338
I05AB	Other joint replacement	\$0.14 billion	5,297	\$26,430
M01AB	Prostate cancer – major male pelvic procedure, surgical only	\$0.13 billion	7,974	\$16,303
W01Z-W61AB	Multiple or significant trauma	\$0.13 billion	4,752	\$27,357
L71AB	Respiratory cancer – medical only	\$0.11 billion	14,847	\$7,409
Y01Z, Y02AB, Y03Z, Y60Z, Y61Z, Y62AB	Major burns	\$0.11 billion	8,034	\$12,447
B66AB	Nervous system malignancy – medical only	\$0.07 billion	7,526	\$9,301

Burden of disease analysis

To identify conditions that have a high impact on population health and wellbeing but do not necessarily generate high hospital-based costs, the NHCDC-derived short-list was supplemented with an analysis of population BOD data.

Rationale

Workshop participants raised the following methodological issues relevant to the use of BOD data as a short-listing tool:

- The extent to which the burden of poor quality care directly correlates with the BOD is unknown, for example
 - a clinical domain associated with very high existing standards of care may exhibit little potential for quality improvement, even if it is associated with a high BOD; and
 - a clinical domain associated with a lower BOD may also be associated with significant variation in care, and therefore significant improvement potential
- Analysing BOD at a population level does not identify conditions in which small numbers of individuals incur significant adverse health outcomes (either directly, as a consequence of the disease or condition, or if evidence-based care is not provided)
- Some potential clinical domains that appear well suited to clinical quality registry development (e.g. patients treated in intensive care units) are not captured through the methodology currently applied by the AIHW to quantifying BOD in Australia.

Nevertheless, if there is similar quality improvement potential across a number of clinical domains, the diagnosis and procedures associated with the greatest BOD are likely to yield the greatest population benefit if that potential for improvement can be captured. The project scope was therefore amended to incorporate a BOD analysis in the short-listing phase.

Method

We analysed the 2016 AIHW estimates of the BOD in Australia, which are based on data collected in 2011. The data are presented as a measure of total BOD expressed as DALYs. This measure combines estimates of fatal burden (years of life lost (YLL) due to premature death) and non-fatal burden (years lived with disability (YLD)) to identify the total years of life lost from disease and injury for specific diseases and disorders (Table 3).

Table 3: Burden of disease in Australia 2011 top 20 DALY (AIHW 2016)*†

Condition	YLD 2011 (rank)	YLL 2011 (rank)	Total DALYs 2011	Percentage of total DALYs 2011 (rank)
Coronary heart disease	70,946 (10)	275,704 (1)	346,651	7.7% (1)
Other musculoskeletal	173,106 (1)	10,841 (>20)	183,947	4.1% (2)
Back pain and problems	162,393 (2)	1,395 (>20)	163,788	3.6% (3)
COPD	84,985 (7)	75,361 (7)	160,346	3.6% (4)
Lung cancer	3,685 (>20)	151,205 (2)	154,890	3.4% (5)
Dementia	70,658 (11)	80,650 (6)	151,308	3.4% (6)
Anxiety disorders	140,936 (3)	35 (>20)	140,971	3.1% (7)
Stroke	16,782 (>20)	119,989 (3)	136,771	3.0% (8)
Depressive disorders	127,034 (4)	625 (>20)	127,659	2.8% (9)
Suicide and self-inflicted injuries	1,550 (>20)	111,920 (4)	113,470	2.5% (10)
Asthma	100,017 (5)	7,296 (>20)	107,313	2.4% (11)
Diabetes	47,543 (14)	54,110 (9)	101,653	2.3% (12)
Bowel cancer	6,598 (>20)	85,824 (5)	92,422	2.1% (13)
Osteoarthritis	85,088 (6)	718 (>20)	85,806	1.9% (14)
Rheumatoid arthritis	81,036 (8)	2,453 (>20)	83,489	1.9% (15)
Upper respiratory conditions	75,151 (9)	523 (>20)	75,674	1.7% (16)
Breast cancer	7,307 (>20)	63,368 (8)	70,675	1.6% (17)
Hearing loss	66,506 (12)	0	66,506	1.5% (18)
Alcohol use disorders	58,211 (13)	7,831 (>20)	66,042	1.5% (19)
Falls	34,982 (20)	24,134 (>20)	59,116	1.3% (20)

† Ibid, reproduced from Table 3.3 of report.

Stakeholder survey

To identify any gaps in the short-listing process based on NHCDC and BOD data sets, a survey was conducted inviting key organisations to nominate domains that they considered clinically important. The organisations that were contacted were:

- Consumer organisations (n=3)
- Professional organisations (n=61)
- All Australian state and territory departments of health (n=8)
- The Australian Government Department of Health and Ageing.

A list of organisations invited to participate in the survey and those that responded is at Attachment 2. Thirty-two organisations (44% of those invited) responded. Because not all clinical organisations and professional associations that were invited to participate responded, some clinical domains where development of a clinical quality registry is a priority may not be represented. Nevertheless, the survey yielded useful information. Survey respondents were asked to identify their top three priorities for clinical quality registry development. Many of the respondents identified clinical domains aligned with those already captured by the NHCDC and BOD analyses; however, a small number of new clinical domains emerged from this process. Not all respondents identified three priorities.

Priority 1

- Pancreatectomy/oesophagectomy
- Cardiac procedures and devices
- Mesh in gynaecological surgery
- Colorectal cancer
- Major burns
- Cancer
- Cancer surgery
- Surgical mortality
- Obstructive sleep apnoea
- Dementia
- Spinal surgery outcomes
- Fractures
- Diabetes
- Transition care
- Breast Cancer Surgery
- Breast Implants
- Disease-specific cancer registries
- Ear disease in Aboriginal and Torres Strait Islander people

- Mental Health – psychosis and schizophrenia, major affective disorders
- CSF shunt.

Priority 2

- Spinal surgery
- Dialysis, transplantation, organ donation
- Maternity
- Breast surgery
- Non-invasive ventilation
- Surgery for joint pain (knee, shoulder, back)
- Stroke
- Insomnia
- Pancreatic adenocarcinoma
- Osteoporotic hip fractures
- Immunisation coverage
- High cost interventional/surgical procedures/devices
- Rhinology, otology, head and neck surgery, specifically outcomes for tonsil, grommet and nasal septum surgery.

Priority 3

- Cancer treatment
- Joint replacement
- Renal
- Gastro-oesophageal surgery
- Insomnia
- Antibiotic resistant bacterial infections
- Depression
- Non-invasive ventilation
- Pregnancy outcomes
- Critical care
- Outcomes for general rhinology, otology and head and neck surgery.

2. Application of the threshold criteria

In order to identify diseases, conditions and interventions that were not suitable for development, the threshold criteria were applied. These threshold prioritisation criteria describe characteristics that were considered necessary for successful functioning of a clinical quality registry (using the *Framework for Australian clinical quality registries* criteria as a guide). A full list of prioritisation criteria, together with the rationale for their application as threshold criteria, is listed in Table 1. Diseases, conditions and interventions

that did not meet these threshold criteria were not included in further prioritisation. The method of assessment of the threshold criteria is provided in Table 4.

Attachment 3 provides information about diseases, conditions and interventions that did not meet one or more threshold prioritisation criterion.

Table 4: Assessment of compliance with threshold prioritisation criteria

Prioritisation criteria	Assessment
1.2 An evidence-based, well executed sequence of care	Whether there is an existing effective clinical quality registry and/or existing evidence-based guidelines and/or literature defining an established sequence of care – see detail in Attachment 4
1.3 Unwarranted variation can be identified and addressed	A qualitative assessment of whether clinical processes and unwarranted variation from the sequence of care can be defined, identified and addressed through a clinical quality registry
2.1.1 Relevant clinical population can be captured	Whether there are: <ul style="list-style-type: none"> ■ Existing established administrative or clinical datasets defining the population group ■ One or more identifiable clinical groups that care for the relevant patients and can be engaged in a clinical quality registry via professional or organisational links, for data submission purposes ■ Any identifiable barriers to registry engagement by patients
2.1.2 Relevant clinical condition or event can be systematically recognised	Whether the clinical domain identifies certain and definable diagnoses, conditions or events sufficiently
2.4.1 Entire population can be captured	Whether there are: <ul style="list-style-type: none"> ■ Existing established administrative or clinical datasets defining the population group ■ One or more identifiable clinical groups that care for the relevant patients and can be engaged in a clinical quality registry via professional or organisational links, for data submission purposes ■ Any identifiable barriers to registry engagement by patients
2.4.2 Suitable data source	Whether: <ul style="list-style-type: none"> ■ Data can be collected through established administrative or clinical datasets ■ Patients are sufficiently concentrated in the care of one or more identifiable clinical groups that can be engaged in and submit data to a clinical quality registry ■ There are any barriers to data collection and submission
2.4.3 Clinically meaningful performance indicators	Whether there is existing effective clinical quality registry and/or literature that identifies relevant performance indicators
2.4.4 Potential for reliable risk adjustment	Whether there is an existing effective clinical quality registry and/or literature that confirms potential to risk adjust

3. Grouping of diseases, conditions and interventions into clinical domains

NHDC data are DRG-based, BOD data are condition-based and stakeholder priorities were described in varying terms. A process was therefore undertaken to identify clinical domains that were pragmatically suitable and clinically meaningful for further prioritisation.

'Domain' is not a defined term in the Australian healthcare system. Existing Australian clinical quality registries have developed organically in response to multiple drivers. These include clinician and/or consumer interest, practical, and funding considerations. Successful clinical registries in Australia all reflect identifiable patient populations characterised by one or more of the following:

- Single DRGs
- Groups of DRGs
- Commonly-recognised diseases
- Aggregates of commonly-recognised diseases
- Single interventions that are not DRG-specific
- Aggregates of interventions that are not DRG-specific
- The provision of care in defined healthcare settings.

Commonly, registries reflect a similar sequence of care provided to a specific patient population group by an identifiable group of clinicians and/or in an identifiable clinical setting.

Workshop participants emphasised the need to ensure that a proliferation of registries does not lead to multiple collections of data relating to the same cohort of patients. This was a key consideration in aggregating and recategorising various diverse clinical diseases, conditions and interventions into potential domains.

An approach was therefore adopted that grouped similar diseases, conditions and interventions to provide a structure of domains under which multiple registries may exist. Under these domains, there may be various device, procedure and clinical registries, which could be developed depending on clinical need and support.

Focusing on these groupings, rather than specific interventions or procedures, allows for increased understanding of the appropriateness of interventions and provides opportunities to improve care across the continuum. It encourages communication between registries under each domain to avoid the burden of data collection and allows for the continuation of a bottom-up approach that has historically dominated registry development.

This approach also provides a structure for national registries in Australia that is flexible to changes in the healthcare system. For example, changing clinical coordination, such as healthcare homes and care coordinators may allow registries to be developed in areas where there were previously dispersed groups of treating clinicians. Improved data collections such as electronic health records may also provide opportunities for registries that were previously not possible.

The application of threshold criteria and pragmatic grouping of conditions resulted in a short-list of clinical domains (Table 5).

Table 5: Consolidated short-list

Clinical domain	NHCDC potential priority	Burden of disease potential priority	Stakeholder-identified potential priority
Ischaemic heart disease	<ul style="list-style-type: none"> ■ AICD related ■ Cardiac valve procedure ■ Pacemaker related ■ Circulatory disorder +/- acute myocardial infarction (with invasive procedure) ■ Coronary bypass ■ Unstable angina, chest pain 	Coronary heart disease	<ul style="list-style-type: none"> ■ Cardiac procedures and devices ■ High cost interventional/surgical procedures/devices
Musculoskeletal disorders	<ul style="list-style-type: none"> ■ Knee replacement, revision ■ Hip replacement, revision ■ Other hip and femur procedures ■ Other joint replacement ■ Humerus, other lower limb procedures 	<ul style="list-style-type: none"> ■ Osteoarthritis ■ Rheumatoid Arthritis ■ Other musculoskeletal 	<ul style="list-style-type: none"> ■ Fragility fractures ■ Osteoporotic hip fractures ■ Surgery for joint pain (knee, shoulder, back) ■ Joint replacement
	Spinal fusion	Back pain and problems	Spinal surgery outcomes
Major trauma	Multiple or significant trauma	N/A	N/A
Adult critical care	Critical care (excluding neonatal)	N/A	Critical care
High burden cancers	Lymphoma, acute and non-acute leukaemia	N/A	N/A
	Prostate cancer – major male pelvic procedure, surgical only	N/A	N/A
	Major small and large bowel procedure	N/A	N/A
	Rectal resection	Bowel cancer	Colorectal cancer
	Respiratory cancer – medical only	Lung cancer	N/A
	Breast condition procedure, reconstruction, breast malignancy	Breast cancer	<ul style="list-style-type: none"> ■ Breast cancer surgery ■ Breast implants ■ Breast surgery
Stroke	TIA, stroke	Stroke	Stroke
Renal disease	Haemodialysis	N/A	<ul style="list-style-type: none"> ■ Dialysis, transplantation and organ donation ■ Renal
Neonatal critical care	Critical care costs only for neonatal admits	N/A	N/A

Clinical domain	NHCDC potential priority	Burden of disease potential priority	Stakeholder-identified potential priority
Mental health	<ul style="list-style-type: none"> Schizophrenia disorder Major affective disorder 	<ul style="list-style-type: none"> Depressive disorders Suicide and self-inflicted injuries Anxiety disorders 	<ul style="list-style-type: none"> Mental health – psychosis and schizophrenia, major affective disorders Depression
Maternity	<ul style="list-style-type: none"> Vaginal delivery Caesarean delivery 	N/A	<ul style="list-style-type: none"> Maternity Pregnancy outcomes
Dementia	N/A	Dementia	Dementia
Major burns	Burns	N/A	Burns
Diabetes	N/A	Diabetes	Diabetes

These domains are described in broad terms only. Further detailed consultation with relevant clinicians would be required to define the specific scope (inclusions and exclusions) of registries that are suitable for development. In relation to specific clinical domains, considerations would include, for example:

- Maternity – It would be sensible to build on existing data collections already held in all jurisdictions. A significant amount of care is community-based and would be difficult to capture in a registry – the scope of data collection would need to be defined and is likely to be primarily hospital-based but would include hospital-based collection of data about some aspects of ante-natal and post-natal care
- Mental health – A significant amount of care is community-based, however most patients experiencing major affective and psychotic disorders are likely to be under the care of a psychiatrist and therefore a registry that includes both hospital- and community-based data collection is likely to be feasible
- Major burns – This clinical domain is likely to be defined by the location of care, consistent with the existing Burns Registry of Australia and New Zealand.*

4. Prioritisation of clinical domains

The final list of domains was assessed against the remaining (non-threshold) prioritisation criteria:

- Criterion 1.1: There are serious consequences for the patient associated with poor quality care for the clinical condition or with poor quality of the device or procedure
- Criterion 1.3: The condition, device or procedure of interest is associated with a high cost to the health system
- Criterion 2.2: There is clinician support for the clinical quality registry (or the proposed clinical quality registry).

Assessment against prioritisation Criterion 1.1: Serious consequences associated with poor quality care

There are numerous sources of information about the impact of poor quality care in individual clinical domains. The project scanned the literature and identified the main consequences of poor quality care for each of the clinical domains. All short-listed potential clinical domains were assessed as associated with serious clinical risk.

* Cleland et. al. The Burns Registry of Australia and New Zealand: progressing the evidence base for burn care. Med J Aust 2016; 204 (5): 195.

The prioritisation process

Because no specific data sources were identified that could reasonably be applied to systematically analyse and rank the impact of poor quality care across all short-listed potential clinical domains, BOD data was used to provide an estimate of the consequences to patients. If there is similar quality improvement potential across a number of clinical domains, the diagnosis and procedures associated with the greatest BOD are likely to yield the greatest population benefit if that potential for improvement can be captured. The BOD associated with clinical domains where registries were considered feasible was assessed using estimates from AIHW 2011 data* and data provided directly by the AIHW.†

There are significant methodological challenges in assigning an accurate numeric rating to the BOD associated with each short-listed clinical domain, including:

- BOD analysis is based on clinical diagnoses and does not capture the burden of location-based care such as care provided in intensive care units
- BOD data is presented in broad categories that do not necessarily directly relate to the relevant clinical domain being assessed, for example, osteo- and rheumatoid arthritis BOD relates to many more people than those who require a major joint procedure.

Because of the methodological limitations, four broad categories, rather than a highly granular categorisation, were adopted for the rating of relative BOD associated with the short-listed clinical domains. Estimates of the BOD for each domain are provided in Table 6.

Table 6: Burden of disease in Australia 2011 for short-listed domains

Clinical domain	Total DALYs 2011	Estimated percentage of total DALYs 2011
Ischaemic heart disease	499,468	11.10%
Musculoskeletal disorders	532,002	11.84%
Major trauma	280,984	6.25%
Adult critical care	Not suitable for burden of disease analysis	Not suitable for burden of disease analysis
High burden cancers	471,422	10.49%
Stroke	136,771	3.04%
Renal disease	56,236	1.25%
Neonatal critical care	102,773	2.27%
Mental health	341,271	7.55%
Maternity	23,083	0.51%
Dementia	151,308	3.4%
Diabetes	101,860	2.3%
Major burns	7,768	0.17%

* Australian Institute of Health and Welfare 2016. Australian Burden of Disease Study: Impact and causes of illness and death in Australia 2011. Australian Burden of Disease Study series no. 3. BOD 4. Canberra: AIHW.

† Australian Institute of Health and Welfare 2016. Unpublished burden of disease data.

More detail of the conditions used by the BOD data within each domain is provided in Attachment 5.

Using the results of this analysis, the domains were given a score using proportion of the total BOD data in accordance with the system described in Table 7.

Table 7: Scoring for burden of disease

Percentage of total burden of disease	Score
>3%	1
2% – 3%	0.75
1% – 2%	0.5
0.75% – 1%	0.25
<0.75%	0

Assessment against prioritisation Criterion 1.4 – High cost to the health care system

As noted earlier, the NHCDC collection has limitations for use in analysing costs to the healthcare system, as it does not provide a completely accurate picture of the total costs of care associated with various clinical domains. However, the NHCDC does help to establish broad rankings of potential clinical domains based on hospital costs.

Estimates of the cost of each domain is provided in Table 8.

Table 8: Cost analysis for short-listed domains

Clinical domain	NHCDC 2012/13 total costs	Percentage of total cost from NHCDC
Ischaemic heart disease	\$2.68 billion	7.94%
Musculoskeletal disorders	\$4.33 billion	12.83%
Major trauma	\$0.83 billion	2.46%
Adult critical care	\$2.40 billion	7.11%
High burden cancers	\$2.52 billion	7.47%
Stroke	\$0.39 billion	1.16%
Renal disease	\$2.19 billion	6.49%
Neonatal critical care	\$0.43 billion	1.27%
Mental health	\$1.6 billion	4.74%
Maternity	\$2.1 billion	6.22%
Dementia	\$0.0953 billion	0.28%
Major burns	\$0.11 billion	0.33%
Diabetes	\$0.193 billion	0.56%

The prioritisation process

More detail of the DRGs applied to each clinical domain is provided in Attachment 6.

Clinical domains were ranked using proportion of the total NHCDC costs in accordance with the scoring system described in Table 9.

Table 9: Scoring for cost

Percentage of total costs	Score
>3%	1
2% – 3%	0.75
1% – 2%	0.5
0.75% – 1%	0.25
<0.75%	0

The category boundaries were chosen to represent broad grouping of the cost to the health system. More gradual scoring was not used due to the limitations of the data discussed earlier. However, as with the BOD analyses, the approach is subject to considerable methodological challenges and is intended to be indicative only.

Assessment against prioritisation Criterion 2.2 – Clinician support

Workshop participants agreed that without strong clinician support, attempts to develop clinical quality registries are generally unsuccessful.

Organisational linkages that facilitate clinician engagement are required to identify relevant patients, ensure data are submitted to the registry and initiate quality improvements based on registry analyses.

The level of clinician leadership is considered to be a key success factor for clinical quality registries. However, some participants questioned whether a deficiency in clinician support should limit the potential development of a clinical quality registry in circumstances where there is otherwise significant potential to improve clinical quality.

The level of clinician support in relation to each potential clinical domain was qualitatively assessed by two senior Commission staff independently, with differences resolved by agreement, in accordance with the scoring system set out in Table 10.

Table 10: Scoring for clinical support

Level of clinical support	Score
Established national clinical quality registry leadership group across the potential clinical domain or national clinical quality registry	1
Existing state clinical registry/audit or existing national clinical registry/audit with limited participation and/or without the characteristics of a clinical quality registry	0.75
Clinician advocacy for a registry in the potential clinical domain, registry under development, leadership group in limited jurisdictions or an existing audit or limited existing registry	0.5
Limited stakeholder engagement in development of clinical quality registries	0.25
No known existing registry resources or no known explicit clinician support for a clinical quality registry	0

Table 11: Clinical support for short-listed domains

Clinical domain	Evidence of clinical support	Current clinical quality registries	Score
Ischaemic heart disease	Established leadership group (ACOR)	<ul style="list-style-type: none"> ■ ACOR – Cardiac Devices Registry ■ Cardiac Procedures Registry ■ National Cardiac Surgery Database 	1

Final list of priority clinical domains

The results of the prioritisation process are consolidated in Table 12. The scope of some prioritised clinical domains is readily identifiable by virtue of the location in which care is provided (e.g. critical care) others, such as maternity, have a potentially broad scope and will need further specification. Definition of specific inclusion/exclusion criteria for some of the prioritised clinical domains will require further detailed consultation with relevant clinical groups and may change over time. Due to the methodological challenges described in this report, the identified clinical domains and their relative priority for development should be regarded as indicative only.

Development of clinical registries in all the clinical domains listed in Table 13 could generate significant benefit for the relevant patient group. Some domains may benefit from multiple registries. However as these registries develop it is important that information and improvements are shared within the domain.

The priority and scope of the registries within each domain should be determined through further consultation with the relevant clinical groups. In some cases specific sub-populations, such as dementia patients receiving care in memory clinics or specific procedures, may be prioritised for development under these domains due to limitations in ability to collect data on the entire patient cohort. As capacity to collect data and coordination of care improves, registries may be expanded to other aspects of care where improvements can be made.

It would be appropriate to conduct a targeted expression of interest process to assess potential registries under these domains. This would allow for a more fulsome and contemporary assessment against each of the prioritisation criteria as well as the *Operating principles for clinical quality registries* endorsed by Health Ministers in November 2010 described in the *Framework for Australian clinical quality registries*.

The prevalence of poor outcomes associated with specific procedures such as use of mesh in gynaecological surgery and AMD treated with new anti-vascular endothelial growth factor drugs are of significant concern. These have not been considered in the prioritisation of clinical domains as they were considered post-market surveillance. Assessment of the suitability and priority of registries such as these should be considered separately to this work and as specific issues associated with care are identified.

The domains identified in this report provide a focus for registry development in the future based on the burden to the health system and potential for harm to patients. There may be other specific areas where a registry could provide significant improvement in care and cost savings. For example, *The First Australian Atlas of Healthcare Variation** identifies conditions in which there is variation in service provision that may correlate with poor quality care. While the atlas does not identify variation in safety or effectiveness and focuses on a limited number of healthcare interventions, further investigation of the cause of variation may identify areas where registries are an appropriate mechanism for quality improvement. Variation in care and potential for patient harm may also be identified through other mechanisms and should be considered individually and as required.

The domains identified represent the current priorities for registry development. As the registry landscape in Australia develops, data availability improves, and clinical practice changes, there is potential for priority domains to be expanded and for these priorities to change.

* Australian Commission on Safety and Quality in Health Care and National Health Performance Authority. [The First Australian Atlas of Healthcare Variation](#). Sydney: ACSQHC, 2015.

Attachments

Attachment 1: Elements of the *Framework for Australian clinical quality registries*

The *Framework for Australian clinical quality registries* comprises five key elements, summarised in points 1 to 5 below:

1. Strategic principles

Strategic principles for clinical quality registries were endorsed by Health Ministers in 2010. The Strategic principles provide a national approach to development of clinical quality registries, and are detailed in Section 2 of the *Framework for Australian clinical quality registries*.

2. National health information arrangements

National health information arrangements for best practice governance and custodianship of clinical quality registry data were developed by a working group of the NHIPPC. Those arrangements were endorsed by NHIPPC (15 November 2012) and by the Commission Board (29 November 2012). The elements of National health information arrangements are detailed in Section 3 of the *Framework for Australian clinical quality registries* and summarised below.

National health information arrangements for clinical quality registries:

- Specify data custodianship requirements that are incumbent on organisations and staff participating in activity under national arrangements
- Recognise existing health information arrangements incorporated in existing legislation, regulation and policies
- Will be documented for specific domains in schedules in the National Health Information Agreement.

National health information arrangements for clinical quality registries provide assurance to all participating stakeholders, including jurisdictions, health services, private hospital groups, clinicians and patients, that requirements regarding registry data custodianship, security and reporting are specified in official arrangements.

3. National infrastructure model

The literature suggests significant cost avoidance associated with improved patient outcomes where clinical quality registries operate and report under national arrangements. Efficiencies are realised by developing a single national clinical quality registry per clinical domain, rather than separate databases in multiple hospitals and jurisdictions.

The Commission has developed a national infrastructure model for the efficient design, build, development, operation and security of clinical quality registries under national arrangements. The infrastructure model was developed in collaboration with jurisdictions, the NEHTA and registry experts. The national model features a small number of expert registry centres (or clusters), with each centre operating multiple clinical quality registries in partnership with jurisdictions, healthcare providers, funders and peak clinical organisations. Interoperability with existing clinical information systems is optimised through the model, providing efficiencies in data collection. Security of data is assured through the application of robust access and reporting controls. Further detail on the elements and benefits of the national infrastructure model is provided in Section 4 of the *Framework for Australian clinical quality registries*.

4. Principles, guidelines and standards

The Commission and registry experts have developed principles, guidelines and standards for best-practice design, build, development, operation and security of clinical quality registries.

The *Operating principles for clinical quality registries* (*Framework for Australian clinical quality registries*, Section 5.1), endorsed by Health Ministers in November 2010, specify best clinical quality registry practice.

Technical guidelines and standards (*Framework for Australian clinical quality registries*, Section 5.2) have been prepared to inform standardised development of national registry infrastructure, and promote best practice registry design, development, operation and security. They include a requirements specification, infrastructure and technical standards, a logical architecture and design and a security compliance guideline.

The security compliance guideline is based on the National eHealth Security and Access framework. It provides clear guidance to those operating clinical quality registries, and can be used to assure stakeholders that registry data is managed securely.

5. Prioritisation criteria

The Commission has developed prioritisation criteria for clinical quality registries (*Framework for Australian clinical quality registries*, Section 6). The prioritisation criteria support the strategic principles for a national approach to the development of clinical quality registries.

Prioritisation criteria are grouped according to two principal considerations for prioritisation; clinical need and the feasibility of establishing the clinical quality registry for a given domain.*

Attachment 2: Summary of stakeholder survey respondents and invitees

Organisations that responded to the stakeholder survey

- Australian Capital Territory Health
- Australian Professional Society on Alcohol and other Drugs
- Australasian College of Dermatology
- Australasian Sleep Association
- Australian and New Zealand Bone and Mineral Society
- Australian and New Zealand Burns Association
- Australian Association for Adolescent Health
- Australian College of Nursing
- Australian Society of Plastic Surgeons
- Breast Surgeons of Australia and New Zealand
- Colorectal Surgical Society of Australia and New Zealand
- Consumer (not specified)
- Department of Health and Human Services Tasmania
- Endocrine Society of Australia
- Epworth Health Care
- Monash University
- Neurosurgical Society of Australasia
- New South Wales Agency for Clinical Innovation
- Northern Territory Health
- Queensland Department of Health
- Queensland Medical Laboratory
- Royal Australian and New Zealand College of Obstetrics and Gynaecology
- Royal Australasian College of Surgeons
- Royal Australian and New Zealand College of Psychiatrists
- Royal College of Pathologists of Australasia
- South Australia Health
- South Australian Prostate Cancer Clinical Outcome Collaborative
- Sonic Healthcare
- South Australian Health and Medical Research Institute
- The Australian Society of Otolaryngology Head and Neck Surgery
- University of South Australia
- Western Australian Department of Health.

Organisations that were invited to participate

Consumer organisations

- Consumer Health Forum of Australia
- Chronic Illness Alliance
- Australian Institute for Patient and Family Centred Care.

Professional organisations

- Australasian College for Emergency Medicine
- Australasian College of Rural and Remote Medicine
- Australasian College of Dermatologists
- Australasian Professional Society on Alcohol and Other Drugs
- Australasian Sleep Association
- Australian Society of Cataract and Refractive Surgeons
- Australasian Society for Infectious Diseases
- Australasian Trauma Society
- Australian and New Zealand Association of Neurologists
- Australian and New Zealand Association of Paediatric Surgeons
- Australian and New Zealand Bone and Mineral Society
- Australian and New Zealand Burns Association
- Australian and New Zealand Child Neurology Society
- Australian and New Zealand College of Anaesthetists
- Australian and New Zealand Society for Geriatric Medicine
- Australian and New Zealand Society for Vascular Surgery
- Australian and New Zealand Society of Cardiac and Thoracic Surgeons
- Australian and New Zealand Society of Nephrology
- Australian College of Midwives
- Australian College of Nursing
- Australian Diabetes Society
- Australian Orthopaedic Association
- Australian Paediatric Orthopaedic Society
- Australian Paediatric Society
- Australian Private Hospitals Association
- Australian Rheumatology Association

- Australasian Society of Clinical Immunology and Allergy
- Australian Society of Orthopaedic Surgeons
- Australian Society of Otolaryngology Head and Neck Surgery
- Australian Society of Plastic Surgeons
- Breast Surgeons of Australia and New Zealand
- Cancer Council Australia
- Cardiac Society of Australia and New Zealand
- College for Intensive Care Medicine of Australia and New Zealand
- Colorectal Surgical Society of Australia and New Zealand
- Cosmetic Physicians College of Australasia
- Endocrine Society of Australia
- Gastroenterological Society of Australia
- Haematology Society of Australia and New Zealand
- Human Genetics Society of Australasia
- Internal Medicine Society of Australia and New Zealand
- Medical Oncology Group of Australia
- Neurosurgical Society of Australia and New Zealand
- Obesity Surgery Society of Australia and New Zealand
- Royal Australasian College of Dental Surgeons
- Royal Australasian College of Medical Administrators
- Royal Australasian College of Physicians
- Royal Australasian College of Surgeons
- Royal Australian and New Zealand College of Obstetricians and Gynaecologists
- Royal Australian and New Zealand College of Ophthalmologists
- Royal Australian and New Zealand College of Psychiatrists
- Royal Australian and New Zealand College of Radiologists
- Royal Australian College of General Practitioners
- Royal College of Pathologists of Australasia
- Spine Society of Australia
- Stroke Society of Australasia
- The Australian Association for Adolescent Health
- The Urological Society of Australia and New Zealand
- Thoracic Society of Australia and New Zealand
- Transplantation Society of Australia and New Zealand
- Clinical Oncological Society of Australia.

Jurisdictions

- All Australian State and Territory Departments of Health
- Australian Government Department of Health and Ageing.

Attachment 3: Analysis of potential conditions, diseases and interventions identified through short-listing

Table A3.1: Rationale for inclusion in short-list

Description	Short-listed by	Whether included or not and rationale
Critical care (excluding neonatal)	Cost	Included, considered under adult critical care
Knee replacement, revision	Cost	Included, considered under musculoskeletal disorders
Hip replacement, revision	Cost	Included, considered under musculoskeletal disorders
Vaginal delivery	Cost	Included, considered under maternity
Caesarean delivery	Cost	Included, considered under maternity
Spinal fusion	Cost	Included, considered under musculoskeletal disorders
Haemodialysis	Cost	Included, considered under renal disease
Respiratory infection / inflammatory	Cost	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 1.2 / 1.3 DRG is heterogeneous for casemix, whereas guidelines are disease specific and variation from the sequence of care is difficult to address ■ Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unlikely to be met as diverse and dispersed group of treating clinicians and organisations ■ While respiratory infection/inflammation is a common complaint and contributes to the cost of the health system it is not well suited to clinical quality registry development. Patients are treated by large numbers of general practitioners, general physicians, respiratory physicians and geriatricians in community and hospital settings. Collection of the entire population would not be possible and there is no readily identifiable sequence of care covering all conditions. ■ An Australian Bronchiectasis Registry* has been developed however this is a research registry rather than a clinical quality registry. The main aims of this registry are to identify and collect health information from patients with non-Cystic Fibrosis (non-CF) Bronchiectasis for doctors to research the causes and to improve treatments.
Schizophrenia disorder	Cost	Included, considered under mental health

* lungfoundation.com.au/health-professionals/bronchiectasis-registry.

Description	Short-listed by	Whether included or not and rationale
Gastroscopy	Cost	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unlikely to be met as diverse and dispersed group of treating clinicians and organisations. Gastrosopies are performed by general practitioners, general physicians, gastroenterologists and surgeons. These disperse professional links would limit the ability to collect data from the entire population. There is also no coherent professional group to feed outcomes from the registry back to in order to improve care. Other methods of quality improvement may be more appropriate such as audit. The Australia and New Zealand Gastro Oesophageal Surgery Association Audit collects clinical and pathological data of patients undergoing resection for upper gastrointestinal cancer and gastrointestinal stromal tumour.
Major small and large bowel procedure	Cost	Included, considered under high burden cancers
Circulatory disorder +/- acute myocardial infarction (with invasive procedure)	Cost	Included, considered under ischaemic heart disease
Pacemaker related	Cost	Included, considered under ischaemic heart disease
Chemotherapy	Cost	Included, considered under high burden cancers
Critical care costs only for neonatal admits	Cost	Included, considered under neonatal critical care
Major affective disorder	Cost	Included, considered under mental health
Cardiac valve procedure	Cost	Included, considered under ischaemic heart disease

Description	Short-listed by	Whether included or not and rationale
COAD (COPD)	<ul style="list-style-type: none"> ■ Cost ■ Burden of disease 	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unlikely to be met as diverse and dispersed group of treating clinicians and organisations. ■ While COAD/COPD is a common complaint it is not well suited to registry development. Patients are treated by large numbers of general practitioners, general physicians, respiratory physicians and geriatricians in community and hospital settings. These disperse professional links, along with the long disease trajectory, limit the ability to collect data from the entire population and use a registry to make improvements in care. There is currently no coherent professional group to feed outcomes from the registry back to in order to improve care. ■ No registry found.
AICD related	Cost	Included, considered under ischaemic heart disease
Other hip and femur procedures	Cost	Included, considered under musculoskeletal disorders
TIA, stroke	Cost	Included, considered under stroke
Coronary bypass	Cost	Included, considered under ischaemic heart disease
Heart failure	Cost	Included, considered under ischaemic heart disease
Cranial procedures	Cost	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 1.2 / 1.3. DRG is heterogeneous for casemix, whereas guidelines are disease specific. No Australian guideline. ■ The DRG is too diverse to meaningfully be grouped under a single domain. It covers procedures for trauma, malignancy, bleeding, hydrocephalus and other intra-cranial abnormalities. There is no evidence-based sequence of care to cover these diverse conditions, and therefore meaningful performance indicators cannot be developed. ■ Some cranial procedures would be considered under cancer and trauma domains.
Hernia procedures	Cost	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 1.2 / 1.3. DRG is heterogeneous for casemix. No Australian guideline. ■ The DRG is too diverse to be meaningful in a clinical quality registry context. There is no evidence-based sequence of care to cover these diverse conditions, and therefore meaningful performance indicators cannot be developed. ■ International registries on hernia focus on specific types of hernia, for example the Swedish Hernia Register is a clinical quality registry that contains data on all groin hernia repairs performed in patients aged 15 years or older.*

* [Swedish Hernia Register](#).

Description	Short-listed by	Whether included or not and rationale
Humerus, other lower limb procedures	Cost	Included, considered under musculoskeletal disorders
Laparoscopic cholecystectomy	Cost	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 1.2 / 1.3. Changing sequence of care. Unwarranted variation from the sequence of care not evident. ■ Laparoscopic cholecystectomy is a common procedure for treatment of pancreatitis and gallstones. There is no evidence of variation from the sequence of care for this procedure. There are changing sequences of care for the treatment of gallstones and pancreatitis including the increased use of this procedure. ■ Sweden has a National Quality Registry for Gallstone Surgery and Endoscopic Retrograde Cholangiopancreatography* and further development of registries in this area could be considered in the future.
Unstable angina, chest pain	Cost	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unlikely to be met as diverse and dispersed group of treating clinicians and organisations. ■ Unstable angina is a common complaint. Patients are treated by large numbers of general practitioners, general physicians, geriatricians and cardiologists in community and hospital settings. These disperse professional links would limit the ability to collect data from the entire population. There is also no coherent professional group to feed outcomes from the registry back to in order to improve care. This condition may be included in ischaemic heart disease in the future. ■ No registry found.
Lymphoma, acute and non-acute leukaemia	Cost	Included, considered under high burden cancers
Cellulitis	Cost	<ul style="list-style-type: none"> ■ Not considered further, threshold criteria not met: ■ Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unlikely to be met as diverse and dispersed group of treating clinicians and organisations. ■ Cellulitis is a common complaint. Patients are treated by large numbers of general practitioners, general physicians, general surgeons, geriatricians and infectious diseases specialists in community and hospital settings. These disperse professional links would limit the ability to collect data from the entire population. There is also no coherent professional group to feed outcomes from the registry back to in order to improve care. ■ No registry found.

* [National Quality Registry for Gallstone Surgery and Endoscopic Retrograde Cholangiopancreatography.](#)

Description	Short-listed by	Whether included or not and rationale
Other digestive system disorders	Cost	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 1.2 / 1.3 / 2.1.1 / 2.4.1 / 2.4.2. DRG is heterogeneous for casemix, whereas guidelines are disease specific. No Australian guideline. Information requirements unlikely to be met as diverse and dispersed group of treating clinicians and organisations. ■ The DRG is too diverse to be meaningful in a clinical quality registry context. Patients are treated by large numbers of general practitioners, gastroenterologists, general physicians and surgeons in community and hospital settings. There is no evidence-based sequence of care to cover these diverse conditions, and therefore meaningful performance indicators cannot be developed.
Kidney and urinary tract infection	Cost	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unlikely to be met as diverse and dispersed group of treating clinicians and organisations. ■ Kidney and urinary tract infection is a common complaint. Patients are treated by large numbers of general practitioners, general physicians, geriatricians, renal physicians and infectious diseases specialists in community and hospital settings. These disperse professional links would limit the ability to collect data from the entire population. There is also no coherent professional group to feed outcomes from the registry back to in order to improve care. ■ No registry found.
Colonoscopy	Cost	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unlikely to be met as diverse and dispersed group of treating clinicians and organisations. ■ Colonoscopies are performed by general practitioners, general physicians, gastroenterologists, general surgeons and colorectal surgeons. These disperse professional links would limit the ability to collect data from the entire population. There is also no coherent professional group to feed outcomes from the registry back to in order to improve care. Quality, including appropriateness, of colonoscopy is being addressed through other projects. ■ The appropriate and safe use of colonoscopies would be considered under disease specific registries such as bowel cancer.
Breast condition procedure, reconstruction, breast malignancy	Cost	Included, considered under high burden cancers
Lens procedures	Cost	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criterion 1.3. Unwarranted variation from the sequence of care not evident. ■ Lens procedures are common procedures with a high cost to the health system. There is no evidence of variation from the sequence of care for this procedure or harm to patients. Where new procedures are developed there may be a need to undertake post-market surveillance.

Description	Short-listed by	Whether included or not and rationale
Rectal resection	Cost	Included, considered under colorectal cancer
Appendicectomy	Cost	Not considered further, threshold criteria not met: <ul style="list-style-type: none"> ■ Criterion 1.2. Changing sequence of care ■ Recent changes in the treatment of appendicitis, such as the use of antibiotics prior to invasive interventions, have led to a changing sequence of care.
Major vascular procedure	Cost	Not considered further, threshold criteria not met: <ul style="list-style-type: none"> ■ While treatment of peripheral vascular disease has a high cost to the health system it is an outcome of multiple disease processes, including smoking and diabetes. The casemix of patients vary and a large proportion is likely to have a number of comorbidities making development of indicators and risk adjustment difficult. A sub-population of patients who receive major vascular procedures may be considered under registries within the diabetes domain.
Other joint replacement	Cost	Included, considered under musculoskeletal disorders
Prostate cancer – major male pelvic procedure, surgical only	Cost	Included, considered under high burden cancers
Multiple or significant trauma	Cost	Included, considered under major trauma
Respiratory cancer – medical only	Cost	Included, considered under high burden cancers
Major burns	Cost	Included, considered under major burns
Nervous system malignancy – medical only	Cost	Included, considered under high burden cancers and hydrocephalus
Coronary heart disease	Burden of disease	Included, considered under ischaemic heart disease
Other musculoskeletal	Burden of disease	Included, considered under musculoskeletal disorders
Back pain and problems	Burden of disease	Included, considered under musculoskeletal disorders
COPD	Burden of disease	Included, considered above
Lung cancer	Burden of disease	Included, considered under high burden cancers
Dementia	Burden of disease	Included, considered under dementia

Description	Short-listed by	Whether included or not and rationale
Anxiety disorders	Burden of disease	Included, considered under mental health
Stroke	Burden of disease	Included, considered under stroke
Depressive disorders	Burden of disease	Included, considered under mental health
Suicide and self-inflicted injuries	Burden of disease	Not considered further, threshold criteria not met: <ul style="list-style-type: none"> Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unable to be met as diverse and dispersed group of treating clinicians and organisations. Patients are treated by large numbers of general practitioners, psychiatrists, psychologists and emergency physicians in community and hospital settings. These disperse professional links would limit the ability to collect data from the entire population. There is also no coherent professional group to feed outcomes from the registry back to in order to improve care. Additionally suicide cases are subject to Coronial inquiry and a registry may be difficult to operate effectively in that context. Aspects of suicide as self-harm would be considered in registries for major psychiatric disorders.
Asthma	Burden of disease	Not considered further, threshold criteria not met: <ul style="list-style-type: none"> Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unlikely to be met as diverse and dispersed group of treating clinicians and organisations. Asthma is a common complaint. Patients are treated by large numbers of general practitioners, general physicians and respiratory physicians in community and hospital settings. These disperse professional links would limit the ability to collect data from the entire population. There is also no coherent professional group to feed outcomes from the registry back to in order to improve care. No registry found.
Diabetes	Burden of disease	Included, considered under diabetes
Bowel cancer	Burden of disease	Included, considered under high burden cancers
Osteoarthritis and Rheumatoid arthritis	Burden of disease	Included, considered under musculoskeletal disorders
Upper respiratory conditions	Burden of disease	Not considered further, threshold criteria not met: <ul style="list-style-type: none"> Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unlikely to be met as diverse and dispersed group of treating clinicians and organisations. Upper respiratory conditions are common complaints. Patients are treated by large numbers of general practitioners, general physicians and respiratory physicians in community and hospital settings. These disperse professional links would limit the ability to collect data from the entire population. There is also no coherent professional group to feed outcomes from the registry back to in order to improve care.

Description	Short-listed by	Whether included or not and rationale
Breast cancer	Burden of disease	Included, considered under high burden cancers
Hearing loss	Burden of disease	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unable to be met as diverse and dispersed group of treating clinicians and organisations. ■ Hearing loss is a common complaint. Patients are treated by large numbers of health professionals including audiologists and ear, nose and throat surgeons, mainly in community settings. These disperse professional links would limit the ability to collect data from the entire population. There is also no coherent professional group to feed outcomes from the registry back to in order to improve care. ■ No registry found.
Alcohol use disorders	Burden of disease	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criterion 1.2. Sequence of care is variable ■ Criteria 2.1.1 / 2.4.1 / 2.4.2 / 2.3. Relevant clinical population unable to be captured and governance and information requirements unlikely to be met as diverse and dispersed group of treating clinicians and organisations. ■ Alcohol use disorder is a common complaint and has a major impact on burden of disease in Australia; however, it is not well suited to clinical quality registry data collection. Patients are treated by large numbers of general practitioners, general physicians, drug and alcohol physicians, counsellors and allied health professionals in community and hospital settings. These disperse professional links would limit the ability to collect data from the entire population. There is also no coherent professional group to feed outcomes from the registry back to in order to improve care. While there are guidelines for the treatment of alcohol problems, within these, there are multiple options for treatment and patient choice has a large impact on the sequence of care. This variation in the sequence of care limits the ability for a registry to collect longitudinal data and generate risk-adjusted reports on the appropriateness and effectiveness of care. ■ No registry found.
Falls	Burden of disease	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 2.1.1 / 2.1.2 / 2.4.1 / 2.4.2. The clinical condition or event is unable to be systematically recognised. Relevant clinical population unable to be captured and information requirements unlikely to be met as diverse and dispersed group of treating clinicians and organisations. ■ Falls occur commonly in hospital and community settings in the older patient cohort. The causes and harms from falls are diverse and treatment varies. Patients who are harmed by falls are treated by large numbers of general practitioners, general physicians, geriatricians, general surgeons, orthopaedic surgeons and other healthcare professionals. The harm from falls, such as hip fracture, would be considered under major orthopaedic procedures and some patients who received harm from falls would be considered under a trauma registry. Some falls would be considered under the trauma domain. ■ No registry found specifically for falls.

Description	Short-listed by	Whether included or not and rationale
Pancreatectomy/oesophagectomy	<ul style="list-style-type: none"> ■ Stakeholder priority 1 ■ Stakeholder priority 2 ■ Stakeholder priority 3 	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criterion 2.4.3. Clinically meaningful performance indicators cannot be defined. ■ The rationale for this proposed clinical quality registry is that of high complexity surgery being undertaken at low volumes in health services settings where there is insufficient procedural volume to achieve quality. It is a well-documented problem that is amenable to a public policy approach to improve service concentration, rather than an effort to demonstrate poor quality through a clinical quality registry. Some of these procedures would be considered under high burden cancers.
Ischaemic heart disease	Stakeholder priority 1	Included, considered under ischaemic heart disease
Mesh in gynaecological surgery	Stakeholder priority 1	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 1.2 / 1.3. Sequence of care not clearly defined. ■ While use of mesh in gynaecological surgery has been raised as a concern, it may be more suitable for a post-market surveillance or epidemiological registry with a goal of determining the risks and benefits of the intervention.
Colorectal cancer	Stakeholder priority 1	Included, considered under high burden cancer
Major burns	Stakeholder priority 1	Included, considered under major burns
Cancer	Stakeholder priority 1	Included, considered under high burden cancers
Cancer surgery	Stakeholder priority 1	Included, considered under high burden cancers
Surgical mortality	Stakeholder priority 1	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criterion 2.4.1. Does not include an entire population with a chronic condition or disease or who have undergone a common acute event (intervention). ■ The Australian Audit of Surgical Mortality is an audit rather than a registry. It is understood to be highly effective, however it does not meet the requirements of a clinical quality registry as it offers one-off case review and improvement opportunities rather than continuous benchmarking of performance in relation to care in a specific setting or for a specific clinical condition. Some specific surgical procedures and diagnoses have been assessed individually.

Description	Short-listed by	Whether included or not and rationale
Obstructive sleep apnoea	Stakeholder priority 1	Not considered further, threshold criteria not met: <ul style="list-style-type: none"> Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unable to be met as diverse and dispersed group of treating clinicians and organisations. Obstructive sleep apnoea is a common complaint. Patients are treated by large numbers of general practitioners, general physicians, geriatricians and respiratory physicians in community and hospital settings. The professional or organisational links that would enable a functional clinical quality registry (particularly for registry outcomes to be acted on) are not evident. No registry found.
Dementia	Stakeholder priority 1	Included, considered under dementia
Spinal surgery outcomes	<ul style="list-style-type: none"> Stakeholder priority 1 Stakeholder priority 2 	Included, considered under musculoskeletal disorders
Fractures	Stakeholder priority 1	Not considered further, threshold criteria not met: <ul style="list-style-type: none"> Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unable to be met as diverse and dispersed group of treating clinicians and organisations. This proposed clinical domain is too diverse to be meaningful in a clinical quality registry context. It includes a number of different sequences of care. Patients are cared for by a range of general practitioners, general surgeons, emergency physicians and orthopaedic surgeons. The professional or organisational links that would enable a functional clinical quality registry (particularly for registry outcomes to be acted on) are not evident. Some fractures would be considered under musculoskeletal disorders.
Diabetes	Stakeholder priority 1	Included, considered under diabetes
Transition care	Stakeholder priority 1	Not considered further, threshold criteria not met: <ul style="list-style-type: none"> Criteria 2.1.1 / 2.1.2 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unable to be met as the clinical condition or event is not always recognisable and there is a diverse and dispersed group of treating clinicians and organisations. Transition of adolescents with chronic health conditions from paediatric to adult hospitals is a common requirement that, reportedly, is often not done well. Barriers include lack of protocols and lack of resources. There are large numbers of receiving hospitals and clinicians of different disciplines and specialties engaged in the transition process. The event is poorly defined and may not be uniformly recognisable.
Breast Cancer Surgery	Stakeholder priority 1	Included, considered under high burden cancers
Breast Implants	Stakeholder priority 1	Included, considered under high burden cancers

Description	Short-listed by	Whether included or not and rationale
Breast surgery	Stakeholder priority 2	Included, considered under high burden cancers
Disease-specific cancer registries	Stakeholder priority 1	Included, considered under high burden cancers
Indigenous ear disease	Stakeholder priority 1	Not considered further, threshold criteria not met: <ul style="list-style-type: none"> Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unable to be met as diverse and dispersed group of treating clinicians and organisations. Indigenous ear disease is a common complaint. Patients are treated by large numbers of general practitioners, paediatricians, public health specialists and other clinicians, mainly in community settings. These disperse professional links would limit the ability to collect data from the entire population. There is also no coherent professional group to feed outcomes from the registry back to in order to improve care. No registry found.
Mental Health – psychosis and schizophrenia, major affective disorders	Stakeholder priority 1	Included, considered under mental health
CSF shunt	Stakeholder priority 1	Not considered further, threshold criteria not met: <ul style="list-style-type: none"> Criteria 2.1.1 / 2.1.2 / 2.2 / 2.4.1. The information requirements required are difficult to establish. CSF shunts are used to treat a number of different conditions in a variety of clinical populations including trauma, malignancy, bleeding, hydrocephalus and other intra-cranial abnormalities. The casemix of patients vary and a large proportion is likely to have a number of comorbidities making development or indicators and risk adjustment difficult. Use of shunts may be considered under registries within the high burden cancer domain.
Dialysis, transplantation, organ donation	Stakeholder priority 2	Included, considered under renal disease
Maternity	Stakeholder priority 2	Included, considered under maternity
Non-invasive ventilation	<ul style="list-style-type: none"> Stakeholder priority 2 Stakeholder priority 3 	Not considered further, threshold criteria not met: <ul style="list-style-type: none"> Criteria 2.1.1 / 2.4.1 / 2.4.2. Relevant clinical population unable to be captured and information requirements unable to be met as diverse and dispersed group of treating clinicians and organisations. Patients are treated by large numbers of general practitioners, general physicians, geriatricians and respiratory physicians in community and hospital settings. These disperse professional links would limit the ability to collect data from the entire population. There is also no coherent professional group to feed outcomes from the registry back to in order to improve care. No registry found.

Description	Short-listed by	Whether included or not and rationale
Surgery for joint pain (knee, shoulder, back)	Stakeholder priority 2	Included, considered under musculoskeletal disorders
Stroke	Stakeholder priority 2	Included, considered under stroke
Insomnia	<ul style="list-style-type: none"> ■ Stakeholder priority 2 ■ Stakeholder priority 3 	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 2.1.1 / 2.4.1 / 2.4.2 Relevant clinical population unable to be captured and information requirements unable to be met as diverse and dispersed group of treating clinicians and organisations. ■ Insomnia is a common complaint. Patients are treated by large numbers of general practitioners, general physicians, respiratory physicians and other sleep specialists, mainly in community settings. These disperse professional links would limit the ability to collect data from the entire population. There is also no coherent professional group to feed outcomes from the registry back to in order to improve care. ■ No registry found.
Osteoporotic hip fractures	Stakeholder priority 2	Included, considered under musculoskeletal disorders
Immunisation coverage	Stakeholder priority 2	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 1.1 / 1.2 / 1.3 / 1.4. Clinical relevance is not established. ■ Immunisation is a simple procedure and there are few risks associated with a routine service. The purpose of a registry would not be to monitor and improve coverage, rather than the quality of the service per se. While that is an important public health goal, an immunisation registry is an epidemiological, rather than a clinical quality registry.
High cost interventional/ surgical procedures/ devices	Stakeholder priority 2	Included, considered under ischaemic heart disease
Rhinology, otology, head and neck surgery, specifically outcomes for tonsil, grommet and nasal septum surgery	<ul style="list-style-type: none"> ■ Stakeholder priority 2 ■ Stakeholder priority 3 	<p>Not considered further, threshold criteria not met:</p> <ul style="list-style-type: none"> ■ Criteria 2.1.1 / 2.4.1 / 2.4.2. The proposed clinical domain is too broad to be meaningful. ■ This proposed clinical domain is too diverse to be meaningful in a clinical quality registry context. It includes a number of different sequences of care. ■ No registry found.
Cancer treatment	Stakeholder priority 3	Included, considered under high burden cancers
Joint replacement	Stakeholder priority 3	Included, considered under musculoskeletal disorders
Renal	Stakeholder priority 3	Included, considered under renal disease

Description	Short-listed by	Whether included or not and rationale
Antibiotic resistant bacterial infections	Stakeholder priority 3	Included, considered above
Depression	Stakeholder priority 3	Included, considered under mental health
Pregnancy outcomes	Stakeholder priority 3	Included, considered under maternity
Critical care	Stakeholder priority 3	Included, considered under adult critical care

A clinical domain of 'AMD treated with new anti-vascular endothelial growth factor drugs' was also proposed during consultation for this project but is not included in the short-list as it did not emerge from the stakeholder survey.

The population cost (reportedly \$12 billion per year in Australia), the prevalence of AMD-related blindness (up to 40,000 new cases each year in Australia) and the availability of new, effective drugs were proposed as the rationale for an AMD clinical quality registry.

A clinical registry has already been established for AMD, the purpose of which is to:

- Track the risks and benefits of the new treatments for macular disease in the general population in Australia to determine how to use these treatments as safely and cost-effectively as possible
- Determine the most appropriate method of treatment for macular disease.

The proposed clinical domain of AMD has been excluded from further consideration because there is no evidence-based, well executed sequence of care that improves patient outcomes for the particular condition (Criterion 1.2). In fact, development of evidence-based clinical management guidelines is one of the anticipated outcomes of the registry. The registry is clearly a valuable and important endeavour, but it does not meet the development criteria for a clinical quality registry. Its purpose appears to be research and/or post-market drug surveillance.

Attachment 4: Analysis of evidence-based sequences of care and/or existing registries

Table A4.1: Evidence analysis

Diagnoses related group	Description	Guidelines and registries
A06AB	Tracheostomy with ventilation >95 hours with / without catastrophic complications	<ul style="list-style-type: none"> ■ DRG is intervention based, not diagnosis based, so very heterogeneous casemix ■ Guideline: Not specific to DRG ■ Australia has the ANZICS CORE registries (adult patient database, paediatric intensive care registry, critical care resources registry and Central Line Associated Blood Stream Infection registry). Note: Not all sites that ventilate patients contribute to the registries.
I04AB, I32ABC	Knee replacement, revision	<ul style="list-style-type: none"> ■ Guideline: Systematic review – Mak, J. C. S., Fransen, M., Jennings, M., March, L., Mittal, R. and Harris, I. A. (2014), Evidence-based review for patients undergoing elective hip and knee replacement. ANZ Journal of Surgery, 84: 17–24. ■ Registry: Australian Orthopaedic Association. National Joint Replacement Registry collects comprehensive data for all knee replacements.
I03AB, I31AB	Hip replacement, revision	<ul style="list-style-type: none"> ■ Guideline: Systematic review – Mak, J. C. S., Fransen, M., Jennings, M., March, L., Mittal, R. and Harris, I. A. (2014), Evidence-based review for patients undergoing elective hip and knee replacement. ANZ Journal of Surgery, 84: 17–24. ■ Registry: Australian Orthopaedic Association. National Joint Replacement Registry collects comprehensive data for all hip replacements.
O60ABC	Vaginal delivery	<ul style="list-style-type: none"> ■ Guideline: State Health Department guidelines for example – NSW Health. (2010). PD2010_045, Maternity-Towards Normal Birth in NSW. ■ No Australian registry, however, national maternal data collection for all pregnancies through National Perinatal Data Collection.
O01ABC	Caesarean delivery	<ul style="list-style-type: none"> ■ Guideline: State Health Department guidelines, for example, NSW Health. (2014). Supporting women in the first birth after caesarean section. NICE (2011). Caesarean section, (CG132). ■ No Australian registry, however, national maternal data collection for all pregnancies through National Perinatal Data Collection.
I06Z, I09AB	Spinal fusion	<ul style="list-style-type: none"> ■ No Australian guideline: Systematic review of seventeen aspects of lumbar spinal fusion management. Groff MW et al. J Neurosurg Spine. 2014 Jul; 21(1):1–139. ■ Registry: Newly established as the Australian Spine Registry. Data does not appear to be available at this stage. ■ Multiple spine registries exist internationally, including in Sweden, Europe, Canada, US and the UK. The British Spine Registry was set up by the British Association of Spinal Surgeons to monitor the outcomes of spinal procedures, collecting data to better understand procedures, techniques and a patient’s experience and quality of life.

Diagnoses related group	Description	Guidelines and registries
L61Z	Haemodialysis	<ul style="list-style-type: none"> Guideline: Kidney Health Australia – CARI guidelines Registry: ANZDATA collects comprehensive data.
U61AB	Schizophrenia disorder	<ul style="list-style-type: none"> Guideline: No Australian guideline. NICE (2014) Psychosis and Schizophrenia in Adults – prevention and management (CG178). No Australian schizophrenia registry Internationally, the Management of Schizophrenia in Clinical Practice registry is a US disease-based schizophrenia registry. Other countries with schizophrenia registries include Malaysia, Latin America, the Netherlands, Denmark, Sweden.
G46ABC, G47ABC	Gastroscopy	<ul style="list-style-type: none"> No Australian or international guideline No Australian registry In the US, the GIQuIC has an endoscopic quality registry of upper gastrointestinal endoscopy and related quality measures. GIQuIC is a quality benchmarking registry co-sponsored by the American College of Gastroenterology and the American Society for Gastrointestinal Endoscopy, to provide reliable and relevant measures of endoscopic quality. The UK Radiofrequency Ablation (RFA) registry captures data on RFA for Barrett's oesophagus from participating centres. Also registries in Malaysia and Sweden.
G02AB	Major small and large bowel procedure	<ul style="list-style-type: none"> No Australian guideline Australian registries include the hereditary cancer registry, Australasian Colorectal Cancer Family Registry and Australasian Association of Cancer Registries Registries that collect data internationally include the Intestinal Transplant Registry and Short Bowel Syndrome Registry. Other countries have inflammatory bowel disease registries (US, UK).
F41AB, F42ABC	Circulatory disorder +/- acute myocardial infarction (with invasive procedure)	<ul style="list-style-type: none"> Guideline: 2016 ACS guidelines being developed. Also 2011 addendum to the National Heart Foundation of Australia/Cardiac Society of Australia and New Zealand guidelines for the management of acute coronary syndromes (ACS) 2006. ACOR is a cardiac procedures registry to document and measure outcomes for patients undergoing cardiovascular procedures in Australia and New Zealand with the aim of improving cardiovascular outcomes for patients. Data are collected on a range of procedures including, coronary artery bypass grafting and valve surgery, Percutaneous coronary intervention, implantable cardioverter defibrillator and cardiac resynchronisation therapy device insertion. Not all sites that perform these procedures contribute to the registry. Australia also has an Australian and New Zealand Society for Vascular Surgery Australasian Vascular Audit, Australian Genetic Heart Disease Registry and Australian Cardiac Procedures Registry The US, UK and Europe operate clinical quality registries in cardiovascular disease. Sweden has the most extensive group of registries internationally. In the cardiovascular domain they have the following registries: heart failure, coronary angiography and angioplasty, heart surgery, cardiac intensive care, out-of-hospital cardiac arrest, congenital heart disease, adult congenital heart disease, secondary prevention in cardiac intensive care, catheter ablation and atrial fibrillation and anticoagulation.

Diagnoses related group	Description	Guidelines and registries
F12AB, F17AB, F18AB	Pacemaker related	<ul style="list-style-type: none"> No Australian guideline. International guideline about device selection: Gillis AM, et al. HRS/ACCF expert consensus statement on pacemaker device and mode selection. Heart Rhythm. 2012 Aug;9(8):1344–65. ACOR is a cardiac procedures registry to document and measure outcomes for patients undergoing cardiovascular procedures in Australia and New Zealand with the aim of improving cardiovascular outcomes for patients. Data are collected on a range of procedures including implantable cardioverter defibrillator and cardiac resynchronisation therapy device insertion. Not all sites that perform these procedures contribute to the registry. The US, UK and Europe operate clinical quality registries that include pacemakers.
P01Z – P67ABCD	Critical care costs only for neonatal admits	<ul style="list-style-type: none"> No Australian guideline In Australia the national data collection for all births is maintained by the National Perinatal Statistics Unit in the National Perinatal Data Collection.
U63AB	Major affective disorder	<ul style="list-style-type: none"> Guideline: Australian Society for bipolar and depressive disorders. A consensus statement for safety monitoring guidelines of treatments for major depressive disorder 2011. Provides guidance about monitoring treatment effects not treatment itself. NICE (2014) Bipolar Disorder – Assessment and Management (CG 184). No Australian registry The Danish Psychiatric Disorders Registry is most comprehensive registry and is used as a basis for assessing effectiveness of different therapy options and monitoring patient outcomes. Also, there are psychiatric registries in some US States and in South-East Asia (Malaysia).
F03AB, F04AB	Cardiac valve procedure	<ul style="list-style-type: none"> No Australian guideline. International guideline: 2014 AHA/ACC guideline for the management of patients with valvular heart disease: a report of the American College of Cardiology/American Heart Association Task Force on Practice Guidelines. ACOR is a cardiac procedures registry to document and measure outcomes for patients undergoing cardiovascular procedures in Australia and New Zealand with the aim of improving cardiovascular outcomes for patients. Data are collected on a range of procedures including valve surgery. Not all sites that perform these procedures contribute to the registry. The US, UK and Europe operate clinical quality registries that include valvular procedures.
F01AB, F02Z	AICD related	<ul style="list-style-type: none"> No Australian guideline. NICE (2014) Implantable defibrillators and cardiac resynchronisation therapy for arrhythmias and heart failure (TAG314) is guidance about patient and device selection, not a clinical pathway. ACOR is a cardiac procedures registry to document and measure outcomes for patients undergoing cardiovascular procedures in Australia and New Zealand with the aim of improving cardiovascular outcomes for patients. Data are collected on a range of procedures including AICDs. Not all sites that perform these procedures contribute to the registry. The US, UK and Europe operate clinical quality registries that include AICDs.

Diagnoses related group	Description	Guidelines and registries
I08AB	Other hip and femur procedures	<ul style="list-style-type: none"> ■ ANZHFR Australian and New Zealand Guideline for Hip Fracture Care - Improving Outcomes in Hip Fracture Management of Adults (2014) ■ No comprehensive registries identified nationally or internationally for surgeries other than joint replacement (with the exception of spinal registries which collect surgical data on all spinal surgeries).
B69AB, B70ABCD	TIA, stroke	<ul style="list-style-type: none"> ■ The Australian Guideline: Stroke Foundation – Clinical guidelines. National Service Improvement Framework for Stroke 2010. ■ The Australian Stroke Clinical Registry is a collaborative national effort to monitor, promote and improve the quality of acute stroke management. The registry collects data from participating hospitals across Australia. ■ Multiple stroke registries exist internationally, including in the US, UK, multiple European sites, Malaysia and India.
F05AB, F06AB	Coronary bypass	<ul style="list-style-type: none"> ■ Guideline: 2016 ACS guidelines being developed. Also 2011 addendum to the National Heart Foundation of Australia/Cardiac Society of Australia and New Zealand guidelines for the management of acute coronary syndromes (ACS) 2006. ■ ACOR is a cardiac procedures registry to document and measure outcomes for patients undergoing cardiovascular procedures in Australia and New Zealand with the aim of improving cardiovascular outcomes for patients. Data are collected on coronary artery bypass grafting. Not all sites that perform these procedures contribute to the registry. ■ The US, UK and Europe operate clinical quality registries that capture coronary bypass data.
H08AB	Laparoscopic cholecystectomy	<ul style="list-style-type: none"> ■ No Australian guideline. International guideline: NICE (2014) Gallstone disease: diagnosis and initial management (CG 188). ■ No Australian registry ■ There is a Norwegian National Cholecystectomy Registry. Some jurisdictions in the US have cholecystectomy registries. There is a US National Laparoscopic Surgery Registry, which some laparoscopic surgeons enter data into.
R60AB, R61ABC	Lymphoma, acute and non-acute leukaemia	<ul style="list-style-type: none"> ■ Comprehensive national data collection through Australasian Association of Cancer Registries. Australia also has the Australian Bone Marrow Donor Registry and Australasian Bone Marrow Transplant Recipient Registry and Australasian Leukaemia and Lymphoma Group Registry and Tissue Bank. There is also a Tasmanian Lymphoma and Leukaemia Registry. ■ Lymphoma-specific registries internationally include the Swedish Lymphoma Registry, Danish Lymphoma Registry, American Burkitt Lymphoma Registry, German Central Cutaneous Lymphoma Registry and European Blood and Marrow Transplant Lymphoma Registry.

Diagnoses related group	Description	Guidelines and registries
G48ABC	Colonoscopy	<ul style="list-style-type: none"> ■ No Australian guideline. There are international guidelines with respect to surveillance colonoscopy and the use of colonoscopy in management of specific conditions. ■ Australia has a bowel cancer screening registry which collects colonoscopy-related data on the sub-group of patients who participate in the National Bowel Cancer Screening Program ■ The US GIQuIC collects data from physicians from hospitals, universities, ambulatory surgery centres and office-based endoscopy units nationwide on quality indicators for colonoscopy.
J06AB, J07AB, J14Z, J62AB	Breast condition procedure, reconstruction, breast malignancy	<ul style="list-style-type: none"> ■ No Australian guideline ■ The ABDR tracks quality and outcomes associated with breast device surgery in participating centres nationally. The Australian Society of Plastic Surgeons operated an Australian Breast Implant Registry which was superseded by the ABDR. ■ There are international and European breast implant registries. There is a Danish Registry for Plastic Surgery of the Breast and there are breast implant registries in the UK and other Scandinavian countries. The US also has a nipple-sparing mastectomy registry.
C16Z	Lens procedures	<ul style="list-style-type: none"> ■ No Australian guideline. International guideline: Cataract in the adult eye. 1996 Sep (revised 2011 Sep). NGC:008993 American Academy of Ophthalmology – Medical Specialty Society. ■ There is no Australia-wide lens registry. The Australian Corneal Graft Registry is an Australia-wide register of human corneal transplants. ■ The American Academy of Ophthalmology IRIS[®] Registry (Intelligent Research in Sight) is a comprehensive US eye disease clinical registry. Active engagement with the IRIS Registry enables ophthalmologists to meet accreditation requirements. The Paediatric Cataract Surgery Outcomes Registry collects data in paediatric patients in the US. The European Registry of Quality Outcomes for Cataract and Refractive Surgery (EUREQUO), the UK Royal College of Ophthalmologists' National Ophthalmology Database and the Malaysian Cataract Registry are also comprehensive eye registries.
G01AB	Rectal resection	<ul style="list-style-type: none"> ■ No Australian guideline. International guideline: NICE (2014) Colorectal cancer: diagnosis and management (CG131). ■ No Australian registry. Rectal and anal cancer data are within the Australasian Association of Cancer Registries and various Australian bowel cancer registries (described above) ■ Europe has the European Stapled Transanal Rectal Resection Registry. There is a Swedish Colorectal Cancer Registry, a Spanish National Registry of Anastomotic Leakage and Norwegian Rectal Cancer Registry.
G07AB	Appendicectomy	<ul style="list-style-type: none"> ■ No Australian guideline. No Australian registry. ■ The Swedish Inpatient Registry contains detailed appendicectomy data.

Diagnoses related group	Description	Guidelines and registries
F08AB	Major vascular procedure	<ul style="list-style-type: none"> Guidelines: Australian and New Zealand Comprehensive Guidelines on Leg Ulcer Management. International guidelines from the US include Management of Diabetic Foot, Atherosclerotic Occlusive Disease of the Lower Extremities, Management of Venous Leg Ulcers, Early Thrombus Removal Strategies for Acute DVT, Management of Extracranial Carotid Disease and from Europe include Critical Limb Ischaemia and Diabetic Foot, Management of Abdominal Aortic Aneurysms, Chronic Venous Disease. Registry: National Vascular Audit.
I05AB	Other joint replacement	<ul style="list-style-type: none"> No Australian guideline. International guideline: NICE (2010) Shoulder resurfacing arthroplasty (IPG 354). A North American systematic review, American Academy of Orthopaedic Surgeons clinical practice guideline on the treatment of glenohumeral joint osteoarthritis. 2009 Dec 4 (reaffirmed 2014). NGC:007581 American Academy of Orthopaedic Surgeons – Medical Specialty Society, was unable to provide definitive recommendations with respect to arthroplasty. Australian Orthopaedic Association National Joint Replacement Registry collects comprehensive data on all joint replacement surgery. Other joint procedures not collected. No comprehensive registries identified nationally or internationally for surgeries other than joint replacement.
M01AB	Prostate cancer – major male pelvic procedure, surgical only	<ul style="list-style-type: none"> Guidelines: Cancer Council Australia Clinical Practice Guidelines: PSA testing and early management of test-detected prostate cancer (2016). Clinical Practice Guidelines for the management of locally advanced and metastatic prostate cancer (2010). There is an Australian And New Zealand Prostate Cancer Outcomes Registry that collects information on the type of prostatectomy procedures performed. Information about prostate cancer is also collected by the Australasian Association of Cancer Registries. The US has the American Urological Association Quality Registry that includes prostate surgery data.
L71AB	Respiratory cancer – medical only	<ul style="list-style-type: none"> Comprehensive national data collection through Australasian Association of Cancer Registries. Victoria has a lung cancer registry.
Y01Z, Y02AB, Y03Z, Y60Z, Y61Z	Burns	<ul style="list-style-type: none"> Registry: Burns Registry of Australia and New Zealand Guidelines: Multiple jurisdictional, e.g. Clinical Practice Guidelines. Burn patient management (NSW Agency for Clinical Innovation). Clinical Practice Guidelines: Burns/ management of burn wounds (RCH Melbourne).
N/A	Mesh in gynaecological surgery	<ul style="list-style-type: none"> Guidelines: RANZCOG guidelines for propylene vaginal mesh implants for vaginal prolapse (produced by the executive of the Urogynaecological Society of Australasia, 2013) No Australian registry: Internationally, there is an Austrian urogynecology vaginal mesh registry.

Diagnoses related group	Description	Guidelines and registries
N/A	Dialysis, transplantation, organ donation	<ul style="list-style-type: none"> ■ Guideline: Kidney Health Australia – Caring for Australasians with Renal Impairment guidelines – chronic kidney disease, dialysis, transplantation ■ Registry: ANZDATA collects comprehensive data.
N/A	CSF shunt	<ul style="list-style-type: none"> ■ Registry: Pilot Australasian Shunt Registry based a Children’s Hospital Westmead. Neurosurgical Society of Australasia proposes broader development of a registry. Multiple international registries, e.g. UK shunt registry. ■ Guidelines: Multiple jurisdictional, e.g. Insertion or revision of ventriculoperitoneal shunt. WA Health.

Attachment 5: Burden of disease data for short-listed clinical domains

Table A5.1: Ischaemic heart disease

Conditions used in burden of disease	Total DALYs 2011	As percentage of total DALYs 2011
Coronary heart disease	346,651	7.71%
Aortic aneurysm	15,472	0.34%
Atrial fibrillation and flutter	37,526	0.83%
Cardiomyopathy	23,105	0.51%
Non-rheumatic valvular disease	27,531	0.61%
Rheumatic heart disease	11,539	0.26%
Other cardiovascular diseases	37,644	0.84%
Total ischaemic heart disease	499,468	11.10%

Table A5.2: Musculoskeletal disorders

Conditions used in burden of disease	Total DALYs 2011	As percentage of total DALYs 2011
Back pain and problems	163,788	3.64%
Spinal cord injuries	7,432	0.17%
Other musculoskeletal, osteoarthritis and rheumatoid arthritis	353,242	7.86%
Other musculoskeletal	183,947	4.09%
Osteoarthritis	85,806	1.91%
Rheumatoid arthritis	83,489	1.86%
Hip fracture	6,977	0.16%
Humerus fracture	142	0.00%
Tibia and ankle fracture	421	0.01%
Total musculoskeletal disorders	532,002	11.84%

Table A5.3: Major trauma

Conditions used in burden of disease	Total DALYs 2011	As percentage of total DALYs 2011
All other external causes of injury	6,874	0.15%
Drowning	10,723	0.24%
Falls	59,116	1.32%
Fire, burns and scalds	7,768	0.17%
Homicide and violence	26,057	0.58%
Other land transport injuries	13,275	0.30%
Other road traffic injuries	12,916	0.29%
Other unintentional injuries	30,671	0.68%
Poisoning	51,406	1.14%
Road traffic injuries – motor vehicle occupants	49,501	1.10%
Road traffic injuries – motorcyclists	12,677	0.28%
Total major trauma	280,984	6.25%

Table A5.4: Adult critical care

Conditions used in burden of disease	Total DALYs 2011	As percentage of total DALYs 2011
Not suitable for burden of disease analysis	–	–
Total adult critical care	–	–

Table A5.5: High burden cancers

Conditions used in burden of disease	Total DALYs 2011	As percentage of total DALYs 2011
Bowel cancer	92,422	2.06%
Gallbladder and bile duct disease	5,110	0.11%
Leukaemia	30,629	0.68%
Non-Hodgkin's lymphoma	25,456	0.57%
Other lymphohaematopoietic (blood) cancers	7,346	0.16%
Breast cancer	70,675	1.57%
Lung cancer	154,890	3.45%
Brain and central nervous system cancer	35,662	0.79%
Prostate cancer	49,232	1.10%
Total high burden cancers	471,422	10.49%

Table A5.6: Stroke

Conditions used in burden of disease	Total DALYs 2011	As percentage of total DALYs 2011
Stroke	136,771	3.04%
Total stroke	136,771	3.04%

Table A5.7: Renal disease

Conditions used in burden of disease	Total DALYs 2011	As percentage of total DALYs 2011
Chronic kidney disease	42,574	0.95%
Other kidney and urinary diseases	13,662	0.30%
Total renal disease	56,236	1.25%

Table A5.8: Neonatal critical care

Conditions used in burden of disease	Total DALYs 2011	As percentage of total DALYs 2011
Birth trauma and asphyxia	18,984	0.42%
Brain malformations	5,217	0.12%
Cardiovascular defects	12,250	0.27%
Cerebral palsy	9,192	0.20%
Cleft lip and/or palate	305	0.01%
Gastrointestinal malformations	3,364	0.07%
Neonatal infections	2,464	0.05%
Neural tube defects	3,001	0.07%
Other congenital conditions	10,238	0.23%
Other disorders of infancy	10,532	0.23%
Pre-term birth and low birth weight complications	25,230	0.56%
Urogenital malformations	1,996	0.04%
Total neonatal critical care	102,773	2.27%

Table A5.9: Mental health

Conditions used in burden of disease	Total DALYs 2011	As percentage of total DALYs 2011
Depressive disorders	127,659	2.84%
Bipolar affective disorder	38,310	0.85%
Schizophrenia	34,331	0.76%
Anxiety disorders	140,971	3.1%
Total mental health	341,271	7.55%

Table A5.10: Maternity

Conditions used in burden of disease	Total DALYs 2011	As percentage of total DALYs 2011
Hypertensive disorders of pregnancy	344	0.01%
Maternal haemorrhage	415	0.01%
Maternal infections	93	0.00%
Obstructed labour	199	0.00%
Genital prolapse	18,263	0.41%
Other reproductive conditions	3,140	0.07%
Other maternal conditions	629	0.01%
Total maternity	23,083	0.51%

Table A5.11: Dementia

Conditions used in burden of disease	Total DALYs 2011	As percentage of total DALYs 2011
Dementia	151,308	3.4%
Total dementia	151,308	3.4%

Table A5.12: Major burns

Conditions used in burden of disease	Total DALYs 2011	As percentage of total DALYs 2011
Fire, burns and scalds	7,768	0.17%
Total major burns	7,768	0.17%

Table A5.13: Diabetes

Conditions used in burden of disease	Total DALYs 2011	As percentage of total DALYs 2011
Diabetes	101,653	2.3%
Gestational diabetes	207	0.00%
Total diabetes	101,860	2.3%

Attachment 6: Cost data for short-listed potential clinical domains

Table A6.1: Ischaemic heart disease

DRG	Description	NHCDC 2012/13 costs
F41AB, F42ABC	Circulatory disorder +/- acute myocardial infarction (with invasive procedure)	\$0.50 billion
F12AB, F17AB, F18AB	Pacemaker-related	\$0.45 billion
F03AB, F04AB	Cardiac valve procedure	\$0.41 billion
F01AB, F02Z	AICD related	\$0.40 billion
F05AB, F06AB	Coronary bypass	\$0.37 billion
F62ABC	Heart failure	\$0.37 billion
F68AB	Congenital heart disease	\$0.003 billion
F76AB	Arrhythmia, cardiac arrest and conduction disorders	\$0.18 billion
Total ischaemic heart disease		\$2.68 billion

Table A6.2: Musculoskeletal disorders

DRG	Description	NHCDC 2012/13 costs
I04AB, I32ABC	Knee replacement, revision	\$1.2 billion
I03AB, I31AB	Hip replacement, revision	\$1.1 billion
I08AB, I78AB	Other hip and femur procedures, fractured neck of femur	\$0.41 billion
I05AB	Other joint replacement	\$0.14 billion
B68AB	Multiple sclerosis and cerebellar ataxia	\$0.193 billion
I09AB	Spinal fusion	\$0.20 billion
I68AB	Non-surgical spinal disorders	\$0.365 billion
A11AB	Insertion of implantable spinal infusion device	\$0.003 billion
B03AB	Spinal procedures	\$0.053 billion
I06Z	Spinal fusion for deformity	\$0.019 billion
I06Z, I09AB	Spinal fusion	\$0.65 billion
Total musculoskeletal disorders		\$4.33 billion

Table A6.3: Major trauma

DRG	Description	NHCDC 2012/13 costs
W01Z-W61AB, I74Z, I75AB, X02A-X60AB	Multi-trauma and injuries	\$0.83 billion
Total major trauma		\$0.83 billion

Table A6.4: Adult critical care

DRG	Description	NHCDC 2012/13 costs
All DRGs ex P01Z-P67ABCD	All critical care costs except neonatal admits	\$2.40 billion
Total adult critical care		\$2.40 billion

Table A6.5: High burden cancers

DRG	Description	NHCDC 2012/13 costs
G02AB	Major small and large bowel procedure	\$0.51 billion
G01AB	Rectal resection	\$0.26 billion
G60AB (73%)	Digestive malignancy	\$0.07 billion
J06AB, J07AB, J14Z, J62AB	Breast condition procedure, reconstruction, breast malignancy	\$0.31 billion
R01AB, R03AB, R60AB, R61ABC	Lymphoma, acute and non-acute leukaemia	\$0.48 billion
E01AB, E71AB	Respiratory cancer	\$0.29 billion
M01AB, M60AB	Prostate cancer	\$0.17 billion
R63Z	Chemotherapy	\$0.43 billion
Total high burden cancers		\$2.52 billion

Table A6.6: Stroke

DRG	Description	NHCDC 2012/13 costs
B69AB, B70ABCD	TIA, stroke	\$0.39 billion
Total stroke		\$0.39 billion

Table A6.7: Renal disease

DRG	Description	NHCDC 2012/13 costs
L61Z	Haemodialysis	\$0.64 billion
L60ABC	Chronic kidney disease	\$0.16 billion
L62AB, L63AB	Kidney and urinary tract neoplasms and infections	\$1.24 billion
L64Z	Urinary stones and obstruction	\$0.07 billion
L68Z	Peritoneal dialysis	\$0.005 billion
L67AB	Other kidney and urinary tract disorders	\$0.077 billion
Total renal disease		\$2.19 billion

Table A6.8: Neonatal critical care

DRG	Description	NHCDC 2012/13 costs
P01Z – P67ABCD	Critical care costs only for neonatal admits	\$0.43 billion
Total neonatal critical care		\$0.43 billion

Table A6.9: Mental health

DRG	Description	NHCDC 2012/13 costs
U61AB	Schizophrenia disorder	\$0.59 billion
U63AB	Major affective disorder	\$0.43 billion
U40Z	Mental health treatment with electroconvulsive therapy, sameday	\$0.011 billion
U60Z	Mental health treatment without electroconvulsive therapy, sameday	\$0.017 billion
U62AB	Paranoia and acute psychiatric disorders	\$0.081 billion
U64Z	Other affective and somatoform disorders	\$0.093 billion
U65Z	Anxiety disorders	\$0.042 billion
U66Z	Eating and obsessive-compulsive disorders	\$0.065 billion
U67Z	Personality disorders and acute reactions	\$0.16 billion
U68Z	Childhood mental disorders	\$0.012 billion
Total mental health		\$1.6 billion

Table A6.10: Maternity

DRG	Description	NHCDC 2012/13 costs
O60ABC	Vaginal delivery	\$1.1 billion
O01ABC	Caesarean delivery	\$1.0 billion
Total maternity		\$2.1 billion

Table A6.11: Dementia

DRG	Description	NHCDC 2012/13 costs
B63Z	Dementia and other chronic disturbances of cerebral function	\$0.095 billion
Total dementia		\$0.095 billion

Table A6.12: Major burns

DRG	Description	NHCDC 2012/13 costs
Y01Z, Y02AB, Y03Z, Y60Z, Y61Z, Y62AB	Burns	\$0.11 billion
Total major burns		\$0.11 billion

Table A6.13: Diabetes

DRG	Description	NHCDC 2012/13 costs
K60ABC, X63AB	Diabetes with and without complications and diabetes sameday	\$0.193 billion
Total diabetes		\$0.193 billion

Attachment 7: Text content for Figure 1

Score (high to low)	Domains	Summary
3	Ischaemic heart disease	Serious consequences of poor quality care, very high burden of disease and cost to the health system. Strong clinical support registries in this domain. Current national registries and potential to expand into non-surgical interventions in the future.
3	Musculoskeletal disorders	Serious consequences of poor quality care, very high cost and high burden domain. A number of national registries in hip and knee procedures. Potential to expand to registries for non-surgical interventions in the future.
2.75	Trauma	Serious consequences of poor quality care, very high burden of disease and high cost to the system. Established leadership group and national registry with incomplete capture as well as jurisdictional registries.
2.75	Adult critical care	Serious consequences of poor quality care, very high cost to the health system and estimated high burden of disease. Very strong clinical support and leadership. National registry with close to complete coverage.
2.75	High burden cancers	Serious consequences of poor quality care, very high cost and high burden of disease. Current national population based registers and a number of jurisdictional cancer specific registries. National registry for prostate cancer.
2.5	Stroke	Serious consequences of poor quality care, high burden of disease and moderately high cost to the system. Strong leadership and a national registry.
2.5	Renal disease	Serious consequences of poor quality care, very high cost and moderately high burden of disease. Established leadership group for dialysis and transplantation and expand to registries in this domain.
2.25	Neonatal critical care	Serious consequences of poor quality care, high burden of disease and moderately high cost. Existing leadership group and national registry with substantial capture.
2.25	Mental health	Serious consequences of poor quality care, very high burden of disease and very high cost. Clinical advocacy for registries but no identified leadership group or current registries. Initial registries may focus on sub-groups of patients where the entire population can be captured.
1.75	Maternity	Serious consequences of poor quality care, moderate burden of disease and high cost. Current data collections by jurisdictions and through administrative data are substantial which could be drawn on to develop clinical quality registries.
1.25	Dementia	Serious consequences of poor quality care, high burden of disease and moderate acute care costs. No current registries. Clinical advocacy for registry development in this area. Scoping study on potential to develop registry in this domain is underway.
1	Major burns	Serious consequences of poor quality care, moderate burden of disease and moderate cost. Established leadership group and national registry with incomplete patient capture.
1	Diabetes	Serious consequences of poor quality care, high burden of disease and moderate cost. Clinical advocacy for the development of clinical quality registries.

Acronyms and abbreviations

ABDR: Australian Breast Device Registry

ACOR: Australasian Cardiac Outcomes Registry

ACS: Acute coronary syndromes

AICD: Automated implantable cardioverter-defibrillator

AIHW: Australian Institute of Health and Welfare

AMD: Age-related macular degeneration

ANDA: Australian National Diabetes Audit

ANZDATA: Australian and New Zealand Dialysis and Transplant Registry

ANZHFR: Australian & New Zealand Hip Fracture Registry

ANZICS: Australian and New Zealand Intensive Care Society

AusTQIP: Australian Trauma Quality Improvement Program

BOD: Burden of disease

COAD: Chronic obstructive airways disease

COPD: Chronic obstructive pulmonary disease

CSF: Cerebrospinal fluid

DALYs: Disability-adjusted life years

DRG: Diagnosis related groups

DVT: Deep vein thrombosis

GIQuIC: Gastrointestinal Quality Improvement Consortium

NCCH: National Centre for Classification in Health

NEHTA: National E-Health Transition Authority

NHCDC: National Hospital Cost Data Collection

NHIPPC: National Health Information and Performance Principal Committee

N/A: Not applicable

PCOR-ANZ: Prostate Cancer Outcomes Registry – Australia and New Zealand

PREMs: Patient reported experience measures

PROMs: Patient reported outcome measures

RANZGOG: Royal Australian and New Zealand College of Obstetricians and Gynaecologists

The Commission: Australian Commission on Safety and Quality in Health Care

TIA: Transient ischaemic attack

YLD: Years lived with disability

YLL: Years of life lost

Glossary

Administrative data: This refers to information that is collected, processed, and stored in automated information systems. Administrative data include enrolment or eligibility information, claims information, and managed care encounters.

Burden of disease (BOD): The quantified impact of a disease or injury on a population using the DALYs measure.

Clinical guidelines: Systematically developed statements to inform practitioner and patient decisions on appropriate health care for specific clinical circumstances.

Clinical quality registry: Organisation that monitor the quality (appropriateness and effectiveness) of health care, within specific clinical domains, by routinely collecting, analysing and reporting health-related information, for a self-improving health system

Clinician: a healthcare provider, trained as a health professional, including registered and non-registered practitioners. Clinicians may provide care within a health service organisation as an employee, a contractor or a credentialed healthcare provider, or under other working arrangements. They include nurses, midwives, medical practitioners, allied health practitioners, technicians, scientists and other clinicians who provide health care, and students who provide health care under supervision.

Consumer: A person who has used, or may potentially use, health services, or is a carer for a patient using health services. A healthcare consumer may also act as a consumer representative to provide a consumer perspective, contribute consumer experiences, advocate for the interests of current and potential health service users, and take part in decision-making processes.

Disability-adjusted life years (DALYs): A measure of healthy life lost, either through premature death or living with disability due to illness or injury. Often used synonymously with health loss.

Governance: The set of relationships and responsibilities established by a health service organisation between its executive, workforce and stakeholders (including patients and consumers). Governance incorporates the processes, customs, policy directives, laws and conventions affecting the way an organisation is directed, administered or controlled. Governance arrangements provide the structure for setting the corporate objectives (social, fiscal, legal, human resources) of the organisation and the means to achieve the objectives. They also specify the mechanisms for monitoring performance. Effective governance provides a clear statement of individual accountabilities within the organisation to help align the roles, interests and actions of different participants in the organisation to achieve the organisation's objectives.

Leadership: Having a vision of what can be achieved, and then communicating this to others and evolving strategies for realising the vision. Leaders motivate people, and can negotiate for resources and other support to achieve goals.

Patient: A person who is receiving care in a health service organisation.

Quality improvement: The combined efforts of the workforce and others – including consumers, patients and their families, researchers, planners and educators – to make changes that will lead to better patient outcomes (health), better system performance (care) and better professional development. Quality improvement activities may be undertaken in sequence, intermittently or continually.

Years lived with disability (YLD): The number of years of what could have been a healthy life that were instead spent in states of less than full health. YLD represent non-fatal burden.

Years of life lost (YLL): The number of years of life lost due to premature death, defined as dying before the ideal life span. YLL represent fatal burden.

Introduction to Surgical Variance Report: Urology

The Royal Australasian College of Surgeons' (RACS) vision is to champion surgical standards, professionalism and surgical education in Australia and New Zealand. It is committed to advocating for sustainable, safe, affordable and high quality healthcare that represents best practice.

Similarly, Medibank, Australia's leading private health insurer, is focussed on improving the health outcomes of patients, improving patient experiences, and improving efficiencies in the health system.

Currently, there is limited available information to surgeons on indicators such as the median length of patient stay, rates of readmission or admission to an intensive care unit (ICU), and prices charged for services, for different procedures within their speciality, and particularly in the private sector.

However, such information would enable surgeons to gain a better understanding of variations, and consider how their practice could be improved for the benefit of patients.

RACS and Medibank are pleased to publish this Surgical Variance Report, which analyses a number of clinical and other indicators for common procedures within Urology. This report has been prepared in consultation with the Clinical Variation Working Party which includes A/Prof Andrew Brooks (Urologist, NSW) and Prof Mark Frydenberg (Urologist, VIC).

This is the second in a series of reports which will be published in the coming months, on common procedures within surgical specialities, including general surgery, urology, ear, nose and throat surgery, vascular surgery and orthopaedic surgery.

The data contained in these reports are based on analysis of de-identified Medibank claims data from 2014, which the College has analysed and interpreted. The reports deliberately pose questions that every clinician can reasonably ask about the possible reasons for the variations, and consider individual answers.

RACS and Medibank will continue to work together to identify opportunities to improve and enhance these reports so that they are as meaningful and useful as possible to surgeons, and we welcome everyone's feedback and comments.

The data contained in these reports do not define best practice, however it is hoped that by highlighting variation in practice, we will be able to improve clinical outcomes and patient care.

Professor David Watters OBE
Chair, Clinical Variation Working Party,
Royal Australasian College of Surgeons

Dr Linda Swan
Chief Medical Officer Medibank

Foreword

Data collected as part of a healthcare episode contains important insights about ways to improve care, achieve better outcomes and make care more efficient. However, there is a substantial challenge in bringing this information to light. The data is inherently complex and there is a shortage of individuals with the skills to extract intelligence from it.

The collaboration between the Royal Australasian College of Surgeons and Medibank combines the perspective of specialty experts with the skills of a data custodian. The value of this collaboration is well illustrated by the high quality information that has been derived. The dataset is large, comprising approximately 25% of the separations that occurred in private hospitals in 2014 for the procedures considered.

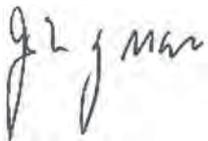

The prime purpose of the analysis is to explore variation in surgical practice and to raise questions that will allow clinicians and others to reflect on aspects of medical practice. It has been demonstrated many times that if information of this type is fed back to clinicians it often leads to greater uniformity of practice. Often the data comes as a revelation to those receiving it.

Studies of variation have become a very important part of healthcare analysis. It is frequently a sign of an evidence gap, but may also point to inefficiency or variation in outcomes. In many cases, it is the flag that initiates further more detailed analyses leading to changed practice.

Some aspects of the present report illustrate limitations typical of all large health datasets. For example, could reported variation infection rates have been influenced by variation in definitions and recording? Are readmission rates influenced by the distinction between planned and unplanned readmissions or whether the readmission was for a complication or an entirely different problem? Similarly, duration of admission is often dependent on comorbidities or social factors. So it is important that data like this is not used to reach simplistic conclusions, but should stimulate more detailed investigation.

Credible data is a powerful motivator of clinician behaviour. When convincing evidence is presented that outcomes could be better or safety improved, it is rarely ignored. One of the biggest problems at present is how little data of this type is routinely available.

For these reasons, this initiative is a welcome advance and a credit to both organisations involved in its production.

Prof. John McNeil, AM, MBBS, MSc, PhD, FRACP, FAFPHM

Professor and Head, Department of Epidemiology & Preventive Medicine, School of Public Health and Preventive Medicine, Faculty of Medicine, Nursing and Health Sciences, Monash University

Data used in this report

The data contained in this report is based on administrative claims data received by Medibank from private hospitals, for treatment of holders of Medibank-branded (but not ahm-branded) policies. The data relates to hospital separations with an admission date falling in 2014 (calendar year) and any follow-up hospital separations funded by Medibank within six months of discharge.

The data comprises:

- Hospital claims data submitted to Medibank by private hospitals and used by Medibank to assess and pay benefits relating to hospital treatment on behalf of members. Hospital claims data includes details relating to the use of, amount charged and benefits paid for hospital accommodation, intensive care and prostheses provided in connection with treatment in hospital
- Hospital casemix protocol (HCP) data submitted to Medibank by private hospitals for each privately insured hospital separation, as required by legislation. HCP data includes details relating to diagnoses, interventions, demographics and financial data in connection with policy holders' treatment in hospital
- Medicare Benefit Schedule (MBS) claims data from medical practitioners, including diagnostic providers, submitted to Medibank by Medicare, medical practitioners or members, which is used by Medibank to assess and pay benefits for medical and diagnostic services provided to policy holders in relation to their hospital treatment. MBS claims data includes details relating to the use of MBS item numbers by medical practitioners as well as the amount charged, benefits paid and out of pocket costs incurred by policy holders for each MBS item claimed.

Data relating to individual surgeons and physicians have been identified using the Medicare provider number on the MBS claim, with activity aggregated and summarised across all practice locations relating to that provider number. A principal surgeon has been identified for each hospital separation based on the surgeon claiming the highest value MBS item schedule fee relating to a surgical procedure for that hospital separation.

The indicators included in this report for each procedure have been selected by RACS, having regard to the limitations of Medibank's datasets, and in consultation with the Clinical Variation Working Party, which comprises a panel of specialty experts (see page 25 for membership).

Surgeon-level analysis of the indicators included in this report has been limited to surgeons who performed at least five procedures. This has been done to ensure that each surgeon has a sufficient sample of separations to allow a value (e.g. an average, median or percentage) against an indicator to be reported. State and territory values have only been published where five or more specialists were included in the dataset, to protect the anonymity of surgeons in those areas. Medibank has not shared any information with RACS which would enable RACS to identify surgeons and only de-identified data is contained in this report.

Outliers at a separation-level and surgeon-level have been included in the analysis, although data points for some outlying surgeons are not shown in the figures.

No attempts have been made to risk adjust the data.

Disclaimer

The purpose of this report is to provide information to surgeons that highlights variation in surgical practice and encourages surgeons to reflect on their own practice and potential causes of the variation, with a view to supporting the continuous improvement of clinical outcomes and patient care.

It is important to recognise that:

- while Medibank has taken reasonable steps to ensure the accuracy and validity of the data, the report relies on the accuracy of information prepared and provided by hospitals, medical practitioners and policy holders;
- the data used for the purposes of this report relates to a specific time period (being calendar year 2014 and part of calendar year 2015);
- no adjustment has been made to the data based on casemix, patient risk or any other factor that may be taken into account when considering the data and any variation;
- the report identifies specialists by MBS provider stems, which in some limited cases may result in one individual being identified more than once;
- the report is not intended to, and is not a basis for, an assessment of relative or actual performance of specialists;
- the report does not contain any qualitative commentary or analysis; and
- the report may not reflect results of the wider private hospital sector or the health industry as a whole.

Indicators measured in this report

A selection of the indicators described below have been analysed for each of the procedures included in this report.

Indicator	Explanation
Median age of patients	The median age of a surgeon's patients at the time of discharge.
Median length of stay (nights)	The median number of nights that a surgeon's patients stayed in hospital.
Percentage of patients that stayed in hospital overnight	Separations where the patient stayed in hospital overnight, expressed as a percentage of a surgeon's total separations for that procedure.
Percentage of separations where the patient was transferred to ICU	Separations where patients were transferred to an intensive care unit (ICU), expressed as a percentage of a surgeon's total separations for that procedure.
Rate of Hospital Acquired Complications per 1,000 separations	Separations where a Hospital Acquired Complication was identified, expressed as a rate per 1000 separations of a surgeon's total separations for that procedure. Hospital Acquired Complications are Medibank's subset of 82 International Classification of Diseases (ICD) codes drawn from the Australian Commission of Safety and Quality in Healthcare's high priority complications dataset (see Table 31). They are selected on the basis that they occur frequently in private hospitals (relative to other complications) and are likely to result in increased costs.
Percentage of patients readmitted within 30 days	Separations where patients were readmitted to the same or a different hospital within 30 days of discharge from the original separation, expressed as a percentage of a surgeon's total separations for that procedure. Readmissions for all-causes except for readmissions for rehabilitation, psychiatric treatment, dialysis and chemotherapy, were included. Separations involving a patient 80 years or older were excluded from this analysis.
Percentage of patients re-operated on within six months	Separations where patients were re-operated on for the same procedure (meaning any one of the MBS codes included in the analysis for that procedure) within 6 months of discharge from the original separation, expressed as a percentage of a surgeon's total separations for that procedure.
Average number of MBS items billed	The total number of MBS items billed by a surgeon, expressed as an average number of MBS items billed per separation for a surgeon.
Average prostheses cost	The total of all charges relating to prostheses items (including consumables) for a hospital separation, expressed as an average prostheses cost per separation for a surgeon.
Average separation cost	The total of all charges relating to the hospital separation, expressed as an average cost per separation for a surgeon. Includes all charges raised by the hospital, medical practitioners, diagnostic providers and for prostheses items.
Average surgeon out of pocket charge	The patient out of pocket charge from the principal surgeon. Expressed as an average out of pocket charge per separation for a surgeon.
Average out of pocket charge for other medical services	The patient out of pocket charge for all other medical services (including charges from the anaesthetist, assistant surgeon and for diagnostics). Expressed as an average out of pocket charge for other medical services per separation, for a surgeon.

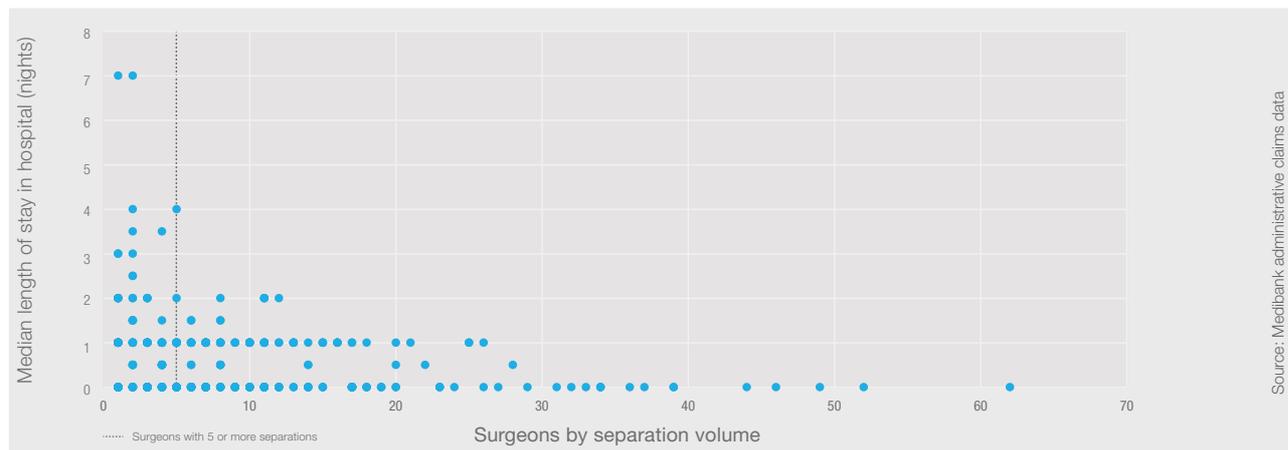

Cystoscopy with resection procedures

In 2014 Medibank funded 3,074 operations in private hospitals where cystoscopy with resection was recorded as the principal procedure (highest value MBS fee from the medical claim) for the hospital admission. This analysis is limited to those 3,074 procedures. 334 surgeons (identified through the stem of their Medicare provider number) billed Medibank for those procedures. 212 (63%) of these surgeons billed Medibank for five or more cystoscopy with resection procedures during 2014. Surgeon-level analysis of the indicators considered for this procedure has been limited to those surgeons with five or more patient separations, so that each surgeon has a sufficient sample of separations from which a value (e.g. an average, median or percentage) for an indicator can be reported.

Table 1: MBS codes included in this analysis

Procedure	MBS Codes	Volume of separations	Percentage of separations	Definition
Cystoscopy with resection	36840	1,740	56.6%	Cystoscopy, with resection, diathermy or visual laser destruction of bladder tumour or other lesion of the bladder, not being a service to which item 36845 applies
	36845	1,334	43.4	Cystoscopy, with diathermy, resection or visual laser destruction of multiple tumours in more than 2 quadrants of the bladder or solitary tumour greater than 2cm in diameter

Figure 1: Median length of stay in hospital (nights)

For the 212 surgeons who performed at least five procedures:

- The median number of nights that a surgeon's patients stayed in hospital ranged between 0 nights (same day admission and discharge) and 4 nights with a median of 0 nights.

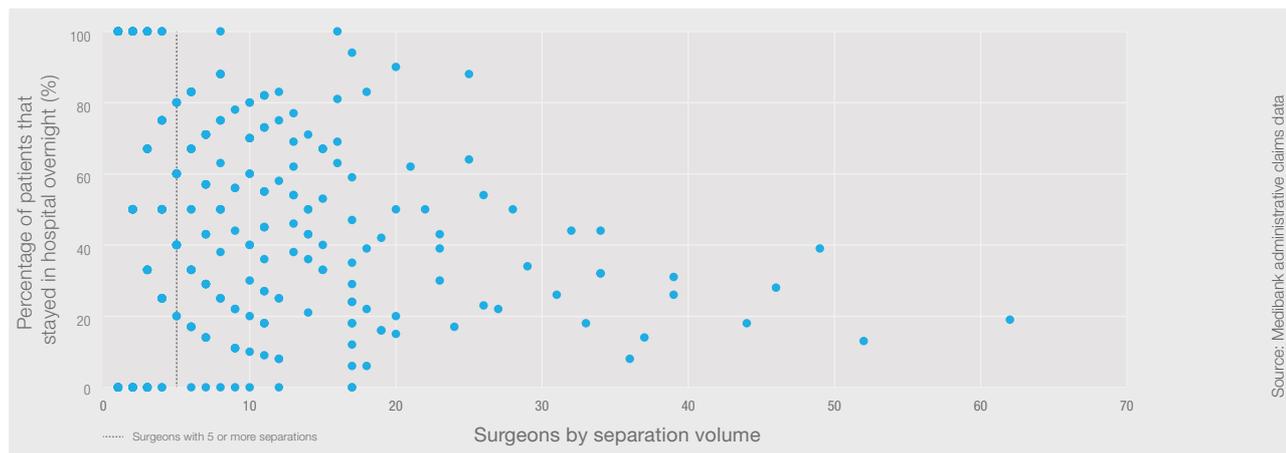

Table 2: Median length of stay (nights) by State/territory

State/territory	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
Length of stay	0	0	NA*	0	0	0	1	1

*Values not published if there were less than five surgeons in the state/territory who billed Medibank, to protect anonymity

What would you consider the most effective length of stay for this procedure?

Figure 2: Percentage of patients that stayed in hospital overnight

Source: Medibank administrative claims data

In 44% of the hospital separations the patient stayed in hospital for at least one night.

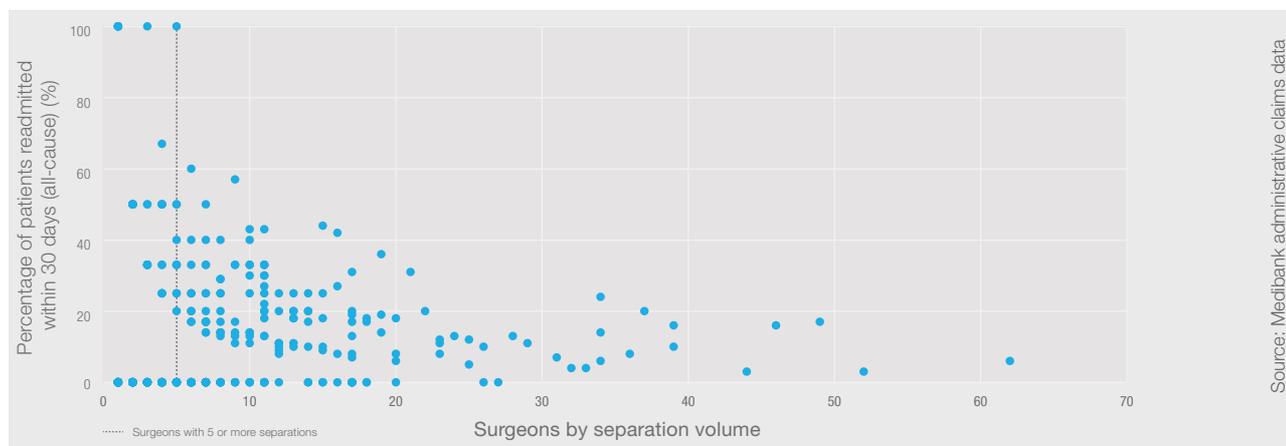

For the 212 surgeons who performed at least five procedures:

- 2 (1%) had all of their patients stay in hospital overnight
- 8 (4%) had all their patients admitted and discharged on the same day
- 202 (95%) had a mix of patients that either stayed in hospital overnight or were admitted and discharged on the same day
- The percentage of a surgeon’s patients that stayed in hospital overnight ranged between 0% and 100% with a median of 43%.

What are the reasons for a patient staying in hospital overnight following this procedure?

Why is there variation in the rate of patients that stay in hospital overnight between surgeons?

Figure 3: Percentage of patients readmitted within 30 days

Source: Medibank administrative claims data

Following 313 (14%) of separations patients were readmitted (for all causes)* to a hospital within 30 days. Administrative claims data does not indicate whether the readmissions were planned or unplanned. The median age of patients readmitted was 69 years, compared with a median age of 68 years for those patients not readmitted. Of the 313 separations followed by a readmission:

- 258 readmissions were to a private hospital (either the same hospital or a different one). In 5 of these separations a Hospital Acquired Complication (see Table 31) was identified (see Table 3)
- 55 readmissions were to a public hospital (where the patient was treated as a private patient).

For the 212 surgeons who performed at least five procedures, the percentage of a surgeon’s patients readmitted within 30 days ranged between 0% and 100% with a median of 13%.

Readmissions to public hospitals, where patients were treated as public patients, are not captured in these datasets.

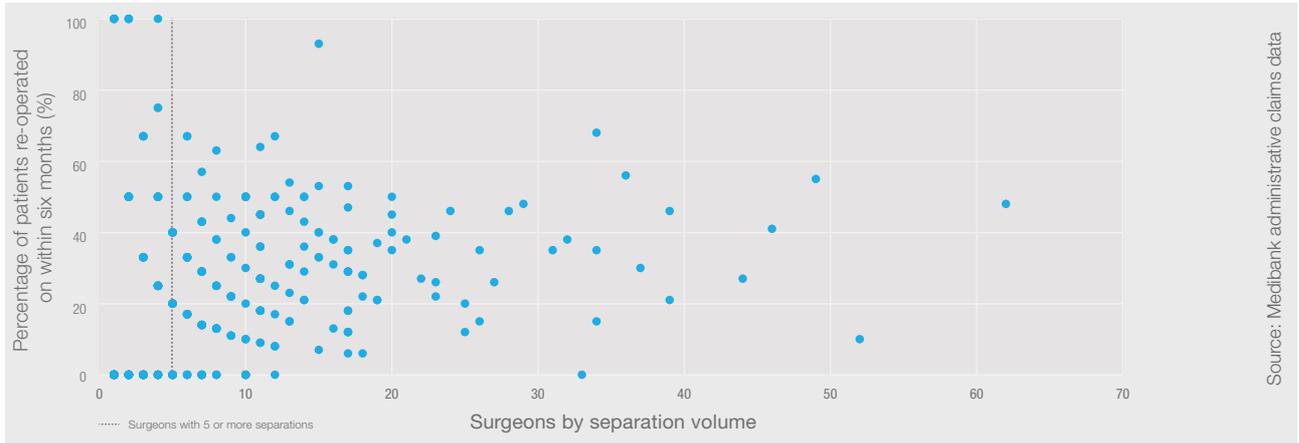

* Readmissions for rehabilitation, psychiatric treatment, dialysis and chemotherapy were excluded where identified. Separations involving a patient 80 years or older were also excluded.

Table 3: Hospital Acquired Complications identified on readmission

Category	Surgical complication	Infection	Pressure injury	Total
Number recorded	3	1	1	5

What are the reasons for readmission for this procedure, and what is the expected rate?

Figure 4: Percentage of patients re-operated on within six months

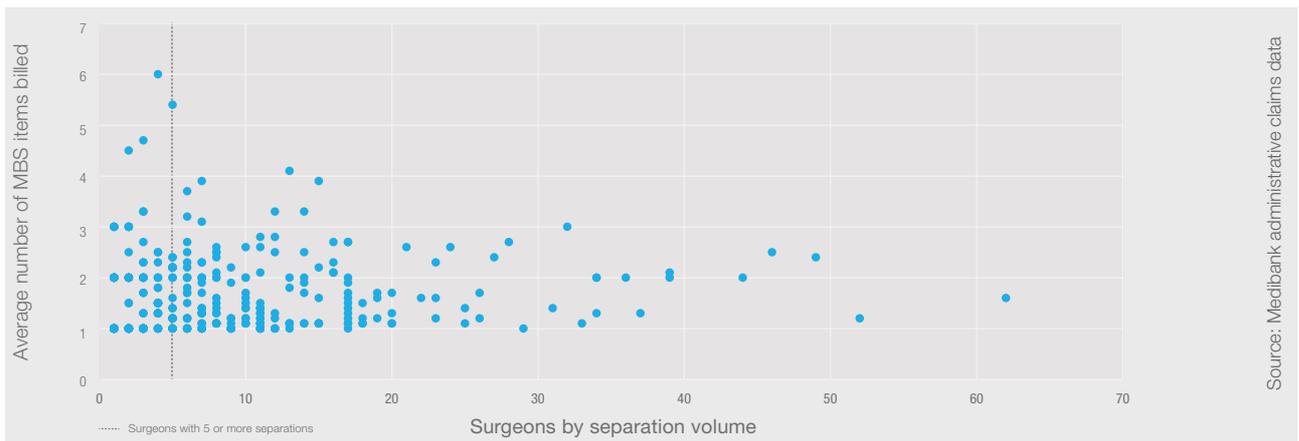

Patients were re-operated on (same procedure) within six months of discharge from hospital following 881 (29%) hospital separations. The median age of patients re-operated on six months after discharge was 74 years, compared with a median age of 72 years for those who were not.

Of the 212 surgeons who performed five or more procedures:

- 182 (86%) had one or more patients that were re-operated on within six months
- The percentage of a surgeon's patients re-operated on within six months ranged between 0% and 93% with a median of 25%.

What are the reasons for re-operation for this procedure, and what is the expected rate?

Figure 5: Average number of MBS items billed

The average number of MBS items billed by the surgeon (the principal surgeon only) was 1.7 per hospital separation.

Of the 212 surgeons who performed five or more procedures, the average number of MBS items billed by a surgeon ranged between a minimum of 1.0 and a maximum of 5.4 with a median of 1.4.

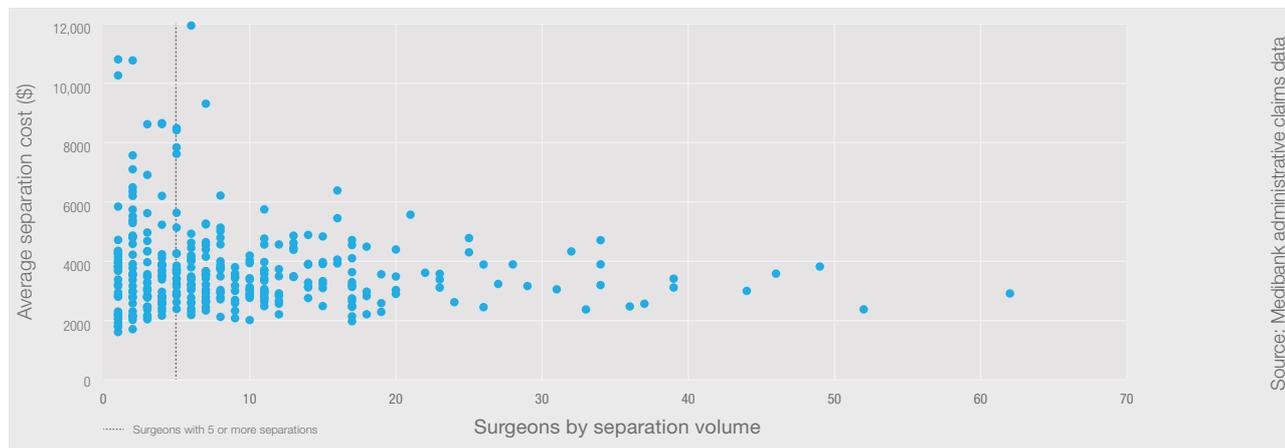

For the separations where MBS item number 36840 was recorded as the principal procedure (1,740 separations) the five most frequent MBS items billed by the surgeon are shown in the table below.

Table 4: MBS items billed by the surgeon (separations with principal MBS item # 36840)

MBS item number	Description	Total frequency	Frequency per separation
36840	Cystoscopy, with resection, diathermy or visual laser destruction of bladder tumour or other lesion	1774	1.02
00105	Professional attendance by a specialist in the practice of his or her specialty	617	0.35
36818	Cystoscopy, with ureteric catheterisation including fluoroscopic imaging of the upper urinary tract,	124	0.07
00104	Specialist, referred consultation - surgery or hospital	54	0.03
36827	Cystoscopy, with controlled hydrodilatation of the bladder (Anaes.)	52	0.03

What are the reasons for the wide variation in the number of MBS items billed?

Figure 6: Average separation cost

The separation cost includes the total charges for the hospital separation, including payments made by Medibank, Medicare and the patient. Costs include hospital accommodation and prostheses charged, and fees charged by medical practitioners and for diagnostic services. The average total cost was \$3,521 per hospital separation.

For the 212 surgeons who performed at least five procedures, the average separation cost for a surgeon ranged between \$1,972 and \$11,941 with a median of \$3,405.

Table 5: Average separation cost by region

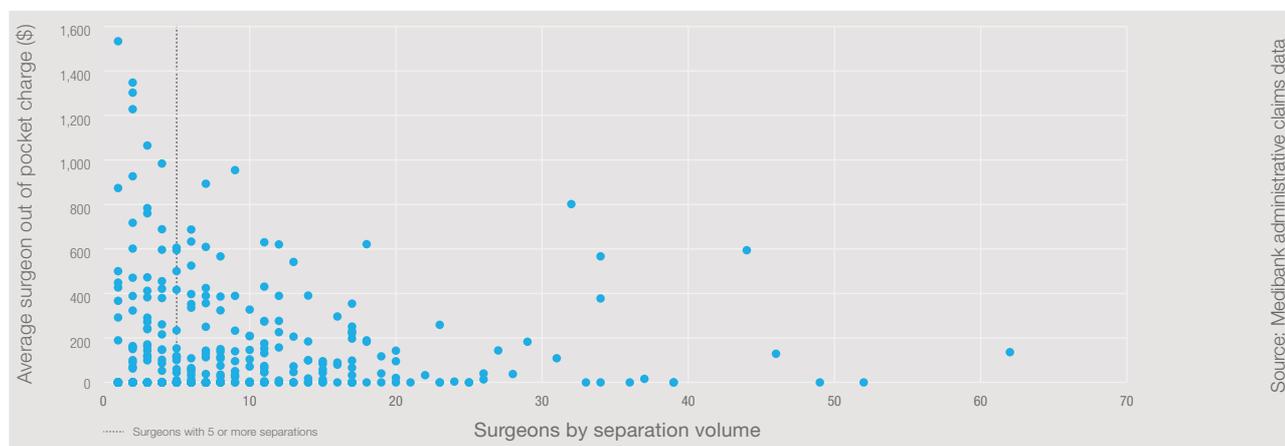

State/territory	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
Average separation cost	\$3,408	\$3,062	NA*	\$3,684	\$3,368	\$3,214	\$3,856	\$3,919

*Values not published if there were less than five surgeons in the state/territory who billed Medibank, to protect anonymity

Are you aware of the associated costs for this procedure such as pathology, diagnostic imaging, surgical assistants, anaesthetists, hospital bed fees?

What are the reasons for variation in separation costs?

Figure 7: Average surgeon out of pocket charge

Patients were charged an out of pocket fee by the principal surgeon in 30% of hospital separations.

For the 212 surgeons who performed at least five procedures, 82 (39%) did not charge any of their patients an out of pocket for the hospital admission. The average out of pocket charge from a surgeon ranged from \$0 (no out of pocket charge) to a maximum of \$954 with a median of \$40.

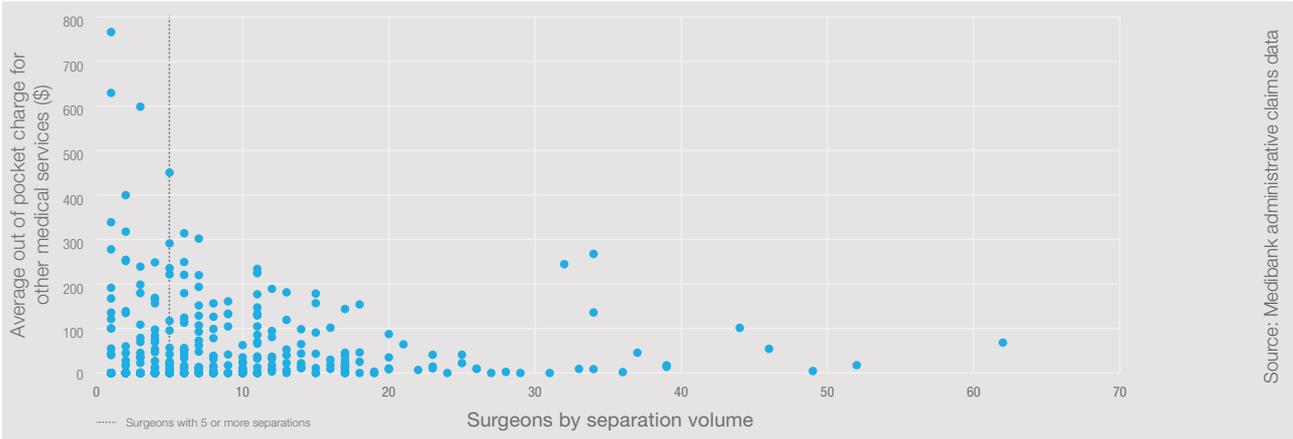

Table 6: Surgeon out of pocket charges by state/territory

State/territory	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
% of separations with OOP	90%	35%	NA*	39%	13%	32%	9%	44%
Average OOP charged	\$554	\$517	NA*	\$428	\$151	\$186	\$349	\$305

*Values not published if there were less than five surgeons in the state/territory who billed Medibank, to protect anonymity

Why is there such variation in the average out of pocket charge?

Figure 8: Average out of pocket charge for other medical services

Source: Medibank administrative claims data

Patients were charged an out of pocket fee for other medical services (including charges raised by the anaesthetist, assistant surgeon and for diagnostics) in 46% of hospital separations. For the 212 surgeons who performed at least five procedures, the average out of pocket charges received by their patients for other medical services ranged between \$0 and \$450 with a median of \$18.

Table 7: Out of pocket charges for other medical services by state/territory

State/territory	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
% of separations with OOP	64%	37%	NA*	37%	23%	41%	60%	58%
Average OOP charged	\$275	\$101	NA*	\$181	\$72	\$112	\$31	\$202

*Values not published if there were less than five surgeons in the state/territory who billed Medibank, to protect anonymity

Why is there such variation in the average out of pocket charge?

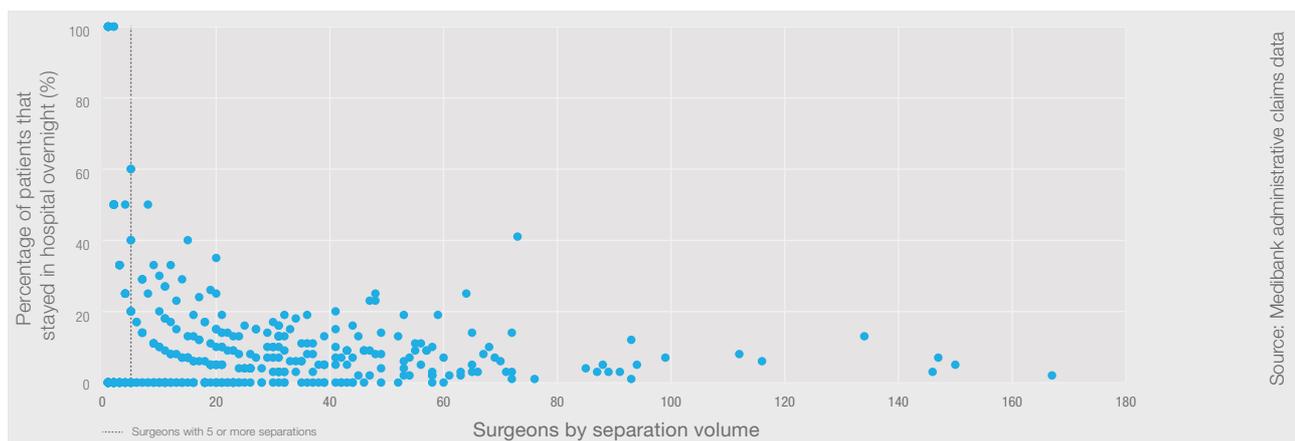

Cystoscopy without resection procedures

In 2014 Medibank funded 10,431 operations in private hospitals where cystoscopy without resection was recorded as the principal procedure (highest value MBS fee from the medical claim) for the hospital admission. The analysis is limited to those 10,431 procedures. 428 surgeons (identified through the stem of their Medicare provider number) billed Medibank for those procedures. 318 (74%) of these surgeons billed Medibank for five or more procedures in 2014. Surgeon-level analysis of the indicators considered for this procedure has been limited to those surgeons with five or more patient separations, so that each surgeon has a sufficient sample of separations from which a value (e.g. an average, median or percentage) for an indicator can be reported. surgeons undertook 5 or more procedures.

Table 8: MBS codes included in this analysis

Procedure	MBS Codes	Volume of separations	Percentage of separations	Definition
Cystoscopy without resection	36812	9,615	92.2%	Cystoscopy with urethroscopy with or without urethral dilatation, not being a service associated with any other urological endoscopic procedure on the lower urinary tract except a service to which item 37327 applies
	36818	816	7.8%	Cystoscopy with ureteric catheterisation including fluoroscopic imaging of the upper urinary tract, unilateral or bilateral, not being a service associated with a service to which item 36824 or 36830 applies

Figure 9: Percentage of patients that stayed in hospital overnight

Source: Medibank administrative claims data

In 8% of the hospital separations the patient stayed in hospital for at least one night. The median age of patients that stayed in hospital overnight was 76 years, compared with a median age of 69 years for patients admitted and discharged on the same day.

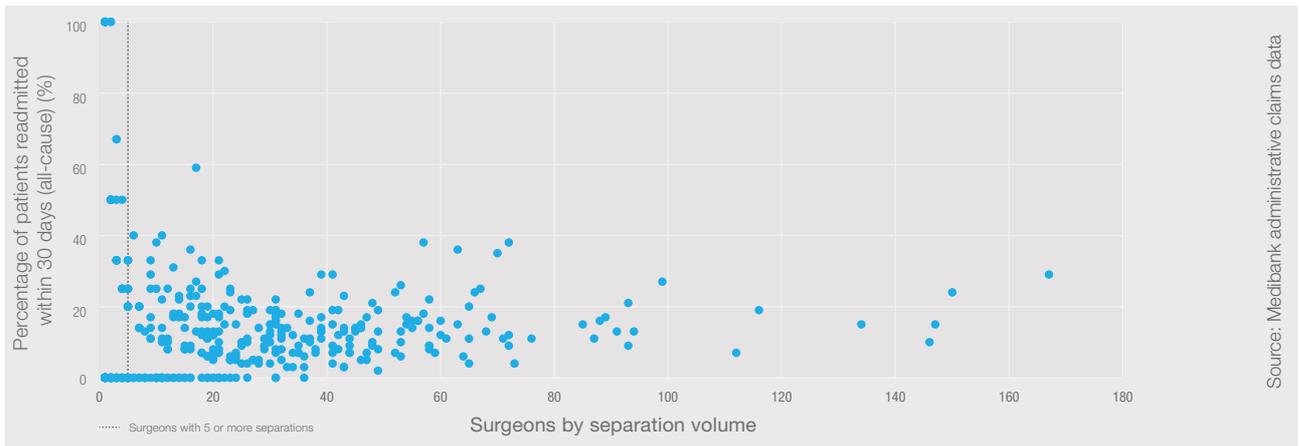

For the 318 surgeons who performed at least five procedures:

- 90 (28%) had all of their patients discharged on the same day of admission
- 228 (72%) had a mix of patients that either stayed in hospital overnight or were admitted and discharged on the same day
- The percentage of a surgeon's patients that stayed in hospital overnight ranged between 0% and 60% with a median of 6%

What are the reasons for a patient staying in hospital overnight following this procedure?

Why is there variation in the rate of patients that stay in hospital overnight between surgeons?

Figure 10: Percentage of patients readmitted within 30 days

Source: Medibank administrative claims data

Following 1,156 (14%) hospital separations, patients were readmitted (for all causes*) to a hospital within 30 days. Administrative claims data does not indicate whether the readmissions were planned or unplanned. The median age of patients readmitted was 68 years, compared with a median age of 66 years for patients not readmitted. Of the 1,156 readmissions:

- 1,053 readmissions were to a private hospital (the same one or a different hospital). In 12 of these separations at least one Hospital Acquired Complication (see Table 31) was identified (see Table 9)
- 103 readmissions were to a public hospital (where the patient was treated as a private patient).

For the 318 surgeons who performed at least five procedures, the percentage of a surgeon’s patients readmitted within 30 days ranged between 0% and 59% with a median of 12%.

Readmissions to public hospitals, where patients were treated as public patients, are not captured in these datasets.

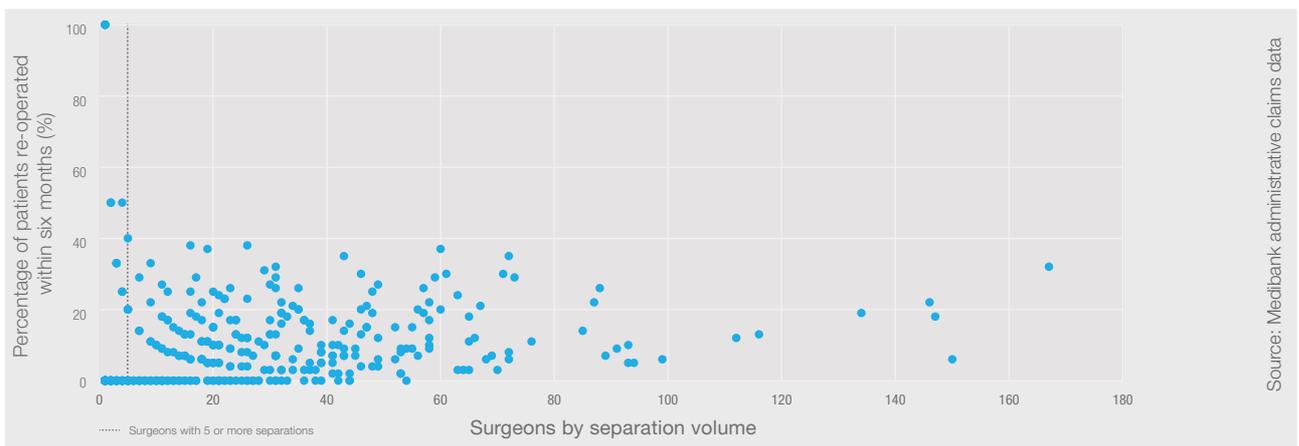

* Readmissions for rehabilitation, psychiatric treatment, dialysis and chemotherapy were excluded where identified. Separations involving a patient 80 years or older were also excluded.

Table 9: Hospital Acquired Complications identified on readmission

Category	Surgical complication	Infection	Total
Number recorded	4	9	13

What are the reasons for readmission for this procedure, and what is the expected rate?

Figure 11: Percentage of patients re-operated on within six months

Source: Medibank administrative claims data

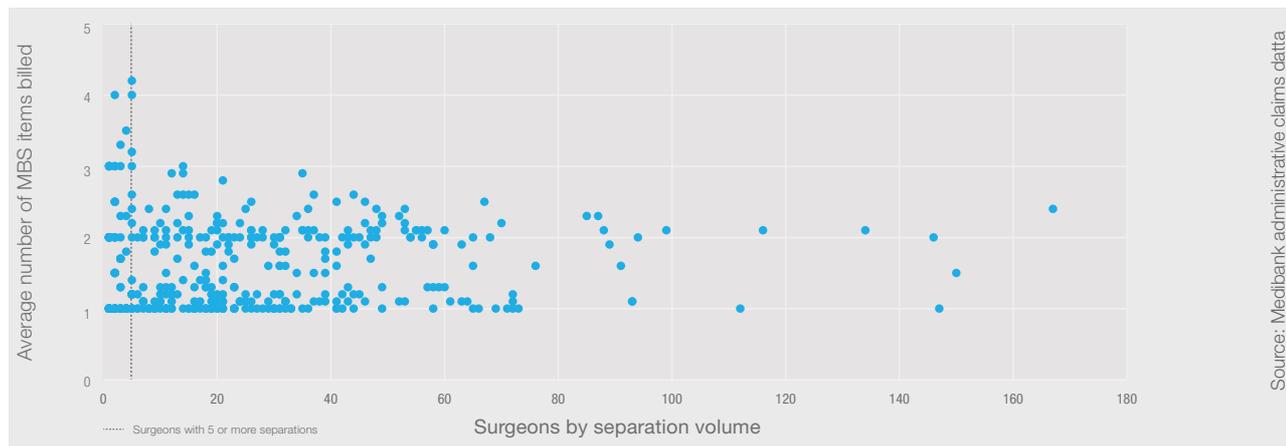

Patients were re-operated on (same procedure*) within six months of discharge from hospital in 1,217 (12%) hospital separations. The median age of patients re-operated on six months post-discharge was 72 years, compared with a median age of 69 years for those who were not.

Of the 318 surgeons who performed five or more procedures:

- 229 (72%) had one or more patients that were re-operated on within six months
- The percentage of a surgeon’s patients re-operated on within six months ranged between 0% and 40% with a median of 7%.

What are the reasons for re-operation for this procedure, and what is the expected rate?

Figure 12: Average number of MBS items billed

The average number of MBS items billed by a surgeon (the principal surgeon only) was 1.6 per hospital separation.

Of the 318 surgeons who performed five or more procedures, the average number of MBS items billed by a surgeon ranged between 1.0 and 4.2 with a median of 1.4.

For the separations where MBS item number 36182 was recorded as the principal procedure (9,615 separations) the five most frequent MBS items billed by the surgeon are shown in the table below.

Table 10: MBS items billed by the surgeon (separations with principal MBS item # 36812)

MBS item number	Description	Total frequency	Frequency per separation
36812	Cystoscopy with urethroscopy, with or without urethral dilatation	9,880	1.03
00105	Professional attendance by a specialist in the practice of his or her specialty	4,452	0.46
11900	Urine flow study including peak urine flow measurement	523	0.05
00104	Specialist, referred consultation – surgery or hospital	336	0.03
55039	Urinary tract, ultrasound scan of	221	0.02

What are the reasons for the wide variation in the number of MBS items billed?

Figure 13: Average separation cost

Three surgeons with less than five separations and an average separation cost over \$6,500 not shown

The separation cost includes the total charges for the hospital separation, including payments made by Medibank, Medicare and the patient. Costs include hospital, prostheses, medical practitioners and diagnostic services. The average total cost per hospital separation was \$1,647.

For the 318 surgeons who performed at least five procedures, the average separation cost of a surgeon ranged between \$773 and \$4,799 with a median of \$1,616.

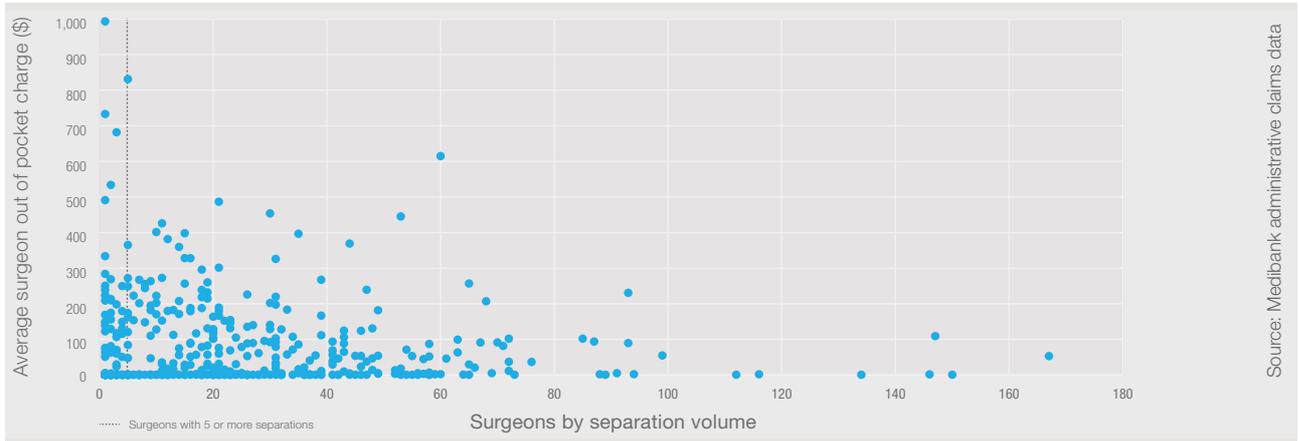

Table 11: Average separation cost by state/territory

State/territory	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
Average separation cost	\$1,804	\$1,754	\$2,028	\$1,779	\$1,339	\$1,479	\$1,606	\$1,552

Are you aware of the associated costs for this procedure such as pathology, diagnostic imaging, surgical assistants, anaesthetists, hospital bed fees?

What are the reasons for variation in separation costs?

Figure 14: Average surgeon out of pocket charge

Source: Medibank administrative claims data

Patients were charged an out of pocket fee by the principal surgeon in 32% of separations and the average out of pocket charged was \$210.

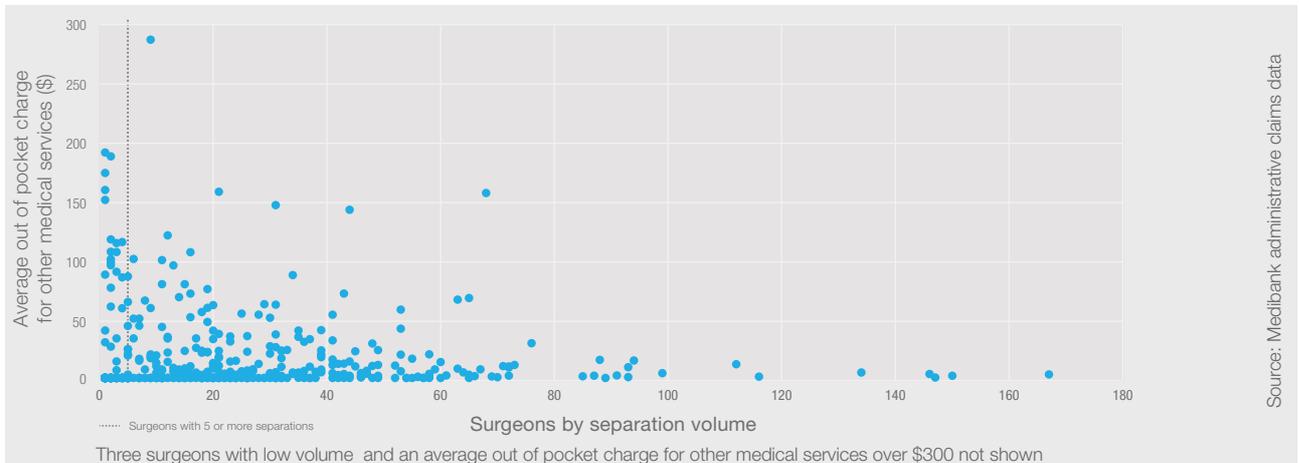

For the 318 surgeons who performed at least five procedures, 89 (28%) did not charge any of their patients an out of pocket for the hospital admission. The average out of pocket charged by these surgeons ranged from \$0 (no out of pocket charged) to \$831 with a median of \$32.

Table 12: Surgeon out of pocket charges by state/territory

State/territory	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
% of separations with OOP	86%	42%	73%	40%	22%	30%	13%	45%
Average OOP charged	\$449	\$270	\$365	\$212	\$112	\$122	\$149	\$144

Why is there such variation in the average out of pocket charge?

Figure 15: Average out of pocket charge for other medical services

Source: Medibank administrative claims data

Three surgeons with low volume and an average out of pocket charge for other medical services over \$300 not shown

Patients were charged an out of pocket fee for other medical services (including charges raised by the anaesthetist, assistant surgeon and for diagnostics) in 12% of the hospital separations.

For the 318 surgeons who performed at least five procedures, the average out of pocket charges received by their patients for other medical services ranged between \$0 and \$285 with a median of \$5.

Table 13: Out of pocket charges for other medical services by state

	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
% of separations with OOP	40%	17%	68%	15%	5%	13%	9%	5%
Average OOP	\$183	\$123	\$176	\$133	\$84	\$85	\$74	\$137

Why is there such variation in the average out of pocket charge?

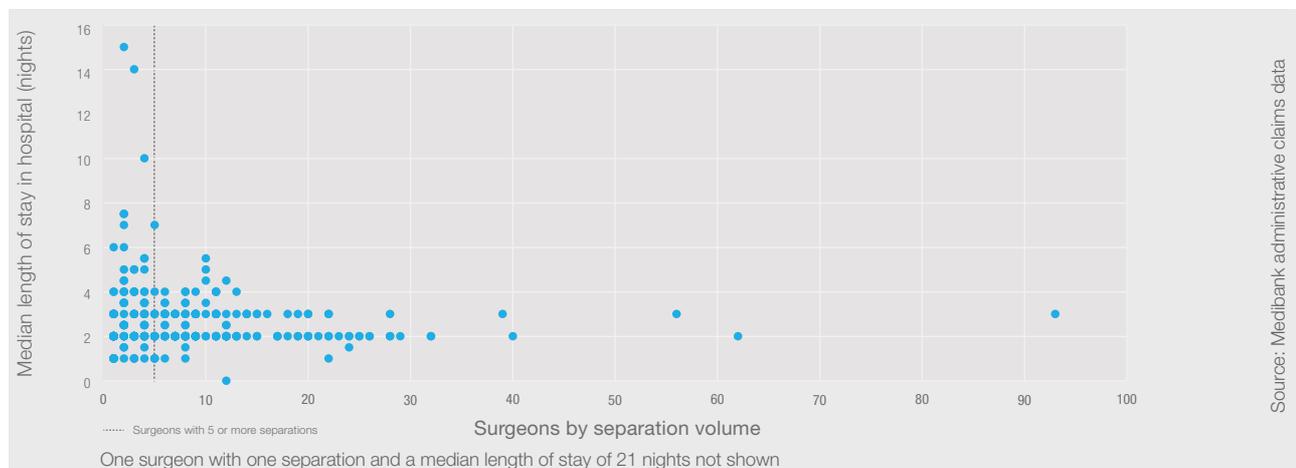

Endoscopic prostatectomy procedures

In 2014 Medibank funded 2,556 operations in private hospitals where endoscopic prostatectomy was recorded as the principal procedure (highest value MBS fee from the medical claim) for the hospital admission. The analysis is limited to those 2,556 procedures. 311 surgeons (identified through the stem of their Medicare provider number) billed Medibank for those procedures. 175 (56%) of these surgeons billed Medibank for five or more procedures. Surgeon-level analysis of the indicators considered for this procedure has been limited to those surgeons with five or more patient separations, so that each surgeon has a sufficient sample of separations from which a value (e.g. an average, median or percentage) for an indicator can be reported.

Table 14: MBS codes included in this analysis

Procedure	MBS Codes	Volume of separations	Percentage of separations	Definition
Endoscopic prostatectomy	37203	2,556	100%	Prostatectomy, (endoscopic, using diathermy or cold punch), with or without cystoscopy and with or without urethroscopy, and including services to which item 36854, 37201, 37202, 37207, 37208, 37245, 37303, 37321 or 37324 applies

Figure 16: Median length of stay in hospital (nights)

For the 175 surgeons who performed at least five procedures:

- The median number of nights that a surgeon's patients stayed in hospital ranged between 0 nights and 7 nights with a median of 2 nights.

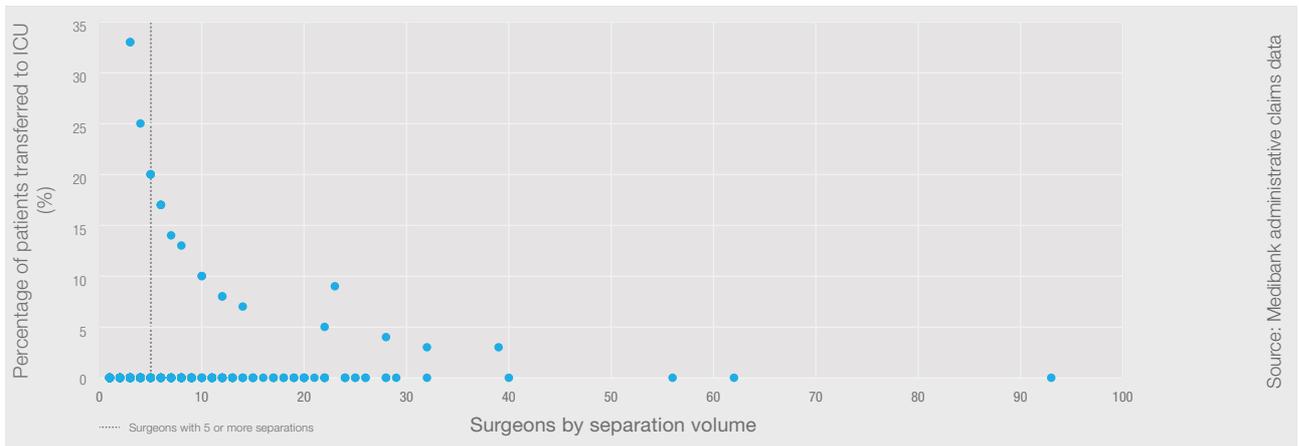

Table 15: Median length of stay (nights) by state/territory

State/territory	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
Length of stay	3	2	NA	2	3	3	2	2

State/territory values not reported if dataset includes less than 5 surgeons

What would you consider the most effective length of stay for this procedure?

Figure 17: Percentage of patients transferred to ICU

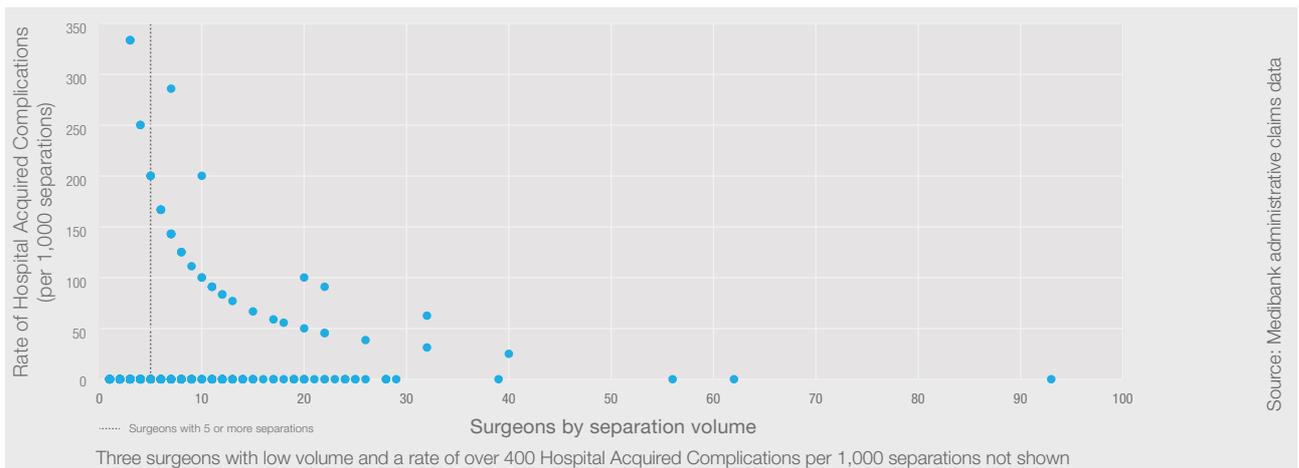

Across the total sample of 2,556 hospital separations, patients were transferred to an intensive care unit (ICU) during 22 hospital separations (1%). Administrative claims data does not indicate whether the transfers were planned or unplanned.

For the 175 surgeons who performed at least five procedures:

- 18 (10%) surgeons had one or more patient separations during which patients were transferred to ICU
- The percentage of a surgeon’s patients that were transferred to ICU ranged between 0% and 20% with a median of 0%.

Given that ICU transfers could indicate a difficult post-operative recovery, what would be the expected transfer rate?

Figure 18: Rate of Hospital Acquired Complications (per 1,000 separations)

Three surgeons with low volume and a rate of over 400 Hospital Acquired Complications per 1,000 separations not shown

Hospital Acquired Complications are a Medibank subset of 82 International Classification of Diseases (ICD) codes drawn from the Australian Commission of Safety and Quality in Health Care’s list of high priority complications (see Table 31).

The rate of Hospital Acquired Complications was 20 per 1,000 hospital separations.

For the 175 surgeons who performed at least five procedures:

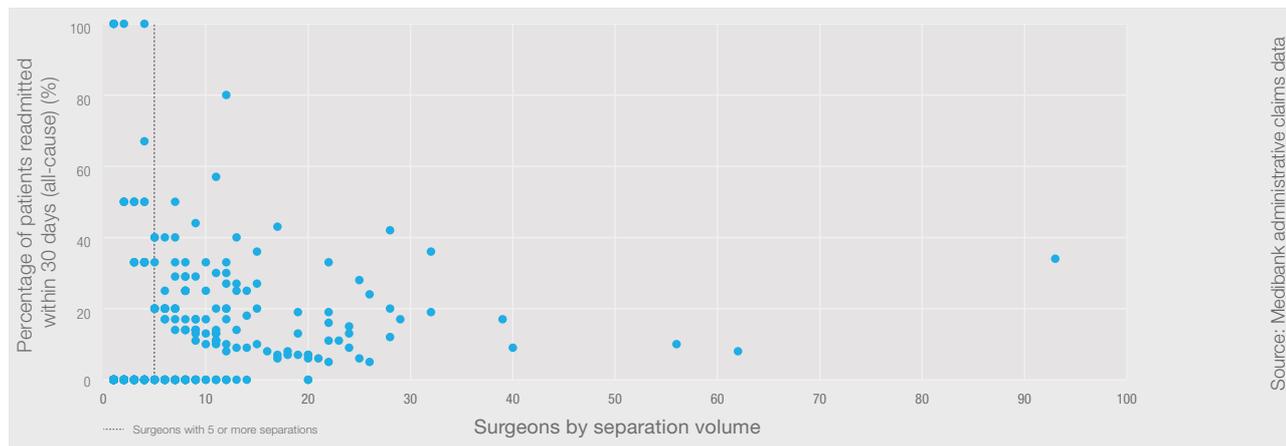

- 38 (22%) surgeons had one or more patient separations during which a Hospital Acquired Complication was identified
- The rate of Hospital Acquired Complications for a surgeon ranged between 0 per 1,000 separations to 286 per 1,000 separations with a median of 0 per 1,000 separations.

Table 16: Hospital Acquired Complications identified during the hospital separation

Description	Number recorded
Haemorrhage and haematoma complicating a procedure, not elsewhere classified	42
Vascular complications following infusion, transfusion and therapeutic injection	1
Foreign body accidentally left in body cavity or operation wound following a procedure	1
Sepsis following a procedure	2
Infection and inflammatory reaction due to other cardiac and vascular devices, implants and grafts	3
Infection and inflammatory reaction due to prosthetic device, implant and graft in urinary system	2
Total	51

What complications have you had for this procedure?

Figure 19: Percentage of patients readmitted within 30 days

In 295 (15%) of the hospital separations patients were readmitted (for all causes*) to a hospital within 30 days. Administrative claims data does not indicate whether the readmissions were planned or unplanned. The median age of patients readmitted was 70 years, compared with a median age of 69 years for those patients not readmitted. For the 295 readmissions:

- 252 readmissions were to a private hospital (the same one or a different hospital). In 14 of these separations a Hospital Acquired Complication was identified (see Table 17)
- 43 readmissions were to a public hospital (where the patient was treated as a private patient).

For the 175 surgeons who performed at least five procedures, the percentage of a surgeon's patients readmitted within 30 days ranged between 0% and 80% with a median of 13%.

Readmissions to public hospitals, where patients were treated as public patients, are not captured in these datasets.

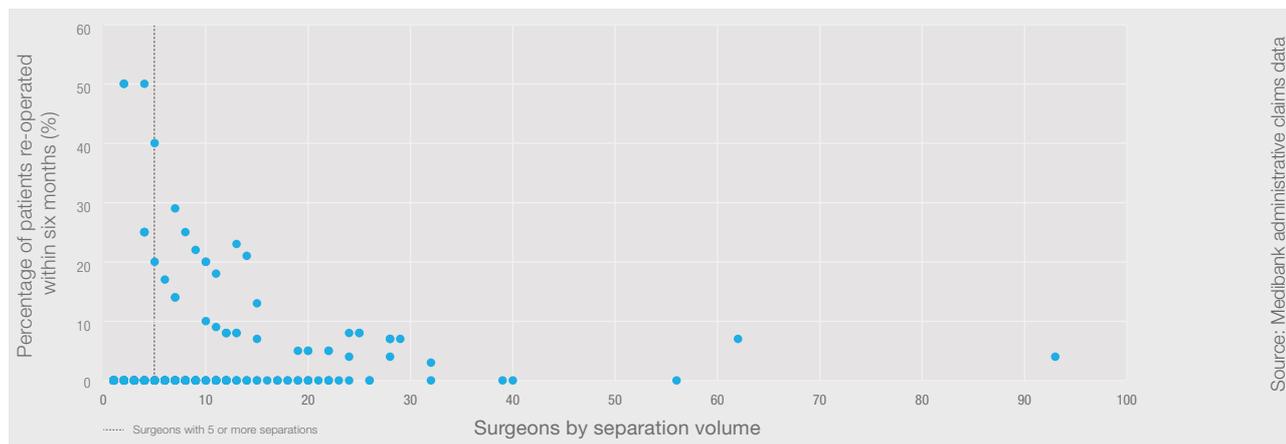

* Readmissions for rehabilitation, psychiatric treatment, dialysis and chemotherapy were excluded where identified. Separations involving a patient 80 years or older were also excluded.

Table 17: Hospital Acquired Complications identified on readmission

Category	Surgical complication	Infection	Total
Number recorded	9	5	14

What are the reasons for readmission for this procedure, and what is the expected rate?

Figure 20: Percentage of patients re-operated on within six months

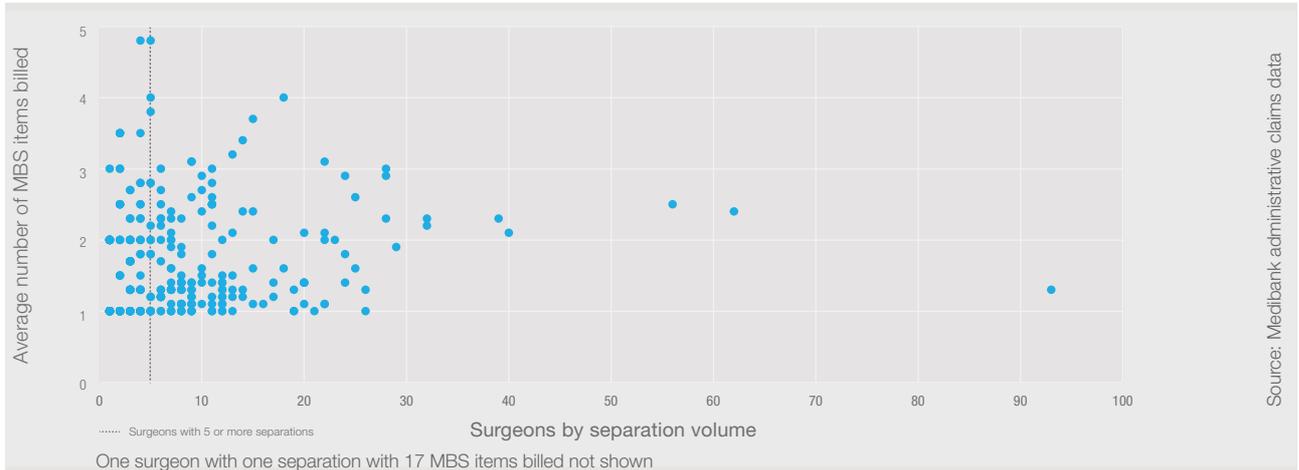

Patients were re-operated on (same procedure) within six months of discharge from hospital following 69 (3%) hospital separations. The median age of patients re-operated on six months after discharge was 72 years, compared with a median age of 71 years for those who were not.

Of the 175 surgeons who performed five or more procedures:

- 38 (22%) had one or more patients that were re-operated on within six months
- The percentage of a surgeon's patients re-operated on within six months ranged between 0% and 40% with a median of 0%.

What are the reasons for re-operation for this procedure, and what is the expected rate?

Figure 21: Average number of MBS items billed

The average number of MBS items billed by the surgeon (the principal surgeon only) was 1.8 per hospital separation.

Of the 175 surgeons who performed five or more procedures, the average number of MBS items billed by a surgeon ranged between 1.0 and 4.8 with a median of 1.4.

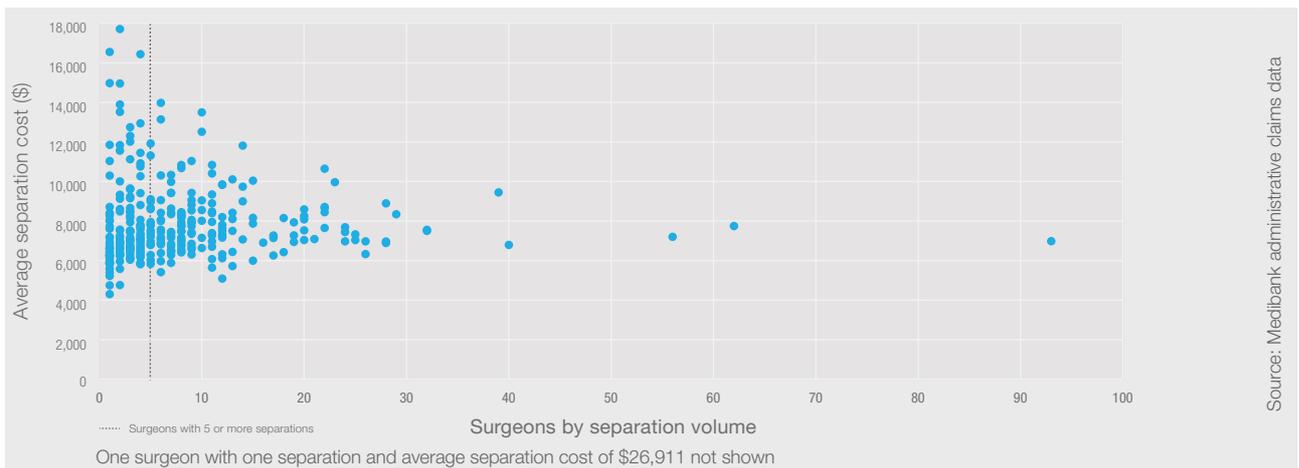

For the separations where MBS item number 37203 was recorded as the principal procedure (2,556 separations) the five most frequent MBS items billed by the surgeon are shown in the table below.

Table 18: MBS items billed by the surgeon (separations with principal MBS item # 37203)

MBS item number	Description	Total frequency	Frequency per separation
37203	Prostatectomy (endoscopic, using diathermy or cold punch), with or without cystoscopy and with or without urethroscopy	2,630	1.03
00105	Professional attendance by a specialist in the practice of his or her specialty	1,285	0.50
00104	Specialist, referred consultation - surgery or hospital	116	0.05
36863	Litholapaxy, with or without cystoscopy (Anaes.) (Assist.)	98	0.04
36845	Cystoscopy, with diathermy, resection or visual laser destruction of multiple tumours	70	0.03

What are the reasons for the wide variation in the number of MBS items billed?

Figure 22: Average separation cost

The separation cost includes the total charges for the hospital separation including payments made by Medibank, Medicare and the patient. Costs include hospital charges and prostheses charges, and fees charged by medical practitioners and for diagnostic services. The average total cost per hospital separation was \$7,857.

For the 175 surgeons who performed at least five procedures, the average separation cost for a surgeon ranged between \$5,078 and \$13,963 with a median of \$7,518.

Table 19: Average separation cost by state/territory

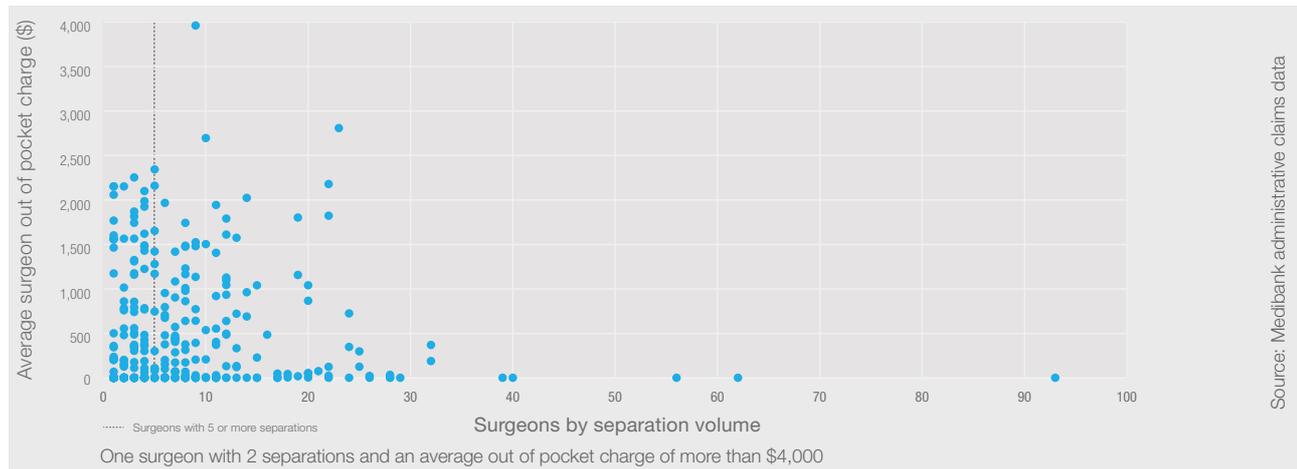

State/territory	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
Average separation cost	\$9,893	\$7,848	NA*	\$7,911	\$6,860	\$7,216	\$8,041	\$7,346

*State/territory values not reported if dataset includes less than 5 surgeons

Are you aware of the associated costs for this procedure such as pathology, diagnostic imaging, surgical assistants, anaesthetists, hospital bed fees?

What are the reasons for variation in separation costs?

Figure 23: Average surgeon out of pocket charge

Patients were charged an out of pocket fee by the surgeon in 35% of separations and the average charge was \$1,279.

For the 175 surgeons who performed at least five procedures, 48 (27%) did not charge any of their patients an out of pocket for the hospital admission. The average out of pocket charged by each surgeon ranged from \$0 (no out of pocket) to a maximum of \$3,958, with a median of \$152.

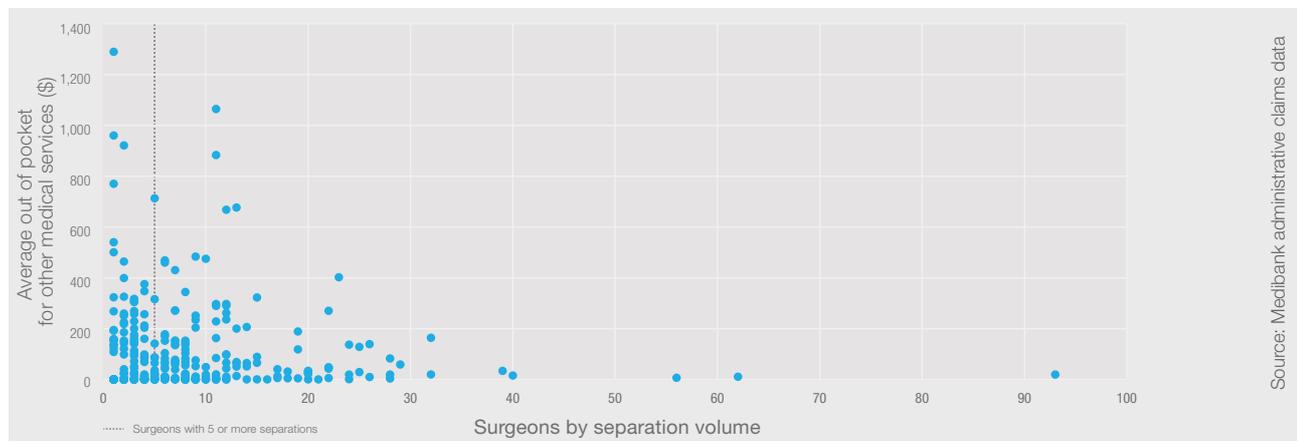

Table 20: Surgeon out of pocket charges by state/territory

State/territory	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
% of separations with OOP	93%	50%	NA*	60%	22%	27%	12%	38%
Average OOP	\$2,802	\$1,620	NA*	\$1,141	\$183	\$629	\$1,138	\$760

*State/territory values not reported if dataset includes less than 5 surgeons

Why is there such variation in the average out of pocket charge?

Figure 24: Average out of pocket charge for other medical services

Patients were charged an out of pocket fee for other medical services (including charges raised by the anaesthetist, assistant surgeon and for diagnostics) in 61% of separations and the average charge was \$147.

For the 175 surgeons who performed at least five procedures, the average out of pocket charges received by their patients for other medical services ranged between \$0 and \$1,064 with a median of \$36.

Table 21: Out of pocket charges for other medical services by state

	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
% of separations with OOP	86%	51%	NA*	55%	53%	35%	70%	74%
Average OOP	\$669	\$214	NA*	\$260	\$80	\$139	\$44	\$153

*State/territory values not reported if dataset includes less than 5 surgeons

Why is there such variation in the average out of pocket charge?

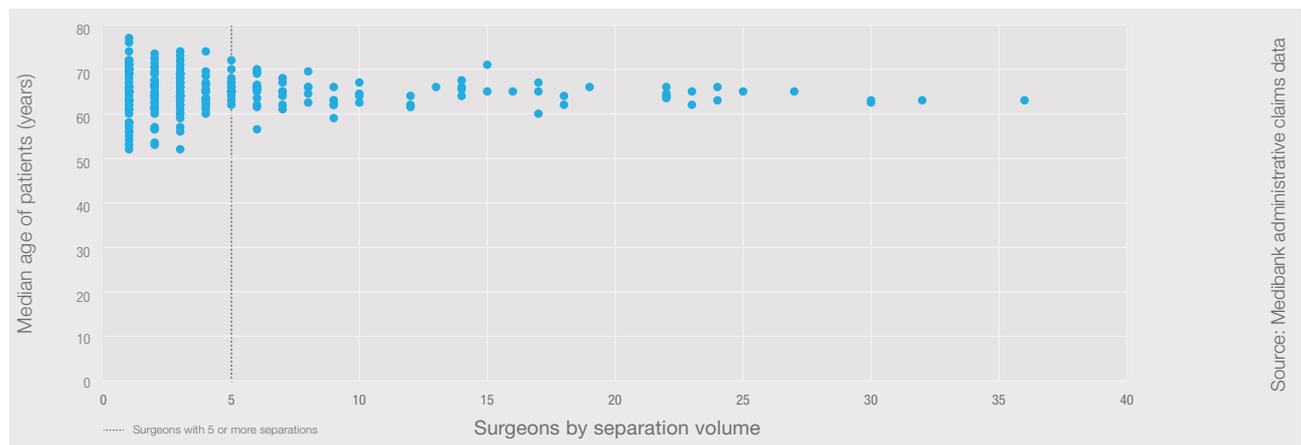

Radical prostatectomy procedures

In 2014 Medibank funded 1,273 operations in private hospitals where radical prostatectomy was recorded as the principal procedure (highest value MBS fee from the medical claim) for the hospital admission. The analysis is limited to those 1,273 procedures. 225 surgeons (identified through the stem of their Medicare provider number) billed Medibank for those procedures. 84 (37%) of these surgeons undertook five or more procedures. Surgeon-level analysis of the indicators considered for this procedure has been limited to those surgeons with five or more patient separations, so that each surgeon has a sufficient sample of separations from which a value (e.g. an average, median or percentage) for an indicator can be reported.

Table 22: MBS codes included in this analysis

Procedure	MBS Codes	Volume of separations	Percentage of separations	Definition
Radical prostatectomy surgery	37210	665	52.2%	Prostatectomy, radical, involving total excision of the prostate, sparing of nerves around the bladder and bladder neck reconstruction, not being a service associated with a service to which item 35551, 36502 or 37375 applies
	37211	608	47.8%	Prostatectomy, radical, involving total excision of the prostate, sparing of nerves around the bladder and bladder neck reconstruction, with pelvic lymphadenectomy, not being a service associated with a service to which item 35551, 36502 or 37375 applies

Figure 25: Median age of patients

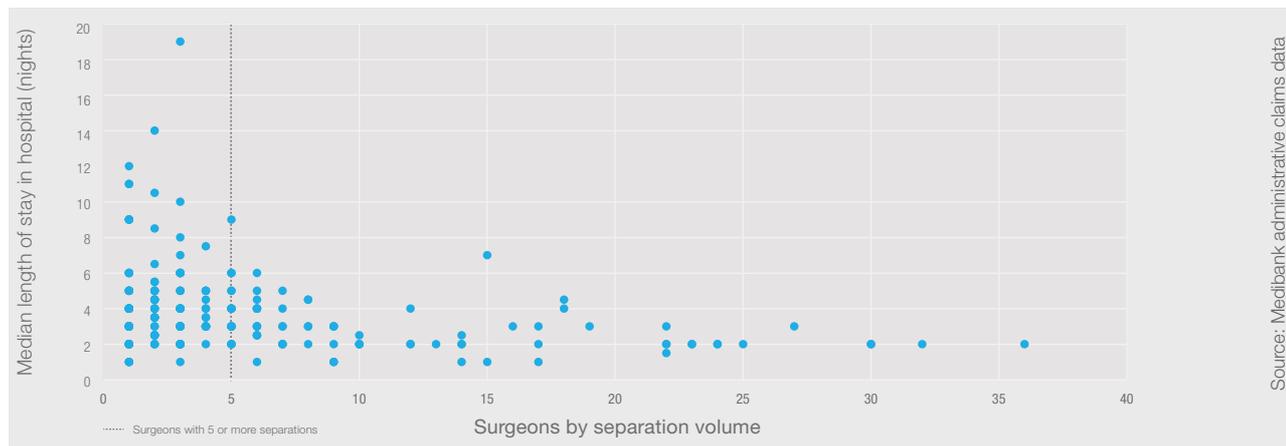

Across all separations the median patient age was 65 years.

For the 84 surgeons who performed at least five procedures:

- The median patient age of a surgeon ranged between 57 years and 72 years.

Is this variation in age clinically expected?

Figure 26: Median length of stay in hospital (nights)

Source: Medibank administrative claims data

For the 84 surgeons who performed at least five procedures:

- The median number of nights that a surgeon’s patients stayed in hospital ranged between 1 night and 9 nights with a median of 3 nights.

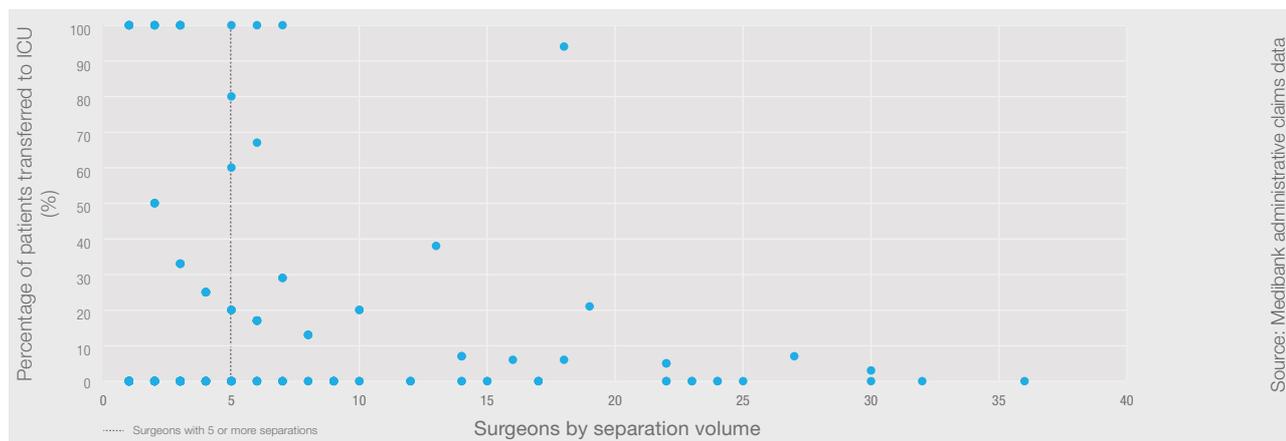

Table 23: Median length of stay (nights) by State/territory

State/territory	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
Length of stay	4	3	NA*	2	2	5	3	3

*Values not published if state/territory comprised less than 5 surgeons who billed Medibank, to protect anonymity

What would you consider the most effective length of stay for this procedure?

Figure 27: Percentage of patients transferred to ICU

Source: Medibank administrative claims data

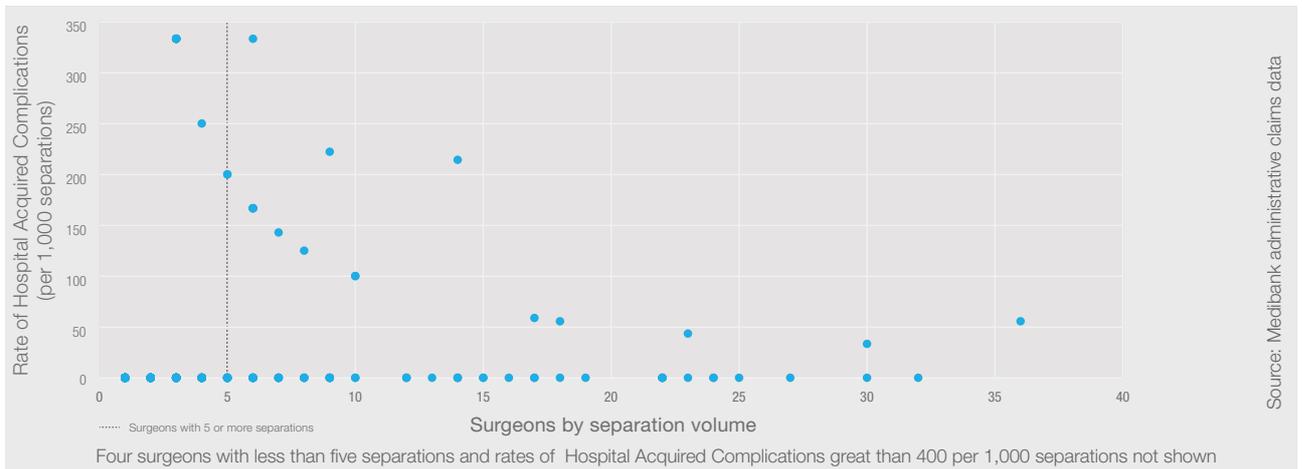

Patients were transferred to an intensive care unit (ICU) during 127 (10%) hospital separations. Administrative claims data does not indicate whether the transfers were planned or unplanned.

For the 84 surgeons who performed at least five procedures:

- 34 (40%) surgeons had one or more patient separations during which patients were transferred to ICU
- The percentage of a surgeon’s patients that were transferred to ICU ranged between 0% and 100% with a median of 0%.

Given that ICU transfers could indicate a difficult post-operative recovery, what would be the expected transfer rate?

Figure 28: Rate of Hospital Acquired Complications (per 1,000 separations)

Hospital Acquired Complications are a Medibank subset of 82 International Classification of Diseases (ICD) codes drawn from the Australian Commission of Safety and Quality in Health Care's list of high priority complications (see Table 31).

Across the total sample of hospital separations, the rate of Hospital Acquired Complications was 27 per 1,000 separations.

For the 84 surgeons who performed at least five procedures:

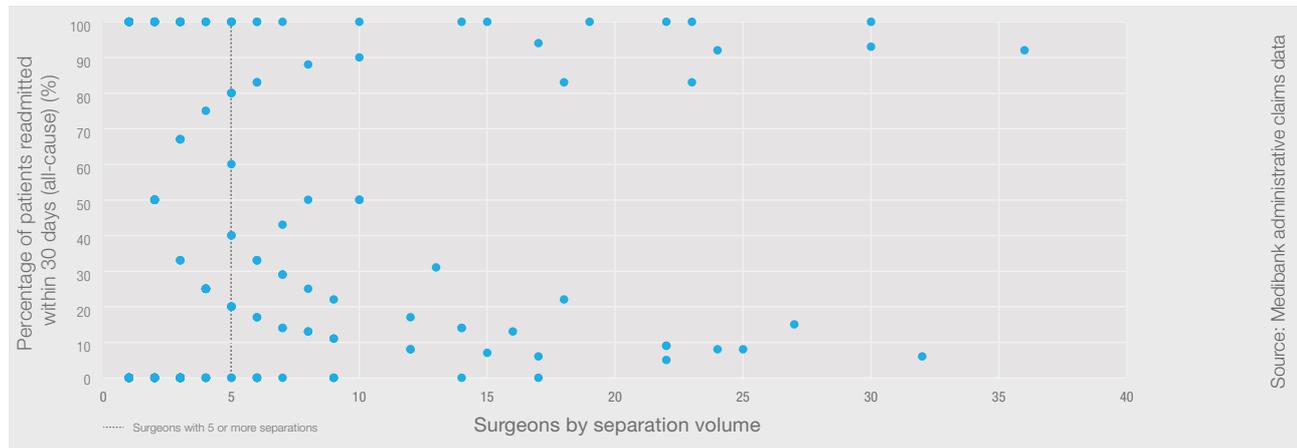

- 18 (21%) surgeons had one or more separations during which a Hospital Acquired Complication was identified
- The rate of Hospital Acquired Complications for a surgeon ranged between 0 per 1,000 separations to 333 per 1,000 separations, with a median of 0 per 1,000 separations.

Table 24: Hospital Acquired Complications identified during the hospital separation

Description	Number recorded
Haemorrhage and haematoma complicating a procedure, not elsewhere classified	26
Wound infection following a procedure	4
Foreign body accidentally left in body cavity or operation wound following a procedure	1
Accidental puncture and laceration during a procedure, not elsewhere classified	4
Disruption of operation wound, not elsewhere classified	1
Total	35

What complications have you had for this procedure?

Figure 29: Percentage of patients readmitted within 30 days

Following 544 (43%) separations, patients were readmitted (for all causes*) to a hospital within 30 days. Administrative claims data does not indicate whether the readmissions were planned or unplanned. There was no difference in the median age of patients readmitted and those not readmitted (65 years). Of the 544 separations followed by a readmission:

- 520 readmissions were to a private hospital (the same or a different private hospital). In 19 of these separations one or more Hospital Acquired Complications were identified, (a total of 20 Hospital Acquired Complications recorded in 520 readmissions, see Table 25)
- 24 readmissions were to a public hospital (where the patient was treated as a private patient).

For the 84 surgeons who performed at least five procedures, the percentage of a surgeon’s patients readmitted within 30 days ranged between 0% and 100% with a median of 24%.

Readmissions to public hospitals, where patients were treated as public patients, are not captured in these datasets.

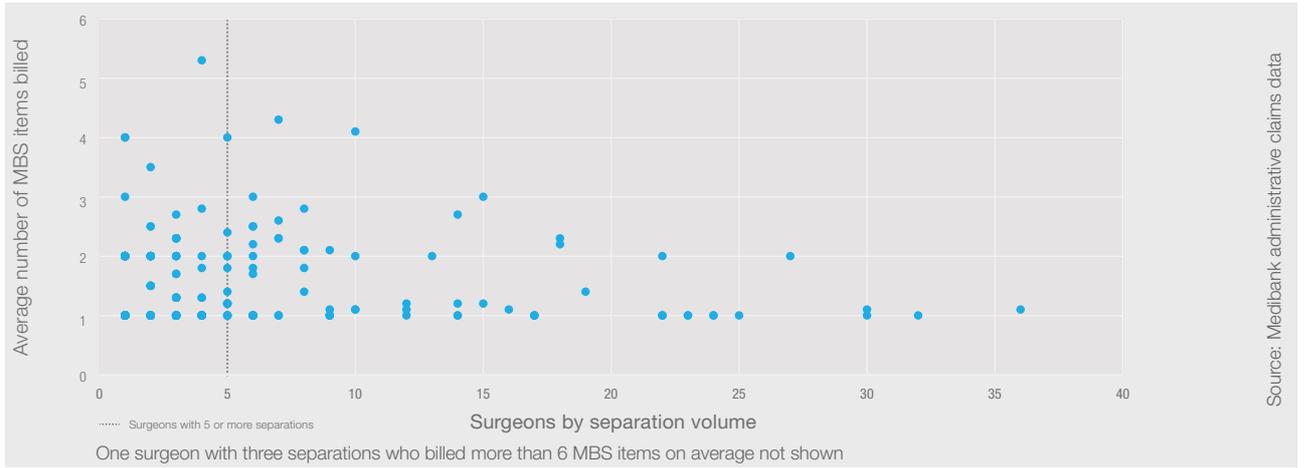

* Readmissions for rehabilitation, psychiatric treatment, dialysis and chemotherapy were excluded where identified. Separations involving a patient 80 years or older were also excluded.

Table 25: Hospital Acquired Complications identified on readmission

Category	Surgical complication	Infection	Total
Number recorded	9	11	20

What are the reasons for readmission for this procedure, and what is the expected rate?

Figure 30: Average number of MBS items billed

The average number of MBS items billed by the surgeon (the principal surgeon only) was 1.5 per hospital separation.

For the 84 surgeons who performed five or more procedures, the average number of MBS items billed by a surgeon ranged between 1.0 and 4.3 with a median of 1.1.

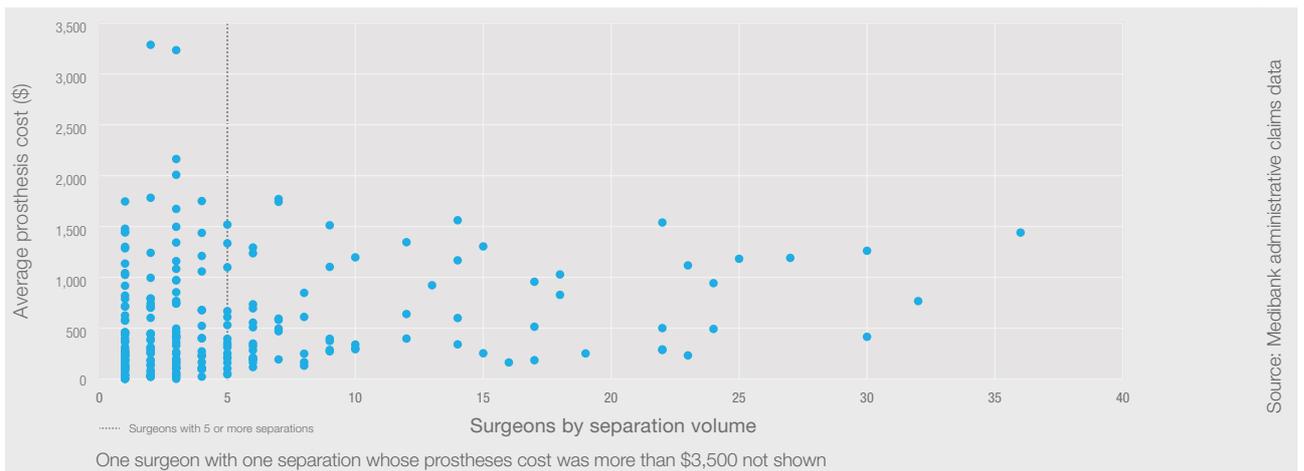

For the separations where MBS item number 37210 was recorded as the principal procedure (665 separations) the five most frequent MBS items billed by the surgeon are shown in the table below.

Table 26: MBS items billed by the surgeon (separations with principal MBS item # 37210)

MBS item number	Description	Total frequency	Frequency per separation
37210	Prostatectomy, radical, involving total excision of the prostate	682	1.03
00105	Professional attendance by a specialist in the practice of his or her specialty	178	0.27
30390	Laparoscopy, diagnostic, not being a service associated with any other laparoscopic procedure	28	0.04
36812	Cystoscopy with urethroscopy, with or without urethral dilatation	24	0.04
30393	Laparoscopic division of adhesions in association with another intra-abdominal procedure	11	0.02

What are the reasons for the wide variation in the number of MBS items billed?

Figure 31: Average prostheses cost

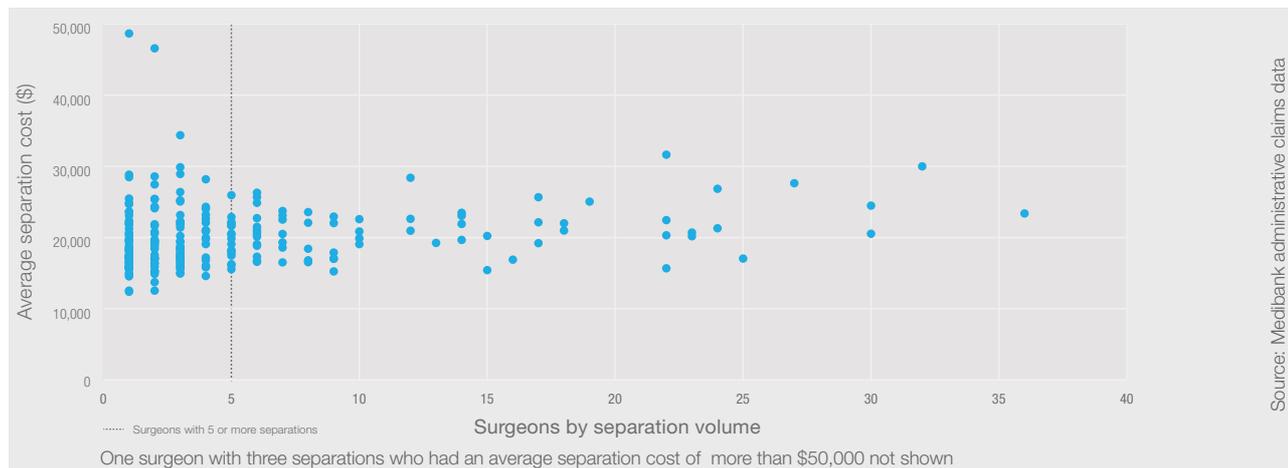

The average cost of prostheses items was \$679 per hospital separation.

For the 84 surgeons who performed at least five procedures, the average cost of prostheses used by a surgeon ranged between \$44 and \$1,768 with a median of \$492.

Are you aware of the associated costs for prostheses items used for this procedure?

What are the reasons for the variation in costs between surgeons?

Figure 32: Average separation cost

The separation cost includes the total charges for the hospital separation, including payments made by Medibank, Medicare and the patient. Costs include hospital charges and prostheses charges, and fees charged by medical practitioners and for diagnostic services. The average total cost was \$21,500 per hospital separation.

For the 84 surgeons who performed at least five procedures, the average separation cost of a surgeon ranged between \$15,215 and \$31,610 with a median of \$20,607.

Table 27: Average separation cost by state/territory

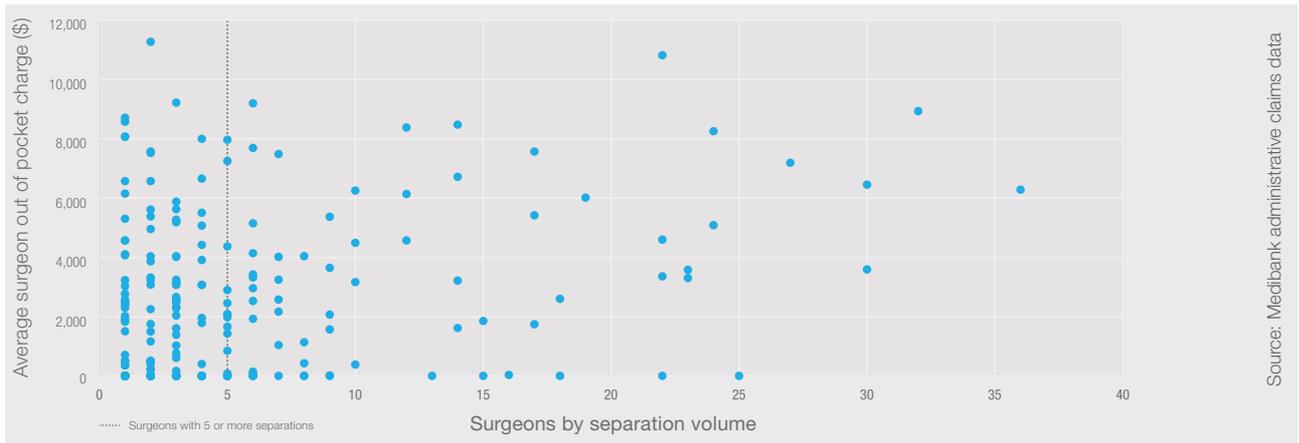

State/territory	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
Average separation cost	\$25,362	\$23,224	NA*	\$21,406	\$16,469	\$19,348	\$21,146	\$19,868

*Values not published if state/territory comprised less than 5 surgeons who billed Medibank, to protect anonymity

Are you aware of the associated costs for this procedure such as pathology, diagnostic imaging, surgical assistants, anaesthetists, hospital bed fees?

What are the reasons for variation in separation costs?

Figure 33: Average surgeon out of pocket charge

Source: Medibank administrative claims data

Patients were charged an out of pocket fee by the principal surgeon in 67% of separations and the average out of pocket charged was \$5,116. Some of these out of pocket charges may be due to the additional costs of robot-assisted surgery, which are typically paid for by the patient.

For the 84 surgeons who performed at least five procedures, 17 (20%) did not charge any of their patients an out of pocket for the hospital admission. The average out of pocket charge for a surgeon ranged from \$0 (no out of pocket charge) to a maximum of \$10,810. The median average out of pocket charged was \$2,585.

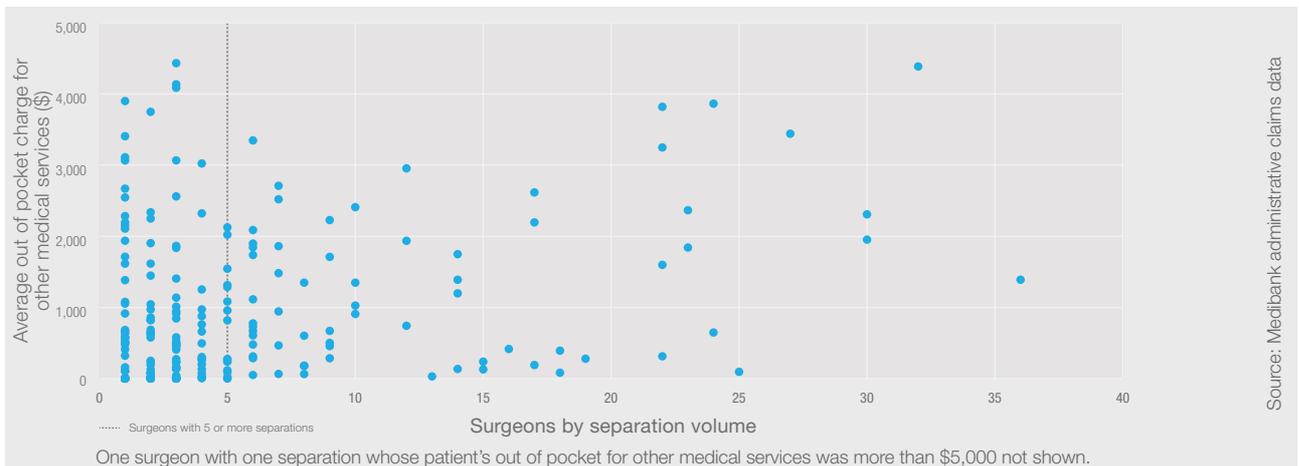

Table 28: Surgeon out of pocket charges by state/territory

State/territory	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
% of separations with OOP	100%	83%	NA*	82%	57%	59%	36%	69%
Average OOP	\$6,181	\$6,508	NA*	\$4,710	\$1,816	\$1,608	\$4,933	\$3,805

*Values not published if state/territory comprised less than 5 surgeons who billed Medibank, to protect anonymity

Why is there such variation in the average out of pocket charge?

Figure 34: Average out of pocket charge for other medical services

Source: Medibank administrative claims data

One surgeon with one separation whose patient's out of pocket for other medical services was more than \$5,000 not shown.

Patients were charged an out of pocket fee for other medical services (including charges raised by the anaesthetist, assistant surgeon and for diagnostics) in 96% of hospital separations.

For the 84 surgeons who performed at least five procedures, the average out of pocket charges received by a surgeon's patients for other medical services ranged between \$0 and \$4,383 with a median of \$924.

Table 29: Out of pocket charges for other medical services by state

	ACT	NSW	NT	QLD	SA	TAS	VIC	WA
% of separations with OOP	97%	98%	NA*	98%	80%	66%	96%	97%

Executive Summary

Introduction

The Royal Australasian College of Surgeons (RACS) and Medibank Private (Ltd.) recently produced a number of reports on surgical variation in high-volume procedures (RACS and Medibank 2016a). These initial reports examined variation within Medibank's administrative data-set, and based on these results an opportunity has arisen to assess the underlying clinical reasons for observed variations and establish recommendations for good clinical practice. Specifically, the data shows that the majority of patients who undergo hernia repair remain in hospital for one or more nights, whilst it is also known to be conducted as a same-day procedure.

The objective of the present review was to develop an evidence-base that can inform those areas of surgical variation in same-day surgery for hernia repair identified by the Surgical Variance Report, General Surgery (RACS and Medibank 2016b). The focus of this review is to provide guidance on best practice, inform on appropriate patient selection criteria and levers to drive change in practice, based on the best available evidence.

Methods

We utilised the rapid review method, which is an adaptation of a comprehensive systematic literature review technique. This approach ensures that project rigor is maintained while the review is completed in an expedited manner. This format allows the timely identification of best quality evidence at the highest level to answer the research questions (Watt et al. 2008a; Watt et al. 2008b). Studies were prioritised based on study design, recency and their relevancy to key clinical outcomes that inform the research questions. Studies were selected for inclusion based on a step-wise approach across three phases, as outlined in Appendix 1.

A Working Group was arranged to provide feedback and advice. The members were:

- Dr David Rankin (Medibank Clinical Director)
- Dr Stephen Bunker (Medibank Clinical Research Advisor)
- Professor Guy Maddern (Surgical Director RACS Research and Evaluation incorporating ASERNIP-S)
- Mr Alex Karatassas (General Surgeon)
- Professor David Watters (General Surgeon)
- Professor David Fletcher (General Surgeon)
- A/Prof Wendy Babidge (RACS Research, Audit and Academic Surgery Director)

The original project questions were refined and presented in a Protocol that received feedback from the Working Group. Results are provided for each research question, with the risk of bias associated with the identified evidence, literature findings (where available) and expert opinion reported for each.

Results and Conclusions

Same-day surgery for repair of inguinal, femoral and umbilical hernia is safe and effective. However, there are a number of limitations on the evidence used to form this conclusion. The evidence base is stronger for inguinal hernia and includes randomised controlled trials and other comparative

studies, while the evidence for femoral and umbilical hernia is limited to small numbers of observational studies. The studies included were able to provide some observations regarding which patient groups are unsuitable for same-day hernia repair in a clinical setting. Limited evidence suggests these patient groups include those who are elderly (over 70 years), over body mass index (BMI) of 40 (overweight), and those undergoing bilateral surgery. Two studies reported the proportion of patients ineligible for same-day hernia repair, which ranged from 3.3 – 8.0 per cent. Follow-up time across studies was relatively short and may be insufficient to investigate and report long-term adverse events. Overall, a range of guidelines and studies are consistent in the message that a large proportion of hernia repairs can be provided as a same-day procedure.

Australian and international guidelines recommend day surgery for most patients undergoing inguinal hernia repair surgery, providing surgical infrastructure is available to assess and select patients and suitable aftercare is available. The available guidelines were not explicit on day surgery for femoral and umbilical hernia repair. Australian guidelines on the broader issue of same-day surgery, published by the Australian & New Zealand College of Anaesthetists, state that requirements for same-day surgery to be acceptable are based on procedural, patient and social factors.

Clinical practice guidelines and published data from a range of countries are consistent in reporting that an appropriate rate of same-day hernia repair is in the order of 70–80 per cent of all hernia repair surgery. This rate is much greater than in Australian clinical practice, as identified through Medicare administrative data, where in 80 per cent of hospital separations the patient stayed in hospital for at least one night.

Besides the established clinical evidence and widely accepted guidelines, day surgery in general is a multifaceted topic, and many influential factors are external to clinical issues. Hospital management, financial incentives, social factors, facilities and staffing are all important aspects to determine the success of day surgery. While barriers for day surgery exist in all of these aspects, the interaction between patients, healthcare providers and the community remains the greatest one. It is plausible to gain leverage in promoting day surgery by enhancing the patient-doctor communication and education to increase patients' satisfaction, ameliorating staffing and facilities to match resources for day surgery, and creating supportive communities and policies. The acceptance and promotion of day surgery requires a holistic approach from a range of financial, institutional, societal and individual efforts.

A draft of this report was shared with the Working Group for input. Overall comments from the Working Group included the need for appropriate preoperative assessment, the benefits of protocols to guide communication and clinical practice, and the importance of dedicated facilities for same day surgery. There was agreement that most inguinal or umbilical hernia repair procedures can be undertaken in a day surgery setting. Patient preference was also discussed as being an important factor.

In summary, although the clinical benefits of day surgery for hernia repair are well established, there are a number of reasons as to why this activity is less common than expected and this report aims to highlight associated incentives which may be used to promote changes in local practice.

Recommendations

1. Most patients with inguinal or umbilical hernia can be managed as day patients.
2. There are patient satisfaction and financial incentives to maximise day surgery rates without posing risks for suitable patients.
3. The method of hernia repair will not generally affect the decision whether to manage the patient as a day patient or plan for an overnight stay.
4. Good preoperative assessment, planning and informing the patient has the potential to improve same-day surgery discharge rates.
5. Collaboration with the anaesthetists and involvement of anaesthetists in discharge planning is important.
6. The rate of same-day patients to overnight stay patients should be made transparent. The target rate for hospitals should be between 70 to 80% patients as same-day cases.
7. Patients with complex hernias and comorbidities will generally benefit from an overnight stay, or at least be considered for such.
8. The development of Australian and New Zealand guidelines or protocols should be considered, especially in the context of communication and planning to minimise barriers to same-day hernia repair.

Background

Introduction

Variation in the provision of services across surgical practice is often necessary as a result of patient needs, surgeon preference, available resources and jurisdictional requirements. However, in certain circumstances variation may be as a result of a range of different issues, which may be unrelated to clinical aspects and which may lead to increased risk for the patient and the service provider.

Guidelines established by the Australian & New Zealand College of Anaesthetists (2010; 2016) provide general recommendations on same-day surgery in Australia. They state these broader issues include patient selection and anaesthesia factors, procedural considerations, and recovery and discharge arrangements, as well as adequacy of facility resources.

The Royal Australasian College of Surgeons (RACS) and Medibank Private (Ltd.) recently produced a number of reports into surgical variation for high-volume procedures (RACS and Medibank 2016a). These initial reports examined variation within Medibank's administrative data-set, and based on these results an opportunity has arisen to assess the underlying clinical reasons for observed variations and establish recommendations for good clinical practice. In 80 per cent of the hospital separations reported in the data set the patients stayed in hospital for at least one night. The length of stay ranged from same day discharge to up to 10 nights, with one night being the median across all states in Australia. This variation in length of stay has also been observed in many other countries where the origin of the variation has been suggested to be related to the preoperative assessment of patients (Stomberg et al. 2013).

This report has been compiled to develop an evidence-base that can inform those areas of surgical variation in same-day surgery for hernia repair identified by the Surgical Variance Report, General Surgery (RACS and Medibank 2016b). Evidence from published literature is required to **demonstrate** and **promote best practice**. The focus of this report is to provide guidance on best practice, inform on appropriate patient selection criteria and levers to drive practice change, based on the best available evidence.

Project scope

The original project questions were refined and presented in a Protocol that received feedback from the Working Group.

Research questions

1. What is the safety and effectiveness of same-day surgery for inguinal, femoral and umbilical hernia repair compared to surgery with at least one night stay in-hospital?
2. What length of hospital stay does evidence-based Australian or International clinical practice guidelines (CPGs) recommend for surgical treatment of inguinal, femoral and umbilical hernia repair?
3. Are any patient groups not suitable for same-day inguinal, femoral or umbilical hernia repair?
4. What proportion of patients undergoing hernia repair are expected to be ineligible for same-day surgery?

5. Are there any broader criteria for same-day procedures to be performed in Australia that are not specific to hernia repairs?
6. What other factors are reported in the literature (peer-reviewed and grey literature) and/or by clinical experts that impact on the decision to perform same-day surgery?

The report is structured by research question; with the risk of bias associated with the identified evidence, literature findings (where available) and expert opinion reported for each.

PICO criteria

Population, Intervention, Comparator and Outcomes (PICO) were defined as following:

- Population: Adult patients undergoing surgery for inguinal, femoral and umbilical hernia of any type or complexity
- Intervention: planned same-day procedure involving surgery of any type (open or laparoscopic, with or without mesh)
- Comparator: planned ≥ 1 overnight stay following surgery
- Outcomes: adverse events, readmission to hospital, hernia recurrence, cost and resource use (e.g. hospital or hotel resources), medical management (e.g. use of analgesia, use of anti-emetics), issues of equity (e.g. distance of patient from hospital)

Note: Same day surgery is defined as admission and discharge within the same calendar day. Admission and discharge within a 23 hour period, including an overnight stay, is not considered same-day surgery for the purposes of this review.

Further detailed methods are provided in Appendix 1.

Established knowledge

In addition to length of hospital stay, literature was identified relating to a number of other variables surrounding surgery for hernia repair. A systematic review by Treadwell et al. (2012) gives a comprehensive review of hernia repair with a comparison across a large range of techniques. The results for each comparison are summarised below:

- **Repair vs watchful waiting for pain-free hernia**

Two randomised controlled trials (RCTs) met the inclusion criteria which were considered to have moderate risk of bias for all outcomes reported. One RCT was a North American multi-centre study which was funded by a manufacturer of mesh plugs (Fitzgibbons 2006), and the second was a United Kingdom single-centre RCT which did not report source of funding (O'Dwyer 2006). Both studies compared watchful waiting to Lichtenstein repair. All patients had clinically apparent hernia.

Considered outcomes were long-term quality of life, long-term pain, and acute hernia/strangulation. There was sufficient comparative evidence to derive a conclusion on one outcome only, quality of life, which at six months and one year was greater for patients who had received mesh repair than for those who were on watchful waiting. No indication was given as to which patients might specifically benefit from watchful waiting.

The European Hernia Group guidelines advise watchful waiting is a safe and acceptable option in patients with minimally symptomatic hernias and should be considered in elderly patients or patients with major comorbidities (Miserez et al. 2014).

- **Open mesh vs laparoscopic repair with mesh for primary hernia**

Of 38 non-randomised comparative studies which met the inclusion criteria, all but two (which were registry studies) were considered to have moderate risk of bias. Comparisons included transabdominal preperitoneal (TAPP) repair vs Lichtenstein repair (14 studies), totally extraperitoneal (TEP) repair vs Lichtenstein repair (14 studies), TAPP repair vs mesh plug (3 studies), TEP repair vs mesh plug (3 studies), and TAPP repair/TEP repair vs Lichtenstein repair (4 studies).

There was sufficient evidence to derive the following conclusions. Laparoscopy was favoured for time to return to work, time to return to daily activities, lower rates of long-term pain, haematoma and wound infection. Open surgery was favoured for hernia recurrence and epigastric vessel injury. There was approximate equivalence for length of stay.

- **Open mesh vs laparoscopic repair with mesh for bilateral hernia**

Six studies met the inclusion criteria, all but one (which was a registry study of level IV evidence) were considered to have moderate risk of bias.

The evidence was adequate to allow a conclusion on one outcome, return to work, with bilateral hernia patients returning to work sooner if they underwent laparoscopic repair.

- **Open mesh vs laparoscopic repair with mesh for recurrent hernia**

Eight non-randomised comparative studies met the inclusion criteria, all but two (which were registry studies) were considered to have moderate risk of bias. Procedures were Lichtenstein repair (including TAPP and TEP repair) and the Stoppa procedure.

Laparoscopic repair was associated with lower rates of recurrence, faster return to daily activities, and lower rates of long-term pain.

- **Different types of open mesh repair**

Nineteen non-randomised comparative studies met the inclusion criteria, most studies were considered to have a moderate risk of bias. Comparisons included Lichtenstein repair vs mesh plug (7 studies), Lichtenstein repair vs Prolene Hernia System (5 studies), Lichtenstein repair vs open preperitoneal mesh (3 studies), mesh plug vs Prolene Hernia System (2 studies), and Lichtenstein repair versus Kugel® patch (2 studies).

For Lichtenstein repair vs mesh plug technique, recurrence rates were similar, but Lichtenstein repair yielded better results for return to work and rates of seroma. For Lichtenstein repair vs Prolene Hernia System and Lichtenstein repair vs open preperitoneal mesh, outcomes for short-term pain were similar. For mesh plug vs Prolene Hernia System, outcomes for short-term pain were similar. For Lichtenstein repair vs Kugel mesh, outcomes were similar for both short-term pain and intermediate-term pain.

- **Different types of laparoscopic mesh repair**

Eleven non-randomised comparative studies met the inclusion criteria, most of which were considered to have a moderate risk of bias.

For the studies that compared TAPP repair versus TEP repair, TAPP resulted in quicker return to work. Data on short-term, intermediate-term, and long-term pain suggested equivalence.

- **Different mesh materials**

Of the 32 non-randomised comparative studies which met the inclusion criteria, most were considered to have a moderate risk of bias. Comparisons included standard polypropylene vs low-weight polypropylene (6 studies), standard polypropylene vs combination materials (12 studies), standard polypropylene vs coated polypropylene (6 studies), standard polypropylene vs three-dimensional Prolene Hernia System (2 studies), standard polypropylene vs porcine (2 studies), combination materials vs porcine (1 study), and low-weight polypropylene vs combination materials (3 studies).

Standard polypropylene mesh and combination materials had similar rates of recurrence. Three types of mesh (standard polypropylene, low-weight polypropylene, and porcine) had approximately equivalent rates of long-term pain.

- **Mesh fixation approaches**

Twenty-three non-randomised comparative studies met the inclusion criteria, most studies were considered to have a moderate risk of bias. Comparisons included tacks or staples vs no fixation (7

studies), fibrin glue vs staples (3 studies), sutures vs tacks (3 studies), sutures vs glue (7 studies), and absorbable sutures vs nonabsorbable sutures (3 study).

Approximate equivalence was found in recurrence rates for tacks or staples vs no fixation and sutures vs glue. Also, for long-term pain, approximate equivalence was found between sutures and glue, but less pain was associated with fibrin glue than staple fixation.

Results

The evidence base for this review is broad and includes a range of publications from systematic reviews, comparative studies, observational studies, evidence-based clinical practice guidelines, together with grey literature and opinion pieces. A PRISMA chart of study selection is shown in Appendix 3. Specific definitions of day surgery were unclear or varied between studies. The literature available is discussed in more detail in the response to each question.

Question 1: What is the safety and effectiveness of same-day surgery for inguinal, femoral and umbilical hernia repair compared to surgery with at least one night stay in hospital?

Identification of literature

Results were sourced from studies with the highest level of evidence on each hernia type. Following phase 2 study selection (full text review), a total of 47 studies were available which were relevant to question 1 (see Appendix 2). From this evidence base five studies (a systematic review and 4 case series) were included for extraction and review. The 41 remaining studies were of lower level evidence which are subject to high levels of bias and did not add to the available higher level evidence. The majority of these lower level evidence studies were included in a systematic review which was one of the five studies included for extraction and review.

The systematic review included all inguinal hernia repair patients (Fischer and Zechmeister-Koss 2014). Further studies were included to ascertain the safety and effectiveness of same-day surgery for femoral and umbilical hernia repair. One case series included a proportion of patients with femoral hernia together with the majority having inguinal hernia (Voorbrood et al. 2015). Three studies included patients with umbilical hernia (Kulacoglu et al. 2012; Kurzer et al. 2004; Menon and Brown 2003). One case series included a proportion of patients with femoral hernia together with the majority having inguinal hernia (Voorbrood et al. 2015). Three studies included patients with umbilical hernia (Kulacoglu et al. 2012; Kurzer et al. 2004; Menon and Brown 2003) (Table 15). A list of studies presenting outcomes relevant to question 1 are provided in Table 1.

As outlined in detail in the Established Knowledge section, Treadwell's (2007) systematic review on different types of hernia surgery, which did not differentiate by hernia type, concluded open and laparoscopic repair were found to have approximate equivalence for length of stay.

GRADE of the evidence-base

Table 1 provides a summary of findings for selected outcomes that were reported for question 1.

Table 1 GRADE of the evidence base for question 1

Outcomes	Assessment	Ne of participants (studies)	Quality of the evidence (GRADE)
Recurrence	Recurrence was recorded in same-day hernia repair patients.	4 (4 observational studies)	⊕⊕○○ LOW ^{ab}

Outcomes	Assessment	No of participants (studies)	Quality of the evidence (GRADE)
Unexpected prolonged stay	Unexpected prolonged stay was recorded in same-day hernia repair patients.	3 (3 observational studies)	⊕⊕○○ LOW ^{a,b}
Complications	Complications were recorded in same-day hernia repair patients.	5 (5 observational studies)	⊕⊕○○ LOW ^{a,b}

a. High risk of bias according to Downs and Black tool (Downs and Black 1998), b. ⊕⊕○○ **Low quality:** Our confidence in the effect estimate is limited: The true effect may be substantially different from the estimate of the effect.

Results: inguinal hernia repair

A systematic review by Fischer and Zechmeister-Koss (2014) addressed the safety and effectiveness of same-day surgery for femoral and inguinal hernia repair. It included three non-randomised controlled trials and two case series on inguinal hernia repair. Follow-up ranged from 3–48 months. The five other studies included to inform on the safety and effectiveness of inguinal hernia repair included one RCT, two non-randomised comparative studies and two case series including a total of 2260 patients. The systematic review identified no studies on femoral hernia repair suitable for inclusion. On the basis of the six included studies the authors concluded that inguinal hernia repair can be done safely and effectively in both day surgery and as an inpatient providing the patient fulfils the general eligibility criteria for day surgery. Satisfaction was reported in the included RCT. There was no significant difference in quality of life as measured with the RAND-36-Item Health Survey between the day case and the inpatient groups. General eligibility criteria for day surgery were not explained, although it was assumed that each hospital or healthcare system will have their own policy on this.

Subsequent to the systematic review Meyer et al. (2015) published a case series of 30 patients with inguinal hernia in France/Brazil, Lingaiah et al. (2015) published a case series of 50 patients with inguinal hernia in India, and Voorbrood et al. (2015) published a case series of 336 patients, 330 of whom had inguinal hernia, in the Netherlands. The studies found that same-day hernia repair is feasible with low rates of complications and, in Voorbrood et al. (2015) on a scale of 0–10 (where 10 was extremely satisfied), patient satisfaction was 9.0 (8.89–9.17 95 % CI).

Results: femoral hernia repair

Only one case series, in which six patients out of 336 had femoral hernia, was available on femoral hernia repair (Voorbrood et al. 2015). All consecutive patients had an appointment for same-day hernia repair in one high volume hospital in the Netherlands and 96.3% of patients had same-day surgery as planned. Of the day surgery, no conversion to open surgery was required and complications were minimal. Nine patients required admission for one night due to complications; one for 10 nights due to an unforeseen complication, and, owing to late scheduled surgery, one patient remained in hospital overnight. Outcomes were not presented for hernia type. In general, it was concluded that same-day surgery for hernia is feasible and satisfactory from an institutional perspective, as well as from a patient perspective.

Results: umbilical hernia repair

Umbilical hernia patients were studied in two retrospective and one prospective case series (Kulacoglu et al. 2012; Kurzer et al. 2004; Menon and Brown 2003), including 185 umbilical repair patients in total. Kulacoglu et al. (2012) concluded that repair of umbilical hernia as day surgery with local anaesthesia is a good option, with low infection and recurrence rates. The mean discharge time after the completion of surgery was 122 ± 58 min (45–420 min). No patient was converted to general anaesthesia. Doses of local anaesthetic agents needed were higher than those for inguinal hernia repair. Higher anaesthetic doses may be required for patients with higher BMI, recurrent hernia, and defects larger than three centimetres. Patient satisfaction rate was 97%, measured as the absence of pain (VAS) and post-operative nausea and vomiting. Being provided with detailed information about the surgery and the anaesthetic improved patient satisfaction.

Kurzer et al. (2004) and Menon & Brown (2003) studied 73 and 32 umbilical hernia repair patients, respectively, and concluded that same day surgery can be accomplished. A high degree of patient satisfaction was claimed in Kurzer et al. (2004), with no measure reported.

Summary

Same-day surgery for repair of inguinal, femoral and umbilical hernia is safe and effective. No study reported low patient satisfaction after same-day hernia repair. However, there are a number of limitations on the evidence used to form this conclusion. The evidence base is stronger for inguinal hernia. The low numbers of published studies, small population sizes and lack of comprehensive reporting with femoral and umbilical hernia repair provide a potential for bias. None of the studies, including those on inguinal hernia, reported on complex hernia repair.

Follow-up time across studies was relatively short, and may be insufficient to investigate and report long-term adverse events (such as small bowel obstruction).

Table 2 Outcomes relevant to question 1

Study ID	Publication Type	Participant characteristics	Same-day discharge rate	Comment
Fischer & Zechmeister-Koss (2014)	Systematic review of hernia repair with a mixture of level of evidence	35 studies	NR	Same-day surgery is safe and effective in 11 procedures, including inguinal hernia repair
Lingaiah et al. (2015)	Case series; retrospective; hospital records	N=40 NR	31%	No mortalities. Day care surgery is effective with low complications.
Meyer et al. (2015)	Case series; prospective; consecutive patients	N=50 NR	100%	Same-day surgery is safe and effective and should be considered for all patients
Voorbrood et al. (2015)	Case series; prospective; consecutive patients	N=336 ASA I or II Unilateral	97%	Same-day inguinal hernia repair is safe and effective, both from an institutional and patient perspective
Kulacoglu et al. (2012)	Case series; retrospective; consecutive patients	N=100 paraumbilical	100%	Same day umbilical hernia repair is safe and effective with low infection and recurrence rates
Kurzer et al. (2004)	Case series; prospective	N=73 ASA I or II	NR	Open repair with mesh is suitable for umbilical hernia and lends itself to same-day surgery with local anaesthetic in the majority of patients
Menon & Brown (2003)	Case series; retrospective	N=32 Uncomplicated	100%	Same-day umbilical hernia repair is safe and effective

ASA: American Society of Anesthesiologists status; NR: not reported.

Question 2: What length of hospital stay does evidence-based Australian or international clinical practice guidelines recommend for surgical treatment of inguinal, femoral or umbilical hernia repair?

Identification of literature

Two searches were conducted to identify clinical practice guidelines (CPGs) providing recommendations on length of hospital stay following inguinal, femoral or umbilical hernia repair. The first search was conducted in PubMed and Embase databases to identify guidelines published in the peer-reviewed literature. The second search involved keyword searching of relevant websites to identify any guideline not identified in the database search. The methods are described in Appendix 1.

Nine clinical practice guidelines, published between 2006 and 2016 were identified from database and grey literature searching. A summary of the guidelines and their recommendations regarding length of hospital stay for hernia surgery is summarised in Table 16 (Appendix 5). The evidence base underpinning the recommendations is described in Table 17 (Appendix 5).

Quality of the evidence-base

The CPGs were appraised using the AGREE II tool by one researcher and checked by a second (Brouwers et al. 2010) (Appendix 1). The CPG by the European Hernia Society (Miserez et al. 2014; Simons et al. 2009) was rated as 'Good' quality, the other CPGs were rated as being of 'Acceptable' quality. All the recommendations in the guidelines were informed by systematic searches of the literature as well as by expert consensus.

Results: inguinal hernia repair

Six guidelines (two of which had recent updates) provided recommendations on length of hospital stay for inguinal hernia repair (Bittner et al. 2011; Bittner et al. 2015; Lomanto et al. 2015; Miserez et al. 2014; Rosenberg et al. 2011; Sanders et al. 2013; Simons et al. 2009; The HerniaSurge Group 2016).

The CPG developed by the HerniaSurge group provided the most recent and comprehensive recommendations on length of stay for inguinal hernias. The guideline Steering Committee and Working Group included members from every continent including an Australasian Hernia Society representative; surgeons who performed (and researched) all types of hernia repair were included. The guideline is intended to cover the management of all adult groin hernia patients worldwide. A literature search was conducted up to 1 January 2015 for systematic reviews and up to 1 July 2016 for RCTs. Evidence was scored using the Oxford, SIGN and GRADE methodologies (Appendix 5). Statements and Recommendations were developed and graded during consensus meetings. "Recommend" was used where strong evidence was available; "Suggest" was used where weak evidence was available.

The HerniaSurge group recommends day surgery for the majority of groin hernia patients provided adequate aftercare is organised. This recommendation is consistent with evidence-based guidelines produced by the European Hernia Society (Miserez et al. 2014; Simons et al. 2009), the British Hernia Society (Sanders et al. 2013) and the Danish Hernia Database (Rosenberg et al. 2011). Guidelines

developed for the Asia region (Lomanto et al. 2015) recommend day surgery should be considered for American Society of Anesthesiologists (ASA) I and II patients following anaesthesia assessment.

The HerniaSurge group also included suggestions for length of stay for specific population groups. Day surgery (providing adequate aftercare is available) was suggested for:

- All endoscopic repairs of simple inguinal hernias
- Selected older patients (including octogenarians but excluding nonogenerians)
- ASA IIIa patients undergoing open repair with local anaesthesia
- Patients undergoing complex inguinal hernia care only in selected cases (these should generally not be performed as day surgery)

The only conflict between these suggestions and the other identified guidelines is that the Asian guidelines recommend all patients ASA \geq III, where surgery is performed under local or general anaesthesia, should be admitted for an overnight stay.

Results: femoral hernia repair

No guideline making recommendations on length of stay following femoral hernia surgery was identified.

Guidelines by the HerniaSurge group (2016) the British Hernia Society and the Danish Hernia Database (Rosenberg et al. 2011) included guidance on femoral hernias; however, recommendations on length of stay and the evidence supporting them are specific to inguinal hernia repair.

Results: umbilical hernia repair

One guideline, reported in two publications, on ventral hernia repair was identified (Bittner et al. 2014a; Bittner et al. 2014b). The guideline did not provide any recommendation on the appropriateness of day surgery; however it did recommend that hospital stay be as short as possible and that based on the shorter hospital stay, laparoscopic repair is recommended.

Summary

Day surgery is recommended for most patients undergoing inguinal hernia repair provided surgical infrastructure is available to assess and select patients and suitable aftercare is available.

Elements which were suitable for or supported same-day surgery were:

- ASA I and II patients following anaesthesia assessment (grade of recommendation: strong)
- Endoscopic repairs of simple inguinal hernias (weak)
- Selected elderly patients (including octogenarians but excluding nonogenerians) (weak)
- ASA IIIa patients undergoing open repair with local anaesthesia (weak)

Elements where a day procedure was generally unsuitable were:

- Patients undergoing complex inguinal hernia care (weak)
- Elderly patients (age not defined but includes all nonogenerians) (weak)
- All ASA IV and some ASA III patients (weak)
- Co-morbidity (weak)
- Patients on anticoagulants due to higher risk of bleeding complications (moderate evidence)

For femoral and umbilical hernia, no guidance on the appropriateness of day surgery was identified.
For umbilical hernia repair, hospital stays are recommended to be as short as possible.

Question 3: Are any patient groups not suitable for same-day inguinal, femoral or umbilical hernia repair?

Identification of literature

Results were sourced from studies with the highest level of evidence including patients with each hernia type of interest. Following phase 2 study selection (full text review), a total of sixteen studies were available which were relevant to question 3 (see Appendix 2). From this evidence base, four studies were included for extraction and review. The 12 remaining studies were of lower level evidence which are subject to high levels of bias and did not add to the available higher level evidence.

The four included studies were non-randomised comparative studies concerning different patient groups. These studies report on patients in all three hernia groups. Patient types included those from metropolitan and regional locations, obese, elderly, those of African-American race, and having bilateral or complex surgery (Table 18; Appendix 6). The World Guidelines for Groin Hernia Management was used to form the response on inguinal hernia repair. Table 4 provides outcomes relevant to question 3.

GRADE of the evidence-base

Table 3 provides a summary of findings for selected outcomes that were reported for question 3.

Table 3 GRADE of the evidence base for question 3

Outcomes	Assessment	No of participants (studies)	Quality of the evidence (GRADE)
Same day discharge	Safety and effectiveness of same-day hernia repair was assessed in different patient groups including elderly vs younger, overweight vs slim, regional vs metropolitan.	2 (2 observational studies)	⊕○○○ VERY LOW ^{a,b}
Unexpected prolonged stay		2 (2 observational studies)	⊕○○○ VERY LOW ^{a,b}
Unexpected readmission		1 (1 observational study)	⊕○○○ VERY LOW ^{a,b}
Emergency readmission		2 (2 observational studies)	⊕○○○ VERY LOW ^{a,b}

a. High risk of bias according to Downs and Black tool (Downs and Black 1998), b. ⊕○○○ **Very low quality:** We have very little confidence in the effect estimate: The true effect is likely to be substantially different from the estimate of effect.

Results: inguinal hernia repair

Memtsoudis et al. (2005) conducted a large retrospective case series on same-day inguinal hernia repair patients. Unexpected prolonged stay was experienced in 7.6 per cent of the patient cohort; independent risk factors were found to be increasing age, bilateral procedure, and African-American race. It was discussed that there may be higher admission rates in patients with social insurance, and

the authors proposed that race and insurance status both influence medical treatment. Patients of African-American race and with social insurance are more likely to access medical care through emergency room and therefore are likely to require longer stay. Sinha et al. (2007) undertook a retrospective analysis on administrative and clinical data on elderly patients with inguinal hernia, comparing the results from same-day and non-same-day patients between patients aged 70 years and above, and 65 years and below. Postoperative symptoms included fever, drowsiness, dizziness, pain, bleeding, nausea, and vomiting, which were not significantly different between groups. Prolonged stay was reported in 12.5 per cent of the elderly group and 9.5 per cent of the younger group ($P=0.43$). It was concluded that same-day hernia repair can be successful in patients ≥ 70 years of age.

The World Guidelines for Groin Hernia Management by The HerniaSurge Group (2016) recommends that, while most inguinal hernias are suitable for same-day surgery, complex cases should not be performed as day surgery. The guideline identifies complex cases to include:

- groin hernias with signs of incarceration, strangulation, infection, relevant preoperative chronic pain, difficult local findings in the groin;
- groin hernias in patients with relevant comorbidities;
- difficult intraoperative findings;
- symptoms and signs of postoperative local complications and/or general complications.

Results: femoral hernia repair

A prospective Australian study by Collopy et al. (1991) reported on length of stay in patients located in regional and metropolitan areas with femoral and inguinal hernia, although the proportion of patients with each hernia type was not given. Postoperative complications were observed in 22 per cent of patients in the metropolitan hospital and 16.6 per cent of patients in the regional hospital ($p>0.05$). There was no significant difference in patient age and type of hernia between the metropolitan and regional hospital. However, there was a trend toward later surgically-advised discharge in the metropolitan hospital. The difference between advised length of stay and actual length of stay was 4.4 days in the metropolitan hospital and 2.1 days in the regional hospital, yet the time between surgery and actual discharge was the same between hospitals. The reasons behind this difference are unclear. This may be based on the beliefs of the operating surgeon or on local practice.

Results: umbilical hernia repair

Acevedo & Leon (2010) undertook a prospective analysis on obese ($BMI>30$) and non-obese ($BMI<30$) patients with umbilical (29%) and general groin (24%), and other hernia. The outcomes of pain during surgery and infection at 30 days postsurgery were significantly higher in the obese group ($P<0.004$ and $P<0.023$, respectively). Although readmissions were slightly higher in the non-obese group, this did not reach significance. It was concluded that obesity ($BMI>40$) is not a contraindication for same-day hernia repair under local anaesthetic in a specialised centre. However patients with a $BMI \geq 40$ will need general anaesthetic and may need to be admitted for a longer stay. It is important to note that while surgery can be undertaken on obese patients, the long-term outcomes may be poorer.

Summary

No studies have explicitly undertaken work to investigate specific populations which are indicated for, or should not be considered for, day-case surgery. The studies included were only able to provide observations on which patients were found to be unsuitable in a clinical setting. The limitations of the published evidence-base include the observational (non-randomised) nature of population groups, small populations of patients in different risk factor groups, and non-relevance to the Australian context. Outcomes are largely related to healthcare funding systems in another country.

Table 4 Outcomes relevant to question 3

Study ID	Publication Type	Participant characteristics	Same-day discharge rate	Comment
Memtsoudis et al. (2005)	Case series; retrospective; registry data	N=7853 inguinal hernia	100%	Increasing age, bi-lateral surgery and African-American race lowered likelihood of discharge
Acevedo & Leon (2010)	Case series; prospective	N=2031 I: BMI > 30 C: BMI < 30	100% (unclear)	Obesity with BMI 30-40 is not a risk factor for same-day hernia repair under local anaesthetic
Sinha et al. (2007)	Comparative; consecutive; retrospective	N=588 I: aged ≥ 70 C: aged ≤ 65	I: 87.5% C: 90.5%	Same-day hernia repair can be done on elderly patients aged 70 and above
Collopy et al. (1991)	Comparative; consecutive; prospective; hospital data followed by telephone survey	N=141 I: metropolitan location C: regional location	NR. Difference between the operation date and the surgically advised discharge date 4.4 days metropolitan hospital and 2.1 days in the regional hospital	The time between surgery and actual discharge was the same between metropolitan and regional hospitals

BMI: body mass index; C: comparator; I: intervention; NR: not reported.

Question 4: What proportion of patients undergoing hernia repair are expected to be ineligible for same-day surgery?

Identification of literature

Following phase 2 study selection (full text review), a total of nine studies were identified which were relevant to question 4 (see Appendix 2). Of these studies three contained relevant data. An additional study was included through pearling, resulting in four studies for extraction and review (Table 19; Appendix 7).

The evidence base is made up of a prospective multi-site case series study (Millat et al. 1993), a prospective single centre case series (Voorbrood et al. 2015), a prospective nationwide database (Kehlet and Bay-Nielsen 2008), and a qualitative study based on a survey of doctors (Toftgaard 2007). Hernia type was defined as inguinal in the survey. In the other two studies hernia type was defined as being in the groin region in general or was not defined. Two guidelines were used to inform the evidence for question 4. A list of studies presenting outcomes relevant to question 4 are provided in Table 6.

GRADE of the evidence-base

Table 5 provides a summary of findings for selected outcomes that were reported for question 4.

Table 5 GRADE of the evidence base for question 4

Outcomes	Assessment	№ of participants (studies)	Quality of the evidence (GRADE)
Proportion ineligible for same-day surgery	The proportion of patients who were ineligible for same-day hernia repair was recorded.	2 (2 observational studies)	⊕○○○ VERY LOW ^{a,b}

a. High risk of bias according to Downs and Black tool (Downs and Black 1998), low number of studies, b. ⊕○○○ **Very low quality:** We have very little confidence in the effect estimate: The true effect is likely to be substantially different from the estimate of effect.

Results

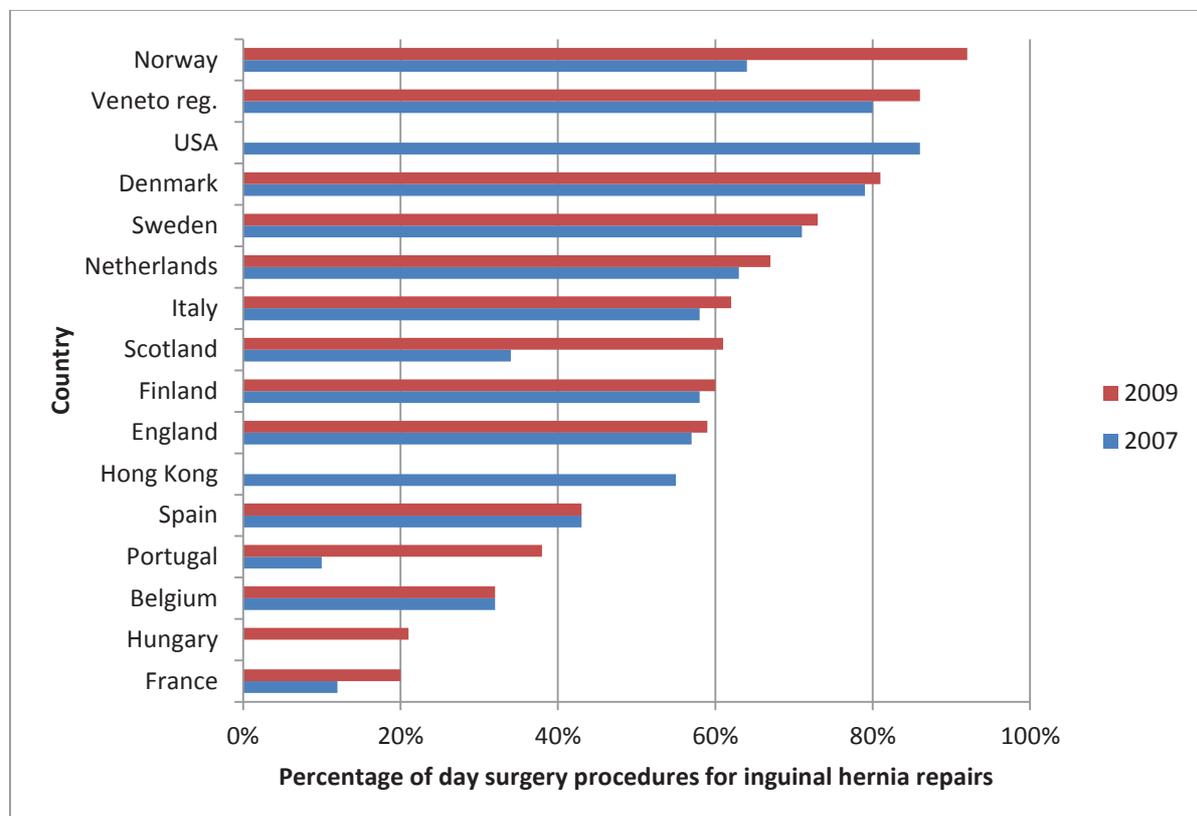

Two included peer-reviewed studies provided the proportion of patients ineligible for same-day hernia repair (Millat et al. 1993; Voorbrood et al. 2015). Across 17 surgical centres in France, a case series study on inguinal hernia repair in 500 consecutive cases identified that 89 (17.8%) were unsuitable for day procedures. Made up of 40 due to medical reasons (8%), 23 for social reasons (4.6%) and 42 due to patient refusal (8.4%). Voorbrood et al. (2015) reported on 336 consecutive patients planning to have hernia repair in a high volume hospital in the Netherlands. Across the cohort, 336 (96.3%) of patients had same-day surgery as planned; of the others, two cancelled their appointment and 11 were rejected for surgery following detailed pre-surgical assessment (3.3%).

In addition to peer-reviewed evidence, two guidelines informed this question. The clinical practice guideline published by the British Hernia Society recommends all patients should be considered for day surgery, with a small number of patients requiring an inpatient stay for comorbidity, social reasons or because of a complex hernia repair (Sanders et al. 2013). The guideline states that if

healthcare providers adhere to this guidance then 70 per cent of hernia repair procedures will be conducted as day procedures.

World guidelines by HerniaSurge suggest day surgery for inguinal hernia repair is becoming increasingly common (The HerniaSurge Group 2016). In Spain in 2005, day surgery inguinal herniorrhaphies constituted 34 per cent of the total. From 2000 to 2010 the rate of inguinal hernia day surgery in the Netherlands increased from 36 per cent to 54 per cent. Data from the Swedish National Registry indicate that 75 per cent of inguinal hernia repairs are performed in day surgery. From 2000 to 2009 the incidence of day surgery for inguinal hernias increased from 62 per cent to 87 per cent in the Northern Italian Veneto region. Further details from these guidelines can be found in the response to research question 2. The most recent analysis of international day surgery rates for inguinal surgery from 2007 and 2009 is shown in Figure 1.

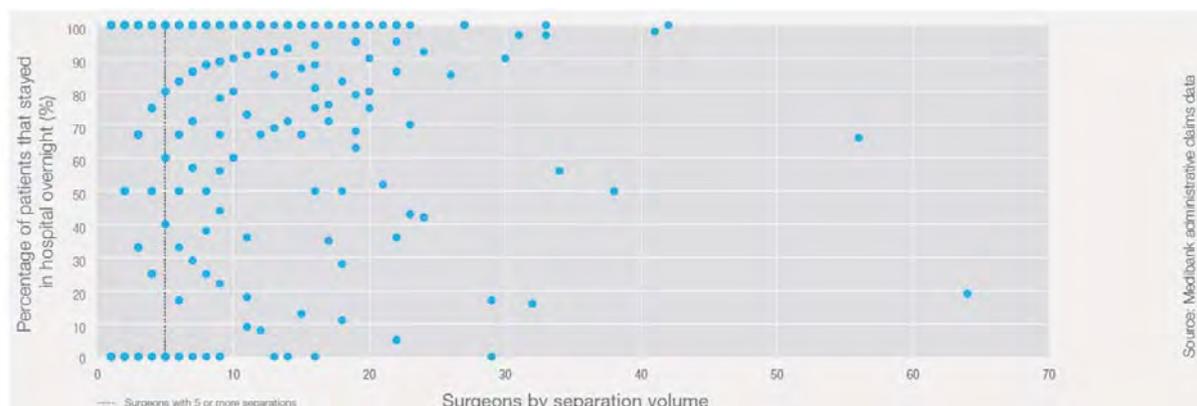

Figure 1 Percentage of day surgery procedures for inguinal hernia repairs in 2007 and 2009 in the Veneto region of Italy and in other countries (Toftgaard 2012)

The database on groin hernias in Denmark identified by pearling further elucidates the rates of same-day hernia repair. Ambulatory surgery for elective hernia repair was observed to have slowly increased over 8 years from 55 per cent in 1998 to 70 per cent in 2005 (Kehlet and Bay-Nielsen 2008). A study with worldwide data reported that in Australia the proportion of hernia repair done as day surgery in 2003 was 22.6 per cent (Toftgaard 2007). Toftgaard (2007) also highlighted there are large differences between countries for day surgery rates.

The surgical variance report also provided Australian data on rates of hernia surgery patients staying overnight by surgeons and their separation volume (Figure 2, RACS and Medibank 2016a). This showed that 80 per cent of hernia repairs funded by Medibank stay overnight and 54 per cent of surgeons kept all of their hernia repair patients overnight, while 6 per cent did not keep any of their patients overnight.

Figure 2 Percentage of hernia surgery patients that stayed in hospital overnight throughout Australia in 2014 (RACS and Medibank 2016b)

Summary

Two studies were able to provide a direct response to the research question. Others were able to indicate the proportion of patients who did undergo day surgery but not those who were found ineligible. The studies have a relatively low sample size and are observational in nature, and the results vary across jurisdictions and over time. However, the studies are consistent in their conclusions that few patients are ineligible for same-day hernia repair with a recent clinical practice guideline stating that 70 per cent of hernia repair procedures can be conducted as day procedures.

Table 6 Outcomes relevant to question 4

Study ID Location	Study design	Patient characteristics	Same-day discharge rate	Proportion ineligible for same-day surgery
Millat et al. (1993)	Case series; prospective (unclear); primary data from 17 sites	N=500 male	82%	17.8%, reasons: medical 8%, social 4.6%, patient refusal 8.4%
Voorbrood et al. (2015)	Case series; prospective; consecutive patients	N=336	97%	3.8%, reasons: no show 0.5%; medical reasons 3.3%
Kehlet et al. (2008)	Case series; prospective; database	87,840 procedures (may include recurrent)	55% in 1998, 70% in 2005	NR
Toftgaard (2003)	Qualitative; retrospective; survey data	Data from 18 countries	22.6%	NR

Question 5: Are there any broader criteria for same-day procedures to be performed in Australia that are not specific to hernia repairs?

Identification of literature

A grey literature search was conducted to identify clinical practice guidelines providing recommendations on same-day surgery in Australia. Two guidelines established by the Australian & New Zealand College of Anaesthetists (ANZCA) were published in 2010 and 2016. In addition, information was identified regarding legislative and accreditation requirements for day surgery (based on a previous report compiled by R&E/ASERNIP-S).

Australian guidelines on day surgery

The Australian & New Zealand College of Anaesthetists has published recommendations which outline the requirements for day surgery (Table 20, Appendix 8). The requirements are grouped into procedure (e.g. rapid return to food and water intake, pain controllable, low risk haemorrhage, low risk airway compromise), patient (willingness, <1 hr travel time, ASA I or II or medically stable II or IV) and social (transport, responsible person to stay overnight, access to telephone). In all cases the ultimate decision for day surgery was deemed to rest with the anaesthetist.

Legislative and accreditation requirements for day surgery

The provision of services in day procedure centres is prescribed by legislation in six jurisdictions (ACT, Qld, Tas, Vic, WA and NSW), where the day procedure services and private hospitals are collectively described as private health facilities. In South Australia and the Northern Territory, the definition of day procedure centres that provide medical and surgical services is unclear. Prescribed surgical procedures in day procedure centres are defined by the level of anaesthesia, or are explicitly listed. The detail and definitions related to this legislation varies from state to state and is currently the subject of review in many jurisdictions.

Due to the requirement of anaesthesia, the service of hernia repair should be provided in a day surgery unit or hospital.

Licensing of facilities is also governed at the state and territory level. In Australia, healthcare facilities are required to be licensed under state legislation prior to operation. Public and private hospitals, day procedure centres and other health service providers are characterised according to local legal definitions. However, each state defines and categorises healthcare facilities differently. A hospital is legislatively distinguished to be a public or a private facility based on whether it is owned by the state government. Distinctions between private hospital and day procedure centres within private settings are not consistent across states.

There is no requirement for day procedure centres to be accredited. However, at the federal level the Private Health Insurance Act (2007)¹ prohibits insurance companies from paying any benefit for treatment in a non-accredited facility. The Act mandates accreditation by an appropriate accreditation body which is defined in the Private Health Insurance (Accreditation) Rules (2011) as a body approved by the Australian Commission on Safety and Quality in Health Care (ACSQHC) to

¹ Private Health Insurance Act 2007 (Cth) ss 121-5(5)-(8)

accredit health care providers against the National Standards.² The Act ensures that any health facility performing procedures which are rebatable by private health insurers must be accredited to the National Safety and Quality Health Service Standards (NSQHS standards) regardless of State legislation.

Due to the availability of insurance and Medicare rebate, the service of hernia repair should be provided in an accredited facility.

Quality of the evidence-base

The quality of the Australian & New Zealand College of Anaesthetists (ANZCA) (2016) guideline on peri-operative care of patients selected for day procedures was appraised with the use of the AGREE II tool (Brouwers et al. 2010) (Appendix 1). The purpose and scope were stated; however, the health questions covered may not have been explicitly described. While target users of the guideline were clearly described, it was unclear if the guideline development included professionals from all groups or if the views of the target audience were sought. The quality of the guideline was diminished by not having a method section where a literature review, or way of ascertaining the knowledge, was reported. It is assumed that, in contrast to most guidelines, this guideline is intended to present the views of the ANZCA on this topic and therefore a rigorous process was not reported. The strength of the guideline was presenting recommendations in a specific and unambiguous manner, with different options for management of health issues clearly stated. The recommendations are easy to identify.

Summary

The Australian & New Zealand College of Anaesthetists has published recommendations which outline the requirements for day surgery. Local regulatory requirements enable same-day procedures in Australia.

² *Private Health Insurance (Accreditation) Rules 2011 rule 2*

Question 6: What other factors are reported in the literature that impact on the decision to perform same-day surgery?

Identification of literature / Sources of evidence

Following phase 2 study selection (full text review), a number of studies were available which were relevant to question 6 (see Appendix 2). Additional information was identified through targeted searches of the peer-reviewed literature and in searches for grey literature.

Each of the included documents was reviewed for any relevant themes relating to the levers and barriers to providing day surgery. Themes, and any supporting information, were extracted into a table (Table 21, Appendix 9). Due to the wide-ranging type (peer-reviewed manuscripts, opinion pieces, editorials, grey literature and so on) and number of publications related to this topic area, resources were extracted until saturation (no new themes were identified in additional resources). In addition, a pragmatic supplementary search was performed in PubMed to broadly capture studies reporting on factors which influence day surgery in any setting. Detailed methods on both approaches are provided in Appendix 1. As such, while every effort was made to identify relevant factors, the reference list used to inform Question 6 should not be seen as all-encompassing, rather as a representative sample. Factors discussed in previous sections of the report (patient factors, anaesthetic requirements) have not been replicated in this section. The combined results of the searches are presented thematically.

Results

A number of levers and barriers for the implementation of day surgery were identified. These encompass community facilities, hospital facilities and staffing, and insurer reimbursement arrangements.

As a result of the wide variety and type of study design that informed this question, a formal quality appraisal and GRADE of the evidence base was not undertaken. The evidence for this question is of a low quality.

A number of themes have been identified to highlight common issues and barriers in performing day surgery.

Barriers to day surgery

It is clear that day surgery can be performed safely and effectively on appropriate patients for less complicated procedures. However, there are still variations in terms of how day procedures are undertaken in real-life practice. Barriers have been identified for day surgery in terms of why a procedure was not performed in a day case but extended with overnight or longer stay. The following potential barriers for day surgery were identified.

Economic

Financial incentives/disincentives could be a barrier to day surgery. For example, private day hospitals in Australia have reported that they are disadvantaged when it comes to contract negotiations with insurers (ADHA 2011). There may be a discrepancy in funding of day hospitals compared to overnight centres for identical procedures (ADHA 2011). There also may be financial incentives to the surgeon or the hospital associated with overnight stays (Barnett 2016).

Reimbursement may be more advantageous to patients if they are kept in overnight (Castoro et al. 2007).

Social factors

A common reason behind a day surgery being extended into an admission with an overnight stay is that there is a lack of social and community support after discharge. Patients may live alone or be unable to receive continuity of care having been discharged. Possible patient support includes:

- Means of transport for travelling back home if needed (Mitchell 2015);
- Relatively short travel distance from hospitals to home (Srivastava et al. 2008), for example a one hour travel time;
- Family and friends being available for the 24 to 48 hours post-discharge to provide care (Srivastava et al. 2008; Weingessel et al. 2008); and
- Patients to provide informed consent (Chung et al. 2005);

In addition, patients should refrain from certain aspects of daily activity once home, such as driving, decision making, caring for dependents and operating machinery. If this support is not available, then day surgery is not feasible (Barnett 2016; Castoro et al. 2007; Quemby and Stocker 2013). These factors are often beyond the control of the patient and become barriers on a societal scale. Therefore, an understanding of the patient circumstances, home location, availability of an appropriate carer and patient adequate education is important to facilitate day surgery.

Facilities

Many practical issues related to the day surgery unit are important for effective provision of day surgery services.

Day surgery should be performed in a dedicated day surgery unit with dedicated administrative support (Kulacoglu et al. 2012; Sandberg et al. 2006). If a separate unit is not feasible, there should be a dedicated nursing team to achieve rapid recovery (Mitchell 2003). The unit needs to be able to remain open long enough that patients at the end of the operating list have sufficient time to recover and to be discharged. If facilities are not set up to optimise day surgery and ease of access this presents a barrier to its implementation (Barnett 2016; Castoro et al. 2007; Quemby and Stocker 2013).

Management and staffing

Day surgery requires a strong multidisciplinary team (Awad and Chung 2006; Suominen et al. 2014). However, often there is a lack of clinical leadership with a specific focus on day surgery and hospital policies and guidelines to cater for it (Awad and Chung 2006; Xirasagar and Lin 2006). The surgical and clinical staff should be supported by a day surgery manager who is in charge of day-to-day running of the unit. The surgeons and anaesthetists who act as champions for same-day surgery should be senior clinicians to promote forward flow and reduce admission rates and complications. The multidisciplinary staffing requirements may be difficult to achieve and therefore represents a potential barrier to day surgery (Barnett 2016; Castoro et al. 2007; Quemby and Stocker 2013).

Communication between patients and carers

Where there is a lack of communication between patients and healthcare providers including surgeons, nurses and other hospital staff, patients and/or healthcare providers may not be aware

that day surgery is an option (Barnett 2016). In addition, patients may often have certain concerns regarding what could happen after discharge, which may seem clinically less important from the surgeon's perspective (Briggs et al. 2009; Hwa and Wren 2013). If surgeons and other healthcare providers are not trained to communicate effectively, this information asymmetry may impact the practicalities and benefits of day surgery, and may therefore create barriers towards more day-procedures being performed (Barnett 2016; Castoro et al. 2007).

Therefore, training and continuing professional development of all staff plays a critical role in the effective adoption of day surgery practices.

Levers for day surgery

Patient satisfaction

High levels of patient satisfaction have been reported for day surgery. This can be optimised by having good postoperative pain control, short waiting times before surgery, providing a friendly environment, avoiding feelings that patients are being rushed or discharged too early and by telephone-based follow-up the day after discharge (Castoro et al. 2007). From patients' perspectives, a high level of understanding of what patients need is vital, not only to whether a day case can be successfully performed, but also of the overall recovery process after discharge (Mitchell 2015). During the a few hours of patient-doctor contact, a keen perception of what information patients would want to have will make a significant difference on patient satisfaction (Quemby and Stocker 2014). With sufficient information and greater certainty, patients are more comfortable to return home on the day of surgery. Therefore, patient satisfaction is a very important lever to day surgery.

As part of patient satisfaction, follow-up is also important. Follow-up phone calls by nurses minimises the burden on primary care, increases patient satisfaction and help early identification of complications (Castoro et al. 2007; Quemby and Stocker 2013). Monitoring and collection of feedback on results of day surgery (from both patients and hospital staff) may also benefit its effective implementation (Castoro et al. 2007).

Patient flow and surgery schedule

Timing of patient admission plays an important role in day surgery decision making. For non-complicated surgery, it is more likely to be conducted as a day case when patients are admitted in the morning (Harries et al. 2013). There will be sufficient time to undergo preoperative assessment and the surgery can be performed early in the day. Patients can be discharged later in the same day and can be followed up in the later evening, the next day or the day after via telephone (Vinoles et al. 2011), or by a visiting nurse. However, patient admission time is affected by many factors.

Comprehensive preoperative assessment

Patient suitability is of vital importance to the success of day surgery. Carefully selecting patients should ensure that day surgery is performed smoothly and efficiently. Adequate preoperative assessment is helpful to increase the efficiency of surgery and avoid unnecessary delay in discharge or cancellation (Harries et al. 2013). However, in day surgery settings, preoperative assessment varied in terms of when it is performed and by whom (Quemby and Stocker 2014; Stomberg et al. 2013). One survey on day hospital staff in Sweden showed that almost 70 per cent of the surgical units schedule their patients for a separate preoperative consultation prior to the day of surgery, and preoperative assessment was commonly undertaken by nurses and anaesthetists. It seemed

that this additional visit could be useful to ensure patients suitability for day case procedures, hence leading to success of the day surgery. However, the author also indicated that such visit might not be necessary to patients who are relatively well (ASA Grade one or two) and scheduled for minor surgery (Gilmartin and Wright 2008; Stomberg et al. 2013).

Economic outcomes

The financial benefits of day surgery are well established. Hospital costs for day surgery are reported as being between 25–68 per cent lower compared to overnight stays. In terms of hospital efficiencies, greater numbers of patients can be treated in a given time period reducing waiting lists so that inpatient facilities are released for more complex or emergency cases. Surgery cancellation due to bed shortages is reduced. Theatres can be used more efficiently. Staffing can be reduced as fewer overnight staff are required (Castoro et al. 2007). To ensure that these economic benefits are achieved the financial incentives for day surgery and overnight stay surgery should be aligned (Castoro et al. 2007). To achieve the full economic benefits of day surgery to the hospital/healthcare system, expansion of day surgery should be accompanied by equivalent reductions in inpatient capacity (Castoro et al. 2007).

Facilities and staffing

The combination of an appropriate facility and adequate staffing can significantly promote day surgery to maximise the efficiency. There should be dedicated day surgery units where patient flows of day surgery and overnight stay patients are separated (Kulacoglu et al. 2012). In addition, providing distinct management structures, and dedicated administration and nursing staff (Castoro et al. 2007) will lead to more timely recovery and discharge (Quemby and Stocker 2014). Specifically, nurse-led discharge, has been promoted in one publication as being more efficient and cost effective (Stomberg et al. 2013). Also, day surgery facilities should take advantage of motivated senior surgeons and anaesthetists as champions to drive change (Castoro et al. 2007).

Patient information and communication

Effective information provision before surgery can prepare patients psychologically for surgery, educate the patient about pre- and postoperative care, minimise risks in the postoperative period, improve patient satisfaction and ensure informed consent is obtained for the procedure (Castoro et al. 2007). As the contact duration in a day case procedure is very limited compared to an in-patient admission, clear instructions in both verbal and written format are important. It is suggested that verbal instructions should be reinforced from an early stage (referral), such as during primary care to discharge (Quemby and Stocker 2014). Written information sheets should also be provided to pre-empt potential hazards during recovery at home. Regular surgical service audits and patient feedback mechanisms are useful to obtain feedback from patients regarding what information they require. A keen insight of what patients are concerned with can give patients greater peace of mind, allowing them to return home with more confidence and less stress.

Regulation

Although regulatory barriers have been noted as being issues in the delivery of same day surgery (Castoro et al. 2007), this is not likely to be a critical issue in the Australian and New Zealand context.

Integration of community support

Primary and community health services play an integral part of day surgery in providing care pre- and postoperatively. Engagement with policy makers, general practitioners, community nurses, family caregivers and social services may improve the available community support.

Summary

The barriers and levers driving the adoption of day surgery practices are more related to logistics and management of patients in hospitals, rather than clinical issues based on published data. In other words, while the benefits of day surgery are understood in terms of clinical safety and effectiveness (see response to question 1), how hospitals, communities, and patients interact remain the biggest factors influencing whether day surgery can be routinely performed. There is a paucity of high quality published evidence in this field, with the majority of published data being surveys, questionnaires and other qualitative studies. No quantitative clinical data is available to answer this question. Large, robust and comprehensive studies are unlikely due to diversity in hospital management, levels of community support and patients' perceptions of day surgery.

Additional input from the Working Group

There was agreement across the Working Group that most inguinal or umbilical hernia repair can be undertaken in a day surgery setting.

In the context of service provision of same-day surgery, including consideration of public and private care, it was thought that practices benefit from access to dedicated day care facilities and established protocols.

Key levers are thought, by the Working Group, to be: appropriate preoperative assessment, coupled with the preparedness of the facility for same day surgery. The most important barrier is thought to be patient information and communication, therefore the process would be facilitated by the development of protocols and guidance for effective patient communication. An engagement strategy for major hospital groups could be beneficial to facilitate hospital and patient preparedness.

At the hospital level, one way to achieve a change in practice is to incorporate performance targets for same-day rates into hospital contracts.

A member of the Working Group highlighted that private patients contribute significantly to their health insurance, and in light of this, suggested surveying the hernia repair patients who stayed overnight after the procedure. This survey would explore the preference of patients for day surgery. It was felt that patient preference is an important factor and survey findings may be an incentive to change practice. Also in line with improving the understanding of local practice, patient information sheets could be reviewed with a view to potentially including some commentary on same day versus overnight hernia procedures.

It was also noted that the development of a position paper or Australian/New Zealand guidelines would be beneficial to advise regarding day surgery in the local context.

The Working Group agrees the initial decision to undertake surgery should include the option of watchful waiting. This must include appropriate patient selection and operating on clinically apparent hernia.

Conclusions

Same-day surgery for repair of inguinal, femoral and umbilical hernia is safe and effective. However, there are a number of limitations on the evidence used to form this conclusion. The evidence base is stronger for inguinal hernia repair and includes RCTs and other comparative studies, while the evidence for femoral and umbilical hernia repair is limited to small numbers of observational studies. The studies included were able to provide some observations regarding which patient groups were found to be unsuitable for same-day hernia repair in a clinical setting. Although few studies had been designed to investigate this question, limited evidence suggests these patient groups include those who are elderly (over 70 years), overweight (BMI over 40), and those undergoing bilateral surgery. Two studies reported the proportion of patients ineligible for same-day hernia repair, including a total of 836 patients, which ranged from 3.3–8 per cent. Overall, a range of guidelines and studies are consistent in the message that a large proportion of hernia repairs (70–80%) can be provided as a same-day procedure.

Australian and international guidelines recommend day surgery for most patients undergoing inguinal surgery, providing that surgical infrastructure is available to assess and select patients and suitable aftercare is available. The available guidelines were not explicit on day surgery for femoral and umbilical hernia repair. Australian guidelines on the broader issue of same-day surgery published by the Australian & New Zealand College of Anaesthetists state that requirements for same-day surgery to be acceptable include procedural, patient and social factors.

Besides the established clinical evidence and widely accepted guidelines, day surgery in general is a multifaceted topic, and many influential factors are external to clinical issues. Hospital management, financial incentives, social factors, facilities and staffing are all important aspects that determine the success of day surgery. While barriers for day surgery exist in all these aspects, the interaction between patients, healthcare providers and the community remains the most significant one. It is plausible to gain leverage in promoting day surgery by enhancing the patient-doctor communication and education to increase patients' satisfaction, ameliorating staffing and facilities to match resources for day surgery, and creating supportive communities and policies. The acceptance and promotion of day surgery requires a holistic approach from a range of financial, institutional, societal and individual efforts.

In summary, although the clinical benefits of day surgery for hernia repair are well established, there are a number of reasons as to why this activity is less common than expected and associated incentives which may be used to promote changes in local practice.

Recommendations

1. Most patients with inguinal or umbilical hernia can be managed as day patients.
2. There are patient satisfaction and financial incentives to maximise day surgery rates without posing risks for suitable patients.
3. The method of hernia repair will not generally affect the decision whether to manage the patient as a day patient or plan for an overnight stay.
4. Good preoperative assessment, planning and informing the patient has the potential to improve same-day surgery discharge rates.

5. Collaboration with the anaesthetists and involvement of anaesthetists in discharge planning is important.
6. The rate of same-day patients to overnight stay patients should be made transparent. The target rate for hospitals should be between 70 to 80% patients as same-day cases.
7. Patients with complex hernias and comorbidities will generally benefit from an overnight stay, or at least be considered for such.
8. The development of Australian and New Zealand guidelines or protocols should be considered, especially in the context of communication and planning to minimise barriers to same-day hernia repair.

Appendix 1 Methods

Different methodologies were used according to the requirements for each research question. A search of the peer-reviewed literature was used to address questions 1, 3 and 4. A search for clinical practice guidelines was used to address questions 2 and 5. Question 6 was addressed with identified peer-reviewed literature, a grey literature search and targeted searches of peer-reviewed databases. A supplementary search of same-day umbilical hernia repair was conducted to fill any gaps in the original literature search. Outlined here are the methods used for the peer-reviewed literature search, search for clinical practice guidelines, and supplementary searches for question 6 and umbilical hernia. An outline of the appraisal of the evidence, grading of the evidence for each outcome and input for the Working Group follows.

Peer-reviewed literature search

For research questions requiring a systematic literature search the Population, Intervention, Comparator, Outcome (PICO) criteria was defined a priori.

PICO and inclusion criteria

Population, Intervention, Comparator and Outcomes are defined as following:

- Population: Patients (adults) undergoing surgery of any type of repair for (simple/complex) inguinal, femoral and umbilical hernia
- Intervention: planned same-day procedure*
- Comparator: planned ≥ 1 overnight stay following surgery
- Outcomes: adverse events, hernia recurrence, unexpected prolonged stay, unexpected readmission, emergency readmission to hospital, groups ineligible, proportion ineligible

*Note: Same day surgery is defined as admission and discharge within the same calendar day. Admission and discharge within a 23 hour period, including an overnight stay, is not considered same-day surgery for the purposes of this review.

Search strategy

Our approach utilised the rapid review method, which is an adaptation of a comprehensive systematic literature review technique. This approach ensures that the project rigor is maintained while the review is completed in an expedited manner. This format allows the timely identification of best quality evidence at the highest level to answer the research questions. (Watt et al. 2008a; Watt et al. 2008b) Studies were prioritised based on recency and their relevancy to key clinical outcomes that inform the research questions.

The search strategy was designed to encompass alternative spelling of the search terms and the corresponding MeSH (medical subject heading) terms where appropriate.

Searches were conducted in the following databases using the search terms outlined in Table 7:

- PubMed
- Embase
- The Cochrane Library

Table 7 PUBMED search terms

Search strategy	<pre> ((((((length of stay[MeSH Terms] OR length of stay[Title/Abstract])) OR (((same day[Title/Abstract] OR day case[Title/Abstract] OR day-case[Title/Abstract] OR day surger*[Title/Abstract])) OR ((Ambulat*[Title/Abstract] OR outpatient*[Title/Abstract])) OR (((Ambulatory Care[MeSH Terms] OR Ambulatory Surgical Procedures[MeSH Terms] OR outpatients[MeSH Terms]))) AND ((((("Hernia, Inguinal/surgery"[Mesh] OR "Hernia, Femoral/surgery"[Mesh] OR "Hernia, Umbilical/surgery"[Mesh])) OR (((((((inguinal[Title/Abstract] OR femoral[Title/Abstract] OR umbilical[Title/Abstract])) OR (((inguinal[MeSH Terms] OR femoral[MeSH Terms] OR umbilical[MeSH Terms]))) AND (((hernia[MeSH Terms] OR (hernia[Title/Abstract] OR hernia*[Title/Abstract])))) AND (((surgery[MeSH Terms] OR ((surger*[Title/Abstract] OR surgical*[Title/Abstract] OR procedur*[Title/Abstract] OR operati*[Title/Abstract])) OR repair*[Title/Abstract])))) </pre>
-----------------	--

This strategy was adapted for the Embase database with relevant keywords and Emtree terms included.

Inclusion of studies

The review included peer-reviewed studies on adult patients undergoing any surgery for repair of simple or complex inguinal, femoral or umbilical hernias which measured length of stay and reported safety or effectiveness outcomes (Table 8).

Table 8 Inclusion and exclusion criteria

Component	Inclusion/exclusion criteria
Population	Studies on adults undergoing inguinal, femoral and/or umbilical hernia repair. Studies on incisional hernia and hiatal hernia, or on children, were excluded.
Intervention	NA
Comparator	NA
Outcomes	Studies reporting length of stay. Studies reporting safety and effectiveness outcomes. Studies not reporting length of stay or effectiveness outcomes were excluded.
Publication type	Peer-reviewed studies.
Publication date	No date limit was applied to the search.

NA: not applicable.

Studies were selected for inclusion based on a step-wise approach across three phases. For phase 1, citations were downloaded into an Endnote library and screened initially by title and abstract, then by full text, according to the inclusion criteria. Screening was completed by a single researcher and checked by a second researcher. Those included from the full text review were sorted based on the specific question(s) that each study provided data on (Appendix 2). This step is referred to as phase 2. The phase 2 table was used to choose the studies to provide evidence for each question.

For phase 3, identified studies were prioritised using the NHMRC levels of evidence (NHMRC 2009). Level I evidence (systematic reviews of RCTs) were sought to be included. Where there was an absence of level I evidence, level II evidence was included; in the absence of level II evidence, level III evidence was included. Level IV evidence (case series studies without a comparator arm) was only included in this review when there was no evidence of higher quality to address a particular patient group.

Searches for clinical practice guidelines

Two searches were conducted to identify clinical practice guidelines (CPGs) providing recommendations on length of hospital stay following inguinal, femoral or umbilical hernia repair.

The first search was conducted in PubMed and Embase databases to identify guidelines published in the peer-reviewed literature. The search strategy used for the PubMed database is described in Table 9. Keywords and MeSH terms were adapted for the Embase database. No limits were applied to the search. All identified citations were downloaded into an Endnote database and reviewed against the inclusion and exclusion criteria described in Table 10.

Table 9 CPG search strategy for the PubMed database.

Population search terms	(((((inguinal hernia) OR inguinal hernia[MeSH Terms]) OR femoral hernia) OR femoral hernia[MeSH Terms]) OR umbilical hernia) OR umbilical hernia[MeSH Terms]))
Publication-type terms	((((((((((((((((((algorithm) OR CPGs) OR CPG) OR position statement) OR position statements) OR position paper) OR consensus) OR clinical recommendations) OR clinical recommendation) OR clinical standard) OR clinical standards) OR clinical protocols) OR clinical protocol) OR clinical pathways) OR clinical pathway) OR standards) OR standard) OR recommendations) OR recommendation) OR guidelines) OR guideline) OR care standards) OR care standard) OR consensus development[MeSH Terms]) OR health planning guideline[MeSH Terms]) OR planning recommendation, health[MeSH Terms]) OR practice guideline[MeSH Terms]) OR standards of care[MeSH Terms]))
Search strategy	Terms relating to the population were combined with terms relating to publication type with AND

This strategy was adapted for the Embase database with relevant keywords and Emtree terms included.

Table 10 Inclusion and exclusion criteria

Component	Inclusion/exclusion criteria
Population	Guidelines covering inguinal, femoral and/or umbilical hernia treatment. Guidelines on incisional hernia and hiatal hernia were excluded.
Intervention	NA
Comparator	NA
Outcomes	Guidelines making any recommendation or statement on the length of hospital stay associated with surgical repair of hernias. Guidelines that did not comment on length of hospital stay were excluded.
Publication type	A document was considered a guideline if: It contains the word 'guideline' or 'recommendation' in its title or introduction, or contains recommendations on same-day surgery for hernia repair; It was developed by at least two authors; It is based on a systematic identification and review of evidence and limited to study designs of Level III comparative evidence or higher. Any document not considered to be a guideline, including primary studies, literature reviews, letters, editorials and abstracts, was excluded.
Publication date	Any guideline published or reviewed since 2006 was included.

NA: not applicable.

The second search involved keyword searching relevant of websites to identify any guideline not identified in the database search. The websites searched are described in Table 11. All relevant documents were downloaded and reviewed for inclusion against the criteria described in Table 10.

Table 11 Grey-literature search for relevant CPGs

http://ssat.com/	guideline

Supplementary searches

Additional targeted searches for peer-reviewed and/or grey literature documents were conducted for question 6 and for umbilical hernia.

Question 6 grey literature search methodology

All grey literature searches were conducted in Google using the following terms:

- Barriers to same day surgery
- Hernia + length of stay factors
- Day surgery + development
- Encouraging day surgery
- Promoting day surgery
- Day surgery + promotion
- Day surgery + increasing
- Day surgery + restrictions
- Ambulatory surgery + barriers
- Ambulatory surgery + promotion
- Drivers of day surgery
- Day surgery + economics
- Day surgery + incentives

Search results were reviewed for relevance and any potentially relevant resources were downloaded or read in full to confirm eligibility.

Question 6 targeted searches in peer-reviewed bibliographic databases

A pragmatic supplementary search was performed in PubMed. Firstly, the existing keyword searches for literature on day surgery (Table 7) were repeated to identify all possible publications. This search was not limited to hernia surgery, but included any type of surgery in a day case setting. Secondly,

titles and abstracts were screened using text words relevant to levers, promotions and incentives of day surgery in the identified literature pool. Within these publications, a small sample of useful studies discussing different aspects of influential factors in day surgery were identified and retrieved for full text review. Finally, articles ‘similar’ (as defined by PubMed) to these useful studies were identified and cross-referenced with the initial literature pool.

Umbilical hernia search methodology

Medline was searched through the Ovid platform. The search strategy is presented in Table 12. From the supplementary search 234 new publications were identified; however, no studies were found that are relevant to the inclusion criteria for this review.

Table 12 Medline search terms

Search strategy	(((((((length of stay) OR length of stay[Title/Abstract])) OR (((same day[Title/Abstract] OR day case[Title/Abstract] OR day-case[Title/Abstract] OR day surger*[Title/Abstract])) OR ((Ambulat*[Title/Abstract] OR outpatient*[Title/Abstract])) OR (((Ambulatory Care) OR Ambulatory Surgical Procedures) OR outpatients))) AND (paraumbilical hernia) OR (ventral hernia) OR (umbilical hernia))) AND (((surgery) OR (((surger*[Title/Abstract] OR surgical*[Title/Abstract] OR procedur*[Title/Abstract] OR operati*[Title/Abstract])))) OR repair*[Title/Abstract]))))
-----------------	---

This strategy was adapted for the Embase database with relevant keywords and Emtree terms included.

Quality appraisal

Prioritised studies were evaluated for quality using established tools:

- AMSTAR for systematic reviews (Shea et al. 2007)
- Modified Downs and Black for RCTs and comparative studies (Downs and Black 1998)
- AGREE II tool for guidelines (Brouwers et al. 2010)

The quality of each included study was appraised by one reviewer and checked by a second reviewer. The quality of the studies helped establish the strength of evidence for each question.

Reporting of the results and GRADE

Due to the rapid review methodology used for this review, no statistical pooling of results was performed for clinical outcomes. Results were reported narratively for each research question.

For each clinical outcome, the GRADE tool was used to assess the quality of the evidence base used to inform the conclusions of the review (Guyatt et al. 2011). The quality of the studies according to the tools above, as well as their inconsistency, indirectness, and imprecision were used to guide the grading of the evidence.

Expert input and Working Group feedback

The Draft Report was circulated to the Working Group for comment. The final report was discussed with the Working Group at a face-to-face meeting on 23 February 2017.

Table 15 Results from question 1

Study ID	Study design	Patient characteristics	Hernia surgery type Same-day discharge rate	Complication rate, complications (safety)	Recurrence Unexpected prolonged stay (effectiveness)
Fischer & Zechmeister-Koss (2014)	Systematic review of mixture of studies on hernia repair with a mixed level of evidence	35 studies	Inguinal = 5 studies (the other 30 studies were on other surgery types) NR	Same day 2-33%, inpatients 2-6%; complication type not given	0% (both groups) 2% (inpatients group)
Voorbrood et al. (2015)	Case series; prospective; consecutive patients	N=336 ASA I or II Unilateral	Femoral = 6, other = 346 97%	Intraoperative minor 1.2%; bleeding, coagulation	1.5% 0.3%
Kulacoglu et al. (2012)	Case series; retrospective; consecutive patients	N=100 paraumbilical	Umbilical = 100 100%	11%; SSI, haematoma, seroma, allergy to material, ecchymosis	0% 1%
Kurzer et al. (2004)	Case series; retrospective; consecutive	N=73 ASA I or II	Umbilical = 73 NR	Postoperative pain on the second day mild in 50%, moderate in 23%, wound infections 9%	0% NR
Menon & Brown (2003)	Case series; retrospective; unknown if consecutive	N=32 Uncomplicated	Umbilical = 32 100%	2 wound infection (6%)	0% NR

ASA: American Society of Anesthesiologists status; NR: not reported.

Author, year, publisher	Location	Scope	Methods	Recommendations on length of stay	Grade
Simons et al. (2016) The HerniaSurge Group	Worldwide	Groin hernia management	Literature search and consensus meetings, vote and external review.	Day surgery is recommended for the majority of groin hernia patients provided adequate aftercare is organized. Day surgery is suggested for all endoscopic repairs of simple inguinal hernias provided adequate aftercare is organized. Day surgery is suggested for selected older and ASA IIIa patients (open repair under local anaesthesia) provided adequate aftercare is organized. Day surgery for patients with complex inguinal hernias is suggested only in selected cases.	Strong Weak Weak
Bittner et al. (2014)	Worldwide	Ventral and incisional hernia. Note only ventral hernia is relevant to this report	Literature search Consensus meeting	The operation time and hospital stay must be as short as possible. Based on the shorter hospital stay, LIVHR is the preferred operative technique Laparoscopic incisional hernia repair can be recommended as a cost-effective repair	Weak Grade A Grade A Grade D

ASA: American Society of Anesthesiologists status; GPP: good practice point; LIVHR: laparoscopic incisional and ventral hernia repair; NA: not applicable; NR: not reported; TAPP: transabdominal preperitoneal; TEPP: totally extraperitoneal; UK: United Kingdom.

Table 17 Evidence base underpinning the recommendations from the CPGs

Author, year, publisher	Summary of evidence	Level of evidence
Lomato et al. (2015)	Hernia repair can mostly be done as an ambulatory surgery except in selected patients.	Level 2A Oxford Centre for Evidence Based Medicine
Bittner et al. (2011). Updated 2015 International Endohernia society	Day-case surgery may be a risk factor for acute pain.	Level 3B Oxford Centre for Evidence Based Medicine

Author, year, publisher	Summary of evidence	Level of evidence
<p>Simons et al. (2009). Updated as Miserez et al. (2014) European Hernia Society</p>	<p>2009 evidence: Inguinal hernia surgery as day surgery is as safe and effective as that in an inpatient setting, and more cost-effective. Inguinal hernia surgery can easily be performed as day surgery, irrespective of the technique used. Selected older and ASA III/IV patients are also eligible for day surgery. 2014 Update: Selected older and ASA III patients are also eligible for day surgery (open repair, local anaesthesia).</p>	<p>Level 2B Level 3 Level 1B</p>
<p>Rosenburg et al. (2011). Danish Hernia Database</p>	<p>Inguinal hernia surgery as day surgery is as safe and effective as inpatient treatment and more cost effective. This applies for all patients including selected elderly and ASA-III-patients, but may depend on local factors such as social backup etc.</p>	<p>NR</p>
<p>Saunders et al. (2013) British Hernia Society</p>	<p>Retrospective studies and small RCTs have shown day surgery is as safe and effective as in-patient stay, and less costly. In two of three studies patients were at least as content with day surgery. Day surgery is associated with lower costs than in-patient procedures. Multiple cohort studies report successful day-procedures under general, regional and local anaesthetics. Tension-free repair under local anaesthetic may be the most suitable procedure for day-surgery; case series data shows other surgical and anaesthetic techniques can be effectively used as day surgery. Initially day surgery had strict selection criteria (for example ASA I-II, age limit, anticipated length of operation less than one hour, low BMI). Such strict criteria are becoming less common and day-surgery can be considered for virtually every patient who has satisfactory home care. Pre-assessment is important to facilitate day surgery.</p>	<p>2++ or extrapolated from 1++ and 1+ studies</p>
<p>Simons et al. (2016) The HerniaSurge Group</p>	<p>The evidence base cited in the European Guidelines was also cited in the World Guidelines. Additional points: Readmission rates following inguinal hernia surgery ranged from 0.8% to 1.1% in two large Danish studies of day procedures. No reports of death or complication directly related to day surgery were identified. Following laparoscopic repair (TAPP/TEP) and posterior open-mesh repair severe bleeding may occur within the first 48 hours. As management of large haematoma is often only possible after immediate diagnosis; short stay treatment can be considered following these procedures.</p>	<p>Moderate evidence (GRADE)</p>

Author, year, publisher	Summary of evidence	Level of evidence
Bittner et al. (2014)	<p>There is insufficient data to recommend outpatient repair of complex inguinal hernia; however if after care is arranged, some cases may be suitable for ambulatory surgery.</p> <p>Operations on strangulated and acutely incarcerated hernias should not be performed as day cases.</p> <p>Barring the exclusions cited above, IH day surgery can be considered for every patient with satisfactory care at home, including stable ASA III patients</p> <p>Day surgery should also be considered for the elderly, including octogenarians. However, nonagenarians should be excluded since even elective IH repair in those over 90 has a tenfold higher mortality rate compared with younger patients. Day surgery should not be performed on patients taking anticoagulants due to the higher risk of bleeding complications.</p> <p>In elderly patients, COPD and low preoperative serum albumin are independent predictors of wound infections; CAD, COPD, low preoperative serum albumin, and steroid use are independent predictors of a longer hospital stay.</p> <p>LIVHR significantly reduces hospital stay compared with open repair.</p> <p>Hospital stays are comparable after suture fixation and tacks fixation.</p> <p>The hospital stay is significantly shorter after LIVHR than after open repair for patients with hernias larger than 15 cm.</p> <p>The hospital stay is shorter after LIVHR for primary ventral hernia than after incisional hernia.</p> <p>The cost of surgery is higher for laparoscopic procedure, but a shorter hospital stay may make laparoscopic surgery more cost effective.</p>	<p>Level 2</p> <p>Level 1a</p> <p>Level 1b</p> <p>Level 2b</p> <p>Level 3</p> <p>Level 1a</p>

ASA: American Society of Anesthesiologists status; BMI: body mass index; CAD: coronary artery disease; COPD: chronic obstructive pulmonary disease; IH: inguinal hernia; LIVHR: laparoscopic incisional and ventral hernia repair; RCT: randomised controlled trial; TAPP: transabdominal preperitoneal; TEPP: totally extraperitoneal.

Excluded clinical practice guidelines

The following guidelines were identified as relevant to hernia repair but did not include any recommendation on length of hospital stay:

Study ID	Publication Type	Patient characteristics	Same-day discharge rate	Proportion ineligible for same-day surgery	Comment
Millat et al. (1993)	Case series; prospective (unclear); consecutive patients; primary data from 17 sites	N=500 male	82%	17.8%, reasons: medical 8%, social 4.6%, patient refusal 8.4%	Being employed, having low physical requirements, being younger, and having fewer than two medical risk factors were associated with successful short-stay surgery, however as not randomised these may not be independent variables
Voorbrood et al. (2015)	Case series; prospective; consecutive patients	N=336	97%	3.8%, reasons: no show 0.5%; medical reasons 3.3%	Ineligibility resulted from erroneous diagnosis (7), asymptomatic and switched to watchful waiting (3), different hernia type requiring a different procedure (1)
Kehlet et al. (2008)	Case series; prospective; database	87,840 procedures (may include recurrent)	55% in 1998, 70% in 2005	NR	Establishment of a compulsory nation-wide database improves patient outcomes
Toftgaard (2007)	Qualitative; retrospective; survey data	Data from 18 countries	In 2003 in Australia hernia repair done as day surgery = 22.6%	NR	There is great variation in day surgery activity between countries

NR: not reported.

Appendix 8 Results from research question 5

Table 20 Extraction of relevant clinical practice guidelines for question 5

Resource ID	Title	Main themes relevant to criteria for same-day procedures to be performed in Australia
<p>Australian and New Zealand College of Anaesthetists (2016)</p>	<p>Guidelines for the perioperative care of patients selected for day stay procedures</p>	<p>Patient selection and anaesthesia factors: Should be of physical status ASA II or medically stable ASA III or IV patients Medical comorbidities assessment should be undertaken, with particular attention to difficult airways or sleep disordered breathing A BMI threshold should be established, above which the patient will be scheduled for early consultation with an anaesthetist While infants and children are suitable, they need to have specific arrangements for their treatment made</p> <p>Procedural considerations: The procedures should: Have minimal post-operative haemorrhage Have minimal risk of post-operative airway compromise Have a level of post-operative pain that can be controlled by outpatient management techniques Permit post-operative care to be managed by the patient or carer with any nursing requirements met by day surgery, home or district nursing facilities Be associated with a rapid return to normal food and fluid intake Be scheduled accounting for recovery period. For example, where a prolonged recovery is expected the procedure should be scheduled high on the list</p> <p>Recovery and discharge arrangements: The post anaesthesia care unit should be separated into 1st stage recovery and 2nd stage recovery. Patients should not leave recovery unaccompanied. The following criteria should be satisfied before a patient can be discharged home: vital signs are stable for at least one hour in a conscious state with orientation as to time, place, and relevant people mobility level is similar to pre-anaesthesia levels, allowing for surgery type pain control is adequate nausea, vomiting and dizziness are manageable is tolerating oral fluids bleeding is minimal for those at risk of urinary retention, must have passed urine written and verbal instructions for post-anaesthesia and surgical care must have been provided to patient or carer, including advice on any regular medicine where needed, and a contact place and telephone number for</p>

Resource ID	Title	Main themes relevant to criteria for same-day procedures to be performed in Australia
		<p>emergency care must have received convalescence advice analgesia has been provided when necessary a responsible adult must be available to transport the patient and stay with them overnight if inpatient transfer, the anaesthetist/surgeon will be responsible for the patient until care is transferred to another medical officer</p> <p>Adequacy of facility resources: Facilities should be licensed or meet equivalent standards Facilities should have appropriately qualified staff, an adequate number of staff, and appropriate equipment Adverse event management and reporting, infection control and drug handling consistent with national standards Ambulance access to air transfer of inpatients, and the discharge area should be convenient Facility should be reasonable close to the patient's home Must have an established system for audit of anaesthesia care outcomes</p>
<p>Australian and New Zealand College of Anaesthetists (2010)</p>	<p>Recommendations for perioperative care of patients selected for day care surgery</p>	<p>Patient requirements: A willingness to have the procedure performed, an understanding of the process, and ability to follow discharge instructions Social requirements: A responsible adult should be able to transport the patient home, stay overnight and understand after the requirements of post-anaesthesia care The patient must be residing within one hour of medical attention on the first night The patient should have ready access to a telephone in their residence</p> <p>Patient preparation: Refer to document <i>PS7 Recommendations on the Pre-Anaesthesia Consultation</i> for all patients who are to receive anaesthesia Refer to document <i>PS26 Guidelines on Consent for Anaesthesia or sedation</i> for preparation for day surgery All day cases must be scheduled with appropriate time for pre-operative anaesthetic assessment Patient assessment can be assisted by: a standard patient questionnaire, prior referral by the surgeon, preliminary nurse assessment, anaesthesia consultation prior to the day of surgery by the anaesthetist who will be present</p> <p>The patient should be provided with information including: information on the procedures to be followed in the day surgery unit instructions for fasting</p>

Resource ID	Title	Main themes relevant to criteria for same-day procedures to be performed in Australia
		<p>Sedation and anaesthesia: General, regional or local anaesthesia, sedation or a combination of these techniques may be used ANZCA Professional Standards documents should be satisfied where appropriate</p> <p>Recovery from anaesthesia: Refer to document <i>PS4 Recommendations for the Post-Anaesthesia Recovery Room</i> which is fully applicable to day surgery units Area should have comfortable reclining seats, be adequately supervised, with assess to resuscitation equipment, and patients may not leave this area unaccompanied</p> <p>Discharge from day care unit: The criteria applying to patients being discharged home as in the 2016 guideline Discharge authorised by an appropriate staff member after discharge criteria satisfied Whenever possible a telephone enquiry as to the patient's wellbeing should be made on the following day</p> <p>Audit: Each day surgery unit must have an established system for audit of the outcomes and include those outcomes in quality assurance and peer review processes</p>

ASA: American Society of Anesthesiologists status; BMI: body mass index; ANZCA: Australian and New Zealand College of Anaesthetists.

Appendix 9 Results from research question 6

Table 2.1 Extraction of relevant resources (excludes studies identified through supplementary searches)

Resource ID Country	Intended use	Main themes relevant to levers and barriers of day surgery
Caroden (2010) and Caroden et al. (2009)	PhD thesis investigating optimum theatre scheduling in a day-case environment	Scheduling: Describes the research around OR scheduling and how to optimise this in a day-care environment.
ADHA (2011)	Australian Day Hospital Association comments to the ACCC re: private health insurance	Economic barriers: Private Day Hospitals are disadvantaged in contract negotiations with insurers. There may be discrepancy in funding compared to overnight centres for identical procedures.
Quemby et al (2013)	Peer-reviewed journal article	Social factors: If 24 hour home care, access to a telephone, accommodation within 1 hour of the hospital and/or patients informed consent are not present then day surgery should not occur. Facilities: The National Day Surgery Task Force set up by the UK government in 1993 recommended that every hospital should have a dedicated day surgery unit. Dedicated day surgery lists in autonomous units provide the best model of care and avoid tension from competing interests of mixed in-patient and day-care lists. Many units fail to achieve this; however, good outcomes have been demonstrated in some units which share theatres with inpatient activity but have dedicated day surgery postoperative facilities. Management and staffing: Each day surgery unit should have a medical clinical lead, unit nurse manager, and administration support. Nurse-led discharge is the key to day-surgery. Follow-up: Nurse-led follow-up by telephone provides a valuable resource for minimising burden on primary care, increasing patient satisfaction and identifying any complications.
Barnett (2016)	Review	Social Factors: Patient must understand procedure and consent to day surgery. Patients must be within 1 hour of a medical facility, have access to a telephone, refrain from driving, operating machinery or decision making, should have appropriate care and not need to care for dependents. Management and staffing: Day surgery units should have a clinical lead with a specific interest in day surgery to develop policies and guidelines. They should be supported by a day surgery manager who is in charge of day-to-day running of the unit. Surgeons and anaesthetists should be senior clinicians to promote forward flow and reduce admission rates and complications. Staff should be multi-skilled. Facilities: Day surgery should occur in a self-contained unit with good transport options nearby.

Resource ID Country	Intended use	Main themes relevant to levers and barriers of day surgery
Castoro (2007)	WHO policy document on day surgery	<p>If a separate unit is not feasible there should be a separate nursing team to achieve rapid recovery. The unit should remain open late enough that patients at the end of the operating list have sufficient time to recover.</p> <p>Economic: There may be financial incentives to the surgeon or hospital associated with inpatient stays</p> <p>Educational: Medical students and doctors may not be trained in the benefits of day surgery and therefore be unwilling to drive change. Lack of home support: There may be a lack of adequate community support.</p> <p>Information: Patients and healthcare providers may not be aware of day surgery as an option.</p> <p>Organisational: Day surgery requires strong multidisciplinary team working and this may be difficult to achieve.</p> <p>Patient satisfaction: High levels of patient satisfaction with day surgery have been reported. This can be optimised by – good postoperative pain control, short waiting times before surgery, courtesy of staff and a friendly environment, avoidance of feeling that they are being rushed or discharged too early, follow-up telephone on the day following discharge.</p> <p>Economic outcomes: The financial benefits are well established – hospital costs are between 25–68% lower. More patients can be treated in the same amount of time reducing waiting lists, inpatient facilities are released for more complex or emergency cases. Surgery cancellation due to bed shortages is reduced. Theatres can be used more efficiently. Staffing can be reduced as fewer overnight staff is required.</p> <p>Management and staffing: The most effective organisational structure is the creation of a distinct day-surgery service led by an experienced manager. A multidisciplinary approach is required. The day-surgery unit should have its own administrative infrastructure to manage patient flows.</p> <p>Nursing requires a multi-skilled approach.</p> <p>Community support: Integration between hospitals and community support (including GPs, policy makers, community nurses, family caregivers and social services) is required for day-surgery to be effective as pre- and postoperative care is performed in the community.</p> <p>Information: Effective information is required to prepare the patient psychologically for surgery, educate the patient about pre- and postoperative care, minimise risks in the postoperative period, improve patient satisfaction and obtain informed consent for the surgery.</p> <p>Regulatory: There may be regulatory barriers to day surgery</p> <p>Economic: Reimbursement may be more advantageous if patients are kept in overnight. Patients may be required to pay more out of pocket for day surgery as opposed to having full coverage for overnight stays.</p> <p>Educational: A lack of education about day surgery may reduce medical students' and doctors' awareness of day surgery.</p>

Resource ID Country	Intended use	Main themes relevant to levers and barriers of day surgery
		<p>Facility design: Health facilities may not be configured to facilitate day surgery. This may be in terms of internal configuration (ease of patients flow) and external configuration (ease of access). Lack of community support: This may be a barrier to day surgery Organisational: Weak multidisciplinary teamwork can be a barrier to day surgery. Recommendations: Consider day surgery, rather than inpatient surgery, the norm for all elective procedures Separate flows of day-surgery patients from inpatients Design day-surgery facilities according to local needs, structurally separate from inpatient facilities whenever possible Provide day-surgery units with independent management structures and dedicated nursing staff Take advantage of motivated surgeons and anaesthetists to lead the change Achieve economies by ensuring that expansion of day surgery facilities is accompanied by reductions in inpatient capacity Invest in educational programmes for hospital and community staff Remove regulatory and economic barriers Align incentives Monitor and provide feedback on results (including patients' views)</p>

**Guidelines for Recognition of
Private
Hospital-Based Rehabilitation Services**

August 2016

Developed by the Consultative Committee on Private Rehabilitation

Guidelines for Recognition of Private Hospital-Based Rehabilitation Services (The Guidelines)

Contents

	Page
Introduction	1
Guidelines	
Criterion 1	2
Rehabilitation care provided by a specialist rehabilitation team on an admitted or non-admitted basis in a specialist rehabilitation unit (a separate physical space).	
and	
Criterion 2	5
Rehabilitation care provided by a multidisciplinary team which is under the clinical management of a Consultant Physician in Rehabilitation medicine or equivalent.	
The service is multidisciplinary and will ensure specialist rehabilitation is available 7 days per week.	
and	
Criterion 3	7
Rehabilitation care provided for a person with impairment or disability and for whom there is reasonable expectation of functional gain.	
and	
Criterion 4	8
Rehabilitation care for which the primary treatment goal is improvement in functional status.	
and	
Criterion 5	9
Rehabilitation care which is evidenced in the medical record by:	
▸ an individualized and documented initial and discharge assessment of functional ability by use of a recognised functional assessment measure;	
▸ an individualized multidisciplinary rehabilitation plan which includes negotiated rehabilitation goals and indicative time frames; and	
▸ hospital-specific documented programmes or treatment plan.	
Appendix 1	
Standardised Nomenclature and Admission Guidelines	11

Introduction

The purpose of specialist rehabilitation units in the private sector is to treat patients requiring specialist rehabilitation.

This particular group of patients, as defined in these Guidelines, requires multidisciplinary rehabilitation treatment in a specialist rehabilitation unit for the clinical intent or treatment goal of improving the functional status of a patient with an impairment, disability or handicap within a clinically appropriate timeframe.

There may be multiple entry paths (e.g. from place of residence, another hospital or hospital ward) to a specialist multidisciplinary rehabilitation service. Referral source is not an indicator of appropriateness for admission to a specialist rehabilitation service, but patients must be admitted to the services under the direction of a Consultant Physician in Rehabilitation Medicine or equivalent and be assessed as appropriate in accordance with the admission criteria in these Guidelines.

Private facilities providing multidisciplinary rehabilitation care which meet *all* the criteria in these Guidelines may be eligible for private health insurance payments.

The Guidelines have been developed in consultation with the Australasian Faculty of Rehabilitation Medicine (AFRM) a Faculty of the Royal Australasian College of Physicians. They have also been endorsed by the Consultative Committee on Private Rehabilitation (CCPR), which has independent industry Representation¹.

The industry recognizes the Functional Independence Measure (FIM) as the functional measure of choice for inpatient rehabilitation, thus ensuring industry data requirements are met as defined by the Australasian Rehabilitation Outcomes Centre (AROC).

It is intended that the Guidelines will guide hospitals and health insurers in their contract negotiations. The definition of a rehabilitation patient is also relevant and can be found in Schedule 1, Part 2, 8 of the *Private Health Insurance (Benefit Requirements) Rules* made under the *Private Health Insurance Act 2007*.

In addition, these Guidelines are a component of the quality criteria for private hospital and day hospital facilities with rehabilitation services seeking eligibility for Second Tier default benefits.

These Guidelines have been developed for the delivery of private rehabilitation services. They may also be of assistance to State and Territory health authorities in the treatment of private and public patients in public hospitals.

It is anticipated that the elements in these requirements will be reviewed biennially by the CCPR.

¹ The Consultative Committee on Private Rehabilitation is a national industry committee comprising representatives of the Australasian Faculty of Rehabilitation Medicine, Private Healthcare Australia, the Australian Private Hospitals Association, the Department of Veterans' Affairs and the Private Health Insurance Ombudsman.

Criterion 1

Rehabilitation care provided by a specialist rehabilitation team on an admitted or non-admitted patient basis in a specialist rehabilitation unit (a separate physical space).

1.1. Specialist Rehabilitation Team

1.1.1. Rehabilitation care must be provided by a multidisciplinary team which is defined as:

- a medical practitioner who is a Consultant Physician in Rehabilitation Medicine and who is a Fellow of the Australasian Faculty of Rehabilitation Medicine (Royal Australasian College of Physicians) or equivalent²;
- nursing staff skilled and experienced in rehabilitation nursing, appropriate to the rehabilitation casemix of the hospital;
- allied health professionals with relevant experience, including FIM credentialing and registered or recognised by the appropriate professional bodies, appropriate to the rehabilitation casemix of the hospital; and
- delivery of defined and documented rehabilitation programmes, reviewed as appropriate.

The Consultant Physician in Rehabilitation Medicine is responsible for the co-ordination of treatment for each patient.

1.2. Specialist Multidisciplinary Rehabilitation Service

1.2.1. Rehabilitation care should be provided in a dedicated facility/unit/ward. It is generally not recommended that overnight inpatient rehabilitation patients will be accommodated outside the dedicated rehabilitation unit/ward other than in situations of short term unavoidable operational requirements.

The design of the facility/unit will be dependent on the casemix of the facility/unit. However, the following features will be included:

- disability access to all areas including bed units, wards, dedicated rooms for individual therapy, dining rooms, toilets and accessible outside areas;
- a physiotherapy area with appropriate equipment and which has dedicated rooms for individual therapy and assessment as well as large open space for gait training and general exercise;
- an occupational therapy area that has space for group activities, rooms for individual therapy and assessment, a therapy workshop and dedicated areas for community assessment of Activities of Daily Living (ADL);

² There may be circumstances in which an alternative qualification to AFRM or equivalent is appropriate, such as where:

- patients are receiving sub-specialty rehabilitation and the qualifications and experience of the medical specialist are applicable to the casemix of the programme; or patients are receiving sub specialty specialty rehabilitation and the qualifications and experience of the medical specialist are applicable to the casemix of the programme; or
- the specialist has extensive experience in rehabilitation.is an experienced physician or surgeon experienced in multidisciplinary rehabilitation medicine.

- individual therapy or consultation areas suitable for quiet clinical consultation or mental state examination or speech therapy, assessment and treatment or psychological assessment, counselling and treatment where appropriate;
- a meeting room suitable for case conferences and family meetings;
- hydrotherapy pool conforming to the relevant Australian Design Standards (if hydrotherapy is appropriate for casemix). In circumstances where hydrotherapy is recommended for individual patients as per their treatment plans and the hospital does not have hydrotherapy pool on site, it must be able to demonstrate that safe and appropriate access to a hydrotherapy pool is available.

1.3. Equipment

1.3.1. The facility/unit's equipment will be dependent on the casemix of the facility/unit:

- parallel bars;
- ergometer, and treadmill calibrated to measure distance/units;
- gym equipment, including weights, pressures and pulleys, suitable for muscle strengthening;
- an area and equipment for provision of personal and domestic ADL training;
- range of wheelchairs and mobility aids;
- appropriate mental state and cognitive screening and assessment tools;
- appropriate speech and language assessment and treating tools;
- appropriate tools for patient and family education; and
- stairs with handrails and turning area at top of stairs.

1.4 Rehabilitation Settings

Rehabilitation services may be provided on an admitted or non-admitted basis including the continuum of services between inpatient and ambulatory settings according to the medical and functional requirements of the patient³.

This ensures the efficient running of the service and assists with early discharge home whilst maximising functional outcomes. Where overnight inpatient multidisciplinary rehabilitation is not clinically indicated, multidisciplinary rehabilitation may be offered through a full Day Rehabilitation Programme, a Half-Day Rehabilitation Programme or a Sessional Therapy Programme.

It should be noted that, within an episode of care, a patient's rehabilitation needs may vary, and that, for example, patients who are receiving a day programme may move progressively between full-day, half-day and sessional programmes. Clinical assessment will direct the appropriate selection of programmes for a patient.

For the purposes of these *Guidelines*, a *session* is defined as functional task management by an appropriately qualified health professional over a period which approximates 30 minutes.

³ Due to differing definitions of admitted and non-admitted care in different states of Australia for their respective data collections, Day Rehabilitation Programmes may be named variously as 'same day' 'day only' 'half day' or 'non-admitted' episodes of care according to the location of the facility. The relevant State legislation, guidelines or operational directives will determine whether the patient is admitted or non-admitted

1.4.1 Full-Day Rehabilitation Programme

Day Rehabilitation Programmes³ are suitable for those patients who have established rehabilitation needs, do not require overnight inpatient care, and whose rehabilitation programmes and goals require the involvement of a multidisciplinary team, under the direction of a Consultant Physician in Rehabilitation Medicine or equivalent. Day Rehabilitation Programmes provide a coordinated programme of care on an admitted or non-admitted same day basis which is documented in an individualised multidisciplinary rehabilitation plan which includes negotiated rehabilitation goals and indicative time frames. The number of sessions associated with a full-day rehabilitation programme will be more than 5 sessions.

1.4.2 Half-Day Rehabilitation Programme

Half-day Rehabilitation Programmes³ are suitable for those patients who have established rehabilitation needs, do not require overnight inpatient care, and whose rehabilitation programmes and goals require the involvement of a multidisciplinary team, under the direction of a Consultant Physician in Rehabilitation Medicine or equivalent. Half-Day Rehabilitation Programmes provide a coordinated programme of care on an admitted or non-admitted same day basis which is documented in an individualised multidisciplinary rehabilitation plan which includes negotiated rehabilitation goals and indicative time frames. The number of sessions associated with a half-day rehabilitation programme will be 3 to 5 sessions.

1.4.3 Sessional Therapy Programme

When a patient has established rehabilitation needs and goals as determined by a Consultant in Rehabilitation Medicine or equivalent, does not require overnight inpatient care and requires a single mode of therapy not involving the coordination of multidisciplinary care, such needs may be met through a Sessional Therapy Programme³. A Sessional Therapy Programme provides a single modality of therapy of up to 2 sessions in a given day which is documented in an individualised rehabilitation plan which includes negotiated rehabilitation goals and indicative time frames.

1.4.4 Inpatient Rehabilitation Programme

Inpatient Rehabilitation Programmes are suitable for those patients who have established rehabilitation needs, but who are also assessed as requiring 24 hour nursing care. Their rehabilitation programs and goals require the involvement of a multidisciplinary team, under the direction of a Consultant in Rehabilitation Medicine or equivalent and should be confirmed with the patient on admission. The multi-disciplinary service will be available 7 days per week ensuring specialist rehabilitation care is available regardless of day of admission.

Inpatient Rehabilitation Programmes provide a daily coordinated programme of care that is documented in an individualised multidisciplinary rehabilitation plan and which includes negotiated rehabilitation goals and indicative time frames.

³ Due to differing definitions of admitted and non-admitted care in different states of Australia for their respective data collections, Day Rehabilitation Programmes may be named variously as 'same day' 'day only' 'half day' or 'non-admitted' episodes of care according to the location of the facility. The relevant State legislation, guidelines or operational directives will determine whether the patient is admitted or non-admitted.

Criterion 2

Rehabilitation care provided by a multidisciplinary team which is under the clinical management of a Consultant Physician in Rehabilitation Medicine or equivalent.

2.1. Clinical Staffing

2.1.1. Rehabilitation care must be provided by a multidisciplinary team.

2.1.1.1. The multidisciplinary rehabilitation team will be under the clinical direction of a Consultant Physician in Rehabilitation Medicine or equivalent⁴.

Each programme shall be supervised by a Consultant Physician in Rehabilitation Medicine or equivalent and staffed by an appropriately qualified multidisciplinary team relevant to the therapeutic needs of the patients being treated and have access to consultative services which are appropriate to the programmes offered.

2.1.1.2. Other clinical staff, both professional and support staff, will be appropriately skilled, experienced and provided in sufficient numbers to provide individual and group therapy programmes for the casemix of patients being serviced.

2.2. Policy and Programme Review

2.2.1. A facility/unit must have:

- a comprehensive manual of policy and procedures applying to and within the facility, and there should be evidence that this is reviewed on an annual basis and updated as per accreditation requirements or legislative changes;
- a demonstrated process for reviewing programmes and patient outcomes.

⁴ There may be circumstances in which an alternative qualification to AFRM or equivalent is appropriate, such as where:

- patients are receiving sub-specialty rehabilitation and the qualifications and experience of the medical specialist are applicable to the casemix of the programme, or
- the specialist is an experienced physician or surgeon experienced in multidisciplinary rehabilitation.

2.3. Data Collection and Outcome Measures

2.3.1. A facility/unit must:

- submit rehabilitation data in AN-SNAP3⁵ format (or update versions) to the Australasian Rehabilitation Outcomes Centre (AROC) targeting 100% of all in-patient rehabilitation episodes for assessment and national benchmarking;
- ensure all rehabilitation episodes will be scored for Functional Independence Measure (FIM) by a FIM-credentialed staff member.

⁵ Australian National Sub-Acute and Non-Acute Patient classification system.

Criterion 3

Rehabilitation care provided for a person with impairment or disability and for whom there is reasonable expectation of functional gain.

3.1. Impairment Codes

3.1.1. Each patient is assigned an impairment code using the current version of the AROC Impairment Coding Guidelines. These guidelines were originally based on the UDSmr Guidelines. The 2013 AROC Guidelines is available on line:
<http://ahsri.uow.edu.au/content/groups/public/@web/@chsd/@aroc/documents/doc/uow125260.pdf>

Classifications include:

- stroke
- brain dysfunction
- neurological conditions
- spinal cord dysfunction
- amputation of limb
- arthritis
- chronic pain
- orthopaedic disorders
- cardiac
- pulmonary disorders
- burns
- congenital deformities
- major multiple trauma
- developmental disabilities
- reconditioning/restorative
- other disabling impairments.

3.1.2. The episode should be classified according to the primary clinical reason for the **current episode** of rehabilitation care. The AROC impairment code identifies the major focus of rehabilitation and the primary subject of the rehabilitation plan.

Criterion 4

Rehabilitation care for which the **primary treatment goal** is improvement in functional status.

4.1. Assessment and Admission

4.1.1. Rehabilitation care must be provided for a person who has all of the following:

- an impairment with associated functional loss;
- a reasonable expectation of functional gain; and
- the primary treatment goal is improvement in functional status.

4.1.1.1. Acceptable rehabilitation impairments are the current version of the AROC Impairment Codes as described in the AROC Impairment Coding Guidelines 2013 <http://ahsri.uow.edu.au/content/groups/public/@web/@chsd/@aroc/documents/doc/uow125260.pdf>

4.1.1.2. Prior to commencement of the rehabilitation programme, a comprehensive and documented rehabilitation assessment should be undertaken.

4.1.1.3. Appropriate outcome measures must be used to document initial assessment of functional ability for all patients.

4.1.1.4. The pre-admission assessment should also indicate that the patient has an understanding of and commitment to the rehabilitation process.

4.1.1.5. The pre-programme assessment will take into account the most appropriate hospital-based setting for rehabilitation care.

4.2. Admission Guidelines

4.2.1 Programmes offered by private rehabilitation facilities that meet these Guidelines would be expected to include the features described in Appendix 1: Standardised Nomenclature and Admission Guidelines for Rehabilitation Patients in Private Facilities.

4.2.2 Admissions to a rehabilitation programme should conform to the admission criteria of that programme as set out in Appendix I

Criterion 5

Rehabilitation care which is **evidenced in the medical record by:**

- ▶ **an individualised and documented initial and discharge assessment of functional ability by use of a recognised functional assessment measure;**
 - ▶ **an individualised multidisciplinary rehabilitation plan which includes negotiated rehabilitation goals and indicative time frames; and**
 - ▶ **hospital-specific documented programmes or treatment plan**
-

5.1. Assessing Functional Ability

5.1.1. Appropriate outcome measures must be used to document admission and discharge assessment of functional ability.

5.1.2. Utilisation of other standardised outcome instruments dependent on casemix.

5.2. Development and implementation of a Multidisciplinary Rehabilitation Programme for each individual patient.

5.2.1. A written patient specific rehabilitation plan must be developed by the multidisciplinary team and include:

- clearly stated multidisciplinary goals and outcomes of the planned rehabilitation;
- predicted period of rehabilitation (length of stay);
- functional gain;
- discharge destination;
- reflect the needs of the patient, family and carers as well as all members of the multidisciplinary team; and
- meeting industry-accepted reporting requirements (for example the relevant Clinical Indicators developed by the Australian Council on Healthcare Standards).

5.2.2. For patient review and multidisciplinary care conferences:

- there must be regular meetings whilst the patient is in a rehabilitation programme;
- there must be a documented policy for regular review of patients;
- this policy must include regular interdisciplinary case conferences which evaluate and document the progress of the patient against the established plan in the medical record. The patient, family members and carers should be kept informed and contribute to the decisions of the rehabilitation team.

5.3. Discharge Planning

5.3.1. All patients will have a comprehensive documented discharge plan. This discharge plan must

be commenced and documented on admission and activated on discharge. The discharge plan will take into account:

- the needs of the patient and family;
- home assessment where appropriate;
- relevant discharge destination end point;
- liaison with community services and communication with the referring doctor and Local Medical Officer; and
- ongoing treatment requirements and care setting.

A copy of the discharge plan will be sent to the patient's General Practitioner and will include details of medications currently prescribed for the patient.

Guidelines for Recognition of Private Hospital-Based Rehabilitation Services

APPENDIX 1

STANDARDISED NOMENCLATURE and ADMISSION GUIDELINES for REHABILITATION PATIENTS IN PRIVATE FACILITIES

Note: These Guidelines apply to rehabilitation facilities and services that meet the
Guidelines for Recognition of Private Hospital-Based Rehabilitation Services

August 2016

Orthopaedic Programme

Upper Limb	Joint Replacement
Lower Limb Complex	Spinal – post surgical

1. UPPER LIMB ORTHOPAEDIC PROGRAMME

Clinical Criteria for Admission:

1. Following upper limb orthopaedic procedures, trauma, injuries or fractures which directly result in disability which requires a rehabilitation programme targeted at developing skills in personal activities of daily living.

OR

2. Patient fitted with an upper limb orthosis – this may require a short term rehabilitation programme directed at developing skills in personal activities of daily living.

OR

3. The patient has co-morbidities which result in the need for rehabilitation

Including, but not limited to:

- a. Significant balance problems where walking aid is ordinarily held by the affected arm.
- b. Widespread generalised arthritis.
- c. Neurological or cognitive dysfunction.

OR

4. Access Indications – Because of upper limb orthopaedic procedures there are mobility and balance changes resulting in safety problems which would benefit from multidisciplinary rehabilitation treatment.

OR

5. The presence of post-operative complications which restrict function.

AND

6. The patient is able to actively participate in a rehabilitation programme with or without the aid of a carer.

2. LOWER LIMB ORTHOPAEDIC

Clinical Criteria for Admission

1. Following lower limb orthopaedic procedures, trauma, injuries or pelvic fractures which result in disability which requires a rehabilitation programme directed at developing skills in personal activities of daily living.

OR

2. Fractures requiring acquisition of specific balance or mobility skills for safety.

OR

3. Bilateral weight bearing limb fractures.

OR

4. Multiple fractures with major trauma.

OR

5. Lower limb fractures with co-morbidities which result in the need for rehabilitation;

Including, but not limited to:

- a. Widespread generalised rheumatoid or osteoarthritis.
- b. Significant balance problems – which includes Parkinson’s disease, early Alzheimer’s disease and other neurological and cognitive dysfunctions, vestibular problems, previous stroke.
- c. Factors which effect ability to weight bear with appropriate aid – such as other joint, replacements, status of upper limb joints, significant respiratory or cardiac disease.
- d. Post-operative complications.

OR

6. Access Indications – Because of lower limb orthopaedic procedures there are mobility and balance changes resulting in safety problems which would benefit from multidisciplinary rehabilitation.

AND

7. The patient is able to actively participate in a rehabilitation programme with or without the aid of a carer.

3. JOINT REPLACEMENT

Clinical criteria for Admission:

1. Lower limb joint replacement with or without local complications of the procedure which result in disability which requires a rehabilitation programme directed at developing skills in personal activities of daily living.

OR

2. Lower limb joint replacement with co-morbidities which result in the need for rehabilitation,

Including but not limited to:

- a. Widespread generalised rheumatoid or osteoarthritis.
- b. Significant balance problems – which includes Parkinson’s disease, early Alzheimer’s disease, vestibular problems, previous stroke.
- c. Factors which effect ability to weight bear with appropriate aid – such as other joint replacements, status of upper limb joints, significant respiratory or cardiac disease.
- d. Patients that have difficulty in complying with safety instructions to ensure the protection of the new joint.
- e. Neurological or cognitive dysfunctions.

OR

3. Access indications – such that the lower limb joint replacement causes mobility changes which result in balance and safety issues.

AND

4. The patient is able to actively participate in a rehabilitation programme with or without the aid of a carer.

4. SPINAL – POST SURGICAL

Clinical Criteria for Admission

1. Following spinal surgery or spinal intervention such as laminectomy

AND

2. The patient has persisting disability and dependency due to:

2.1 Post-operative complications which restrict function.

OR

2.2 Co-morbidities which result in the need for rehabilitation because of balance and safety issues.

OR

2.3 Impairment in muscle strength, joint instability (e.g. Halo brace), limited and painful range of movement, disturbance of peripheral joint sensation, postural and gait dysfunction.

OR

2.4 A condition which results in disability which requires a rehabilitation programme directed at developing skills in personal activities of daily living.

OR

2.5 Access Indications – Because of spinal intervention there are mobility and balance changes resulting in safety problems which would benefit from multidisciplinary rehabilitation.

AND

3 The patient is able to actively participate in a rehabilitation programme with or without the aid of a carer.

Neurological Programme

Non Stroke – e.g.: Parkinson’s & Extra Pyramidal Disorders	
Non Stroke - Peripheral	Traumatic brain
Non Stroke – Neurological	Non traumatic brain
Stroke	

1. NON STROKE – PARKINSON’S & EXTRA PYRAMIDAL DISORDERS

Clinical Criteria for Admission

Indications are:

1. Recent onset or deterioration in mobility and function requiring medication manipulation as an adjunct to the rehabilitation received.

OR

2. Parkinson’s disease / Extra pyramidal disorders with:

- 2.1 Recurrent falls + sequelae.

OR

- 2.2 Swallowing disorders with subsequent problems, e.g. Dietary, chest Infection.

OR

- 2.3 Communication disorder.

AND

- 4 The patient is able to actively participate in a rehabilitation programme with or without the aid of a carer.

2. NON STROKE – PERIPHERAL

Clinical Criteria for Admission

1. The patient has suffered a recent onset of neurological condition.

OR

2. The patient has suffered deterioration of functional ability in association with an established neurological condition.

Including but not limited to:

- a. Guillain-Barre' Syndrome.
- b. Other Neuropathies.
- c. Myopathies.
- d. Peripheral Nerve injuries.

AND/OR

3. The disability is assessed as being likely to respond to rehabilitation.

AND

4. The patient is able to actively participate in a rehabilitation programme with or without the aid of a carer.

3. NON STROKE – NEUROLOGICAL

Clinical Criteria for Admission

1. The patient has suffered deterioration of functional ability in association with an established neurological condition

Including but not limited to:

- a. Multiple sclerosis.
- b. Other Multi focal conditions.

This would exclude conditions that primarily manifest as dementia e.g. Alzheimer's disease

OR

2. The patient has persisting disability and dependency due to:

- 2.1. Nerve root damage.

OR

- 2.2 Spinal Cord damage including Cauda Equina syndrome involving bladder or bowel.

AND/OR

3. The disability is assessed as being likely to respond to rehabilitation.

AND

4. The patient is able to actively participate in a rehabilitation programme with or without the aid of a carer.

4 STROKE

Clinical Criteria for Admission:

1. The patient has suffered a recent onset of stroke with functional loss

OR

2. The patient has suffered deterioration of functional ability following a previous stroke.

AND/OR

3. The disability is assessed as being likely to respond to rehabilitation.

AND

4. The patient is able to actively participate in a rehabilitation programme with or without the aid of a carer.

5. TRAUMATIC BRAIN INJURY

Clinical Criteria for Admission

1. The patient has suffered a recent traumatic brain injury.

AND/OR

2. The patient's impairment (cognitive, behavioural and/or communicative impairment) is such that the functional deficit requires specific care which cannot be safely provided at home or in an outpatient setting.

AND/OR

3. The patient and/or carer requires intensive daily therapy in a multidisciplinary setting.

AND/OR

4. The disability is assessed as being likely to respond to rehabilitation.

AND

5. The patient is able to actively participate in a rehabilitation programme with or without the aid of a carer.

6. NON TRAUMATIC BRAIN INJURY

Conditions causing brain injury including but not limited to hypoxia, post-surgical infection, post sub-arachnoid haemorrhage, and following neurosurgery for brain tumour.

Clinical Criteria for Admission

1. The patient has suffered a recent brain injury or brain surgery or emerges from coma or vegetative state.

OR

2. The patient has experienced a recent or progressive deterioration in functional capability following previous non traumatic brain injury.

AND

3. The patient's impairment (cognitive, behavioural and/or communicative impairment) is such that the functional deficit requires specific care which cannot be safely provided at home or in an outpatient setting.

AND/OR

4. The patient requires intensive daily therapy in a multidisciplinary setting.

AND

5. The disability is assessed as being likely to respond to rehabilitation.

AND

6. The patient is able to actively participate in a rehabilitation programme with or without the aid of a carer.

Pain Programme

Clinical Criteria for Admission:

1. Diagnosis of chronic/intractable pain condition or patient pain levels and medication use resulting in a deficit in balance, mobility and functioning which requires multidisciplinary intervention.

AND

2. Assessment indicates the patient is in an appropriate psychological state to participate, with potential for positive response to intervention.

AND/ OR

3. Aiming to avoid surgical intervention and minimise/rationalise medication use.

AND/OR

4. The disability is assessed as being likely to respond to rehabilitation.

AND

5. The patient is able to actively participate in a rehabilitation programme with or without the aid of a carer.

Re-conditioning Programme

Clinical Criteria for Admission:

Where a rehabilitation programme aims to maximise or restore functional independence, exercise tolerance and endurance in a patient who is deconditioned:

1. Following an acute surgical intervention.

OR

2. Following an acute medical condition or exacerbation

Including, but not limited to:

- a. Septicaemia.
- b. Renal failure.
- c. Liver failure.
- d. Cardiac or respiratory illness.

OR

3. Patient is experiencing an acute exacerbation of inflammatory arthritis (e.g. As evidenced by multiple joints, ESR elevation, mobility of upper and lower limbs diminished) with concurrent disability.

OR

4. Following exacerbation of chronic illness.

OR

5. Patient is deconditioned as a result of cancer or following treatment from cancer.

AND

6. The acute episode has resulted in a functional deterioration to a level that the patient requires support and guidance with basic ADL tasks and/or increased inability to transfer and ambulate.

AND

7. The patient's disability is assessed as being likely to respond to multidisciplinary rehabilitation therapy within appropriate time frames and the rehabilitation therapy is not part of respite care.

AND

8. The patient is able to actively participate in a rehabilitation programme with or without the aid of a carer.

Amputee Programme

Clinical Criteria for Admission:

1. Below Knee Amputation (transtibial), Symes, Through Knee Amputation, Above Knee Amputation (transfemoral), Above Elbow Amputation and Below Elbow Amputation or higher complication.

OR

2. Bilateral amputations.

OR

3. Functional education and training for prosthesis.

OR

4. Any of the above amputation or fracture with other significant co-morbidities, including, but not limited to stroke, rheumatoid arthritis, cardiac diseases.

OR

5. Following amputation:

Failed stump healing or wound breakdown.

OR

Debilitating amputation-related pain.

OR

Contractures restricting mobility.

OR

Phantom pain.

AND

6. The patient is able to actively participate in a rehabilitation programme with or without the aid of a carer.

Cardiac Programme

Clinical Criteria for Admission:

Where a rehabilitation programme aims to maximise or restore functional independence, exercise tolerance and endurance:

1. Following a recent cardiac event.

AND

2. The patient is medically stable:
 - Post-operative cases afebrile for 48 hours
 - No arrhythmia changes for 48 hours
 - Wounds are sound
 - Cardiac Failure controlled and stabilised
 - Angina controlled and stabilised

AND/OR

3. There is associated persisting disability and dependency following the cardiac event e.g.:
 - Recent Stroke,
 - Respiratory Compromise,
 - Significant Comorbidities e.g. Generalised Arthritis, previous Stroke.

AND

4. The Patient's disability is assessed as being likely to respond to multidisciplinary rehabilitation, with rehabilitation goals being identified, within appropriate timeframes.

AND

5. The patient is able to actively participate in a rehabilitation programme with or without the aid of a carer.

Implementation guides

To accompany the National Standards for Mental Health Services there are three Implementation Guideline documents that provide more detail to inform the implementation of the Standards.

The implementation guides provide clear directions for mental health services on how the criteria of the Standards apply to different services.

The three guideline documents are aimed at the following service sector groups:

- public mental health services and private hospitals
- community (non government) organisations
- private office based mental health services

The guideline documents were developed with significant input and recommendations from the following areas:

- Alcohol, Tobacco and Other Drugs (ATOD)
- Aboriginal and Torres Strait Islanders
- Culturally And Linguistically Diverse (CALD)

The recommendations from these groups have been incorporated in an integrated fashion within each of the three implementation guideline documents.

An electronic copy of the implementation guideline documents can be found on the Mental Health Standing Committee website. These are available for downloading from this website at:

➤ <http://www.health.gov.au/mhsc>

Foreword

The National Standards for Mental Health Services (the Standards) were first introduced in 1996 to assist in the development and implementation of appropriate practices and guide continuous quality improvement in mental health services, which at that time were predominantly provided through State and Territory funded specialist clinical mental health services. They were welcomed by the service sector and were very influential in how services responded to the needs and expectations of consumers and carers.

Much has changed since then, with increased service provision in the community—both clinical and non-clinical, expansion of the non-government and private sectors, and greater focus on the role of the primary care sector in mental health. New services have been developed and funded through all levels of government.

In response to these changes, a review of the Standards was commenced in November 2006, in consultation with the sector, and with consumers and carers. The review consisted of a number of different phases and avenues of consultation. Significant effort was made to ensure the consultation was as inclusive as possible although it is acknowledged that some stakeholders would have preferred an even more extensive consultation process. The inclusion of a recovery standard is a new and welcomed addition. This standard in particular may further evolve as experience is gained in its implementation and measurement.

These National Standards for Mental Health Services focus on:

- how services are delivered
- whether they comply with policy directions
- whether they meet expected standards of communication and consent
- whether they have procedures and practices in place to monitor and govern particular areas—especially those which may be associated with risk to the consumer, or which involve coercive interventions.

All of the Standards, except the consumer standard, are designed to be assessed. In contrast, the consumer standard is designed to inform consumers about their rights and responsibilities and the key elements underpinning the provision of quality service that consumers can expect to receive from mental health service providers throughout the continuum of care. The consumer standard is therefore not intended to be assessed, as it contains criteria that are all assessable within the other standards.

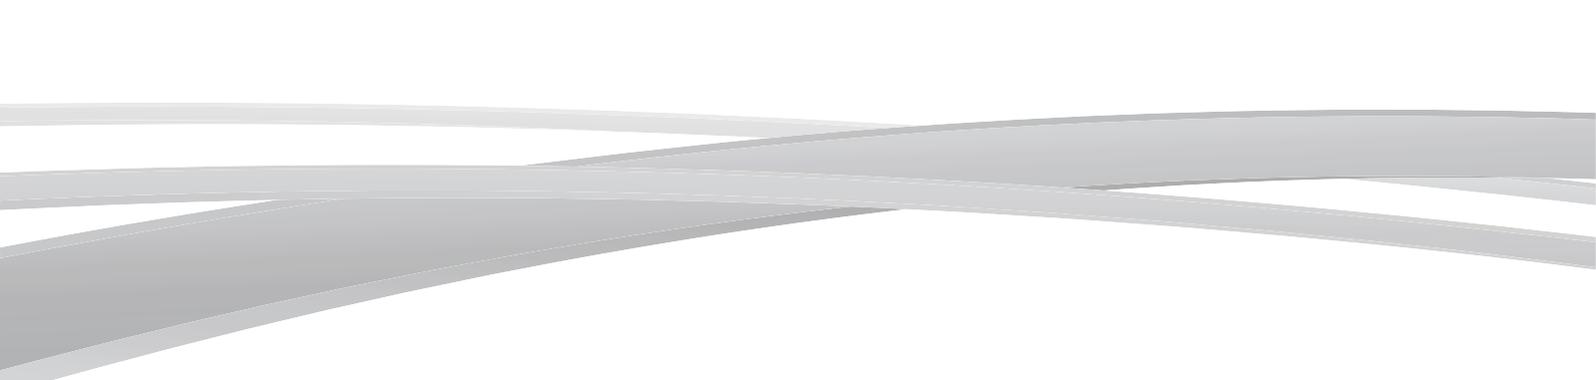

The Standards have been developed to be applied across the broad range of mental health services. This includes bed based and community mental health services, those in the clinical and non-government sectors, those in the private sector and also those in primary care and general practice. They are not intended to apply to services where mental health is not the main focus of care, such as generic community services which support people with a range of disabilities, or generic aged care services. Other practice frameworks are more appropriately applied in those settings. However, when assessing the performance of a mental health service against the Standards, it will be necessary to do this within the context of the individual mental health service i.e. the expectations will vary depending on the service type and setting.

Consideration of the Standards should also be incorporated into the delivery of services such as indigenous health services, alcohol tobacco and other drug services (ATODS) and aged care services, where they are responsible for the delivery of mental health care within the service. The Standards apply to ATOD services that are part of a mental health service. For stand-alone ATOD services, mental health services should be able to demonstrate that they are developing or have collaborative / partnership arrangements in place to ensure integration and coordination of care for consumers.

Expectation that the Standards will be incorporated across the broad range of mental health services marks a significant shift, and one that will need to be developed over time. It is anticipated that the Standards will be a 'living document' that will further evolve as services across the spectrum progressively strive to meet relevant and expected standards of care.

Across the health and community sectors, service delivery is influenced by a number of different quality, safety and performance frameworks. The Standards represent only one component of this environment which includes specific state and sector legislation, associated regulation, professional regulation, accreditation and employment conditions, purchasing and funding agreements, government policy, service development and accreditation. All of these contribute to and affect the achievement of standards. It is anticipated that the Standards will be incorporated into the relevant service accreditation programs.

However, while accreditation is one mechanism to monitor compliance, it is by no means the only one. Compliance can also be measured through reporting frameworks such as key performance indicators and licensing processes. Importantly, there must be evidence that a service has a commitment to improving the quality of care whether this is through review against the Standards, or other quality improvement processes.

Service development is uneven, and this can create a tension between expectation and current practice. Not all states and territories, or even all areas within a jurisdiction, will be at the same stage of development. Also, not all of these standards will be equally relevant to different service types. Standards that are critical in an in-patient setting, for example seclusion practice, will not be relevant to community based settings. To inform the implementation of the Standards, a series of implementation guides that more clearly outline the expectations for different sectors and service settings will be developed. In addition, where more than one standard applies to an element of service delivery, the implementation guides will provide cross-referencing of the relevant standards.

It is recognised that quality improvement is a continuous process. As services are at different stages, some criteria will be routine practice for some and aspirational for others. In considering implementation attainment and maintenance of the Standards, services will need to be cognisant of their stage of development and model of service delivery, and therefore which standards and criteria are most relevant, and which should be addressed most urgently. It is expected that consumers and carers will be involved in these deliberations.

Demonstration of the delivery of services against these standards ensures that consumers, carers and the community can be confident of what to expect from mental health services. For example, mental health services are expected to ensure that issues around consent are handled in accordance with relevant Commonwealth, state or territory jurisdictional and legislative requirements.

A number of the Standards focus on the experience of consumers and carers (rather than the mental health service) to measure the effectiveness of service delivery. Investment in staff and resources is essential for the provision of services that meet these consumer and carer standards. This includes ongoing professional development, training and support.

Implementation of the Standards will require the involvement of staff, consumers and carers to ensure shared understanding and awareness of the standards to be adopted and met by a particular service. Measurement of levels of achievement against the standards also forms a means of accountability to consumers, carers, community, staff and funders.

The Standards recognise that mental health services provide services to individual consumers, carers and where developmentally appropriate, families and also support communities. How the community is defined varies depending upon the purpose, structure and type of service. The community may be determined by a target population or, in the case of public services, a defined catchment area. The assessment of standards will be undertaken in the context of that given community as defined by the particular service and the national, state and territory mental health policies and legislation applying to similar kinds of services and communities.

Regardless of the type of mental health service, the community or clients it serves, there are a number of principles that apply to the delivery of mental health services, irrespective of the context in which they are delivered.

Key principles

These key principles are consistent with national policy and requirements for the delivery of mental health services in Australia and are embedded in the Standards. Key principles that have informed the development of the Standards include:

- Mental health services should promote an optimal quality of life for people with mental health problems and / or mental illness.
- Services are delivered with the aim of facilitating sustained recovery.
- Consumers should be involved in all decisions regarding their treatment and care, and as far as possible, the opportunity to choose their treatment and setting.
- Consumers have the right to have their nominated carer(s) involved in all aspects of their care.
- The role played by carers, as well as their capacity, needs and requirements as separate from those of consumers is recognised.
- Participation by consumers and carers is integral to the development, planning, delivery and evaluation of mental health services.
- Mental health treatment, care and support should be tailored to meet the specific needs of the individual consumer.
- Mental health treatment and support should impose the least personal restriction on the rights and choices of consumers taking account of their living situation, level of support within the community and the needs of their carer(s).

Finally the Standards describe care that will be delivered in accordance with each of the nine (9) domains from the *Key Performance Indicators for Australian Public Mental Health Services (2005)* as follows:

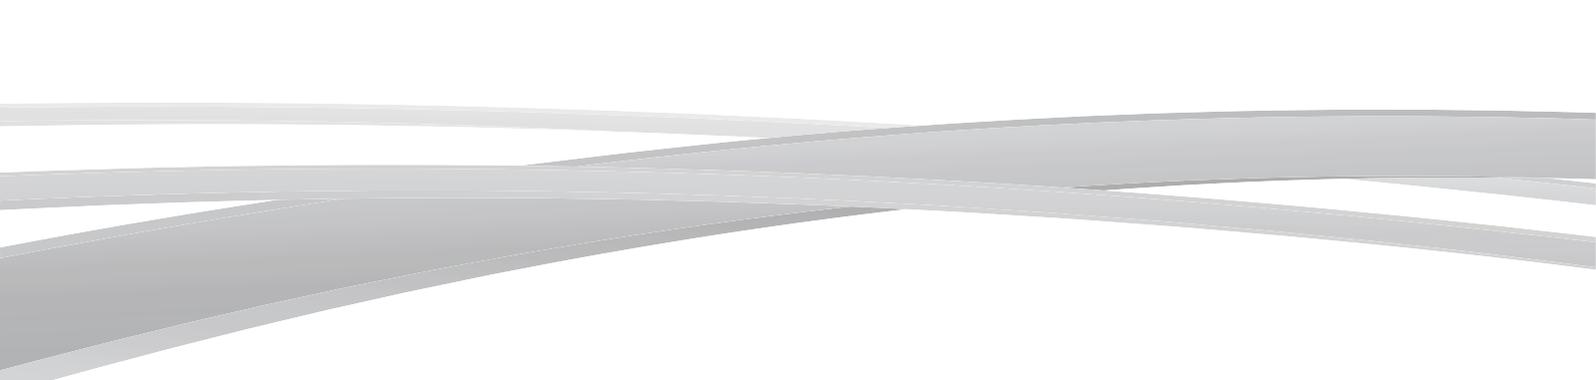

Effectiveness: care, intervention or action achieves desired outcome in an appropriate timeframe.

Appropriateness: care, intervention or action provided is relevant to the client's needs and based on established standards.

Efficiency: achieving desired results with the most cost-effective use of resources.

Accessibility: ability of people to obtain health care at the right place and right time irrespective of income, physical location and cultural background.

Continuity: ability to provide uninterrupted, coordinated care or service across programs, practitioners, organisations and levels over time.

Responsiveness: the service provides respect for all persons and is client orientated. It includes respect for dignity, cultural diversity, confidentiality, participation in choices, promptness, quality of amenities, access to social support networks, and choice of provider.

Capability: an individual's or service's capacity to provide a health service based on skills and knowledge.

Safety: the avoidance or reduction to acceptable limits of actual or potential harm from health care management or the environment in which health care is delivered.

Sustainability: system or organisation's capacity to provide infrastructure such as workforce, facilities, and equipment, and be innovative and respond to emerging needs.

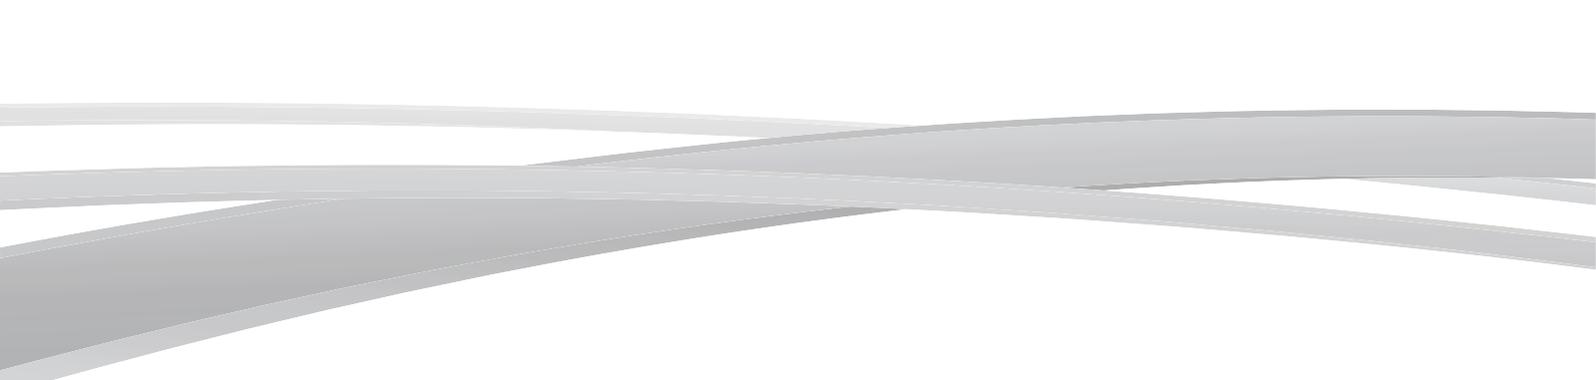

Standard 1.

Rights and responsibilities

The rights and responsibilities of people affected by mental health problems and / or mental illness are upheld by the mental health service (MHS) and are documented, prominently displayed, applied and promoted throughout all phases of care.

CRITERIA

- 1.1** The MHS upholds the right of the consumer to be treated with respect and dignity at all times.
- 1.2** All care is delivered in accordance with relevant Commonwealth, state / territory mental health legislation and related Acts.
- 1.3** All care delivered is subject to the informed consent of the voluntary consumer and wherever possible, by the involuntary consumer in accordance with Commonwealth and state / territory jurisdictional and legislative requirements.
- 1.4** The MHS provides consumers and their carers with a written statement, together with a verbal explanation of their rights and responsibilities, in a way that is understandable to them as soon as possible after entering the MHS and at regular intervals throughout their care.
- 1.5** Staff and volunteers are provided with a written statement of the rights and responsibilities of consumers and carers, together with a written code of conduct as part of their induction to the MHS.
- 1.6** The MHS communicates with consumers, carers and other service providers and applies the rights and responsibilities of involuntary patients as per relevant Commonwealth, state / territory mental health legislation and related Acts.

- 
- 1.7** The MHS upholds the right of the consumer to have their needs understood in a way that is meaningful to them and appropriate services are engaged when required to support this.
 - 1.8** The MHS upholds the right of the consumer to have their privacy and confidentiality recognised and maintained to the extent that it does not impose serious risk to the consumer or others.
 - 1.9** The MHS upholds the right of the consumer to be treated in the least restrictive environment to the extent that it does not impose serious risk to the consumer or others.
 - 1.10** The MHS upholds the right of the consumer to be involved in all aspects of their treatment, care and recovery planning.
 - 1.11** The MHS upholds the right of the consumer to nominate if they wish to have (or not to have) others involved in their care to the extent that it does not impose serious risk to the consumer or others.
 - 1.12** The MHS upholds the right of carers to be involved in the management of the consumer's care with the consumer's informed consent.
 - 1.13** The MHS upholds the right of consumers to have access to their own health records in accordance with relevant Commonwealth, state / territory legislation.
 - 1.14** The MHS enacts policy and procedures to ensure that personal and health related information is handled in accordance with Commonwealth, state / territory privacy legislation when personal information is communicated to health professionals outside the MHS, carers or other relevant agencies.
 - 1.15** The MHS upholds the right of the consumer to access advocacy and support services.
 - 1.16** The MHS upholds the right of the consumer to express compliments, complaints and grievances regarding their care and to have them addressed by the MHS.
 - 1.17** The MHS upholds the right of the consumer, wherever possible, to access a staff member of their own gender.

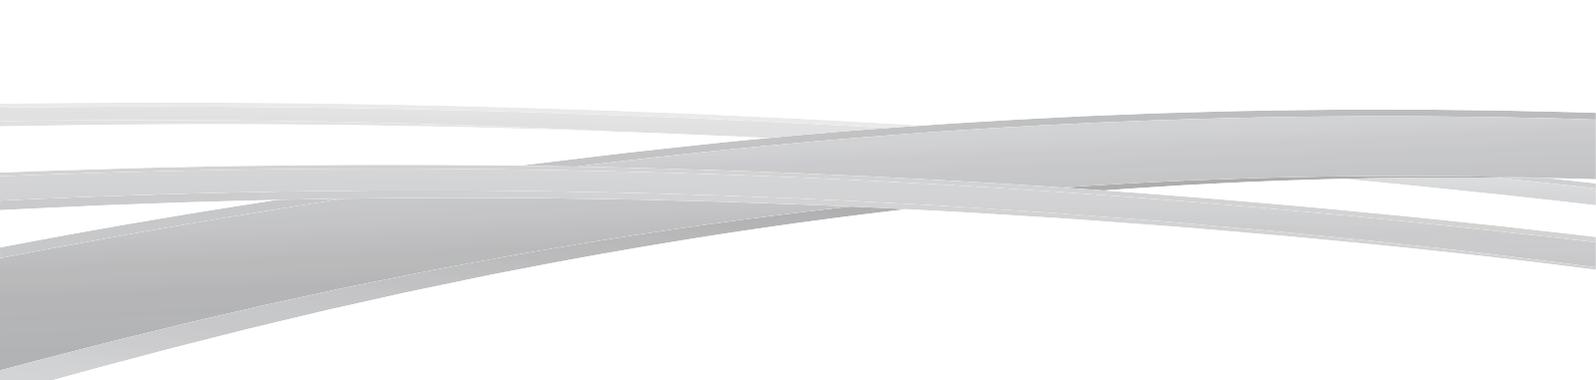

Standard 2.

Safety

The activities and environment of the MHS are safe for consumers, carers, families, visitors, staff and its community.

CRITERIA

- 2.1** The MHS promotes the optimal safety and wellbeing of the consumer in all mental health settings and ensures that the consumer is protected from abuse and exploitation.
- 2.2** The MHS reduces and where possible eliminates the use of restraint and seclusion within all MHS settings.
- 2.3** The MHS assesses and minimises the risk of deliberate self harm and suicide within all MHS settings.
- 2.4** The MHS minimises the occurrence of adverse medication events within all MHS settings.
- 2.5** The MHS complies with relevant Commonwealth and state / territory transport policies and guidelines, including the current National Safe Transport Principles.
- 2.6** The MHS meets their legal occupational health and safety obligations to provide a safe workplace and environment.
- 2.7** The MHS complies with infection control requirements.
- 2.8** The MHS can demonstrate investment in adequate staffing and resources for the safe delivery of care.
- 2.9** The MHS conducts a risk assessment of staff working conditions and has documented procedures to manage and mitigate identified risks.

- 
- 2.10** Staff are regularly trained to, wherever possible, prevent, minimise and safely respond to aggressive and other difficult behaviours.
 - 2.11** The MHS conducts risk assessment of consumers throughout all stages of the care continuum, including consumers who are being formally discharged from the service, exiting the service temporarily and / or are transferred to another service.
 - 2.12** The MHS conducts regular reviews of safety in all MHS settings, including an environmental appraisal for safety to minimise risk for consumers, carers, families, visitors and staff.
 - 2.13** The MHS has a formal process for identification, mitigation, resolution (where possible) and review of any safety issues.

Standard 3.

Consumer and carer participation

Consumers and carers are actively involved in the development, planning, delivery and evaluation of services.

CRITERIA

- 3.1** The MHS has processes to actively involve consumers and carers in planning, service delivery, evaluation and quality programs.
- 3.2** The MHS upholds the right of the consumer and their carer(s) to have their needs and feedback taken into account in the planning, delivery and evaluation of services.
- 3.3** The MHS provides training and support for consumers, carers and staff, which maximise consumer and carer(s) representation and participation in the MHS.
- 3.4** Consumers and carers have the right to independently determine who will represent their views to the MHS.
- 3.5** The MHS provides ongoing training and support to consumers and carers who are involved in formal advocacy and / or support roles within the MHS.
- 3.6** Where the MHS employs consumers and carers, the MHS is responsible for ensuring mentoring and supervision is provided.
- 3.7** The MHS has policies and procedures to assist consumers and carers to participate in the relevant committees, including payment (direct or in-kind) and / or reimbursement of expenses when formally engaged in activities undertaken for the MHS.

Standard 4.

Diversity responsiveness

The MHS delivers services that take into account the cultural and social diversity of its consumers and meets their needs and those of their carers and community throughout all phases of care.

CRITERIA

- 4.1** The MHS identifies the diverse groups (Aboriginal and Torres Strait Islander, Culturally And Linguistically Diverse (CALD), religious / spiritual beliefs, gender, sexual orientation, physical and intellectual disability, age and socio-economic status) that access the service.
- 4.2** The MHS whenever possible utilises available and reliable data on identified diverse groups to document and regularly review the needs of its community and communicates this information to staff.
- 4.3** Planning and service implementation ensures differences and values of its community are recognised and incorporated as required.
- 4.4** The MHS has demonstrated knowledge of and engagement with other service providers or organisations with diversity expertise / programs relevant to the unique needs of its community.
- 4.5** Staff are trained to access information and resources to provide services that are appropriate to the diverse needs of its consumers.
- 4.6** The MHS addresses issues associated with prejudice, bias and discrimination in regards to its own staff to ensure non-discriminatory practices and equitable access to services.

Standard 5.

Promotion and prevention

The MHS works in partnership with its community to promote mental health and address prevention of mental health problems and / or mental illness.

CRITERIA

- 5.1** The MHS develops strategies appropriate to the needs of its community to promote mental health and address early identification and prevention of mental health problems and / or mental illness that are responsive to the needs of its community, by establishing and sustaining partnerships with consumers, carers, other service providers and relevant stakeholders.
- 5.2** The MHS develops implementation plans to undertake promotion and prevention activities, which include the prioritisation of the needs of its community and the identification of resources required for implementation, in consultation with their partners.
- 5.3** The MHS, in partnership with other sectors and settings supports the inclusion of mental health consumers and carers in strategies and activities that aim to promote health and wellbeing.
- 5.4** The MHS evaluates strategies, implementation plans, sustainability of partnerships and individual activities in consultation with their partners. Regular progress reports on achievements are provided to consumers, carers, other service providers and relevant stakeholders.
- 5.5** The MHS identifies a person who is accountable for developing, implementing and evaluating promotion and prevention activities.
- 5.6** The MHS ensures that their workforce is adequately trained in the principles of mental health promotion and prevention and their applicability to the specialised mental health service context with appropriate support provided to implement mental health promotion and prevention activities.

Standard 6.

Consumers

Consumers have the right to comprehensive and integrated mental health care that meets their individual needs and achieves the best possible outcome in terms of their recovery.

(**Note:** The consumer standard is not assessable, as it contains criteria that are all assessable within the other standards.)

CRITERIA

- 6.1** Consumers have the right to be treated with respect and dignity at all times.
- 6.2** Consumers have the right to receive service free from abuse, exploitation, discrimination, coercion, harassment and neglect.
- 6.3** Consumers have the right to receive a written statement, together with a verbal explanation, of their rights and responsibilities in a way that is understandable to them as soon as possible after entering the MHS.
- 6.4** Consumers are continually educated about their rights and responsibilities.
- 6.5** Consumers have the right to receive the least restrictive treatment appropriate, considering the consumer's preference, the demands on carers, and the availability of support and safety of those involved.
- 6.6** A mental health professional responsible for coordinating clinical care is identified and made known to consumers.
- 6.7** Consumers are partners in the management of all aspects of their treatment, care and recovery planning.
- 6.8** Informed consent is actively sought from consumers prior to any service or intervention provided or any changes in care delivery are planned, where it is established that the consumer has capacity to give informed consent.

- 
- 6.9** Consumers are provided with current and accurate information on the care being delivered.
 - 6.10** Consumers have the right to choose from the available range of treatment and support programs appropriate to their needs.
 - 6.11** The right of consumers to involve or not to involve carers and others is recognised and respected by the MHS.
 - 6.12** Consumers have an individual exit plan with information on how to re-enter the service if needed.
 - 6.13** Consumers are actively involved in follow-up arrangements to maintain continuity of care.
 - 6.14** The right of consumers to have access to their own health records is recognised in accordance with relevant Commonwealth and state / territory legislation / guidelines.
 - 6.15** Information about consumers can be accessed by authorised persons only.
 - 6.16** The right of the consumer to have visitors and maintain close relationships with family and friends is recognised and respected by the MHS.
 - 6.17** Consumers are engaged in development, planning, delivery and evaluation of the MHS.
 - 6.18** Training and support is provided for consumers involved in a formal advocacy and / or support role within the MHS.

Standard 7.

Carers

The MHS recognises, respects, values and supports the importance of carers to the wellbeing, treatment, and recovery of people with a mental illness.

CRITERIA

- 7.1** The MHS has clear policies and service delivery protocols to enable staff to effectively identify carers as soon as possible in all episodes of care, and this is recorded and prominently displayed within the consumer's health record.
- 7.2** The MHS implements and maintains ongoing engagement with carers as partners in the delivery of care as soon as possible in all episodes of care.
- 7.3** In circumstances where a consumer refuses to nominate their carer(s), the MHS reviews this status at regular intervals during the episode of care in accordance with Commonwealth and state / territory jurisdictional and legislative requirements.
- 7.4** The MHS provides carers with a written statement, together with a verbal explanation of their rights and responsibilities in a way that is understandable to them as soon as possible after engaging with the MHS.
- 7.5** The MHS considers the needs of carers in relation to Aboriginal and Torres Strait Islander persons, culturally and linguistically diverse (CALD) persons, religious / spiritual beliefs, gender, sexual orientation, physical and intellectual disability, age profile and socio-economic status.
- 7.6** The MHS considers the special needs of children and aged persons as carers and makes appropriate arrangements for their support.

- 
- 7.7** The MHS has documented policies and procedures for clinical practice in accordance with Commonwealth, state / territory privacy legislation and guidelines that address the issue of sharing confidential information with carers.
 - 7.8** The MHS ensures information regarding identified carers is accurately recorded in the consumer's health record and reviewed on a regular basis.
 - 7.9** The MHS provides carers with non-personal information about the consumer's mental health condition, treatment, ongoing care and if applicable, rehabilitation.
 - 7.10** The MHS actively seeks information from carers in relation to the consumer's condition during assessment, treatment and ongoing care and records that information in the consumer's health record.
 - 7.11** The MHS actively encourages routine identification of carers in the development of relapse prevention plans.
 - 7.12** The MHS engages carers in discharge planning involving crisis management and continuing care prior to discharge from all episodes of care.
 - 7.13** The MHS provides information about and facilitates access to services that maximise the wellbeing of carers.
 - 7.14** The MHS actively seeks participation of carers in the policy development, planning, delivery and evaluation of services to optimise outcomes for consumers.
 - 7.15** The MHS provides ongoing training and support to carers who participate in representational and advocacy roles.
 - 7.16** The MHS provides training to staff to develop skills and competencies for working with carers.
 - 7.17** The MHS has documented policies and procedures for working with carers.

Standard 8.

Governance, leadership and management

The MHS is governed, led and managed effectively and efficiently to facilitate the delivery of quality and coordinated services.

CRITERIA

- 8.1** The governance of the MHS ensures that its services are integrated and coordinated with other services to optimise continuity of effective care for its consumers and carers.
- 8.2** The MHS has processes to ensure accountability for developing strategies to promote mental health and address early identification and prevention of mental health problems and / or mental illness.
- 8.3** The MHS develops and regularly reviews its strategic plan in conjunction with all relevant service providers. The plan incorporates needs analysis, resource planning and service evaluation. This should be developed with the participation of staff, stakeholders, consumers, carers and representatives of its community.
- 8.4** The MHS has processes in place to ensure compliance with relevant Commonwealth, state / territory mental health legislation and related Acts.
- 8.5** Identified resources are allocated to support the documented priorities of the MHS.
- 8.6** The recruitment and selection process of the MHS ensures that staff have the skills and capability to perform the duties required of them.
- 8.7** Staff are appropriately trained, developed and supported to safely perform the duties required of them.
- 8.8** The MHS has a policy and process to support staff during and after critical incidents.

- 
- 8.9** The MHS manages and maintains an information system that facilitates the appropriate collection, use, storage, transmission and analysis of data to enable review of services and outcomes at an individual consumer and MHS level in accordance with Commonwealth, state / territory legislation and related Acts.
 - 8.10** The MHS has an integrated risk management policy and practices to identify, evaluate, monitor, manage and communicate organisational and clinical risks.
 - 8.11** The MHS has a formal quality improvement program incorporating evaluation of its services that result in changes to improve practice.

Standard 9. Integration

The MHS collaborates with and develops partnerships within in its own organisation and externally with other service providers to facilitate coordinated and integrated services for consumers and carers.

CRITERIA

- 9.1** The MHS ensures that a person responsible for the coordination of care is available to facilitate coordinated and integrated services throughout all stages of care for consumers and carers.
- 9.2** The MHS has formal processes to support and sustain interdisciplinary care teams.
- 9.3** The MHS facilitates continuity of integrated care across programs, sites and other related services with appropriate communication, documentation and evaluation to meet the identified needs of consumers and carers.
- 9.4** The MHS establishes links with the consumers' nominated primary health care provider and has procedures to facilitate and review internal and external referral processes.
- 9.5** The MHS has formal processes to develop inter-agency and intersectoral links and collaboration.

Standard 10.

Delivery of care

10.1 SUPPORTING RECOVERY

The MHS incorporates recovery principles into service delivery, culture and practice providing consumers with access and referral to a range of programs that will support sustainable recovery.

CRITERIA

- 10.1.1** The MHS actively supports and promotes recovery oriented values and principles in its policies and practices.
- 10.1.2** The MHS treats consumers and carers with respect and dignity.
- 10.1.3** The MHS recognises the lived experience of consumers and carers and supports their personal resourcefulness, individuality, strengths and abilities.
- 10.1.4** The MHS encourages and supports the self determination and autonomy of consumers and carers.
- 10.1.5** The MHS promotes the social inclusion of consumers and advocates for their rights of citizenship and freedom from discrimination.
- 10.1.6** The MHS provides education that supports consumer and carer participation in goal setting, treatment, care and recovery planning, including the development of advance directives.
- 10.1.7** The MHS supports and promotes opportunities to enhance consumers' positive social connections with family, children, friends and their valued community.
- 10.1.8** The MHS demonstrates systems and processes for consumer and carer participation in the development, delivery and evaluation of the services.

- 10.1.9** The MHS has a comprehensive knowledge of community services and resources and collaborates with consumers and carers to assist them to identify and access relevant services.
- 10.1.10** The MHS provides access for consumers and their carer(s) to a range of carer-inclusive approaches to service delivery and support.

10.2 ACCESS

The MHS is accessible to the individual and meets the needs of its community in a timely manner.

CRITERIA

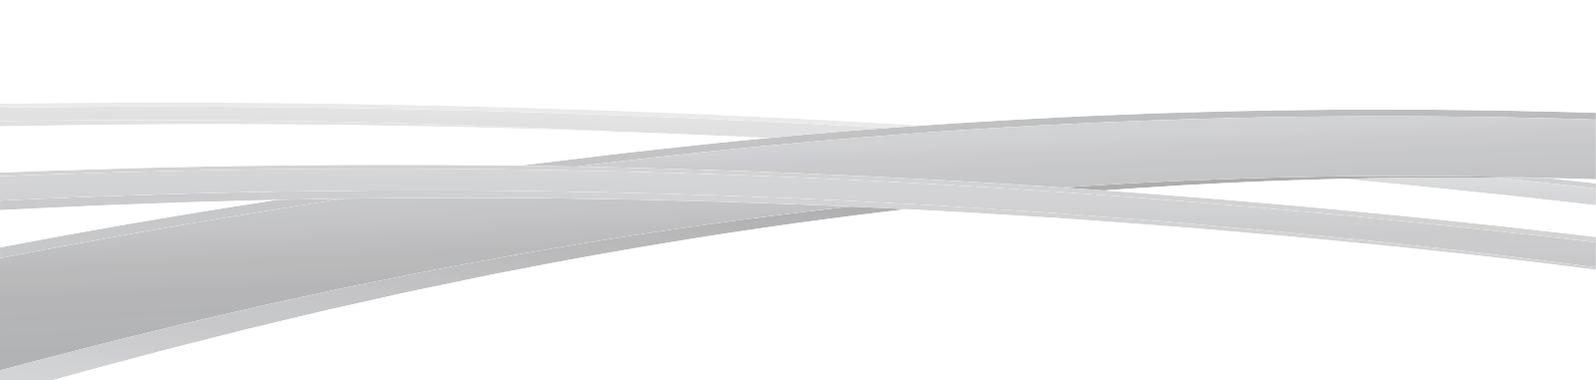

- 10.2.1** Access to available services meets the identified needs of its community in a timely manner.
- 10.2.2** The MHS informs its community about the availability, range of services and methods for establishing contact with its service.
- 10.2.3** The MHS makes provision for consumers to access acute services 24 hours per day by either providing the service itself or information about how to access such care from a 24/7 public mental health service or alternate mental health service.
- 10.2.4** The MHS, wherever possible, is located to provide ease of physical access with special attention being given to those people with physical disabilities and / or reliance on public transport.

10.3 ENTRY

The entry process to the MHS meets the needs of its community and facilitates timeliness of entry and ongoing assessment.

CRITERIA

- 10.3.1** The MHS has a written description of its entry process, inclusion and exclusion criteria and means of facilitating access to alternative care for people not accepted by the service.
- 10.3.2** The MHS makes known its entry process, inclusion and exclusion criteria to consumers, carers, other service providers, and relevant stakeholders including police, ambulance services and emergency departments.
- 10.3.3** The MHS has a documented system for prioritising referrals according to risk, urgency, distress, dysfunction and disability with timely advice and / or response to all those referred, at the time of assessment.
- 10.3.4** The entry process to the MHS is a defined pathway with service specific entry points that meet the needs of the consumer, their carer(s) and its community that are complementary to any existing generic health or welfare intake systems.
- 10.3.5** Entry to the MHS minimises delay and the need for duplication in assessment, treatment, care and recovery planning and care delivery.
- 10.3.6** Where admission to an inpatient psychiatric service is required, the MHS makes every attempt to facilitate voluntary admission for the consumer and continue voluntary status for the duration of their stay.

- 
- 10.3.7** When the consumer requires involuntary admission to the MHS the transport occurs in the safest and most respectful manner possible and complies with relevant Commonwealth and state / territory policies and guidelines, including the National Safe Transportation Principles.
 - 10.3.8** The MHS ensures that a consumer and their carer(s) are able to identify a nominated person responsible for coordinating their care and informing them about any changes in the care management.

10.4 ASSESSMENT AND REVIEW

Consumers receive a comprehensive, timely and accurate assessment and a regular review of progress is provided to the consumer and their carer(s).

CRITERIA

- 10.4.1** Assessments conducted and diagnoses made are evidence-based and use accepted methods and tools, as well as internationally accepted disease classification systems.
- 10.4.2** Assessments are conducted during the consumer's first contact with the MHS by appropriately qualified staff experienced and trained in assessing mental health problems, and where possible in a consumer's preferred setting with consideration of safety for all involved.
- 10.4.3** The MHS, with the consumer's informed consent includes carers, other service providers and others nominated by the consumer in assessment.
- 10.4.4** The MHS actively plans as early as possible in the course of psychiatric inpatient admission, for the discharge of the consumer from inpatient care.

10.4.5 The MHS conducts a review of a consumer's treatment, care and recovery plan when the consumer:

- requests a review
- declines treatment and support
- is at significant risk of injury to themselves or another person
- receives involuntary treatment or is removed from an involuntary order
- is transferred between service sites
- is going to exit the MHS
- is observed through monitoring of their outcomes (satisfaction with service, measure of quality of life, measure of functioning) to be in decline.

10.4.6 The MHS conducts assessment and review of the consumer's treatment, care and recovery plan, whether involuntary or voluntary, at least every three months (if not previously required for reasons stated in criteria 10.4.5 above).

10.4.7 The MHS has a procedure for appropriate follow-up of those who decline to participate in an assessment.

10.4.8 There is a current individual interdisciplinary treatment, care and recovery plan, which is developed in consultation with and regularly reviewed with the consumer and with the consumer's informed consent, their carer(s) and the treatment, care and recovery plan is available to both of them.

10.5 TREATMENT AND SUPPORT

The MHS provides access to a range of evidence based treatments and facilitates access to rehabilitation and support programs which address the specific needs of consumers and promotes their recovery.

CRITERIA

- 10.5.1** Treatment and support provided by the MHS reflects best available evidence and emphasises early intervention and positive outcomes for consumers and their carer(s).
- 10.5.2** Treatment and services provided by the MHS are responsive to the changing needs of consumers during their episodes of care that address acute needs, promote rehabilitation and support recovery.
- 10.5.3** The MHS is responsible for providing the consumer and their carer(s) with information on the range and implications of available therapies.
- 10.5.4** Any participation of the consumer in clinical trials and experimental treatments is subject to the informed consent of the consumer.
- 10.5.5** The MHS provides the least restrictive and most appropriate treatment and support possible. Consideration is given to the consumer's needs and preferences, the demands on carers, and the availability of support and safety of those involved.
- 10.5.6** Medications are prescribed, stored, transported, administered and reviewed by authorised persons in a manner consistent with Commonwealth, state / territory legislation and related Acts, regulations and professional guidelines.
- 10.5.7** The MHS actively promotes adherence to evidenced based treatments through negotiation and the provision of understandable information to the consumer.

- 
- 10.5.8** The views of the consumer and their carer(s), and the history of previous treatment is considered and documented prior to administration of new medication and / or other technologies.
 - 10.5.9** The MHS ensures that there is continuity of care or appropriate referral and transfer between inpatient, outpatient, day patient, community settings and other health / support services.
 - 10.5.10** The MHS ensures that medication and / or other therapies when required, are only used as part of a documented continuum of treatment strategies.
 - 10.5.11** The treatment and support provided by the MHS is developed and evaluated collaboratively with the consumer and their carer(s). This is documented in the current individual treatment, care and recovery plan.
 - 10.5.12** The MHS facilitates access to an appropriate range of agencies, programs, and / or interventions to meet the consumer's needs for leisure, relationships, recreation, education, training, work, accommodation and employment in settings appropriate to the individual consumer.
 - 10.5.13** The MHS supports and / or provides information regarding self care programs that can enable the consumer to develop or re-develop the competence to meet their everyday living needs.
 - 10.5.14** The setting for the learning or the re-learning of self care activities is the most familiar and / or the most appropriate for the skills acquired.
 - 10.5.15** Information on self care programs or interventions is provided to consumers and their carer(s) in a way that is understandable to them.
 - 10.5.16** The MHS endeavours to provide access to a range of accommodation and support options that meet the needs of the consumer and gives the consumer the opportunity to choose between these options.
 - 10.5.17** The MHS promotes access to vocational support systems, education and employment programs.

10.6 EXIT AND RE-ENTRY

The MHS assists consumers to exit the service and ensures re-entry according to the consumer's needs.

CRITERIA

- 10.6.1** The MHS ensures that on exiting the service the consumer has access to services that promote recovery and aim to minimise psychiatric disability and prevent relapse.
- 10.6.2** The consumer and their carer(s) are provided with understandable information on the range of relevant services and support available in the community.
- 10.6.3** The MHS has a process to commence development of an exit plan at the time the consumer enters the service.
- 10.6.4** The consumer and their carer(s) and other service providers are involved in developing the exit plan. Copies of the exit plan are made available to the consumer and with the consumers' informed consent, their carer(s).
- 10.6.5** The MHS provides consumers, their carers and other service providers involved in follow-up with information on the process for re-entering the MHS if required.
- 10.6.6** The MHS ensures ease of access for consumers re-entering the MHS.
- 10.6.7** Staff review the outcomes of treatment and support as well as ongoing follow-up arrangements for each consumer prior to their exit from the MHS.
- 10.6.8** The MHS, in conjunction with the treating clinician, has a procedure for appropriate follow-up of all consumers within 7 days after discharge from inpatient care wherever possible, and has a follow-up procedure for those consumers who do not keep the planned follow-up arrangements.

Glossary

Access	Ability of consumers or potential consumers to obtain required or available services when needed within an appropriate time.
Acute	A condition that requires immediate medical attention.
Adverse drug events	A particular type of adverse drug event where a drug or medication is implicated as a causal factor in the adverse event. This encompasses both harm that results from the intrinsic nature of medicine (an adverse drug reaction) as well as harm that results from medication errors or system failures associated with the manufacture, distribution or use of medicines.
Advocacy	Representing the concerns and interests of consumers and carers, speaking on their behalf, and providing training and support so they can represent themselves.
Appropriate	Care, intervention or action provided is relevant to the consumer needs and based on established standards.
Assessment	Process by which the characteristics and needs of consumers, groups or situations are evaluated or determined so they can be addressed. The assessment forms the basis of a plan for services or action.
Available	Information, services and support that is present in the catchment area of the mental health service.
Best available evidence	Pre-appraised evidence such as systematic reviews, clinical practice guidelines and critically appraised papers and topics.
CALD	Culturally and linguistically diverse.
Care	All services and interventions provided to a person with a mental health problem and / or mental illness by health and other sectors, community organisation, family and carers.
Care management	A cyclical process, in which needs are assessed, services are delivered in response, and needs are re-assessed, leading to a changed service response.

Care plan	A written statement developed for entitled persons which states the nursing and other interventions to be undertaken, the health outcomes to be achieved and the review of care which will occur at regular intervals.
Carer	<p>A person whose life is affected by virtue of close relationship with a consumer, or who has a chosen caring role with a consumer.</p> <p>Carer, in this document, may also refer to the consumer's identified family, including children and parents, as well as other legal guardians and people significant to the consumer.</p>
Clinical trial	Any research project that prospectively assigns human participants or groups to one or more health-related interventions to evaluate the effects on health outcome.
Community	How the community is defined depends on the purpose, structure and type of service. The community may be determined by a target population, such as consumers and / or clinicians who access the service or, in the case of public services, a defined catchment area.
Community living	The ability of the consumer to live independently in the community with the best possible quality of life.
Co-morbid condition	Existing simultaneously with and usually independently of another medical condition.
Confidentiality	The restriction of access to personal information to authorised persons, entities and processes at authorised times and in an authorised manner.
Consent	Consumer agreement based on an understanding of the implications of a particular activity or decision and the likely consequences for the consumer.
Consumer	A person who is currently using, or has previously used, a mental health service.

Consumer advocate	People who have been given the power by consumers to speak on their behalf, who represent the concerns and interest of the consumer as directed by the consumer, and seek the outcomes desired by the consumer. Although government and others may give power to advocates, such advocacy is token unless it is directly accountable to the consumer.
Consumer representative	A member of a government, professional body, industry or non-government organisation committee who voices consumer perspectives and takes part in the decision-making process on behalf of consumers. This person is nominated by, and is accountable to, an organisation of consumers. The role of a consumer representative is to provide a consumer perspective.
Continuity of care	Linkage of components of individualised treatment and care across health service agencies according to individual needs.
Coordinate	To bring together in a common and harmonious action or effort.
Culture	A shared system of values, beliefs and behaviour.
Data	Information collected for analysis or reference.
Data collection	A store of data captured in an organised way for a defined purpose.
Diagnosis	A decision based on the recognition of clinically relevant symptomatology, the consideration of causes that may exclude a diagnosis of another condition and the application of clinical judgment.
Disability	A concept of several dimensions relating to an impairment in body structure or function, a limitation in activities (such as mobility and communication), a restriction in participation (involvement in life situations such as work, social interaction and education), and the affected person's physical and social environment.

Discharge / exit planning

A process for ensuring transfer of care of a consumer between service providers.

Discharge planning results in a formal written discharge plan, the aim of which is to ensure continuity of services that are necessary for successful community living. The discharge plan is a negotiated enterprise between the consumer, carer or family, referring doctor, community mental health team and the inpatient unit. It includes medical information, follow-up appointments and the desired outcomes of treatment.

The process of discharge planning begins at the time of admission. Barriers to discharge are identified at the time of admission and specific planning initiated to address these barriers, for example anticipated difficulties in finding suitable accommodation.

The relevant stakeholders who are not directly involved in the discharge planning should also be notified of the anticipated discharge date, for example general practitioner and supported accommodation provider.

Diversity

A broad concept that includes age, personal and corporate background, education, function and personality. Includes lifestyle, sexual orientation, ethnicity and status within the general community.

Documentation

Process of recording information in the health record and other documents that are a source of information; a written, tangible record of care and services provided.

Early intervention

Interventions targeting people displaying the early signs and symptoms of a mental health problem or mental disorder.

Education

Systematic Instruction and learning activities to develop or bring about change in knowledge, attitudes, values or skills.

Effective

Producing the intended or expected result.

Efficiency

Achieving desired results with most cost effective use of resources.

Entry	The process provided by the mental health service which assists the consumer and their carers to make contact with the mental health service and receive appropriate assistance.
Equitable	Minimising avoidable disparities in health and its determinants, including but not limited to health care, between groups of people who have different levels of underlying social attributes.
Evaluation	Judging the value of something by gathering valid information about it in a systematic way and by making a comparison. The purpose of evaluation is to help the user of the evaluation to decide what to do, or to contribute to scientific knowledge
Exit	When the consumer no longer requires treatment, support, or any other service from the mental health service, and there has been a last review of the case with peers and the case is closed. Exit is prepared for in a collaborative manner with the consumer. This may be referred to as discharge in some services.
Exit plan	See discharge plan.
Feedback	A communication from a consumer relaying how delivered products, services and messages compare with consumer expectations.
First contact	The first time the consumer makes contact with the mental health service during any episode of care.
Follow-up	Processes and actions taken after a service has been completed.
Funders	State and territory governments, Australian government, private health funds.
Governance	The system by which organisations are directed and controlled. It ensures the power of organisations is harnessed for the agreed purpose. Governance spells out the rules and procedures for making decisions on organisational affairs.
Human resources	The personnel requirements of the organisation.
Incidence	The number of new cases (of an illness or event etc.) occurring during a given period.

Incident	An event or circumstance which led to, or could have, unintended and / or unnecessary harm to a person, and / or a complaint, loss or damage.
Individual health record	Term to cover consumer record, medical record, care record, health care record or record that documents care or service to a consumer. A health record is a legal document that outlines the total needs, care and management of consumers.
Induction	A process of bringing a new employee into the organisation. This program assimilates them into the culture, accepted practices, and performance standards of the organisation.
Infection control	Measures practised by healthcare personnel in healthcare facilities to decrease transmission and acquisition of infectious agents. This includes proper hand hygiene, scrupulous work practices and use of personal protective equipment (PPE)—masks or respirators, gloves, gowns, and eye protection. Infection control measures are based on how an infectious agent is transmitted and include standard, contact, droplet, and airborne precautions.
Information	Data elements that have been organised and analysed and that provide a basis for decision making.
Information system	A system that provides access to information using hardware, software, supplies, policies, procedures and people.

Informed consent	<p>Consent obtained freely, without coercion, threats or improper inducements, after questions asked by the consumer have been answered, after appropriate disclosure to the patient, adequate and understandable information in a form and language demonstrably understood by the patient.</p> <p>Such answers and disclosures must be sufficient to enable the consumer to make a fully informed decision based on all relevant factors including the nature of treatment involved, the range of other options and the possible outcomes and implications, risks and benefits for the consumer and others.</p> <p>In the context of mental health, this means that the client provides permission for a specific treatment to occur based on their understanding of the nature of the procedure, the risks involved, the consequences of withholding permission and their knowledge of available alternative treatments.</p>
Inpatient psychiatric service	<p>A ward / unit / facility in a general hospital, private psychiatric hospital, stand alone psychiatric hospital or some other location used primarily for the treatment of mental health problems and / or mental illness.</p>
Integration	<p>The process whereby inpatient and community components of a mental health service become coordinated as a single, specialist network and include mechanisms which link intake, assessment, crisis intervention, and acute, extended and ongoing treatment using a case management approach to ensure continuity of care.</p>
Interdisciplinary team	<p>Care or a service given with input from more than one discipline or profession.</p>
Intervention	<p>An activity or set of activities aimed at modifying a process, course of action or sequence of events, to change one or several of their characteristics such as performance or expected outcome.</p>
Involuntary	<p>Where persons are detained in hospital or compulsorily treated in the community under mental health legislation for the purpose of assessment or provision of appropriate treatment or care.</p>

Leadership	Ability to provide direction and cope with change. It involves establishing a vision, developing strategies for producing the changes needed to implement the vision, aligning people and motivating and inspiring people to overcome obstacles.
Legislation	The body of laws made by Parliament. These laws consist of Acts of Parliament and Regulations, Ordinances and / or Rules which are also called subordinate or delegated legislation.
Links	Connections, contacts and working relationships established with others.
Management	Setting targets or goals for the future through planning and budgeting, establishing processes for achieving those targets and allocating resources to accomplish those plans. Ensuring that plans are achieved by organising, staffing, controlling and problem-solving.
Medication and other medical technologies	The range of evidence-based therapeutic and diagnostic approaches which use medication and other technology as their basis, for example seclusion or ECT.
Mental health	The capacity of individuals within the groups and the environment to interact with one another in ways that promote subjective wellbeing, optimal development and use of mental abilities (cognitive, affective and relational) and achievement of individual and collective goals consistent with justice.
Mental health problems	A disruption in the interaction between the individual, the group and the environment, producing a diminished state of mental health.
Mental health professional	A person who offers services for the purpose of improving an individual's mental health or to treat mental illness. These professionals include psychiatrists, clinical psychologists, clinical social workers, occupational therapists, psychiatric nurses as well as other professionals.
Mental health promotion	Action to maximise mental health and wellbeing among populations and individuals. Mental health promotion is concerned with promoting wellbeing across entire population groups for people who are currently well, for those at-risk, and for those experiencing illness.

Mental health service (MHS) Specialised mental health services are those with the primary function to provide treatment, rehabilitation or community health support targeted towards people with a mental illness or psychiatric disability. These activities are delivered from a service or facility that is readily identifiable as both specialised and serving a mental health care function.

Mental illness A clinically diagnosable disorder that significantly interferes with an individual's cognitive, emotional or social abilities.

The diagnosis of mental illness is generally made according to the classification systems of the *Diagnostic and Statistical Manual of Mental Disorders*, Fourth Edition Text Revision (DSM-IV-TR) or the *International Classification of Diseases*, Tenth Edition (ICD-10). These classification systems apply to a wide range of mental disorders (for the DSM-IV) and mental and physical disorders (for the ICD-10). Not all the DSM-IV mental disorders are within the ambit of the National Mental Health Plan 2003–2008.

In Australia, drug and alcohol problems are primarily the responsibility of the drug and alcohol service system and there is a separate, but linked, national strategy. Similarly, dementia is treated primarily in aged care settings. Both are considered important in terms of their co-morbidity with mental illness.

Monitor To check, observe critically, measure or record the progress of an activity, action or system on a regular basis to identify change.

Ongoing care The process of care that follows an admission to a health care organisation.

Onset A beginning or start.

Operational plan A plan on a short term basis that provides details of how the strategic plan will be accomplished.

Orientation The process by which staff become familiar with all aspects of the work environment and their responsibilities.

Outcome A measurable change in the health of an individual, or group of people or population, which is attributable to interventions or services.

Personal and health related information

Any information or an opinion about a person whose identity is apparent or can reasonably be ascertained from the information or opinion. Personal information can include a person's name, date of birth, address, telephone number, family members or any other information that could allow the person to be identified.

Health related information includes symptoms or observations about the person's health, prescriptions, billing details, pathology or other test results, dental records, Medicare or health insurance numbers, admission and discharge details, genetic information and any other sensitive information about things such as race, sexuality or religion when it's collected by a health service. In the context of these standards, personal and health related information, where it can lead to the identity of the consumer, is considered in the same way.

Physical

Relating to the body.

Plan

Any detailed scheme, program or method developed for the accomplishment of an objective. Detailed notes of intended proceedings.

Planning

To formulate a scheme or program for the accomplishment or attainment of an object.

Policy

A documented statement that formalises the approach to tasks and concepts which is consistent with organisational objectives.

Prevention

Interventions that occur before the initial onset of a disorder (Mrazek and Haggerty, 1994, p. 23).

Primary care provider

Staff or individuals who, in cooperation with the consumer, assume responsibility for all aspects of care in response to the diagnosis and needs of the consumer.

Procedure

A set of documented instructions conveying the approved and recommended steps for a particular act or sequence of acts.

Process

A series of actions, changes / functions that bring about an end or result.

Program	A part or function of the mental health service such as the rehabilitation team, health promotion unit, the crisis team, the living skills centre or inpatient psychiatric unit. Some mental health services may have only one team which performs all of these functions.
Promotion	See mental health promotion.
Quality	The extent to which the properties of a service or product produces a desired outcome.
Quality improvement	Ongoing response to quality assessment data about a service in ways that improve the process by which services are provided to consumers.
Recovery	A deeply personal, unique process of changing one's attitudes, values, feelings, goals, skills and / or roles. It is a way of living a satisfying, hopeful and contributing life. Recovery involves the development of new meaning and purpose in one's life as one grows beyond the catastrophic effects of psychiatric disability.
Referral processes / pathways	Systems and protocols that ensure linkages between services to support continuity of care and ensure that consumers of services are able to negotiate the system in a seamless and timely manner.
Relapse	<p>A subsequent episode of mental illness. It is a recurrence of symptoms of mental illness similar to those that have previously been experienced. The threshold of symptoms required to identify a relapse varies according to the differing perspectives of the person experiencing the symptoms, their family and carers, and service providers.</p> <p>Relapse is generally agreed to have occurred when the person experiencing the symptoms is not able to cope using their usual supports and requires a greater intensity of intervention. The word 'relapse' is viewed by many as a negative and medicalised term, and the words 'episode' or 'being unwell' may be preferred.</p>
Research	An active, diligent and systematic process of inquiry to discover, interpret or revise facts, events, behaviours, or theories, or to make practical applications with the help of such facts, laws or theories.

Restraint	A restrictive intervention that relies on external controls to limit the movement or response of a person.
Rights	Something that can be claimed as justly, fairly, legally or morally one's own. A formal description of the services that consumers can expect and demand from an organisation.
Risk	The chance of something happening that will have a (negative) impact. It is measured in terms of consequence and likelihood.
Risk assessment	The process of identification, analysis and evaluation of a risk.
Risk management	In health care, designing and implementing a program of activities to identify and avoid or minimise risks to patients, employees, visitors and the institution; to minimise financial losses (including legal liability) that might arise consequentially; and to transfer risk to others through payment of premiums (insurance).
Safety	Freedom from hazard.
Seclusion	The act of confining a patient in a room when it is not within their control to leave. It should not be confused with the practice of time out, where a patient is requested to seek voluntary social isolation for a minimum period of time.
Sentinel event	Events in which death or serious harm to a patient has occurred. They signal catastrophic system failure and have the potential to seriously undermine public confidence in the health-care system.
Service provider	A person, usually with professional qualifications, who receives remuneration for providing services to people who have a mental health problem and / or mental illness.
Services	Products of the organisation delivered to consumers or units of the organisation that deliver products to consumers.
Settings	The setting in which assistance or services are provided.
Social	Of or relating to life and relation to human beings in a community.
Staff	Term which includes employed, visiting, sessional, contracted or volunteer personnel.

Stakeholder	Individuals, organisations or groups that have an interest or share in services.
Strategic plan	Plan that is organisation-wide, that establishes an organisation's overall objectives.
Support services	Direct services and interventions provided for a person with a mental health problem and / or mental illness and associated disability aimed at reducing handicap and promoting community tenure, for example assistance with cooking and cleaning. Support services do not necessarily have a treatment or rehabilitation focus.
System	A group of interacting, interrelated or interdependent elements forming or regarded as forming a collective entity.
Therapies	The range of therapeutic approaches which reflect best available evidence and are used in mental health care, excluding medication and other technologies. Therapies could include psycho-therapeutic, psycho-educational, rehabilitative, collaborative approaches using individual and / or group methods.
Training	The teaching of vocational or practical skills and relates to specific useful skills; often referred to as professional development.
Treatment	Specific physical, psychological and social interventions provided by health professionals aimed at the reduction of impairment and disability and / or the maintenance of current level of functioning.
Triage	A system for determining the relative priority of new referrals. Might also be called intake or engagement.
Values	Principles and beliefs that guide an organisation and may involve social or ethical issues.
Voluntary admission	Admission to a mental health unit for treatment that results from the client making the decision for admission and signing the necessary agreement for inpatient treatment.
Wellbeing	The state of complete physical, mental and social wellbeing and not merely the absence of disease or infirmity. The enjoyment of the highest attainable standard of health is one of the fundamental rights of every human being without distinction of race, religion, political belief or economic and social condition.

Principles of recovery oriented mental health practice

From the perspective of the individual with mental illness, recovery means gaining and retaining hope, understanding of ones abilities and disabilities, engagement in an active life, personal autonomy, social identity, meaning and purpose in life, and a positive sense of self.

It is important to remember that recovery is not synonymous with cure. Recovery refers to both internal conditions experienced by persons who describe themselves as being in recovery—hope, healing, empowerment and connection—and external conditions that facilitate recovery—implementation of human rights, a positive culture of healing, and recovery-oriented services. (Jacobson and Greenley, 2001 p. 482)

The purpose of principles of recovery oriented mental health practice is to ensure that mental health services are being delivered in a way that supports the recovery of mental health consumers.

1. UNIQUENESS OF THE INDIVIDUAL

Recovery oriented mental health practice:

- recognises that recovery is not necessarily about cure but is about having opportunities for choices and living a meaningful, satisfying and purposeful life, and being a valued member of the community
- accepts that recovery outcomes are personal and unique for each individual and go beyond an exclusive health focus to include an emphasis on social inclusion and quality of life
- empowers individuals so they recognise that they are at the centre of the care they receive.

2. REAL CHOICES

Recovery oriented mental health practice:

- supports and empowers individuals to make their own choices about how they want to lead their lives and acknowledges choices need to be meaningful and creatively explored
- supports individuals to build on their strengths and take as much responsibility for their lives as they can at any given time
- ensures that there is a balance between duty of care and support for individuals to take positive risks and make the most of new opportunities.

3. ATTITUDES AND RIGHTS

Recovery oriented mental health practice:

- involves listening to, learning from and acting upon communications from the individual and their carers about what is important to each individual
- promotes and protects individual's legal, citizenship and human rights
- supports individuals to maintain and develop social, recreational, occupational and vocational activities which are meaningful to the individual
- instils hope in an individual's future and ability to live a meaningful life.

4. DIGNITY AND RESPECT

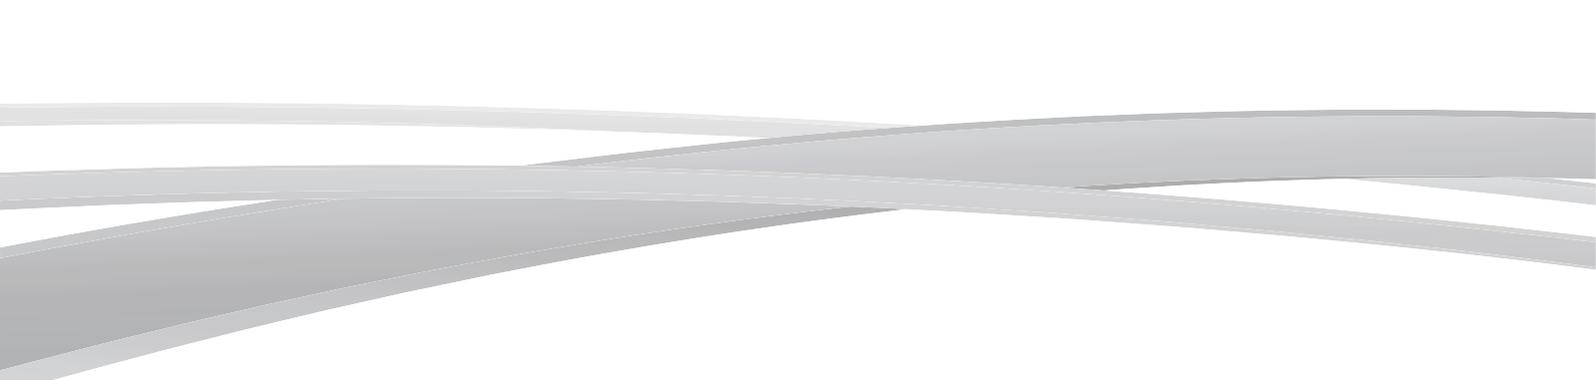

Recovery oriented mental health practice:

- consists of being courteous, respectful and honest in all interactions
- involves sensitivity and respect for each individual, particularly for their values, beliefs and culture
- challenges discrimination and stigma wherever it exists within our own services or the broader community.

5. PARTNERSHIP AND COMMUNICATION

Recovery oriented mental health practice:

- acknowledges each individual is an expert on their own life and that recovery involves working in partnership with individuals and their carers to provide support in a way that makes sense to them
- values the importance of sharing relevant information and the need to communicate clearly to enable effective engagement
- involves working in positive and realistic ways with individuals and their carers to help them realise their own hopes, goals and aspirations.

6. EVALUATING RECOVERY

Recovery oriented mental health practice:

- ensures and enables continuous evaluation of recovery based practice at several levels
- individuals and their carers can track their own progress
- services demonstrate that they use the individual's experiences of care to inform quality improvement activities
- the mental health system reports on key outcomes that indicate recovery including (but not limited to) housing, employment, education and social and family relationships as well as health and well being measures.

These Recovery Principles have been adapted from the Hertfordshire Partnership NHS Foundation Trust Recovery Principles in the UK.

Introduction

The private sector provides a range of mental health services that are delivered by a variety of service providers and across a number of service settings including community, office and hospital-based. Payment for private mental health services and treatments is made through a variety of mechanisms including the Medicare Benefits Schedule (MBS), the Pharmaceutical Benefits Scheme, private health insurance arrangements, individuals who fund their own care, and third party payers, including the Australian Government Department of Veterans' Affairs and compensation insurers.

Services provided by psychiatrists, GPs, psychologists, nurses, occupational therapists and social workers in private practice may attract Medicare benefits. Private health insurers may also pay benefits for a range of ancillary services. Overnight, admitted day only, outreach, outpatient and community patient services, provided by private hospitals, may attract benefits paid by private health insurers and third party payers, whilst the private medical practitioner component of services delivered while a patient receives hospital-based care and services, may continue to attract benefits through the MBS. Private health insurers also provide medical benefits for inpatient care.

These Guidelines have been endorsed by the Private Mental Health Alliance (PMHA)¹ and were developed by the PMHA's Collaborative Care Models Working Group.² They include advice that is applicable to private hospital-based psychiatric services and in some instances to those services that substitute for traditional admitted patient treatment. The Guidelines should be read in conjunction with the National Standards for Mental Health Services and the Australian Commission on Safety and Quality in Healthcare National Safety and Quality Health Service Standards.

The Guidelines cannot be prescriptive and, at present, are primarily intended to provide guidance for hospitals and private health insurers in determining health insurance benefits for private patient hospital-based mental health care. This includes same-day, half-day, overnight and services that substitute for traditional admitted patient treatment, as well as community and outpatient services, where applicable. The Guidelines may also be of assistance to State/Territory health authorities and their public hospitals in the treatment of Medicare and privately insured patients and to office-based practitioners.

1 The PMHA is a national industry alliance that resulted from the 2007 restructure of its antecedent the Strategic Planning Group for Private Psychiatric Services (SP3PPS). This industry alliance has been operating since 1996 to address issues related to funding classification, quality of care, outcome measurement, consumer and carer participation and related topics as they affect the private mental health sector. PMHA is currently comprised of representatives of the Australian Medical Association, Private Healthcare Australia, Australian Private Hospitals Association, the Private Mental Health Consumer Carer Network (Australia), and the Australian Government Department of Health and the Department of Veterans' Affairs.

2 Since the 2007 restructure, the PMHA has been further expanded to include a Collaborative Care Models Working Group. In addition to the organisations participating on PMHA, the CCMWG includes representatives from The Royal Australian and New Zealand College of Psychiatrists, the Royal Australian College of General Practitioners, the Australian College of Mental Health Nurses, the Australian Psychological Society, the Australian Association of Social Workers, and Occupational Therapy Australia.

Principles

The following key principles underpin these Guidelines.

- 1.1. Private patients have a right to high quality private mental health services focused on symptomatic and functional recovery.
- 1.2. Private patients have the right to the Doctor of their choice.
- 1.3. Health Insurance benefits and funding models will support the provision of high quality, evidence-based care.
- 1.4. It is a shared responsibility of funders, providers and treating doctors to assist consumers and carers in establishing the extent of the consumer's private health insurance cover and potential out-of-pocket expenses.
- 1.5. Consumer, carer and family participation will be included in all aspects of private mental health service provision, with the specific permission of the consumer.
- 1.6. Consideration must be given to the most appropriate, evidence-based³ and cost-effective recovery oriented treatment options delivered in the most appropriate environment.
- 1.7. The Guidelines support private mental health care services being delivered in accordance with a continuum of care and encourage hospitals and appropriately qualified practitioners to provide care in this manner.
- 1.8. Private health insurers, hospitals and mental health professionals should be strongly encouraged to co design funding models in support of the continuum of care.
- 1.9. Private mental health services should comply with the following, where applicable.
 - National Health Act 1953
 - Health Insurance Act 1973
 - Private Health Insurance Act 2007
 - Disability Discrimination Act 1992
 - Australian Government Privacy Act 1998
 - Private Health Insurance (Accreditation) Rules 2008
 - National Mental Health Policy and Plan
 - National Standards for Mental Health Services (NSMHS)

³ While it is acknowledged that evidence-based practice can be applied in the majority of cases, there will be situations where evidence-based practice cannot be applied, due to the complexity of some psychiatric problems and the nature of some forms of psychotherapeutic treatment.

- A model for data collection and analysis that enables the monitoring and evaluation of improvement in the quality of services, in accordance with the NSMHS. It is strongly recommended that such data be analysed and used within a collaborative framework that enables benchmarking with best practice.⁴
 - National Health Data Dictionary
 - National Practice Standards for the Mental Health Workforce
 - Australian Commission on Safety and Quality in Healthcare (ACSQHC) National Safety and Quality Health Service Standards
 - PMHA Principles for Collaboration, Communication and Cooperation between Private Mental Health Service Providers
 - Relevant State and Territory Mental Health Acts
 - State and Territory Private Hospital and Day Hospital Facility Licensing Acts
 - Guidelines for Approved Outreach Service under the Health Legislation Amendment Act (No 1) 2001
 - RACGP Standards for general practices
- 1.10 Hospitals, private health insurers and appropriately qualified practitioners are encouraged to develop the appropriate expertise to implement these Guidelines to achieve cost effective high quality, consumer and service outcomes, in accordance with best practice.
- 1.11 Applications for funding of private hospital-based mental health services must demonstrate there is a need for such services. Decisions regarding approval and level of funding remain a matter for negotiation between hospitals and private health insurers, and the Australian Government through its regulatory function.
- 1.12 Private hospital-based mental health services should actively engage in recognised quality assurance processes, including review of services against the National Standards for Mental Health Services, by an independent accreditation agency and implementation of quality assurance plans arising from such external review.
- 1.13 University affiliation and collaboration are encouraged in relation to research, education and training.

Service Provision

People with a mental illness or mental disorder, require access to a comprehensive range of services, with an emphasis on coordination, integration and individualised care. Mental health services should be funded and delivered according to a continuum of care model and a range of specialist treatment and support services should be available.

⁴ National Model for the Collection and Analysis of a Minimum Data Set with Outcome Measures for Private Hospital-based Psychiatric Services.

Such services may include the following.

- Early intervention.
- Crisis assessment.
- Domiciliary/community care
- Outpatient services
- Day, half-day, partial-day and evening services
- Hospital programs
- Admitted overnight services
- Maintenance and supportive care
- Patient and carer education
- Discharge planning and preventative care
- Leave as part of the process for preparing for discharge
- Self-management and recovery focussed treatment
- Hospital treatment services provided outside the hospital setting

Funding for some of these services will be provided by private health insurers, while other services will be funded through the Medicare Benefits Schedule, the Pharmaceutical Benefits Scheme, the Australian Government, State and Territory and Local Governments, third party funders, and by the patients themselves.

Private Hospital-based Services

Section 121.5 of the *Private Health Insurance Act 2007* (Act), which commenced on 1 April 2007, describes the meaning of *hospital treatment* as follows.

- (1) *Hospital treatment* is treatment (including the provision of goods and services) that:
- (a) is intended to manage a disease, injury or condition; and
 - (b) is provided to a person:
 - (i) by a person who is authorised by a hospital to provide the treatment; or
 - (ii) under the management or control of such a person; and
 - (c) either:
 - (i) is provided at a hospital; or
 - (ii) is provided, or arranged, with the direct involvement of a hospital.

The Act also provides a platform for private health insurers to cover a wide range of services provided outside the hospital including hospital-substitute treatment, and programs that help their members better manage their health, such as chronic disease management programs.

Under the Act, services are classified as either *hospital treatment* or *general treatment*.

Hospital treatment is defined under Section 121-5 of the Act as treatment that is intended to manage a disease, injury or condition that is provided to an insured person by a hospital, or arranged with the direct involvement of a hospital.

General treatment is defined under Section 121–10 of the Act as treatment that is intended to manage or prevent a disease, injury or condition, and is not *hospital treatment*.

Hospital–substitute treatment is a subset of *general treatment* and is defined under Section 69–10 of the Act. It is treatment provided by a provider that is not a declared hospital, but which substitutes for an episode of hospital treatment, i.e. it is the same treatment that is usually provided by a hospital. It is not mandatory for private health insurers to cover *Hospital–substitute treatment*. It is up to private health insurers to decide the services they pay benefits for and to determine that the services provide value for money in terms of cost outlays and health outcomes for their members. Providers that wish to provide services outside of hospital must contact private health insurers and establish an agreement before health insurance benefits can be paid.

1. Care delivery

It is strongly recommended that hospitals, where applicable to privately insured patients, meet the principles for guiding the delivery of care as recommended by the National Standards for Mental Health Services.⁵ This should include the following.

- Choice and access to a range of treatment options in consultation with the patient and, where nominated and clinically appropriate, their family or carer(s).
- Reference to the patient’s social, cultural and developmental context.
- Continuous and coordinated care delivered via a range of services across a variety of care settings.
- Comprehensive individualised care, access to treatment and support services able to meet specific needs during the various stages of the individual’s illness.
- Treatment in the most facilitative environment appropriate for the individual patient.
- Care provided must also be documented in an individual care plan and be transparent based on, for example, the use of Clinical Care Pathways, Clinical Practice Guidelines,⁶ and Clinical Notes.
- Priority must be given to the most appropriate evidence based, recovery oriented, and cost–effective treatment options for each individual patient. While it is acknowledged that Evidence–based practice can be applied in the majority of cases, there will be situations where evidence does not exist for the level of complexity of some psychiatric problems and the nature of some forms of psychotherapeutic treatment.

⁵ PMHA has endorsed the National Standards for Mental Health Services, where applicable, for implementation in private sector mental health services.

⁶ Clinical Practice Guidelines (or CPGs) are systematically developed statements intended to assist practitioners in making decisions about appropriate health care for specific clinical circumstances. Their main purpose is to improve health outcomes for patients by improving the practice of clinicians. As they become available, CPGs for psychiatric disorders are placed on the internet at <http://www.ranzcp.org>.

2. Choice of setting

The following factors need to be considered when selecting the most appropriate setting for care delivery.

- Patient acuity, level of distress and disability.
- Level of social support in the home.
- Geographical considerations.

3. Patient acuity, level of distress and disability

Patients should have:

- a diagnosed psychiatric illness classified by either ICD-10-AM or DSM-5 and have a level of distress and/or disability that demonstrably impacts on their ability to function in day-to-day living and their relationships with others; and
- require specialised intervention, treatment or support in an appropriate care setting or range of settings, with an expected measurable outcome.

It is acknowledged that early intervention for people with a mental illness, or mental disorder, is particularly important in minimising the impact of first episodes, the incidence of relapse, maximising recovery and reducing the length of hospital stay.

Direct admission to an appropriate same-day program (half or full-day), or attendances at outpatient services, where available, should be considered as an alternative to admitted overnight patient services.

3.1 Admitted overnight services

After mental health assessment by the treating psychiatrist, level of distress and/or disability is assessed as acute, severe, or serious as evidenced by but not confined to, the following.

- High risk of harm to self, or others.
- Incapacitating symptoms or distress. This may be evidenced by a highly disorganised state impacting on self-care and/or physical health, including inability to comply with treatment, resulting in a need for 24 hour care.
- The need to establish the nature of a disorder, initiate and/or stabilise complex treatment modalities, such as pharmacotherapy and Electroconvulsive Therapy (ECT).
- Significant problems in initiating treatment, or continuing treatment, in another setting. As patient acuity, dysfunction and available support change the patient should, as soon as possible, be relocated to an appropriate level in the continuum of care, in consultation with the patient and, where nominated and clinically appropriate, his or her family/carer.

Admitted overnight length-of-stay should be determined by the patient's treating psychiatrist in accordance with individual patient clinical need, and clinical best practice⁷, not by length of program.

3.2 Admitted same-day patient services

Admitted same-day services should be the setting of choice for early intervention and when the patient exhibits a level of acuity, distress, or disability that is assessed as:

- manageable risk of harm to self, or others; and
- lower indicators of severity and complexity than those necessitating admitted overnight stay; and
- able to comply with treatment and self-care; or
- able to cope with their usual environment.

As patient acuity, level of functioning and disability and available supports change, the patient should, as soon as possible, be relocated to an appropriate level in the continuum of care, in consultation with the patient and, where nominated and clinically appropriate, their family/carer(s) and with consideration of funding options.

All occasions of service must be determined on an individual basis. This may include participation in a structured program of defined interventions and duration, where it is indicated by Best Practice.

Admitted same-day services should only be provided when that treatment environment is the best for the individual patient.

3.3 Community, hospital-in-the-home, and outreach type services

Community, hospital-in-the-home and outreach type services that are provided by private hospitals should meet all applicable guidelines and be delivered by appropriately trained and qualified health professionals. Patients can receive such services as a direct substitution for admitted overnight, or admitted same-day care. It is expected that psychiatrists and hospitals will regularly communicate with each other to reassess the appropriateness of this level of care for the patient.

4. Treatment and care options

Treatment and care options should comply with any relevant clinical guidelines regarding treatment of any specific disorders (see Footnote 6).

At all times, in the selection of treatment options, the focus needs to be on individual needs and restoration or stabilisation of function, taking into account environmental factors for the patient, patient preferences and the patient's support systems.

⁷ Clinical best practice is defined in this context as those clinical interventions that have been judged to be most effective at delivering a particular clinical outcome, such as the RANZCP Clinical Practice Guidelines.

Phases of treatment include pre-admission assessment, admission, immediate assessment and intervention, continued diagnostic evaluation and refinement of treatment, clarification of treatment goals and discharge criteria, progress towards and achievement of goals, discharge, and transition to appropriate aftercare or follow up.

A full continuum of care ranges from intensive/high dependency admitted overnight treatment to day hospital, outpatient, rehabilitation, office-based, and community care.

It is expected that program modules designed to develop/increase skill levels to prevent or minimise relapses will be primarily conducted on a same-day, outpatient, half or full-day basis, where possible and clinically appropriate.

Admission, treatment and care must be under the supervision of the attending psychiatrist irrespective of care setting. Treatment and care options based on biopsychosocial principles, should be negotiated with the patient and, where nominated and clinically appropriate, their family/carer(s). It is acknowledged that there will be two possible scenarios:

1. the patient is able to make an informed decision regarding the involvement of their family/carer(s) in their treatment and care options;
- or
2. the patient is unable to make an informed decision concerning the involvement of their family/carer(s).

In the second situation, the attending psychiatrist is responsible for determining the level of involvement of family/carer(s) in the consideration of treatment and care options.

A care plan should be developed as part of the assessment process and documented prior to commencement of specialist treatment. Regular reviews of the care plan should occur at intervals appropriate to the care setting and include those members of the multidisciplinary team involved in the treatment. Care plans and reviews must always reflect the needs of the patient and include those members of the multi-disciplinary team and appropriate and relevant families/carers.

The care plan should:

- document chosen treatment and care options;
- take into account transitions in levels of care;
- include discharge planning;
- clearly state goals and outcomes, including detailed functional improvement or decline and an estimate of length/duration of treatment(s);
- be developed collaboratively and regularly reviewed with the patient, and with the patient's informed consent, their carers, and be available to them.

Care and treatment options should be selected from Evidence-based treatment choices, within a recovery oriented framework such as the following.

- Individual, group, family and other psychotherapies.
- Psychopharmacotherapy.
- Electroconvulsive Therapy (in accordance with guidelines of the RANZCP and the Australian and New Zealand College of Anaesthetists).⁸
- Specific post-natal mental health services where babies should usually accompany their mother during her admission.⁹
- Other Evidence-based treatment modalities.
- Specific rehabilitation and education services to facilitate return of function.
- Outreach services to facilitate return of function, maintain function or prevent relapse.
- Education, promotion, prevention and support services.
- Drug and alcohol program following assessment (and treatment if necessary) by a psychiatrist.

5. Quality standards

Hospitals should implement appropriate quality improvement processes taking account of relevant sections of the *National Safety and Quality Health Service (NSQHS) Standards*, the *National Standards for Mental Health Services* and the *National Practice Standards for the Mental Health Workforce* including but not limited to, the following.

- Recognised by the Australian Government Department of Health for private health insurance purposes.
- Licensed by a State/Territory as a Private Psychiatric Facility.
- Accreditation by an industry recognised body.
- Demonstrated quality improvement activities.
- Ongoing collection and benchmarking of industry agreed and validated outcome measures, both patient and clinician rated.

8 The Royal Australian and New Zealand College of Psychiatrists, *Guidelines on the Administration of Electroconvulsive Therapy (ECT)*, can be obtained from their website at: <http://www.ranzcp.org/resources/clinical-memoranda.html>. The Australian and New Zealand College of Anaesthetists, *T1 Recommendations of Minimum Facilities for Safe Administration of Anaesthesia in Operating Suites and Other Anaesthetising Locations – Interim Review 2008*, are available from their website at: <http://www.anzca.edu.au/resources/professional-documents/pdf/T1.pdf>

9 Royal Australian and New Zealand College of Psychiatrists *Position Statement #57 – Mothers, Babies and Psychiatric Inpatient Treatment*.

- Data collected are stored and reported in a manner, which ensures confidentiality and complies with relevant legislation and the *National Model for the Collection and Analysis of a Minimum Data Set with Outcome Measures for Private, Hospital-based Psychiatric Services*.
- Mechanism for clinical case review of patients.
- Ongoing peer review and/or clinical supervision as appropriate for all health professionals involved in patient care.
- Quality initiatives ratified from time-to-time by the PMHA

6. Staffing

All treatment, irrespective of care setting, is to be provided by appropriately trained and qualified health professionals who are registered, where registration is required, or otherwise members of their relevant professional bodies, with substantiated and relevant clinical experience in the forms of treatment, therapy and care they provide. These may include the following.

- *General Practitioners (GPs) and GP Registrars*, registered with Australian Health Practitioner Regulation Agency (AHPRA).
- *Psychiatrists and Psychiatric Registrars* registered with AHPRA
- *Psychologists* registered with AHPRA, including those endorsed to practice as a Clinical Psychologist.
- *Registered and Enrolled Nurses and Nurse Practitioners* registered with AHPRA.
- Mental Health Nurses credentialed by the Australian College of Mental Health Nurses (ACMHN).
- *Occupational Therapists* registered with AHPRA
- *Accredited Mental Health Social Workers* accredited with the Australian Association of Social Workers (AASW).

It is acknowledged that the medical practitioner component (for example Psychiatrist, General Practitioner, Anaesthetist, Physician) of private hospital-based treatment is provided by a private medical practitioner operating under the MBS.

6.1 Staffing levels

Each mental health unit/service will be staffed according to occupancy rates, the current severity of illness experienced by patients, special individual needs and age-specific needs and vulnerabilities.

Appropriately trained Mental Health Professionals will make up the majority (minimum 60%) of the staffing numbers.

Hours per patient day will be an average of 4 hours, with the aim of achieving 4.2 hours, per patient day over 7 days.

Therapy services provided by Mental Health Professionals should be available seven days a week for Admitted Overnight patients.

Twenty four hour cover for Admitted Overnight patients, through a roster for Consultant Psychiatrists, or hospital registrars/medical officers or both, are encouraged.

6.2 Professional Development

There must be a continuing education and development program for staff, which takes cognisance of the *National Standards for Mental Health Services* and *National Practice Standards for the Mental Health Workforce*. It is recognised that private hospitals provide training and clinical placements for a range of students including Nurses, Allied Health and Medical.

All clinical staff must be credentialed by the service and participate in regular peer evaluations and reviews. Clinical case assessments must be performed where appropriate and documented. Clinical supervision of all nursing and allied health professional staff must be undertaken on a regular basis.

All staff must be aware of, and comply with, the obligations specified under the Privacy Act 1998 (as amended).

6.3 Admitted Overnight Patient Services

Admitted Overnight Patient Services must be delivered by appropriately trained and qualified health professionals. Patients should have a structured therapeutic plan that is tailored to meet their individual and group therapy requirements.

6.4 Admitted Same-day Patient Services

Services must be delivered by appropriately trained and qualified health professionals for specific contact hours. Contact hours include:

- Participation in specialised group therapy programs that have clearly defined clinical outcome goals.
- One-to-one counselling/therapy sessions.

Contact hours should not include time allocated for meal and tea breaks, unless they are part of an eating disorders program.

Same-day Programs – full-day

A minimum number of four and a half hours of structured therapeutic contact hours per day, except where agreement has been reached for alternative arrangements.

Same-day Programs – half-day

A minimum number of two and a half hours of structured therapeutic contact per day, except where agreement has been reached for alternative arrangements.

7. Facilities

Facilities must be licensed by the relevant State/Territory health authority or approved as equivalent by the Australian Government Department of Health. Licensing arrangements vary significantly from one jurisdiction to another. The following minimum requirements are strongly recommended.

7.1 Hospitals

A hospital building or unit designed and built specifically for the purpose of providing psychiatric care, or another type of hospital building which has been converted or modified to specifically provide psychiatric care and incorporates the following.

Therapy rooms There should be sufficient purpose designed rooms to cater for the needs of all admitted overnight and same-day patients.

Therapy Group Size The **maximum** size of groups should not exceed 12 participants, unless additional facilitators are involved.

Lounge/recreation rooms Properly furnished rooms and/or areas should be set aside for admitted overnight patients and same-day patient's relaxation. Access to a safe outside leisure area. Private areas should also be set aside for admitted overnight patients to meet with relatives and friends.

Interview rooms There should be an adequate number of rooms provided for use by clinicians to interview/consult with patients on a confidential basis.

Dining rooms Fully equipped dining rooms should be provided adequate to meet the needs of the total service including admitted overnight patients and same-day patients, day patients and staff.

Electroconvulsive Therapy (ECT) If ECT is administered, separate preoperative, procedure, and post-operative rooms must be available. Hospitals must comply with State and Territory licensing requirements for ECT, where they exist, the guidelines for ECT of the Royal Australian and New Zealand College of Psychiatrists, and those of the Australian and New Zealand College of Anaesthetists (see Footnote 9).

Facilities for specialist programs Hospitals providing specialist programs, e.g. High Dependency Units, Parent/Infant Units, Alcohol Detoxification Programs must be able to demonstrate the existence of appropriate facilities and equipment. In some cases this may require the designation of specific special purpose areas within the hospital.

Wards Wards should be comfortable with adequate bathroom facilities and, in shared wards, must include screens or curtains to ensure individual privacy for each patient. Each facility should have an appropriate number of single bed wards designed and

positioned to permit observation and monitoring of progress of high risk patients.

Smoking areas Where permitted, dedicated smoking areas for patients should be functional but discourage lengthy personal interactions or individual isolation. Nicotine Replacement Therapy should be routinely offered to all patients who smoke and dedicated program/s should promote withdrawal, assist abstinence and encourage alternatives within the context of the management of their mental illness.

Alternatives to In Hospital Treatment

Under Australian legislation, contractual arrangements can be established in the private sector between providers and private health insurers for the provision of service models that substitute for traditional admitted patient treatment, overnight and day only hospital-based care (*hereafter* traditional admitted patient treatment).

These transitional models constitute a form of substitute service delivery that can improve the quality of health outcomes for some people living with a mental illness in the community. Such acute care services aim to reduce the severity of illness over time, reduce hospital admissions, re-admissions and the length of hospital stay. They include, but are not limited to such models as Hospital-in-the-Home (HITH), Outreach, and Hospital-substitute type services. These services are time limited and focus on integrating the patient back into the community with the relevant community-based supports. They are not a substitute for community-based care and care should be taken to make sure the patient does not become inappropriately dependent on these, particularly when socially isolated.

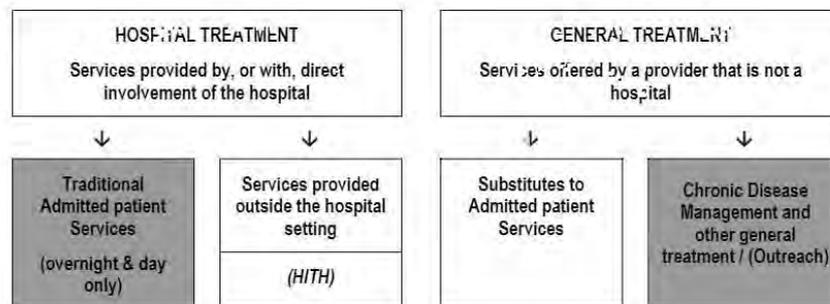

To facilitate the delivery of such services, a central lead agency that is responsible and accountable for the services provided is required. Within the private sector, the lead agency is more likely to be a private hospital. There is, however, sufficient flexibility under the legislation to enable providers that are not hospitals to undertake the provision of such services.

This section of the Guidelines is intended to assist providers, payers, consumers and carers, better understand the nature of these services and the terminology involved.

1. Legislation

As detailed earlier in these Guidelines, the *Private Health Insurance Act 2007* (the Act) is intended to provide a platform for private health insurers to provide benefits for a wide range of services and programs including those that can be substituted for traditional admitted patient treatment, and those that can help their members better manage their health, such as chronic disease management programs.

Figure 1: Comparison of Models under Hospital Treatment and General Treatment

1.1 Hospital Treatment

Under current legislation, *hospital treatment* is defined under Section 121–5 of the Act as treatment that is intended to manage a disease, injury or condition that can be provided to an insured person by a hospital, or arranged with the direct involvement of a hospital.

Two distinct models of service provision can be provided under *hospital treatment*.

- (1) Traditional overnight and day only admitted patient treatment that is conducted to achieve a continuum of care for the patient *within* the hospital setting.

Private health insurers for the purpose of paying benefits **may** consider the patient to be admitted.

- (2) Substitution of traditional admitted patient treatment with an alternative service model able to achieve a continuum of care for the patient *outside* the hospital setting.

These services are usually delivered to the patient at their home or in another appropriate setting. While a range of terms exist for these alternative models, such as HITH, the hospital is the lead agency that is both responsible and accountable for the provision of the services.

These services are usually provided by hospital-based personnel, or by personnel subcontracted by the hospital. The services include clinical assessment, monitoring, support and interventions to assist to maximise recovery and prevent relapse.

Under this model, while the hospital does not consider the patient to be an in-patient of the hospital, they are considered to be an admitted patient. This ensures continuity of care and enables the hospital to meet its clinical responsibilities and legal obligations to the patient.

Private health insurers, for the purpose of paying benefits, **may** consider the patient to be admitted.

1.2 General Treatment

General treatment is defined under Section 121–10 of the Act as treatment that is intended to manage or prevent a disease, injury or condition, and is not hospital treatment. However, while the service provider is **not** a hospital, a subset of the Act (Section 69–10), does facilitate the provision of what is described formally in the Act as *hospital-substitute treatment*. *Hospital-substitute treatment* can be offered by a provider or agency that is not a declared hospital in substitution for an episode of hospital treatment. In other words, it is intended to give providers and private health insurers the flexibility to provide the same treatment that would normally be provided by a hospital without the direct involvement of a hospital.

Under *hospital–substitute treatment*, the provider(s) would be considered both responsible and accountable for the provision of the services, but the patient is not considered to be admitted in the hospital. *Hospital–substitute treatment* may be undertaken by the provider, or by personnel subcontracted by the provider.

These services include clinical assessment, monitoring, support and interventions to assist to maximise recovery and prevent relapse. Under this model, the provider would be responsible for ensuring there is continuity of care and that the relevant clinical responsibilities and legal obligations to the patient and their health records are met.

2 Funding

It is not mandatory for private health insurers to cover these services. It is up to private health insurers to decide the services they pay benefits for and to determine that the services provide value for money in terms of cost outlays and health outcomes for their members. Providers that wish to provide services that substitute for traditional admitted patient treatment must contact private health insurers and establish an agreement before health insurance benefits can be paid. There may be agreement for a variety of different funding models to be used in these circumstances within the overall funding of the service. Insurers, for example, may consider alternative funding arrangements, such as providing benefits for a finite number of visits or alternatively having a step down arrangement for such services.

Under *hospital–substitute treatment*, services that substitute for traditional admitted patient treatment are able to be covered by the MBS. A private health insurance member may also be entitled to receive higher than 100% of the MBS fee under their membership, depending on what medical no gap arrangement they have with their insurer. The MBS is able to cover up to 75% of the MBS fee and health insurers cover the remaining gap of 25%. However, insured persons receiving hospital substitute treatment may instead elect to be billed the 35% MBS fee, and cover any gap.

3. Approaches to service delivery

Services that substitute for the traditional admitted patient treatment will vary in how they are structured and operate. They are not a substitute for community–based care.

It is critically important that substitute services for people with a mental illness are able to provide continuity of care and clear lines of communication so that multiple sources of possibly differing treatment and advice are avoided.

Cooperation with other treatment services and providers is also critical to ensure a person with a mental illness receives not only an appropriate mix of services, but is also able to transition appropriately between other services including inpatient, day only, outpatient and substitute treatment services, without unnecessary overlap or duplication. This will require appropriate linkages to be established with a variety of public sector and Non Government Organisations.

It may also require agreement between providers and the person receiving treatment about the use and sharing of their health record.

Substitute services include clinical assessment, monitoring, support and interventions to assist to maximise recovery and prevent relapse. The service is then delivered on a face-to-face basis either at the patient's home, or in another appropriate setting. Such services should be directed toward integrating the patient back into the community with the relevant community-based supports. Visits should involve face-to-face contact with an appropriately trained mental health professional and be of a clinically appropriate duration. Each visit should be recorded in the medical record. These services should generally not be conducted whilst a patient is participating in a day only program, unless under short-term exceptional circumstances.

4. Quality and Standards

Services that substitute for traditional admitted patient treatment should comply with the National Standards for Mental Health Services and the ACSQHC National Safety and Quality Health Service Standards, particularly in relation to person centred care in relation to the following.

- Services are evidence-based and directed at supporting recovery.
- Consultation with the patient and family/carer, where nominated by the patient, regarding choice of access to support and treatment services.
- Provision of services in a manner that respects social and cultural values, beliefs and practices.
- Provision of co-ordinated care across a range of settings and service providers, as appropriate.
- Provision of individualised care to meet specific needs during various stages of the patient's illness.

They should aim to meet the principles guiding care delivery recommended by the National Practice Standards for Mental Health Workforce and other relevant professional standards.

Services should collect and benchmark against agreed and validated outcome measures, both patient and clinician rated. Data collected should be stored and reported in a manner, which ensures confidentiality and complies with relevant legislation and the *National Model for the Collection and Analysis of a Minimum Data Set with Outcome Measures for Private, Hospital-based Psychiatric Services*.

Consumer feedback should be sought regarding the quality of service provision.

Substitute services should also comply with any local requirements of the lead agency providing the service and any relevant Commonwealth, State or Territory legislation.

5. Entry and Duty of Care

Patients who are assessed as appropriate for referral to a private hospital for services that substitute for the traditional admitted patient treatment following an inpatient stay should be under the care of private psychiatrist who is accredited to practice at that hospital. The treating psychiatrist should then be responsible for prescribing and reviewing the substitute treatment service.

The hospital is responsible for providing the range of services including assessment, monitoring, support, risk assessment and information on sources of emergency support, after hours support and integration back to living as independently as possible in the community. Throughout each episode of care, patients are considered to be concurrently patients of the hospital and of the treating psychiatrist.

When patients are being supported by services external to the hospital, the duty of care for those services lies with the treating psychiatrist and the external service provider.

A tracking system should be maintained that ensures all patients referred to a substitute service are followed up within 5 working days of referral.

6. Care Plan

A written Care Plan outlines the goals and strategies for management, support, and rehabilitation for the patient's particular identified mental health problem.

Following the initial assessment and referral to a substitute service, a care plan should be completed in collaboration with the patient and members of the treating team, and where nominated and clinically appropriate, the carer(s). The treating team is usually comprised of the treating psychiatrist and other clinical, medical or allied health personnel involved in the patient's regular mental health care. The multi-disciplinary nature of the team ensures the staff delivering the substitute service, have access to a range of personnel with expertise in a variety of areas. In addition, the patient's carer(s) should be consulted, where nominated, as should personnel from other support agencies to ensure information sharing, continuity of care, and transfer of care, when and if applicable. Discharge planning should be undertaken as part of the assessment and admission process and should form part of the care plan.

Services that substitute for traditional admitted patient treatment should be part of a patient's overall Care Plan. Substitute services should receive a copy of the Care Plan, which should include documentation of the following.

- Chosen treatment and care options.
- Other services/providers the patient has attended, or is currently attending.
- Goals for initial referral to the substitute service.
- Results achieved to date.
- Number of any additional visits deemed appropriate.

- Strategies to be implemented.
- Evaluation of progress.
- What community support services have been initiated, where appropriate.
- Mechanism for review by the treating psychiatrist.
- Next review by the treating psychiatrist.
- Transitions in levels of care.
- Discharge planning.
- Functional improvement.
- Estimate of length/duration of treatment(s).
- Management of crisis intervention.

Care plans should be regularly reviewed with the patient at appropriate intervals [monthly]. The review should include those members of the treating team involved in providing the substitute treatment. A care plan tracking system should be used to assist all the members of the treating team to maintain consistency in the review process.

7. Review

It is critical that the review of the patient's progress is embedded in the cycle of the substitute treatment. This will involve both the usual ongoing review at each contact with the patient and more formal regular reviews by treating team, including the psychiatrist. The care plan should be adjusted accordingly.

All members of the treating team should have an opportunity to contribute to the review and the development of the subsequent plan. Where required, the patient and their nominated carer(s) should be consulted, as should personnel from other support agencies.

The methods of review for services that substitute for traditional admitted patient treatment should be similar to those that are available to in-patients and should be geared toward addressing whether this level of care, or type of service, is still appropriate for the patient. Where this level of care is not appropriate, alternative forms of maintenance or chronic disease management should be considered. It is expected that psychiatrists and hospitals will regularly communicate with each other to reassess the appropriateness of this level of care for the patient.

8. Discharge

A patient should not be discharged from a substitute type service until alternative external support services have been put in place as required and the discharge has been approved by the treating psychiatrist.

Discharge planning is undertaken from initial contact with the development of the care plan with any specific discharge policies and procedural processes detailed therein.

While specific discharge policies and procedural processes will differ from service provider to service provider they commonly include documentation of at least the following.

- Follow-up and support arrangements including referrals to other services.
- Notification of the treating psychiatrist of discharge arrangements.
- Contact procedure to be followed if the patient fails to attend a follow-up visit.
- Transition to another level of care, such as admission to traditional admitted patient treatment, should be considered as a separate episode of care.

9. Governance

Substitute services governed by a hospital must comply with the relevant by-laws of that facility.

Services should have an integrated risk management framework in place and a formal quality assurance process.

Policies should be in place to ensure the safety of patients and staff, and to support them during and post, critical incidents.

10. Staffing

Mental Health Professionals providing the service should be experienced and competent to practice within their scope of practice. Targeted recruitment should be undertaken to ensure the service is able to maintain high quality delivery of care to mental health patients and their families outside of the hospital setting.

There should be mandatory training and education to ensure staff are familiar with evidence-based care and contemporary evidence-based practices.

Guidelines Review

These Guidelines shall be reviewed on a biennial basis by the PMHA in consultation with the following organisations.

Predictors of Intensive Care Unit Admission After Total Joint Arthroplasty

Hossam AbdelSalam, MD, Camilo Restrepo, MD, T. David Tarity, MD,
William Sangster, BS, and Javad Parvizi, MD, FRCS

Abstract: Total joint arthroplasty (TJA) is a relatively safe orthopedic procedure. However, complications do occur, and some may necessitate admission to the intensive care unit (ICU). Our purpose was to determine risk factors associated with admittance to ICU after TJA. We evaluated 22 343 primary and revision total hip and knee arthroplasties from 1999 to 2008. One hundred thirty patients were admitted to the ICU. Cases were matched 1:2 for date of surgery, surgeon, and type of surgery. The causes for admission to ICU were recorded. Independent risk factors for ICU admission were smoking, cemented arthroplasty, general anesthesia, allogenic transfusion, higher C-reactive protein, lower hemoglobin level, higher body mass index, and older age. Proper identification and management of these “at-risk” patients may decrease the incidence of ICU admittance after TJA. **Keywords:** total joint arthroplasty, intensive care unit, smoking, cemented arthroplasty, general anesthesia.

Although total joint arthroplasty (TJA) is a very safe and well-tolerated surgery for most patients, it is not without minor and major complications [1-3]. The literature is replete with well-documented incidence reports of minor complications such as superficial wound infection, skin numbness, wound drainage, atelectasis, urinary tract infection, and anemia [2,4-8]. These complications, when present, are commonly managed by the treating orthopedic surgeon or comanaged with medical teams [9].

However, the more serious major surgical complications, reported by some to be as high as 6.3% [2], may depend on the operative site, primary or revision arthroplasty, and whether cement for prosthetic fixation is used [7,10,11]. These major surgical complications include cardiac arrest, tachyarrhythmia, myocardial infarction, congestive heart failure, hypotensive crisis, pulmonary embolism, pneumothorax, acute renal failure, cerebral vascular accidents and/or transient ischemic attack, and deep venous thrombosis [2,12,13].

The rates of both minor and major complications may not differ between academic and private practice services [14], but at least 1 study found that high-volume specialty orthopedic hospitals had less adverse outcomes such as sepsis, hemorrhage, pulmonary embolism, and deep venous thrombosis compared with general hospitals [15]. Furthermore, patient comorbidities such as hypertension, diabetes, obesity, and smoking typically reflected by a higher American Society of Anesthesiologists score [16] have been shown to increase complication rates after TJA [17-21]. Some of the patients with the aforementioned comorbidities and complications may require an unexpected admission to intensive care units (ICUs) after TJA for vigilant monitoring.

To our knowledge, there are few studies that describe the predisposing risk factors or predictors for ICU admission after TJA. Most of the literature focuses on 1 major complication after joint arthroplasty. Therefore, it may be worthwhile for the treating surgeon to highlight the major medical complications after joint arthroplasties, to know their incidences and try to reliably predict which patients have a greater likelihood of developing these complications, thus requiring ICU admission.

The objective of this study was to determine the incidence of and establish the risk factors for ICU admission after TJA. Our rationale for conduct of this study was that identification and reversal of predisposing factors for unexpected ICU admission, whenever possible, are likely to improve outcome after TJA. The study was conducted in a case-control fashion, with all patients evaluated from a single institution.

Materials and Methods

With the use of our institutional electronic database and after institutional review board approval, a query from 22 343 TJA procedures performed from May 1999 to February 2008 was conducted. Of these, 130 patients (0.6%) developed a major complication and were subsequently admitted to the ICU during the same hospital stay. The records from our database in addition to the hard copy ICU charts of these patients were meticulously examined in a retrospective fashion. This cohort was matched according to date of surgery (± 4 weeks); surgeon; and procedure type, in a 1:2 ratio against 260 patients who did not develop postoperative complications necessitating admission to the ICU.

Demographics

Demographic variables including age; sex; body mass index (BMI); Charlson index for comorbidities [22]; and social history significant for alcohol, tobacco, or illicit drug abuse were evaluated for both groups (Table 1).

Table 1. Demographic Distribution, Preoperative Vital Signs and Laboratory Values, and Surgical Data

	Cases (n = 130)	Controls (n = 260)
Demographic distribution		
Age, (y) mean (SD)	72.8 (12.3)	66.1 (13.0)
Female	67 (51.5%)	173 (66.5%)
Male	63 (48.5%)	87 (33.5%)
BMI, mean (SD)	30.6 (8.8)	20.8 (6.8)
Charlson index, mean (SD)	3.9 (2.1)	2.7 (1.6)
Ever smoked	49 (37.7%)	14 (5.3%)
Preoperative vital signs and laboratory values		
Heart rate, mean (SD)	82.98 (15.81)	74.48 (10.72)
Systolic BP, mean (SD)	131.07 (24.37)	133.63 (18.39)
Diastolic BP, mean (SD)	70.16 (16.26)	75.90 (10.87)
Hemoglobin level, mean (SD)	11.64 (1.63)	13.11 (1.51)
Glucose, mean (SD)	120.56 (47.49)	107.54 (32.69)
ESR, mean (SD)	43.42 (30.36)	26.92 (12.45)
CRP, mean (SD)	4.24 (5.71)	1.98 (1.37)
Surgical data		
Hip vs knee	60 (46.2%)	120 (46.2%)
Revision	48 (36.9%)	46 (17.4%)
Bilateral	26 (20%)	38 (14.4%)
Cement	95 (73.1%)	189 (72.7%)
Primary knee	70 (73.7%)	140 (74.1%)
Revision knee	21 (22.1%)	40 (21.2%)
Revision hips	4 (4.2%)	9 (4.8%)
General anesthesia	34 (26.2%)	19 (7.2%)
Surgery duration, mean (SD)	109.20 (52.31)	68.74 (30.29)
EBL, (mL), mean (SD)	545.0 (926.2)	230.8 (292.1)
Total PAD units		
0	84 (64.6%)	114 (43.2%)
1	26 (20%)	103 (39%)
2	20 (15.4%)	45 (17.1%)
3	0	1 (0.4%)
4	0	1 (0.4%)
Total allogenic units, mean (SD)	4.92 (6.40)	0.78 (1.55)
Cell saver, mean (SD)	77.76 (167.49)	46.95 (135.05)

BP indicates blood pressure; ESR, erythrocyte sedimentation rate.

Preoperative Vital Signs and Laboratory Values

The preoperative vital signs, mean heart rate, mean systolic blood pressure, and mean diastolic pressure as well as hemoglobin level, glucose, erythrocyte sedimentation rate, and C-reactive protein (CRP) levels were reviewed for both groups, (Table 1).

Surgical Data

Surgical variables analyzed included location (hip or knee), primary or revision procedure, unilateral or bilateral procedures, the type of fixation (cemented vs cementless), the type of anesthesia, the duration of surgical procedure, estimated blood loss (EBL), preautologous donation (PAD) of blood, the number of autologous or allogenic blood transfused, and the use or not of cell saver (Table 1). All surgeries were performed using the same approach, direct lateral (Hardinge) approach for total hip arthroplasty (THA) and a midline incision and medial parapatellar arthrotomy approach for total knee arthroplasty (TKA). The average length of operation and estimated blood loss during the index surgery were 109 minutes and 545 mL, respectively, for the cases admitted to the ICU. Conversely, the length of operation and EBL for the control series were 69 minutes and 230 mL, respectively.

Statistical Analysis

All statistical analyses were performed using STATA 10.0 (College Station, TX). The variables from the 130 cases and 260 controls were intercorrelated with each other; therefore, study of each single parameter individually was not sufficient because of the paired nature of the data. Baseline and operative characteristics were compared between cases and controls using the *t* test for continuous variables and the Fisher exact test for categorical variables. The odds ratio with 95% confidence intervals and the associated *P* value were determined for each variable using a multivariable logistic regression analysis performed, which included variables found to be significant ($P < .05$) and not close to 1.00 in the preceding univariate analysis. Multivariate analyses can statistically accommodate imbalances between study groups in nonrandomized studies. All *P* values reported are 2 sided.

Results

Descriptive analysis for the variables mentioned in the "Materials and Methods" section demonstrated no statistically significant differences in the following: BMI, systolic blood pressure, arthroplasty location, unilateral vs bilateral procedures, and the use of cell saver. All other variables analyzed yielded statistically significant differences.

A multivariate analysis controlling for potential confounders was then performed. Variables included are depicted (Table 2). Body mass index was included in this analysis, as it had some statistical significance over

* Independent predictors of increased risk to requiring ICU admission.

dichotomous versions of the variable such as BMI more than 25 kg/m² and BMI more than 30 kg/m².

The results of this analysis indicate that smoking history, cemented arthroplasty, general anesthesia, greater allogenic blood units transfused, higher preoperative CRP levels, lower preoperative hemoglobin levels, increased BMI, and older age are independent predictors of an increased risk for ICU admission after TJA (Table 2).

Discussion

It is estimated that the number of TJA procedures per year is well over half a million in the United States and will continue to rise given the aging population [23]. Therefore, it follows that given the prevalence of comorbidities in these patients, admission rates to the ICU are also on the rise [24]. In a study by Mantilla et al [12], increased age was found to be the strongest predictor of major complications after TJA. Our study found that older age (>65 years) was a weak (1.1× greater risk) but an independent risk factor for ICU admission. Other authors have concluded that male sex, a positive smoking history, and ethnicity (blacks at higher risk than whites) may predict who will need ICU monitoring after TJA [12,13,19,25]. Interestingly, although some demographic features reported by others were not significant in our study, obesity did result in an independent risk factor after multivariate analysis, albeit very weakly significant. The patient population had a mean BMI of 30.6 kg/m² for the study cohort and a BMI of 20.8 kg/m² for the control cohort. We recommend evaluation of a patient's BMI as a general consideration, part of the overall evaluation of a surgical candidate but would generally refrain from advocating all obese patients strongly be considered for ICU admission after TJA.

Smoking has a deleterious effect on TJA outcomes. Forty-nine patients (37.7%) in the study cohort compared with only 14 control patients (5.4%) had a positive smoking history. Smokers were 65 times more

likely than nonsmokers to be admitted to the ICU. Our results were consistent with another report in the literature by Sadr et al [21] who found that heavy tobacco use was associated with an increased risk of systemic postoperative complications ($P = .004$). In their study, previous and current smokers had a 43% and 56% increased risk of systemic complications, respectively, when compared with nonsmokers. In heavy smokers, the risk increased by 121% [21]. Similarly, Moller et al [19], in their investigation of 811 patients who had elective orthopedic surgery, found that smoking affected the rate of wound healing and cardiopulmonary complications and had an 8-fold increase in the need for admission to the ICU. We recommend preoperative counseling with patients who smoke and encourage the implementation of recent advances in cessation strategy to decrease the likelihood of admittance to ICU after TJA.

The second greatest risk factor for ICU admission after TJA from our analysis was cemented joint replacement. Although all TKAs were cemented procedures, only 70 TKA patients in the study cohort were admitted to the ICU. Sixty THA patients developed complications and were sent to the ICU. Of these, 35 were press fit cementless implants, whereas 25 cases were cemented (42%). This is in contrast to 114 (95%) of 120 THA patients in the control group who underwent cementless implantation. The adverse reactions associated with acrylic bone cement (polymethylmethacrylate) are well known and have been documented for nearly 40 years [26]. This reaction, the so-called cement implantation syndrome, may include systemic hypotension, anaphylactoid reaction, pulmonary hypertension, hypoxemia, and cardiovascular collapse [13,27-29]. In a study by Sanborn et al, 5% of all cemented arthroplasty procedures were associated with hypotension after femoral stem prosthesis placement; however; this high figure has been reduced by adequate medullary lavage, intraoperative canal suctioning, the use low-viscosity polymethylmethacrylate, and other efforts to decrease

intramedullary pressure that may lead to fat microemboli [13,30-32]. Furthermore, uncemented arthroplasty has been associated with less hemodynamic changes when compared with cemented procedures [7]. The true incidence of adverse events after cement implantation syndrome is difficult to know based on a variety of patient populations and the defined complications in the literature [33]. The surgeons at this institution routinely perform uncemented THA on all primary hips. A decision to use cement to achieve proper fixation of the femoral or acetabular components may occur depending on conditions such as preoperative analysis, poor intraoperative bone stock encountered, or inadequate fixation of a traditional press fit prosthesis during a primary or revision THA. Some caution must be taken when interpreting these results of potentially higher risk of ICU admission with cemented prostheses. Although we did elect to use the Charlson index for comorbidities, this method has limitations and may not adequately capture all potential confounding variables. Specifically, long-term steroid exposure, inflammatory arthropathies, and metabolic bone disease all affect bone stock and can influence the decision to perform cemented THA. All patients in our investigation had a diagnosis of osteoarthritis for primary TJA in both the study cohort and control group. Diagnoses among the revision TJA were as follows: aseptic loosening in 29 patients (14.6%) in the study cohort and 39 patients (15%) in the control group, periprosthetic joint infection (including irrigation and debridement, resection arthroplasty, and reimplantation) in 20 patients (15.4%) in the cohort study and 2 (0.8%) in the control group, and conversion from previous hip fracture or from hemiarthroplasty in 4 patients (3.1%) in the study cohort and 5 patients (1.9%) in the control group. Furthermore, cement fixation may be the only option for the treating surgeon to achieve stability and a predictable long-term result in the setting of pathologic bone.

General anesthesia was also found to be a predisposing factor for early postoperative complications requiring ICU admission after TJA. In our study, we found that 34 ICU patients (26.15%) had arthroplasty procedures under general anesthesia compared with only 19 control patients (7.2%). After multivariable analysis, we found that patients, for whom general anesthesia was used, were more than 45 times more likely to develop postoperative major complications and need ICU admission. This finding corroborates other studies, which suggest that regional anesthesia may be associated with less morbidity and mortality compared with general anesthesia [13]. A meta-analysis by Rodgers et al [34] found that neuraxial blockade significantly reduced the rates of deep vein thrombosis, pulmonary embolism, respiratory depression, myocardial infarction, and blood transfusion requirements. Furthermore, general anesthesia has been shown to be associated

with a greater likelihood of oxygen desaturation compared with regional anesthesia [35]. The rate of unanticipated ICU admissions after TJA is decreased when neuraxial anesthesia is used both in average and in higher risk patients [36]. We advocate the use of regional anesthesia, when not contraindicated, for the TJA patient and routinely implement this strategy presently at our institution.

Another risk factor for ICU admission after TJA from our analysis was the need for blood transfusion. Patients who were transfused allogenic blood products intraoperatively were 3.5 times more likely to be admitted to the ICU. This seems somewhat intuitive given the spectrum of complications associated with blood transfusion ranging from febrile reaction to the more serious transfusion-related acute lung injury. The need for blood transfusion also portends a more complex or challenging reconstruction. Circumstances encountered intraoperatively such as multiple changes to acetabular version or inclination, component trialing to obtain proper soft tissue balance, stability, and limb length or iatrogenic fracture correction among others may increase the operative time and blood loss. The treating surgeon should be aware that patients who require blood transfusion are more likely to be admitted to the ICU; however, this finding may also reflect the surgeon's preference for close postoperative monitoring after extensive blood loss or difficulty of reconstruction. We also advocate correcting preoperative anemia (defined as <13.5 g/dL in males and <12.0 g/dL in females), which was found to be an independent risk factor in our study. Although this finding marginally reached statistical significance, normalizing preoperative hemoglobin level may serve to decrease the need for intraoperative blood transfusion and potentially the need for ICU admissions after TJA.

Patients who had preoperative elevated levels of the acute phase reactant CRP had a slight increased risk (1.8) to be admitted to the ICU. C-reactive protein is a nonspecific marker of inflammation and often used as a marker for periprosthetic infection. At our institution, the upper limit of normal CRP is 0.8 mg/dL. The individuals in the study cohort had a mean CRP level of 4.24 mg/dL compared with the control group mean of 1.98 mg/dL. The results of this study suggest that perhaps the inflammatory cascade may trigger systemic effects that required ICU monitoring after TJA. We recommend that patients who have an increased preoperative CRP be considered for more vigilant postoperative monitoring.

This study has some limitations in addition to those defined previously in the discussion. Perhaps the most important one is its retrospective design with the inherent deficiency of variability in data collection. The other shortcoming of this study is that all patients in this study received TJA procedures in a large-volume center

by surgeons specializing in joint reconstruction that might limit the applicability of the findings to some extent. Despite the aforementioned limitations, we identified patients who are at greater risk for developing complications requiring ICU admission. The authors believe that the conclusions drawn from this investigation have relevant application to the treating adult reconstruction surgeon of varying practice volume. The overall incidence of ICU admission after TJA at this single institution, 0.6%, represents an acceptable number. This incidence is more favorable than the authors expected at the onset of this investigation. To our knowledge, the true incidence of complications or risk factors that necessitate ICU has not yet been firmly established. This study proceeds on a continuum of work that is uncovering those patients that are predisposed to complications after TJA.

COMMONWEALTH OF AUSTRALIA

Competition and Consumer Act 2010 (Cth)

IN THE AUSTRALIAN COMPETITION TRIBUNAL

File No: ACT 4 of 2021 and ACT 5 of 2021

Re: Application for review of authorisation AA1000542 lodged by nib Health Funds Ltd and Honeysuckle Health Pty Ltd and the determination made by ACCC on 21 September 2021.

Applicants: National Association of Practising Psychiatrists and Rehabilitation Medicine Society of Australia and New Zealand

ANNEXURE CERTIFICATE

DD-53

This is the Annexure marked "DD-53" referred to in the affidavit of David Du Plessis affirmed at Newcastle in New South Wales on June 2022.

Before me:

AR

.....
Signature of witness

ADELAIDE NANCY ROSENTHAL, 447 COLLINS STREET, MELBOURNE VIC 3000
An Australian Legal Practitioner within the meaning of the Legal Profession Uniform Law (Victoria).
A person authorised under section 19(1) of the Oaths and Affirmations Act 2018 to take an affidavit.

Changes to MBS Cardiac Surgical Services:

Selective coronary angiography and percutaneous coronary intervention, and related items.

Date of change: 01 July 2021

Legislation: [Health Insurance Legislation Amendment \(2021 Measures No. 1\) Regulations 2021](#)

Amended items:

38200 38203 38206 38241 38272 38274 38309 57360

New items:

38244 38254 38247 38248 38249 38251 38252 38307 38308 38310
38311 38313 38314 38316 38317 38319 38320 38322 38323 57364

Deleted items:

38215 38218 38220 38222 38225 38228 38231 38234 38237 38240 38243
38246 38300 38303 38306 38312 38315 38318 59903 59912 59925

Revised structure

From 1 July 2021, Medicare Benefits Schedule (MBS) items for cardiac procedural services are changing to reflect contemporary practice. These changes are the result of MBS Review Taskforce (the Taskforce) recommendations following extensive consultation with stakeholders.

From 1 July 2021, billing practices will need to be adjusted to reflect these changes.

Overarching intent of the restructure of Coronary Artery Disease related Interventional items

Changes to cardiac interventional items for coronary artery disease involve the restructure of selective coronary angiography, percutaneous coronary intervention (PCI) items and related items. New selective coronary angiography and PCI items are restructured to provide a complete medical service, which covers all components required to perform the service as described in a single item. In most cases, this will simplify billing to a single item and reduce rebate variability for patients. Where there is a need for a specific approach which is not routinely performed as part of this complete medical service, additional 'add-on' items can be billed.

New selective coronary angiography and PCI items are based on inclusion criteria, following the principle of appropriate use criteria. Inclusion criteria are grouped into 'high risk' and 'lower risk' patient groups for diagnostic angiography and PCI, with a clear alignment of these cohorts. Inclusion of a Heart Team conference will allow consideration of 'stable' patients, who do not meet the defined inclusion criteria, ensuring access to coronary angiography and revascularisation through a consensus decision.

Restructure of Selective Coronary Angiography

The restructure of the selective coronary angiography items will introduce single items billed as a complete medical service separated into three new distinct clinical groups based on inclusion criteria. This includes those from the: high risk ischaemic heart disease group, clinically stable ischaemic heart disease group and non-ischaemic heart disease group (e.g. non-coronary pre-surgical).

These items will be mirrored for performing a selective coronary angiography for patients with grafts - recognising these are more complex investigations (new items 38247, 38249 and 38252). Therefore, it is not permissible to claim new items 38244, 38248 or 38251 for patients who have coronary bypass grafts that should be included in a diagnostic coronary angiography service.

The mirrored graft items will require the interrogation of the native arteries and all graft vessels that are present for a given patient. This would include free coronary grafts attached to the aorta and one or more internal mammary artery grafts.

Selective coronary angiography will be claimed as a complete service, which includes imaging, catheter and contrast.

If patients do not meet the clinical indications, as described in the selective coronary angiography items for the clinically stable ischaemic heart disease group, eligibility can be assessed through a Heart Team meeting (see the definition of Heart Team meeting) to ensure access for those patient's falling outside the inclusion criteria, but considered by the Heart Team meeting to have an appropriate clinical need for angiography. This provision will be closely monitored to ensure appropriate use of this indication.

A consultation will not be claimable pre-procedure where the provider has an existing relationship with the patient (subsequent attendance).

A new item for right heart catheterisation will be introduced, which is only claimable in association with the new selective coronary angiography items, for when this is clinically required in addition to left heart catheterisation, which is included in the primary selective coronary angiography items.

Existing item (38241), for use of a coronary pressure wire will be amended to clarify inclusion criteria. This item can be billed once if a single vascular territory is interrogated, twice if two vascular territories are interrogated or thrice if three vascular territories are interrogated during angiography. This service will allow for the measurement of fractional flow reserve, non-hyperaemic pressure ratios or coronary flow reserve in intermediate lesions (50%-70%).

Time restrictions

Selective angiography type	Item numbers	Time restrictions
----------------------------	--------------	-------------------

Acute (ACS) selective coronary angiography	38244, 38247	3 months unless another ACS episode occurs
Stable (non-acute) selective angiography	38248, 38249	Applicable each 3 months
Non-coronary pre-surgical assessment	38251, 38252	Applicable each 12 months

Abandoned T8 Surgical Procedures and Selective Coronary Angiography

The new selective coronary angiography items now have time restrictions applied whether claimed by the same or different providers. It is important for the patient that if a provider cannot complete (abandoned) a comprehensive diagnostic angiography that appropriately informs the diagnosis and treatment pathway or is discontinued due to the clinical status of the patient, item 30001 is claimed. This will allow claiming by the provider who subsequently completes the entire diagnostic angiography service taking into consideration the time restrictions for each of the selective angiography items.

Item 30001 applies when a procedure has commenced, but is then discontinued for medical reasons, or for other reasons which are beyond the surgeon's control (eg equipment failure).

An operative procedure commences when:

- The patient is in the procedure room or on the bed or operation table where the procedure is to be performed; and
- The patient is anaesthetised, or operative site is sufficiently anaesthetised for the procedure to commence; and
- The patient is positioned or the operative site which is prepared with antiseptic or draping.

Where an abandoned procedure eligible for a benefit under item 30001 attracts an assistant under the provisions of the items listed in Group T9 (Assistance at Operations), the fee for the surgical assistant is calculated as 50% of the assistance fee that would have applied under the relevant item from Group T9.

Practitioners claiming an assistant fee for abandoned surgery should itemise their accounts with the relevant item from group T9. Such claims should include an account endorsement "assistance at abandoned surgery" or similar.

Under the Health Insurance Act 1973 the Chief Executive Medicare does not require claims for this item to be accompanied by details of the proposed surgery and the reasons why the operation was discontinued. However, practitioners must maintain a clinical record of this information, which may be subject to audit.

Restructure of Percutaneous Coronary Intervention (PCI)

The restructure of the PCI items will introduce single items billed as a complete medical service based on inclusion criteria *and* the number of territories treated. The primary intention of this change is to encourage the completion of the coronary intervention at the same time as diagnostic angiography (if it hasn't been completed in the previous 3 months and when clinically safe to do so), thereby avoiding unnecessary re-intervention.

Vascular territories refer to the major artery and all of its associated branches, including:

- Left Anterior Descending;
- Circumflex;
- Right coronary artery.

The number of coronary vascular territories treated is defined by the territories normally supplied by the Left Anterior Descending, Circumflex and Right Coronary Arteries, or their branches, or the territory supplied via a bypass graft. The item number claimed should reflect the number of coronary vascular territories that are treated (including stenting, with or without angioplasty; or angioplasty alone) during the procedure, not the total number of diseased territories, nor the number of lesions treated within a single vascular territory, nor the total number of territories that have undergone intervention to date.

For treatment of isolated Left Main Coronary Artery Disease (no involvement of the bifurcation), a single territory should be claimed, but if the treated segment involves the bifurcation, then 2 territories may be claimed. The intermediate artery when treated in isolation is a single territory, but when treated with the Left Anterior Descending or Circumflex artery, or both, may be claimed as a maximum of two territories. Treatment of a single lesion in a bypass graft should be claimed as a single territory, regardless of how many vascular territories are supplied by that graft. If more than one lesion is treated in a single graft and those lesions are in separate portions of a sequential graft, subtending different territories, then one additional territory may be claimed (maximum claim of two territories per graft).

Inclusion criteria of PCI items align with inclusion criteria for selective coronary angiography items to allow appropriate progression to intervention when clinically required. Hence, new PCI items can be grouped into two subgroups:

- Standalone PCI – which is performed within 3 months of diagnostic coronary angiography service, the fee is reduced to reflect that a complete diagnostic coronary angiography is not required.
- PCI – where complete diagnostic angiography precedes the PCI. The fee includes an allowance for the provision of the selective coronary angiography preceding the PCI in the same service, therefore qualifying that the selective angiography has not been completed in the previous 3 months. The only exception to this rule is when a patient experiences a new acute coronary syndrome or angina that meets the criteria detailed in the explanatory note (will appear on MBS Online as note: TR.8.3).

Within these two subgroups, items are separated into two new distinct clinical groups based on inclusion criteria, those from the high risk ischaemic heart disease group and those from the clinically stable ischaemic heart disease group.

If patients do not meet the clinical indications as described in the clinically stable ischaemic heart disease group items, a provider is permitted to perform a PCI following recommendation by a Heart Team conference. This provision will be closely monitored by the Department to ensure appropriate use of this indication.

Heart Team Meetings are used in two ways:

- a) For angiography and non-complex (stable) PCI the heart team can be used for patients who do not fulfill the clinical indications as described in the item descriptor and can therefore still undergo intervention with agreement from the Heart Team.
- b) For complex triple vessel disease (non-Acute Coronary Syndrome - stable), the Heart Team meeting must involve a Cardiothoracic surgeon (items 38314, 38323) with the intent to offer the patient the best therapeutic intervention.

For non-complex stable triple vessel disease providers are encouraged to include a cardiothoracic surgeon in the Heart Team, for PCI items 38311, 38313, 38320 and 38322, however it is not compulsory.

Staging of acute PCI

Staging of acute PCI is permissible when clinically appropriate. An example of appropriate Acute Coronary Syndrome (ACS) staging could include intervention on an occluded proximal lesion in the context of an ST elevation myocardial infarction (STEMI) and a decision is made not to intervene on a distal lesion as it is difficult to determine whether it is a real lesion (possibly a thrombus) or the patient's haemodynamic status remains compromised (clinically unsafe to continue).

Requirements of subsequent stages of a staged acute PCI include:

The qualifying indication for the initial procedure is to be used as the qualifier for the relevant subsequent stages. Subsequent stages are required to be completed within 3 months of the initial procedure otherwise the patient will need to requalify under the appropriate indication (if applicable). However, it would generally be expected that subsequent stages would be completed as soon as is practicable proceeding the initial intervention.

For subsequent stages of an acute PCI it is implied that diagnostic angiography has been completed in the previous 3 months and therefore it is only permissible to claim items 38316, 38317 or 38319 for subsequent stages.

Staging of non-acute (stable) PCI

Staging of stable PCI is permissible when clinically appropriate. An example of appropriate stable staging could include intervention on the primary target lesion and a decision is made not to intervene on secondary lesions (in triple vessel disease) due to the patient's deteriorating haemodynamic status (clinically unsafe to continue).

Requirements of subsequent stages of a staged *stable* PCI include:

- The qualifying indication for the initial procedure is to be used as the qualifier for the relevant subsequent stages. Subsequent stages are expected to be completed within a reasonable time period following the initial intervention.

- For subsequent stages of a stable PCI it is implied that diagnostic angiography has been completed in the previous 3 months and therefore it is only permissible to claim items 38320, 38322 or 38323 (standalone PCI items) for subsequent stages.
- Note: For patients who meet the criteria in subclause (2)(b) of note TR.8.4 in 3 vascular territories (triple vessel disease), whether treated in an initial procedure (items 38314 or 38323) or in subsequent stages (items 38311, 38313, 38320 or 38322) it is expected that the patient must meet the criteria for (2)(b) of note TR.8.4 for each territory for each subsequent stage. This requirement ensures that the patient who has triple vessel disease must meet the criteria for (2)(b) for each territory when staged or completed in an initial procedure.

The Department will be closely monitoring claiming patterns for staged procedures, particularly where volumes for staged procedures at the same site are not consistent with the broader provider claiming base.

Multiple Providers of one episode of care (acute or stable) PCI – Separate interventional sites or Same interventional site.

- One of the primary intentions of the changes to selective coronary angiography and PCI items, is to encourage the provision of the entire intervention in a single episode of care. Therefore, the provider should consider that there will be a reasonable need to intervene (revascularise), noting that in some cases intervention is not required (e.g. pressure testing – FFR result does not support the need for stenting). However, it is recognised that some providers of interventional cardiology services only provide selective coronary angiography (diagnostic) and require a secondary provider to undertake angioplasty, stenting and/or atherectomy.

Non-interventional – selective angiography providers (clinical assessment suggests intervention required)

Acute/Unstable patients

- Acute/Unstable patients should undergo both selective coronary angiography and PCI by an accredited PCI provider in a single episode of care, unless staging is clinically required.
- Rare exceptions might include rural or remote sites that offer diagnostic angiography as a triage service prior to limited availability PCI.
- Therefore, it would be expected that the non-interventional cardiologist (non-PCI accredited) has a limited role in the management of acute/unstable patients.

Stable patients

It is accepted clinical practice that the following patient pathways for stable PCI service provision (other than a complete service by an accredited PCI cardiologist) may occur when considering the role of the non-interventional cardiologist (non-PCI accredited) as follows;

- Ad-hoc PCI: provider 1 completes the selective angiography and hands over to provider 2 to perform the PCI while the patient is still on the cardiac catheterisation table with the arterial access still in place.
 - Similar to the acute items, this scenario would likely be rare for e.g. dissection of a coronary artery caused by the angiography catheter that may convert the patient from stable to unstable.

- It is current accepted practice that the selective coronary angiography component of the service can be performed by a non-interventional cardiologist and the PCI component (when required) completed by a PCI accredited provider. However, ideally ad-hoc stable PCI should be completed by a PCI accredited provider and therefore consideration should be given to current practice site arrangements going forward.
- Delayed PCI: provider 1 completes ICA and refers the patient to provider 2, who performs the PCI later on the same day.
 - In the stable patient this scenario presents the opportunity to pause and consider whether optimal medical therapy, PCI or coronary artery bypass may be the preferred option in consultation with a PCI accredited cardiologist and/or cardiothoracic surgeon; and
 - It also allows for a further opportunity to obtain informed consent from the patient for the proposed intervention.
 - In most cases this would involve maintaining the arterial access with an indwelling arterial sheath to avoid repuncture.
- Elective PCI: provider 1 completes ICA and refers the patient to provider 2, who performs the PCI on the next day, or any subsequent day.
 - Similar to delayed PCI, however the PCI accredited cardiologist may not be available on the same day as when the selective coronary angiography was completed; or
 - A short trial of optimal medical therapy is recommended; or
 - Further non-invasive functional testing is recommended.

The Department will be closely monitoring claiming patterns, particularly at the same site where selective angiography is completed by a non-accredited cardiologist and the PCI component completed by a PCI accredited provider.

The following provides guidance for when the provider can only undertake the selective angiography component of a complete PCI service (PCI non-accredited provider):

- **Separate hospital/procedural sites (Acute/Unstable or Stable)** – The first provider undertakes the diagnostic angiography and either makes an independent decision or following discussion with the interventional cardiologist refers to the secondary provider at another site for the purposes of revascularisation (e.g. referral from a rural or regional hospital to a metropolitan hospital). In this scenario there is a clear delineation between the angiography and revascularisation services due to the different geographical locations (separate episodes of care). Example claiming is as follows:

Acute (ACS) - example

- Provider 1 – site 1 (diagnostic angiography) claims item 38244 (ACS – selective angiography).
Provider 2 – site 2 (PCI) claims item 38316 (ACS – PCI single territory)

Stable - example

- Provider 1 – site 1 (diagnostic angiography) claims item 38248 stable – selective angiography).
Provider 2 – site 2 (PCI) claims item 38320 (stable – PCI single territory)
- **Same hospital/procedural site (Stable)** - The first provider undertakes the diagnostic angiography and either makes an independent decision or following discussion with the interventional cardiologist requesting that the secondary provider undertakes the revascularisation component. Please note that the underlying intention of a complete PCI service is that the entire service, including diagnostic angiography is completed by a single provider where possible.

Abandoned T8 Surgical Procedures and Acute or Stable Percutaneous Coronary Intervention (PCI) – Excluding appropriate staging

The new **acute** PCI items have time restrictions applied whether claimed by the same or different providers. It is important for the patient that if a provider cannot complete (abandoned) the PCI and rescue PCI needs to be conducted by another provider, item 30001 is claimed. This will allow claiming by the provider who subsequently completes the rescue PCI, taking into consideration the time restrictions for each of the selective angiography items.

The new **stable** PCI items do not have time restrictions. However, it is important for the patient that if a provider cannot complete (abandoned) the PCI and rescue PCI needs to be conducted by another provider, item 30001 is claimed. This will allow claiming by the provider who subsequently completes the rescue PCI, taking into consideration the time restrictions for each of the selective angiography items.

PCI type	Item numbers	Time restrictions
Acute (ACS)/Unstable PCI	38307, 38308, 38310, 38316, 38317, 38319	3 months unless another ACS episode occurs
Stable (non-acute) PCI	38311, 38313, 38314, 38320, 38322, 38323	Nil

Claiming restrictions PCI

PCI Items	Cannot claim same day	Time dependency- cannot claim within 3 months unless new acute episode	Cannot claim within 3 months - hard block	Cannot claim within 12 months	Cannot claim within 9 months
38307	38200, 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38308, 38310, 38311, 38313, 38314, 38316, 38317, 38319, 38320, 38322 or 38323	38244, 38247, 38307, 38308, 38310	38248, 38249,	38251, 38252

Reporting on Selective Coronary Angiography and Percutaneous Coronary Intervention items:

Providers are required to prepare a report or clinical note (this could include the operation report) for the service provided and this must include documentation demonstrating how the patient met the eligibility requirements of the item being billed. (Referenced in Note TR.8.5)

Note: TR.8.5 Reports and clinical notes

Restriction on items 38244, 38247, 38248, 38249, 38251, 38252, 38307, 38308, 38310, 38311, 38313, 38314, 38320, 38322, 38323, 38316, 38317 and 38319

Items 38244, 38247, 38248, 38249, 38251, 38252, 38307, 38308, 38310, 38311, 38313, 38314, 38320, 38322, 38323, 38316, 38317 and 38319 apply to a service provided to a patient only if a report or clinical note:

- (a) is prepared for the service; and
- (b) includes documentation that demonstrates how the item applies to the service, including how the patient is eligible for the service.

Patient impacts

The creation of complete medical services aims to simplify the MBS and reduce rebate variability for patients. Patients should no longer receive different Medicare rebates for the same operation, as there should be less variation in the items claimed by different providers.

Patients will receive Medicare rebates for cardiac procedural services that are clinically appropriate and reflect modern clinical practice. These changes will provide access for patients to high-value cardiac investigations and procedures, leading to improved health outcomes.

Restrictions or requirements

Providers will need to familiarise themselves with the changes to the cardiac services MBS items and any associated rules and/or explanatory notes. Providers have a responsibility to ensure that any services they bill to Medicare fully meet the eligibility requirements outlined in the legislation.

Claiming Same-Day Restriction:

“Not being a service associated with” refers to a restriction preventing the payment of a benefit when the service is performed in association, on the same occasion, with a specific MBS item or item range; another MBS item within the same group or subgroup or a similar type of service or procedure.

Claiming subsequent attendance items with items in Group T8 (items 30001 to 51171 of the MBS):

Some subsequent attendance items can't be billed on the same day with any Group T8 item equal to or greater than \$309.35 (These items include: 105, 116, 119, 386, 2806, 2814, 3010, 3014, 6009, 6011, 6013, 6015, 6019, 6052, or 16404).

Specialist subsequent attendance items (111 or CP item 117 and 120) can only be claimed on the same day as a surgical operation in Group T8 with a schedule fee of equal to or greater than \$309.35 if the procedure is urgent and not able to be predicted prior to the commencement of the attendance. Item 115 allows for co-claiming of a consultation item, if the nature of the consultation could not be predicted prior to the Group T8 procedure with a MBS fee higher than \$309.35. It is expected that these items would be rarely required. Clinician records should clearly indicate the reasons why either the consultation or procedure is necessary including the clinical risk for the patient to defer.

Multiple Operation Rule (MOR) – applies when 2 or more MBS items from Category 3, Group T8 for services performed on a patient on one occasion:

The Total schedule for all surgical items is calculated by applying the MOR. That is:

- 100% of the fee for the item with the highest schedule fee;
- plus 50% of the fee for the item with the next highest schedule fee;
- plus 25% of the fee for any further surgical items.

Applying this rule results in one total schedule fee for all surgical items billed.

(see explanatory note [TN.8.2](#) at MBS Online for more information)

Aftercare – post-operative care and treatment provided to patients after an operation:

Aftercare is the post-operative care and treatment provided to patients after a surgical operation or procedure. This includes all attendances until recovery and the final check or examination. Aftercare services can take place at a hospital, private rooms or a patient's home. MBS fees for most surgical items in MBS Group T8 include an aftercare component.

Some MBS services don't include aftercare and this is noted in their description. Group T8 items not containing this note include aftercare. Schedule fees for most surgical items include normal post-operative care. This means attendance items for normal aftercare cannot be billed. However, if the MBS description of the surgical item performed excludes aftercare in the item's description, an attendance item can be billed for providing aftercare.

Agnostic approach to the procedural intervention performed in PCI:

An agnostic approach supports the provider to decide the most appropriate intervention for the patient, allowing multiple approaches within the one item, e.g.: angioplasty performed alone or with stenting. All approaches are accounted for in the one PCI item.

Prosthesis Listing of cardiac stents is unchanged by the MBS changes. Private health insurers will be required to pay benefits for products listed on the Prosthesis List such as cardiac stents (which is not affected by the use of coronary territories in the new items), if the stents are provided to the patient with the requisite cover as part of hospital treatment.

Definition of a heart team conference: relevant to items 38248, 38249, 38311, 38313, 38320, 38322 and 57364

is a team of 3 or more participants who are cardiac specialists, where:

- i. the first participant is a specialist or consultant physician who is an **interventional cardiologist**; and
 - ii. the second participant is a specialist or consultant who is a **non-interventional cardiologist**; and
 - iii. the third participant is a **specialist or consultant physician**; and
- (a) the team assesses a patient's risk and technical suitability to receive the service; and
 - (b) the result of the heart team conference's assessment is that the team makes a recommendation about whether or not the patient is suitable for selective coronary angiography (for items 38248, 38249, 38320) or percutaneous coronary intervention (for items 38311, 38313, 38320, 38322) ; and
 - (c) the particulars of the assessment and recommendation/s, and the names of those providers making the recommendation/s are recorded in writing.

Note: For non-complex stable triple vessel disease, providers are encouraged to include a cardiothoracic surgeon in

Definition of a heart team conference: relevant to items 38314 and 38323

is a team of 3 or more participants who are cardiac specialists, where:

- i. the first participant is a specialist or consultant physician who is an **interventional cardiologist**; and
 - ii. the second participant is a specialist or consultant who is a **cardiothoracic surgeon**; and
 - iii. the third participant is a specialist or consultant who is a **non-interventional cardiologist** ; and
- (a) the team assesses a patient's risk and technical suitability to receive the service; and
 - (b) the result of the heart team conference's assessment is that the team makes a recommendation about whether or not the patient is suitable for percutaneous coronary intervention; and
 - (c) the particulars of the assessment and recommendation/s, and the names of those providers making the recommendation/s are recorded in writing.

Items relating to selective coronary angiography

Deleted item 38215 – Selective coronary angiography into native coronary arteries

This item is deleted as part of the restructure of selective coronary angiography items to simplify claiming to a single item, according to inclusion criteria and vessel complexity. This item would now be expected to be claimed under either item 38244 (for acute indications) or item 38248 (stable indications) or item 38251 (pre-operative assessment).

Deleted item 38218 – Selective coronary angiography with right or left catheterisation into native or graft coronary arteries

This item is deleted as part of the restructure of selective coronary angiography items to simplify claiming to a single item, according to inclusion criteria and vessel complexity. Left heart catheterisation is considered a routine part of angiography and included as part of all selective coronary angiography items; however, right heart catheterisation is not considered a routine part of angiography and if this procedure is required it is billed as a separate item under new item 38254.

Deleted item 38220 – Selective coronary graft angiography into free coronary graft(s) attached to the aorta

This item is deleted as part of the restructure of selective coronary angiography items to simplify claiming to a single item, according to inclusion criteria and vessel complexity.

Deleted item 38222 – Selective coronary graft angiography into direct internal mammary artery graft(s)

This item is deleted as part of the restructure of selective coronary angiography items to simplify claiming to a single item, according to inclusion criteria and vessel complexity.

Deleted item 38225 – Selective coronary angiography into native or graft coronary arteries

This item is deleted as part of the restructure of selective coronary angiography items to simplify claiming to a single item, according to inclusion criteria and vessel complexity.

Deleted item 38228 – Selective coronary angiography into native coronary and direct internal mammary artery grafts

This item is deleted as part of the restructure of selective coronary angiography items to simplify claiming to a single item, according to inclusion criteria and vessel complexity.

Deleted item 38231 – Selective coronary angiography

This item is deleted as part of the restructure of selective coronary angiography items to simplify claiming to a single item, according to inclusion criteria and vessel complexity.

Deleted item 38234 – Selective coronary angiography

This item is deleted as part of the restructure of selective coronary angiography items to simplify claiming to a single item, according to inclusion criteria and vessel complexity.

Deleted item 38237 – Selective coronary angiography

This item is deleted as part of the restructure of selective coronary angiography items to simplify claiming to a single item, according to inclusion criteria and vessel complexity.

Deleted item 38240 – Selective coronary angiography

This item is deleted as part of the restructure of selective coronary angiography items to simplify claiming to a single item, according to inclusion criteria and vessel complexity.

Deleted item 38243 – Placement of catheter(s)

This item is deleted as part of the restructure of selective coronary angiography items to simplify claiming to a single item, according to inclusion criteria and vessel complexity.

Deleted item 38246 – Selective coronary angiography with with right or left catheterisation into native or graft coronary arteries

This item is deleted as part of the restructure of selective coronary angiography items to simplify claiming to a single item, according to inclusion criteria and vessel complexity.

Deleted item 59903 – Angiocardiography

This item is deleted as it is obsolete.

Deleted item 59912 – Selective coronary arteriography

This item is deleted as part of the restructure of selective coronary angiography items to simplify claiming to a single item, according to inclusion criteria and vessel complexity.

Deleted item 59925 – Selective coronary arteriography and angiocardiography

This item is deleted as part of the restructure of selective coronary angiography items to simplify claiming to a single item, according to inclusion criteria and vessel complexity.

New selective coronary angiography items for acute indications:

New item 38244 – Selective coronary angiography into native coronary arteries (Acute indications)

Overview: New item introduced as part of the restructure of coronary angiography, providing a single item as a complete medical service for an angiography involving native coronary arteries. A consultation cannot be claimed pre-procedure where the provider already has an existing relationship with the patient.

Service/Descriptor: Displayed on the following page for ease of reading

Billing requirement: Not claimable with items 38200, 38203, 38206 38247, 38248, 38249, 38251 or 38252. Claimable once in any 3-month period unless a new acute coronary syndrome or angina occurs within this period as described in paragraph 2 (a), (b) or (c) in that period (Note TR.8.3)

MBS fee: \$920.00

Private Health Insurance Classifications:

Clinical Category: Heart and Vascular System

Procedure Type: Type A – Advanced Surgical

Item 38244 Service/Descriptor:

Note: (acute coronary syndrome) the service only applies if the patient meets the requirements of the descriptor and the requirements of Note: TR.8.2 and TR.8.5

Selective coronary angiography:

- (a) for a patient who is eligible for the service, if:

Note: TR.8.2 Patient eligibility and timing referred to in the descriptor as clause 5.10.17A:

- (1) A patient is eligible for a service to which item 38244, 38247, 38307, 38308, 38310, 38316, 38317 or 38319 applies if:
- (a) subclause (2) applies to the patient; and
 - (b) a service to which the item applies has not been provided to the patient in the previous 3 months, unless:
 - (i) the patient experiences a new acute coronary syndrome or angina, as described in paragraph (2)(a), (b) or (c), in that period; or
 - (ii) for a service to which item 38316, 38317 or 38319 applies—the service was provided to the patient in that period as a subsequent stage following an initial primary percutaneous coronary intervention procedure.
- (2) This subclause applies to a patient who has:
- (a) an acute coronary syndrome evidenced by any of the following:
 - (i) ST segment elevation;
 - (ii) new left bundle branch block;
 - (iii) troponin elevation above the local upper reference limit;
 - (iv) new resting wall motion abnormality or perfusion defect;
 - (v) cardiogenic shock;
 - (vi) resuscitated cardiac arrest;
 - (vii) ventricular fibrillation;
 - (viii) sustained ventricular tachycardia; or
 - (b) unstable angina or angina equivalent with a crescendo pattern, rest pain or other high risk clinical features, such as hypotension, dizziness, pallor, diaphoresis or syncope occurring at a low threshold; or
 - (c) either of the following, detected on computed tomography coronary angiography:
 - (i) significant left main coronary artery disease with greater than 50% stenosis or a cross sectional area of less than 6 mm²;
 - (ii) severe proximal left anterior descending coronary artery disease (with stenosis of more than 70% or a cross sectional area of less than 4 mm² before the first major diagonal branch).

- and (b) with placement of one or more catheters and injection of opaque material into native coronary arteries; and
- (c) with or without left heart catheterisation, left ventriculography or aortography; and
 - (d) including all associated imaging;

other than a service associated with a service to which 38200, 38203, 38206, 38247, 38248, 38249, 38251 or 38252 applies (Anaes)

Explanatory Note: Discussions of the results, findings or interpretation of a study are reasonably expected to be part of a formal report. Discussion of these findings with a patient does not constitute a consult. Similarly, discussion(s) during the course of a study or to determine the safety or appropriateness of the study is part of the service and should not be claimed as a consult.

New item 38247 – Selective coronary graft angiography involving native coronary vessels and graft(s) (Acute indications)

Overview: New item introduced as part of the restructure of coronary angiography, providing a single item as a complete medical service for an angiography involving graft vessels. Inclusion criteria and distinct items now apply for performing an angiogram for patients with graft vessels in recognition of the added complexity in the graft setting. A consultation cannot be claimed pre-procedure where the provider already has an existing relationship with the patient. This is the graft equivalent item of item 38244.

Service/Descriptor:

Note: (acute coronary syndrome - graft) the service only applies if the patient meets the requirements of the descriptor and the requirements of Note: TR.8.3 and TR.8.5

Selective coronary and graft angiography:

- (a) for a patient who is eligible for the service if indications referenced in Note: TR.8.3 apply; and
- (b) with placement of one or more catheters and injection of opaque material into the native coronary arteries; and
- (c) if free coronary grafts attached to the aorta or direct internal mammary artery grafts are present—with placement of one or more catheters and injection of opaque material into those grafts (irrespective of the number of grafts); and
- (d) with or without left heart catheterisation, left ventriculography or aortography; and
- (e) including all associated imaging;

other than a service associated with a service to which item 38200, 38203, 38206, 38244, 38248, 38249, 38251 or 38252 applies (Anaes)

Explanatory note: This item is only claimable when the patient has graft arteries present and has undergone angiographic investigation of the native coronary arteries and any graft arteries, which can include free coronary grafts attached to the aorta or direct internal mammary artery grafts.

Discussions of the results, findings or interpretation of a study are reasonably expected to be part of a formal report. Discussion of these findings with a patient does not constitute a consult. Similarly, discussion(s) during the course of a

study or to determine the safety or appropriateness of the study is part of the service and should not be claimed as a consult.

Billing requirement: Not claimable with items 38200, 38203, 38206, 38244, 38248, 38249, 38251 or 38252. Claimable once in any 3-month period unless a new acute coronary syndrome or angina occurs within this period as described in paragraph 2 (a), (b) or (c) in that period (Note TR.8.3)

MBS fee: \$1,473.95

Private Health Insurance Classifications:

Clinical Category: Heart and Vascular System

Procedure Type: Type A – Advanced Surgical

New selective coronary angiography items for stable indications:

New item 38248 – Selective coronary angiography involving native coronary arteries (Stable indications)

Overview: New item introduced as part of the restructure of coronary angiography, providing a single item as a complete medical service for an angiography performed involving native vessels where the patient has 'stable' indications. Specific indications are outlined in the descriptor or eligibility can also be met through recommendation by a heart team conference. A consultation cannot be claimed pre-procedure where the provider already has an existing relationship with the patient.

Service/Descriptor: Displayed on the following page for ease of reading

Billing requirement: Not claimable with items 38200, 38203, 38206, 38244, 38247, 38249, 38251 or 38252. Claimable once in any 3 month period.

MBS fee: \$920.00

Private Health Insurance Classifications:

Clinical Category: Heart and Vascular System

Procedure Type: Type A – Advanced Surgical

Item 38248 Service/Descriptor:

Note: (stable coronary syndrome) the service only applies if the patient meets the requirements of the descriptor and the requirements of Note: TR.8.3 and TR.8.5

Note: TR.8.3 Patient eligibility referred to in the item as clause 5.10.17B:

- (1) A patient is eligible for a service to which item 38248 and 28249 applies if:
 - (a) subclause (2) applies to the patient; or
 - (b) the patient is recommended for coronary angiography as a result of a heart team conference that meets the requirements of subclause (3).
- (2) This subclause applies to a patient who has:
 - (a) limiting angina or angina equivalent, despite an adequate trial of optimal medical therapy; or
 - (b) high risk features, including at least one of the following:
 - (i) myocardial ischaemia demonstrated on functional imaging;
 - (ii) ST segment elevation, sustained ST depression, hypotension or a Duke treadmill score of minus 11 or less, demonstrated by stress electrocardiogram testing;
 - (iii) computed tomography coronary angiography evidence of one or more coronary arteries with stenosis of 70% or more; or
 - (iv) left ventricular dysfunction with an ejection fraction of less than 40% or segmental wall motion abnormality at rest.
- (3) For the purposes of paragraph (1)(b), the requirements for a heart team conference are as follows:
 - (a) the conference must be conducted by a team of specialists or consultant physicians practising in the speciality of cardiology or cardiothoracic surgery, including each of the following:
 - (i) an interventional cardiologist;
 - (ii) a non interventional cardiologist;
 - (iii) a specialist or consultant physician; and
 - (b) the team must:
 - (i) assess the patient's risk and technical suitability to receive the service; and
 - (ii) make a recommendation about whether or not the patient is suitable for selective coronary angiography; and
 - (c) a record of the conference must be created, and must include the following:
 - (i) the particulars of the assessment of the patient during the conference;
 - (ii) the recommendations made as a result of the conference;
 - (iii) the names of the members of the team making the recommendations.

Selective coronary angiography:

- (b) as part of the management of the patient; and
- (c) with placement of catheters and injection of opaque material into native coronary arteries; and
- (d) with or without left heart catheterisation, left ventriculography or aortography; and
- (e) including all associated imaging;

other than a service associated with a service to which item 38200, 38203, 38206, 38244, 38247, 38249, 38251 or 38252 applies—applicable each 3 months (Anaes.)

Explanatory Note: Discussions of the results, findings or interpretation of a study are reasonably expected to be part of a formal report. Discussion of these findings with a patient does not constitute a consult. Similarly, discussion(s) during the course of a study or to determine the safety or appropriateness of the study is part of the service and should not be claimed as a consult.

New item 38249 – Selective coronary angiography native and graft coronary vessels (Stable indications)

Overview: New item introduced as part of the restructure of coronary angiography, providing a single item as a complete medical service for an angiography performed involving graft vessels where the patient has ‘stable’ indications. Specific indications are outlined in the descriptor, eligibility can also be met through recommendation by a heart team conference. A consultation cannot be claimed pre-procedure where the provider already has an existing relationship with the patient. This is the graft equivalent item of 38248.

Service/Descriptor:

Note: (stable coronary syndrome – graft) the service only applies if the patient meets the requirements of the descriptor and the requirements of Note: TR.8.3 and TR.8.5

Selective coronary and graft angiography:

- (a) for a patient who is eligible for the service if indications referenced in Note: TR.8.3 apply; and
- (b) as part of the management of the patient; and
- (c) with placement of one or more catheters and injection of opaque material into the native coronary arteries; and
- (d) if free coronary grafts attached to the aorta or direct internal mammary artery grafts are present—with placement of one or more catheters and injection of opaque material into those grafts (irrespective of the number of grafts); and
- (e) with or without left heart catheterisation, left ventriculography or aortography; and
- (f) including all associated imaging;

other than a service associated with a service to which item 38200, 38203, 38206, 38244, 38247, 38248, 38251 or 38252 applies—applicable once each 3 months (Anaes.)

Explanatory note: This item is only claimable when the patient has graft arteries present and has undergone angiographic investigation of the native coronary arteries and any graft arteries, which can include free coronary grafts attached to the aorta or direct internal mammary artery grafts.

Discussions of the results, findings or interpretation of a study are reasonably expected to be part of a formal report. Discussion of these findings with a patient does not constitute a consult. Similarly, discussion(s) during the course of a study or to determine the safety or appropriateness of the study is part of the service and should not be claimed as a consult.

Billing requirement: Not claimable with items 38200, 38203, 38206, 38244, 38247, 38248, 38251 or 38252.
Claimable once in any 3 month period

MBS fee: \$1,473.95

Private Health Insurance Classifications:

Clinical Category: Heart and Vascular System

Procedure Type: Type A – Advanced Surgical

New selective coronary angiography items for non-coronary pre-surgical assessment:

New item 38251 – Selective coronary angiography involving native coronary vessels (For pre-operative assessment)

Overview: New item introduced as part of the restructure of coronary angiography, providing a single item as a complete medical service for an angiography performed involving native vessels for pre-operative assessment or evaluation of valvular or non-coronary structural heart disease. Specific indications are outlined in the descriptor. A consultation cannot be claimed pre-procedure where the provider already has an existing relationship with the patient.

Service/Descriptor:

Note: (pre-operative assessment) the service only applies if the patient meets the requirements of the descriptor and the requirements of Note: TR.8.5

Selective coronary angiography:

- (a) for a symptomatic patient with valvular or other non-coronary structural heart disease; and
- (b) as part of the management of the patient for:
 - (i) pre-operative assessment for planning non-coronary cardiac surgery, including by transcatheter approaches; or
 - (ii) evaluation of valvular heart disease or other non-coronary structural heart disease where clinical impression is discordant with non-invasive assessment; and
- (c) with placement of catheters and injection of opaque material into native coronary arteries; and
- (d) with or without left heart catheterisation, left ventriculography or aortography; and
- (e) including all associated imaging;

other than a service associated with a service to which item 38200, 38203, 38206, 38244, 38247, 38248, 38249 or 38252 applies—applicable once each 12 months (Anaes.)

Explanatory Note: Discussions of the results, findings or interpretation of a study are reasonably expected to be part of a formal report. Discussion of these findings with a patient does not constitute a consult. Similarly, discussion(s) during the course of a study or to determine the safety or appropriateness of the study is part of the service and should not be claimed as a consult.

Billing requirement: Not claimable with items 38200, 38203, 38206, 38244, 38247, 38248, 38249 or 38252. Claimable once in any 12 month period.

MBS fee: \$920.00

New item 38252 – Selective coronary angiography involving native and graft coronary vessels (For pre-operative assessment)

Overview: New item introduced as part of the restructure of coronary angiography, providing a single item as a complete medical service for an angiography performed involving native and graft vessels for pre-operative assessment or evaluation of valvular or non-coronary structural heart disease. Specific indications are outlined in the descriptor. A consultation cannot be claimed pre-procedure where the provider already has an existing relationship with the patient. This is the graft equivalent item of 38251.

Service/Descriptor:

Note: (pre-operative assessment - graft) the service only applies if the patient meets the requirements of the descriptor and the requirements of Note: TR.8.5

Selective coronary and graft angiography:

- (a) for a symptomatic patient with valvular or other non-coronary structural heart disease; and
- (b) as part of the management of the patient for:
 - (i) pre-operative assessment for planning non coronary cardiac surgery, including by transcatheter approaches; or
 - (ii) evaluation of valvular heart disease or other non-coronary structural heart disease where clinical impression is discordant with non-invasive assessment; and
- (c) with placement of one or more catheters and injection of opaque material into the native coronary arteries; and

- (d) if free coronary grafts attached to the aorta or direct internal mammary artery grafts are present—with placement of one or more catheters and injection of opaque material into those grafts (irrespective of the number of grafts); and
- (e) with or without left heart catheterisation, left ventriculography or aortography; and
- (f) including all associated imaging;

other than a service associated with a service to which item 38200, 38203, 38206, 38244, 38247, 38248, 38249 or 38251 applies—applicable once each 12 months (Anaes.)

Explanatory note: This item is only claimable when the patient has graft arteries present and has undergone angiographic investigation of the native coronary arteries and any graft arteries, which can include free coronary grafts attached to the aorta or direct internal mammary artery grafts.

Discussions of the results, findings or interpretation of a study are reasonably expected to be part of a formal report. Discussion of these findings with a patient does not constitute a consult. Similarly, discussion(s) during the course of a study or to determine the safety or appropriateness of the study is part of the service and should not be claimed as a consult.

Billing requirement: Not claimable with items 38200, 38203, 38206, 38244, 38247, 38248, 38249 or 38251. Claimable once in any 12 month period

MBS fee: \$1,473.95

- Procedure Type:** Type A – Advanced Surgical

New items used in conjunction with coronary angiography items:

New item 38254 – Right heart catheterisation performed at the same time as selective coronary angiography

Overview: A new item introduced for use in association with selective coronary angiography items, as right heart catheterisation is not considered a routine part of all angiography procedures. This procedure is provided as a separate item to be billed when required in the selective coronary angiography setting.

Service/Descriptor: Right heart catheterisation:

- (a) performed at the same time as service to which item 38244, 38247, 38248, 38249, 38251 or 38252 applies; and
- (b) including any of the following (if performed):
 - (i) fluoroscopy;

- (ii) oximetry;
- (iii) dye dilution curves;
- (iv) cardiac output measurement;
- (v) shunt detection;
- (vi) exercise stress test

(Anaes.)

Billing requirement: Claimed in association with coronary angiography items 38244, 38247, 38248, 38249, 38251 or 38252.

MBS fee: \$463.50

Items relating to percutaneous coronary intervention (PCI)

Deleted item 38300 – Transluminal balloon angioplasty of one coronary artery

This item is being deleted as it is considered obsolete.

Deleted item 38306 – Transluminal insertion of stent or stents

This item is being deleted and is incorporated into the new PCI items.

Deleted item 38312 – Percutaneous transluminal rotational atherectomy

This item is being deleted and consolidated with items 38309, 38315 and 38318. The consolidated item will be claimed through item 38309 and will be claimable as a standalone item or in association with the PCI items if required.

Deleted item 38315 – Percutaneous transluminal rotational atherectomy

This item is being deleted and consolidated with items 38309, 38312 and 38318. The consolidated item will be claimed through item 38309 and will be claimable as a standalone item or in association with the PCI items if required.

Deleted item 38318 – Percutaneous transluminal rotational atherectomy

This item is being deleted and consolidated with items 38309, 38312 and 38315. The consolidated item will be claimed through item 38309 and will be claimable as a standalone item or in association with the PCI items if required.

Deleted item 38303 – Transluminal balloon angioplasty

This item is being deleted and is incorporated into the new PCI items.

New PCI items for use in the Acute Coronary Syndrome (ACS) setting:

New item 38307 – Selective coronary angiography and percutaneous angioplasty or transluminal insertion of stent(s) in one territory

Overview: As part of the restructure of selective coronary angiography and PCI items, this item provides a single item for performing an angiography and proceeding to a PCI involving a single vascular territory in the patient with acute coronary syndrome indications. This item is not claimable if diagnostic coronary angiography has been performed in the previous 3 months, in this instance item 38316 should be claimed.

Service/Descriptor: Displayed on the following page for ease of reading

Billing requirement: Not claimable with items 38200, 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38308, 38310, 38311, 38313, 38314, 38316, 38317, 38319, 38320, 38322 or 38323

MBS fee: \$1,844.60

Private Health Insurance Classifications:

Clinical Category: Heart and Vascular System

Procedure Type: Type A – Advanced Surgical

Item 38307 Service/Descriptor:

Note: (acute coronary syndrome - 1 coronary territory with selective coronary angiography) the service only applies if the patient meets the requirements of the descriptor and the requirements of Note: TR.8.2 and TR.8.5

Percutaneous coronary intervention:

- (a) for a patient eligible for the service, if:

Note: TR.8.2 Patient eligibility and timing referred to in the descriptor as clause 5.10.17A:

(1) A patient is eligible for a service to which item 38244, 38247, 38307, 38308, 38310, 38316, 38317 or 38319 applies if:

- (a) subclause (2) applies to the patient; and
(b) a service to which the item applies has not been provided to the patient in the previous 3 months, unless:
(i) the patient experiences a new acute coronary syndrome or angina, as described in paragraph (2)(a), (b) or (c), in that period; or
(ii) for a service to which item 38316, 38317 or 38319 applies—the service was provided to the patient in that period as a subsequent stage following an initial primary percutaneous coronary intervention procedure.

(2) This subclause applies to a patient who has:

- (a) an acute coronary syndrome evidenced by any of the following:
(i) ST segment elevation;
(ii) new left bundle branch block;
(iii) troponin elevation above the local upper reference limit;
(iv) new resting wall motion abnormality or perfusion defect;
(v) cardiogenic shock;
(vi) resuscitated cardiac arrest;
(vii) ventricular fibrillation;
(viii) sustained ventricular tachycardia; or

(b) unstable angina or angina equivalent with a crescendo pattern, rest pain or other high risk clinical features, such as hypotension, dizziness, pallor, diaphoresis or syncope occurring at a low threshold; or

(c) either of the following, detected on computed tomography coronary angiography:

- (i) significant left main coronary artery disease with greater than 50% stenosis or a cross sectional area of less than 6 mm²;
(ii) severe proximal left anterior descending coronary artery disease (with stenosis of more than 70% or a cross sectional area of less than 4 mm² before the first major diagonal branch).

and

- (ii) for whom selective coronary angiography has not been completed in the previous 3 months; and
(b) including selective coronary angiography and all associated imaging, catheter and contrast; and
(c) including either or both:

- (i) percutaneous angioplasty;
- (ii) transluminal insertion of one or more stents; and
- (d) performed on one coronary vascular territory; and
- (e) excluding aftercare;

other than a service associated with a service to which item 38200, 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38308, 38310, 38311, 38313, 38314, 38316, 38317, 38319, 38320, 38322 or 38323 applies

(Anaes.) (Assist.)

Explanatory note: If a staged procedure is appropriately performed over multiple days, items 38316, 38317 or 38319 must be used for subsequent stages.

For subsequent stages of an acute percutaneous coronary intervention completed up to 3 months after the initial procedure, it is expected that the patient would receive the subsequent stage/s of the intervention based on the qualifying indication for the initial procedure

The item number claimed should reflect the number of coronary vascular territories (Left Anterior Descending, Circumflex or Right Coronary Artery distribution) that are treated during the procedure, not the total number of treated territories the patient has received to date.

For isolated Left Main (no involvement of the bifurcation), a single territory should be claimed but if the treated segment involves the bifurcation then 2 territories should be claimed.

The intermediate artery when treated in isolation is single territory, when treated with the Left Anterior Descending or Circumflex or both, should be claimed as two territories.

A single lesion in a bypass graft should be claimed as single territory regardless of how many vascular territories are supplied by that graft. If the graft has multiple lesions and those lesions are in separate skip portions to a different territory, then an additional territory may be claimed.

New item 38308 – Selective coronary angiography and percutaneous angioplasty or transluminal insertion of stent(s) in two territories

Overview: As part of the restructure of selective coronary angiography and PCI items, this item provides a single item for performing an angiography and proceeding to a PCI involving two vascular territories in the patient with acute coronary syndrome indications. This item is not claimable if diagnostic coronary angiography has been performed in the previous 3 months, in this instance item 38317 should be claimed.

Service/Descriptor:

Note: (acute coronary syndrome - 2 coronary territories with selective coronary angiography) the service only applies if the patient meets the requirements of the descriptor and the requirements of Note: TR.8.3 and TR.8.5

Percutaneous coronary intervention:

- (a) for a patient:
 - (i) eligible for the service if indications referenced in Note: TR.8.3 apply; and
 - (ii) for whom selective coronary angiography has not been completed in the previous 3 months; and
- (b) including selective coronary angiography and all associated imaging, catheter and contrast; and
- (c) including either or both:
 - (i) percutaneous angioplasty; and
 - (ii) transluminal insertion of one or more stents; and
- (d) performed on 2 coronary vascular territories; and
- (e) excluding aftercare;

other than a service associated with a service to which item 38200, 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38307, 38310, 38311, 38313, 38314, 38316, 38317, 38319, 38320, 38322 or 38323 applies

(Anaes.) (Assist.)

Explanatory note: If a staged procedure is appropriately performed over multiple days, items 38316, 38317 or 38319 must be used for subsequent stages.

For subsequent stages of an acute percutaneous coronary intervention completed up to 3 months after the initial procedure, it is expected that the patient would receive the subsequent stage/s of the intervention based on the qualifying indication for the initial procedure

The item number claimed should reflect the number of coronary vascular territories (Left Anterior Descending, Circumflex or Right Coronary Artery distribution) that are treated during the procedure, not the total number of treated territories the patient has received to date.

For isolated Left Main (no involvement of the bifurcation), a single territory should be claimed but if the treated segment involves the bifurcation then 2 territories should be claimed.

The intermediate artery when treated in isolation is single territory, when treated with the Left Anterior Descending or Circumflex or both, should be claimed as two territories.

A single lesion in a bypass graft should be claimed as single territory regardless of how many vascular territories are supplied by that graft. If the graft has multiple lesions and those lesions are in separate skip portions to a different territory, then an additional territory may be claimed.

Billing requirement: Not claimable with items 38200, 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38307, 38310, 38311, 38313, 38314, 38316, 38317, 38319, 38320, 38322 or 38323

MBS fee: \$2,122.25

Private Health Insurance Classifications:

New item 38310 – Selective coronary angiography and percutaneous angioplasty or transluminal insertion of stent(s) in three territories

Overview: As part of the restructure of selective coronary angiography and PCI items, this item provides a single item for performing an angiography and proceeding to a PCI involving three vascular territories in the patient with acute coronary syndrome indications. This item is not claimable if diagnostic coronary angiography has been performed in the previous 3 months, in this instance item 38319 should be claimed.

Service/Descriptor:

Note: (acute coronary syndrome - 3 coronary territories with selective coronary angiography) the service only applies if the patient meets the requirements of the descriptor and the requirements of Note: TR.8.3 and TR.8.5

Percutaneous coronary intervention:

(a) for a patient:

(i) eligible for the service if indications referenced in Note: TR.8.3 apply; and

(ii) for whom selective coronary angiography has not been completed in the previous 3 months; and

(b) including selective coronary angiography and all associated imaging, catheter and contrast; and

(c) including either or both:

(i) percutaneous angioplasty; and

(ii) transluminal insertion of one or more stents; and

(d) performed on 3 coronary vascular territories; and

(e) excluding aftercare;

other than a service associated with a service to which item 38200, 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38307, 38308, 38311, 38313, 38314, 38316, 38317, 38319, 38320, 38322 or 38323 applies

(Anaes.) (Assist.)

Explanatory note:

If a staged procedure is appropriately performed over multiple days, items 38316, 38317 or 38319 must be used for subsequent stages.

For subsequent stages of an acute percutaneous coronary intervention completed up to 3 months after the initial procedure, it is expected that the patient would receive the subsequent stage/s of the intervention based on the qualifying indication for the initial procedure

The item number claimed should reflect the number of coronary vascular territories (Left Anterior Descending, Circumflex or Right Coronary Artery distribution) that are treated during the procedure, not the total number of treated territories the patient has received to date.

For isolated Left Main (no involvement of the bifurcation), a single territory should be claimed but if the treated segment involves the bifurcation then 2 territories should be claimed.

The intermediate artery when treated in isolation is single territory, when treated with the Left Anterior Descending or Circumflex or both, should be claimed as two territories.

A single lesion in a bypass graft should be claimed as single territory regardless of how many vascular territories are supplied by that graft. If the graft has multiple lesions and those lesions are in separate skip portions to a different territory, then an additional territory may be claimed.

Billing requirement: Not claimable with items 38200, 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38307, 38308, 38311, 38313, 38314, 38316, 38317, 38319, 38320, 38322 or 38323.

MBS fee: \$2,399.90

New PCI item for use in the Non- Acute Coronary Syndrome (stable) setting:

New item 38311 – Selective coronary angiography and percutaneous angioplasty or transluminal insertion of stent(s) in one territory

Overview: As part of the restructure of selective coronary angiography and PCI items, this item provides a single item for performing an angiography and proceeding to a PCI involving a single vascular territory in the patient with non-acute coronary syndrome (stable) indications. This item is not claimable if diagnostic coronary angiography has been performed in the previous 3 months, in this instance item 38320 should be claimed. Eligibility for this item can also be met through recommendation of a heart team conference.

Service/Descriptor: Displayed on the following page for ease of reading.

Billing requirement: Not claimable with items 38200, 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38307, 38308, 38310, 38313, 38314, 38316, 38317, 38319, 38320, 38322 or 38323

MBS fee: \$1,844.60

Private Health Insurance Classifications:

New Item 38311 Service/Descriptor: Note: (stable multi-vessel disease – 1 coronary territory with selective angiography) the service only applies if the patient meets the requirements of the descriptor and the requirements of Note: TR.8.4 and TR.8.5

Percutaneous coronary intervention: (a) for a patient:

- (i) eligible for the service if Note TR.8.4 applies and a service to which item 38314 applies;

Note: TR.8.4 Patient eligibility referred to in the descriptor as clause 5.10.17C:

(1) A patient is eligible for a service to which item 38311, 38313, 38314, 38320, 38322 or 38323 applies if:

- (a) subclause (2) applies to the patient; or
- (b) the patient is recommended for the service as a result of a heart team conference that meets the requirements of subclause (4).

(2) This subclause applies to a patient if:

- (a) the patient has any of the following:
 - (i) limiting angina or angina equivalent despite an adequate trial of optimal medical therapy;
 - (ii) myocardial ischaemia demonstrated on functional imaging;
 - (iii) high risk features such as ST segment elevation, sustained ST depression, hypotension or a Duke treadmill score of minus 11 or less, demonstrated by stress electrocardiogram testing; and
- (b) the patient has either of the following in a vascular territory treated:
 - (i) a stenosis of 70% or more;
 - (ii) a fractional flow reserve of 0.80 or less, or non hyperaemic pressure ratios distal to the lesions of 0.89 or less; and
- (c) for items 38314 and 38323—either:
 - (i) the patient does not have diabetes mellitus and the multi vessel coronary artery disease of the patient meets the criterion in subclause (3); or
 - (ii) despite a recommendation that surgery is preferable, the patient has expressed a preference for catheter based intervention.

(3) For the purposes of subparagraph (2)(c)(i), the criterion for the multi vessel coronary artery disease is that the disease does not involve any of the following:

- (a) stenosis of more than 50% in the left main coronary artery;
- (b) bifurcation lesions involving side branches with a diameter of more than 2.75 mm;
- (c) chronic vessel occlusions for more than 3 months;
- (d) severely angulated or calcified lesions;
- (e) a SYNTAX score of more than 23.

(4) For the purposes of paragraph (1)(b), the requirements for a heart team conference are as follows:

- (a) the conference must be conducted by a team of specialists or consultant physicians practising in the speciality of cardiology or cardiothoracic surgery, including each of the following:
 - (i) an interventional cardiologist;
 - (ii) a specialist or consultant physician;
 - (iii) for items 38314 and 38323—a cardiothoracic surgeon;
 - (iv) for items 38311, 38313, 38320 and 38322—a cardiothoracic surgeon or a non interventional cardiologist; and
- (b) the team must:
 - (i) assess the patient's risk and technical suitability to receive the service; and
 - (ii) make a recommendation about whether or not the patient is suitable for percutaneous coronary intervention; and
- (c) a record of the conference must be created, and must include the following:
 - (i) the particulars of the assessment of the patient during the conference;
 - (ii) the recommendations made as a result of the conference;
 - (iii) the names of the members of the team making the recommendations.

and

- (ii) for whom selective coronary angiography has not been completed in the previous 3 months; and
- (b) including selective coronary angiography and all associated imaging, catheter and contrast; and
- (c) including either or both:
 - (i) percutaneous angioplasty; and
 - (ii) transluminal insertion of one or more stents; and
- (d) performed on one coronary vascular territory; and
- (e) excluding aftercare;

other than a service associated with a service to which item 38200, 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38307, 38308, 38310, 38313, 38314, 38316, 38317, 38319, 38320, 38322 or 38323 applies

(Anaes.) (Assist.)

Explanatory Note:

Stable angina or angina equivalent includes chest pain, chest discomfort and/or shortness of breath due to myocardial ischaemia.

Limiting angina includes patients with symptoms that are Canadian Cardiovascular Society (CCS) class II, III or IV.

If a staged procedure is appropriately performed over multiple days, items 38320, 38322 or 38323 should be used for subsequent stages.

For subsequent stages of a stable percutaneous coronary intervention completed up to 3 months after the initial procedure, it is expected that the patient would receive the subsequent stage/s of the intervention based on the qualifying indication for the initial procedure

The item number claimed should reflect the number of coronary vascular territories (Left Anterior Descending, Circumflex or Right Coronary Artery distribution) that are treated during the procedure, not the total number of treated territories the patient has received to date.

The number of coronary vascular territory refers to any of the 3 major arteries (Left Anterior Descending, Circumflex or Right Coronary Artery) or their branches. The item number claimed should reflect the number of coronary vascular territories that are treated during the procedure, not the total number of diseased territories.

For isolated Left Main (no involvement of the bifurcation), a single territory should be claimed but if the treated segment involves the bifurcation then 2 territories should be claimed.

The intermediate artery when treated in isolation is single territory, when treated with the Left Anterior Descending or Circumflex or both, should be claimed as two territories.

A single lesion in a bypass graft should be claimed as single territory regardless of how many vascular territories are supplied by that graft. If the graft has multiple lesions and those lesions are in separate skip portions to a different territory, then an additional territory may be claimed.

New item 38313 – Selective coronary angiography and percutaneous angioplasty or transluminal insertion of stent(s) in two territories

Overview: As part of the restructure of selective coronary angiography and PCI items, this item provides a single item for performing an angiography and proceeding to a PCI involving two vascular territories in the patient with non-acute coronary syndrome (stable) indications. This item is not claimable if diagnostic coronary angiography has been performed in the previous 3 months, in this instance item 38322 should be claimed. Eligibility for this item can also be met through recommendation of a heart team conference.

Service/Descriptor:

Note: (stable multi-vessel disease - 2 coronary territories with selective angiography) the service only applies if the patient meets the requirements of the descriptor and the requirements of Note: TR.8.4 and TR.8.5

Percutaneous coronary intervention:

- (a) for a patient:
 - (i) eligible for the service if Note TR.8.4 applies and a service to which item 38314 applies; and
 - (ii) for whom selective coronary angiography has not been completed in the previous 3 months; and
- (b) including selective coronary angiography and all associated imaging, catheter and contrast; and
- (c) including either or both:
 - (i) percutaneous angioplasty; and
 - (ii) transluminal insertion of one or more stents; and
- (d) performed on 2 coronary vascular territories; and
- (e) excluding aftercare;

other than a service associated with a service to which item 38200, 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38307, 38308, 38310, 38311, 38314, 38316, 38317, 38319, 38320, 38322 or 38323 applies (Anaes.) (Assist.)

Explanatory Note: Stable angina or angina equivalent includes chest pain, chest discomfort and/or shortness of breath due to myocardial ischaemia.

Limiting angina includes patients with symptoms that are Canadian Cardiovascular Society (CCS) class II, III or IV.

If a staged procedure is appropriately performed over multiple days, items 38320, 38322 or 38323 should be used for subsequent stages.

For subsequent stages of a stable percutaneous coronary intervention completed up to 3 months after the initial procedure, it is expected that the patient would receive the subsequent stage/s of the intervention based on the qualifying indication for the initial procedure.

The number of coronary vascular territory refers to any of the 3 major arteries (Left Anterior Descending, Circumflex or Right Coronary Artery) or their branches. The item number claimed should reflect the number of coronary vascular territories that are treated during the procedure, not the total number of diseased territories.

For isolated Left Main (no involvement of the bifurcation), a single territory should be claimed but if the treated segment involves the bifurcation then 2 territories should be claimed.

The intermediate artery when treated in isolation is single territory, when treated with the Left Anterior Descending or Circumflex or both, should be claimed as two territories.

A single lesion in a bypass graft should be claimed as single territory regardless of how many vascular territories are supplied by that graft. If the graft has multiple lesions and those lesions are in separate skip portions to a different territory, then an additional territory may be claimed.

Billing requirement: Not claimable with items 38200, 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38307, 38308, 38310, 38311, 38314, 38316, 38317, 38319, 38320, 38322 or 38323

MBS fee: \$2,122.25

Procedure Type: Type A – Advanced Surgical

New item 38314 – Selective coronary angiography and percutaneous angioplasty or transluminal insertion of stent(s) in three territories

Overview: As part of the restructure of selective coronary angiography and PCI items, this item provides a single item for performing an angiography and proceeding to a PCI involving three vascular territories in the patient with non-acute coronary syndrome (stable) indications. This item is not claimable if diagnostic coronary angiography has been performed in the previous 3 months, in this instance item 38323 should be claimed. Eligibility for this item can also be met through recommendation of a heart team conference, where one of the cardiac specialists is a cardiothoracic surgeon.

Service/Descriptor:

Note: (stable multi-vessel disease - 3 coronary territories with selective angiography) the service only applies if the patient meets the requirements of the descriptor and the requirements of Note: TR.8.4 and TR.8.5

Percutaneous coronary intervention:

(a) for a patient:

(i) eligible for the service if Note TR.8.4 applies; and

(ii) for whom selective coronary angiography has not been completed in the previous 3 months; and

(b) including selective coronary angiography and all associated imaging, catheter and contrast; and

(c) including either or both:

- (i) percutaneous angioplasty; and
- (ii) transluminal insertion of one or more stents; and
- (c) performed on 3 coronary vascular territories; and
- (e) excluding aftercare;

other than a service associated with a service to which item 38200, 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38307, 38308, 38310, 38311, 38313, 38316, 38317, 38319, 38320, 38322 or 38323 applies

(Anaes.) (Assist.)

Explanatory Note: Complex coronary artery disease is defined as (a) a stenosis >50% in the left main coronary artery; (b) >90% in the proximal left anterior coronary artery; (c) bifurcation lesions involving side branches with a diameter >2.75mm; (d) chronic vessel occlusions (>3 months); (e) severely angulated or severely calcified lesions; or (f) SYNTAX score >23. Such disease should only undergo PCI with a documented recommendation from a Heart Team Conference.

Stable angina or angina equivalent includes chest pain, chest discomfort and/or shortness of breath due to myocardial ischaemia.

Limiting angina includes patients with symptoms that are Canadian Cardiovascular Society (CCS) class II, III or IV.

If a staged procedure is appropriately performed over multiple days, items 38320, 38322 or 38323 should be used for subsequent stages.

For subsequent stages of a stable percutaneous coronary intervention completed up to 3 months after the initial procedure, it is expected that the patient would receive the subsequent stage/s of the intervention based on the qualifying indication for the initial procedure.

The number of coronary vascular territory refers to any of the 3 major arteries (Left Anterior Descending, Circumflex or Right Coronary Artery) or their branches. The item number claimed should reflect the number of coronary vascular territories that are treated during the procedure, not the total number of diseased territories.

For isolated Left Main (no involvement of the bifurcation), a single territory should be claimed but if the treated segment involves the bifurcation then 2 territories should be claimed.

The intermediate artery when treated in isolation is single territory, when treated with the Left Anterior Descending or Circumflex or both, should be claimed as two territories.

A single lesion in a bypass graft should be claimed as single territory regardless of how many vascular territories are supplied by that graft. If the graft has multiple lesions and those lesions are in separate skip portions to a different territory, then an additional territory may be claimed.

Billing requirement: Not claimable with items 38200, 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38307, 38308, 38310, 38311, 38313, 38316, 38317, 38319, 38320, 38322 or 38323

MBS fee: \$2,399.90

New standalone PCI items for use in the Acute Coronary Syndrome (ACS) setting:

New item 38316 – Selective coronary angiography and percutaneous angioplasty or transluminal insertion of stent(s) in one territory

Overview: As part of the restructure of selective coronary angiography and PCI items, this item provides a single item for performing a standalone PCI involving a single vascular territory in the patient with acute coronary syndrome indication and diagnostic coronary angiography has been performed in the preceding 3 months. This item mirrors item 38307 with the exclusion of the diagnostic coronary angiography component.

Service/Descriptor:

Note: (acute coronary syndrome - 1 coronary territory without selective angiography) the service only applies if the patient meets the requirements of the descriptor and the requirements of Note: TR.8.3 and TR.8.5

Percutaneous coronary intervention:

- (a) for a patient:
 - (i) eligible for the service if indications referenced in Note: TR.8.3 apply; and
 - (ii) for whom selective coronary angiography has been completed in the previous 3 months; and
- (b) including any associated coronary angiography; and
- (c) including either or both:
 - (i) percutaneous angioplasty; and
 - (ii) transluminal insertion of one or more stents; and
- (d) performed on one coronary vascular territory; and
- (e) excluding aftercare;

other than a service associated with a service to which item 38200, 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38307, 38308, 38310, 38311, 38313, 38314, 38317, 38319, 38320, 38322 or 38323 applies

(Anaes.) (Assist.)

Explanatory note: If a staged procedure is appropriately performed over multiple days, items 38316, 38317 or 38319 must be used for subsequent stages.

For subsequent stages of an acute percutaneous coronary intervention completed up to 3 months after the initial procedure, it is expected that the patient would receive the subsequent stage/s of the intervention based on the qualifying indication for the initial procedure

Computed Tomography of the Coronary Arteries (CTCA)

Amended item 57360 – Computed tomography of the coronary arteries where patient is not known to have coronary artery disease

Overview: This item is amended for specialist investigation of coronary arteries where the patient is not known to have coronary artery disease.

Service/Descriptor: Computed tomography of the coronary arteries performed on a minimum of a 64 slice (or equivalent) scanner if:

- (a) the request is made by a specialist or consultant physician; and
- (b) for a patient not known to have coronary artery disease who:
 - (i) has stable or acute symptoms consistent with coronary ischaemia; and
 - (ii) is at low to intermediate risk of an acute coronary event, including having no significant cardiac biomarker elevation and no electrocardiogram changes indicating acute ischaemia

Applicable not more than once in a 5 year period (R) (Anaes.)

Explanatory Note: Please note that an administrative update will be provided 1 November 2021 advising when item 57360 can be claimed within 5 years of a previous service to which item 57360 applies.

- The clause ‘for a patient who is not known to have coronary artery disease’ is defined as those patients who do not already have documented significant obstructive coronary artery disease that is being treated by the requesting provider.
- Patients with typical or atypical angina symptoms (as per NICE criteria) or known coronary artery disease should be referred for functional testing and/or referred to a cardiologist or consultant physician for management.
- Heart rate during CTCA should be less than 65 beats per minute wherever possible, and sublingual GTN should be administered immediately prior to scanning where clinically appropriate.

MBS fee: \$710.50 (no change)

Private Health Insurance Classifications:

Clinical Category: Heart and Vascular System

Procedure Type: Unlisted

New item 57364 – Computed tomography of the coronary arteries for investigation of non-coronary artery related indications

Overview: Introduction of a new item for computed tomography angiography for investigation of non-coronary artery related indications, including newly diagnosed left ventricular systolic dysfunction, patients who are undergoing non-coronary cardiac surgery, or as an alternative treatment to selective coronary angiography (provided the patient meets the criteria for the items listed in 38247, 38249, or 38252).

Service/Descriptor:

Note: the service only applies if the patient meets the requirements of the descriptor and the requirements of Note: TR.8.3 (item 38247), TR.8.2 (item 38249) or 38252 if subclause (iv) applies.

Computed tomography of the coronary arteries performed on a minimum of a 64 slice (or equivalent) scanner, if:

- (a) the service is requested by a specialist or consultant physician; and
- (b) at least one of the following apply to the patient:
 - (i) the patient has stable symptoms and newly recognised left ventricular systolic dysfunction of unknown aetiology;
 - (ii) the patient requires exclusion of coronary artery anomaly or fistula;
 - (iii) the patient will be undergoing non coronary cardiac surgery;
 - (iv) the patient meets the criteria to be eligible for a service to which item 38247, 38249 or 38252 applies, but as an alternative to selective coronary angiography will require an assessment of the patency of one or more bypass grafts

(R) (Anaes)

Explanatory Note:

Heart rate during CTCA should be less than 65 beats per minute wherever possible, and sublingual GTN should be administered immediately prior to scanning where clinically appropriate.

The presence of coronary calcium alone does not preclude CTCA.

Discussions of the results, findings or interpretation of a study are reasonably expected to be part of a formal report. Discussion of these findings with a patient does not constitute a consult. Similarly, discussion(s) during the course of a study or to determine the safety or appropriateness of the study is part of the service and should not be claimed as a consult.

MBS fee: \$710.50

Private Health Insurance Classifications:

Clinical Category: Support List

Procedure Type: Type C

Amended item 38241 – Use of a coronary pressure wire during selective coronary angiography

Overview: This item has been amended to align with the changes in selective coronary angiography and PCI items. The changes clarify inclusion criteria, providing access to use of a pressure wire per vascular territory during angiography or percutaneous coronary intervention.

Service/Descriptor: Use of a coronary pressure wire, if the service is:

- (a) performed during selective coronary angiography, percutaneous angioplasty or transluminal insertion of one or more stents; and
- (b) to measure fractional flow reserve, non-hyperaemic pressure ratios or coronary flow reserve in intermediate coronary artery or graft lesions (stenosis of 50 to 70%); and
- (c) to determine whether revascularisation is appropriate if previous functional imaging:
 - (i) has not been performed; or
 - (ii) has been performed but the results are inconclusive or do not apply to the vessel being interrogated; and
- (d) performed on one or more coronary vascular territories (Anaes.)

Billing requirement: This item can be claimed once if a single vascular territory is interrogated, twice if two vascular territories are interrogated or thrice if three vascular territories are interrogated during angiography.

MBS fee: \$488.70

Private Health Insurance Classifications:

Clinical Category: Heart and Vascular System

Procedure Type: Unlisted

Other items – using transcatheter approach

Amended item 38200 – Right heart catheterisation for use in the non-coronary setting

Overview: This item has been amended to provide access to right heart catheterisation for use in the non-coronary setting (outside of angiography). Same day claiming restrictions have been added to this item to restrict claiming with selective coronary angiography items.

Service/Descriptor: Right heart catheterisation with any one or more of the following:

- (a) fluoroscopy;

- (b) oximetry;
- (c) dye dilution curves;
- (d) cardiac output measurement by any method;
- (e) shunt detection;
- (f) exercise stress test;

other than a service associated with a service to which item 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38254 or 38368 applies (Anaes.)

Explanatory Note: Discussions of the results, findings or interpretation of a study are reasonably expected to be part of a formal report. Discussion of these findings with a patient does not constitute a consult. Similarly, discussion(s) during the course of a study or to determine the safety or appropriateness of the study is part of the service and should not be claimed as a consult.

For investigations performed by a specialist paediatric cardiologist, co-claiming of a consultation with the investigation is permitted even when a consultation was not specifically requested when:

- the paediatric patient was referred for an investigation; and
- the paediatric patient was not known to the provider; and
- the paediatric patient was not under the care of another paediatric cardiologist; and
- the findings on the investigation appropriately warranted a consultation.

The paediatric co-claiming exception should not be applied to cardiologists treating or investigating adult congenital heart disease.

Billing requirement: Not claimable with items 38203, 38206, 38244, 38247, 38248, 38249, 38251, 38252, 38254 or 38368

MBS fee: \$463.50

Private Health Insurance Classifications:

Clinical Category: Heart and Vascular System

Procedure Type: Type A – Surgical and Type B – Non-band specific

Amended item 38203 – Left heart catheterisation for use in the non-coronary setting

Overview: This item has been amended to provide access to left heart catheterisation for use in the non-coronary setting (outside of angiography). Same day claiming restrictions have been added to this item to restrict claiming with selective coronary angiography items.

Service/Descriptor: Left heart catheterisation by percutaneous arterial puncture, arteriotomy or percutaneous left ventricular puncture, with any one or more of the following:

- (a) fluoroscopy;
- (b) oximetry;
- (c) dye dilution curves;
- (d) cardiac output measurements by any method;
- (e) shunt detection;
- (f) exercise stress test;

other than a service associated with a service to which item 38200, 38206, 38244, 38247, 38248, 38249, 38251, 38252 or 38254 applies (Anaes.)

Explanatory Note: Discussions of the results, findings or interpretation of a study are reasonably expected to be part of a formal report. Discussion of these findings with a patient does not constitute a consult. Similarly, discussion(s) during the course of a study or to determine the safety or appropriateness of the study is part of the service and should not be claimed as a consult.

For investigations performed by a specialist paediatric cardiologist, co-claiming of a consultation with the investigation is permitted even when a consultation was not specifically requested when:

- the paediatric patient was referred for an investigation; and
- the paediatric patient was not known to the provider; and
- the paediatric patient was not under the care of another paediatric cardiologist; and
- the findings on the investigation appropriately warranted a consultation.

The paediatric co-claiming exception should not be applied to cardiologists treating or investigating adult congenital heart disease.

Billing requirement: Not claimable with items 38200, 38206, 38244, 38247, 38248, 38249, 38251, 38252 or 38254

MBS fee: \$553.10

Private Health Insurance Classifications:

Clinical Category: Heart and Vascular System

Procedure Type: Type A – Surgical

Amended item 38206 – Right heart catheterisation with left heart catheterisation

Overview: This item has been amended to provide access to right heart catheterisation with left heart catheterisation for use in the non-coronary setting (outside of angiography). Same day claiming restrictions have been added to this item to restrict claiming with the selective coronary angiography items.

Service/Descriptor: Right heart catheterisation with left heart catheterisation via the right heart or by another procedure, with any one or more of the following:

- (a) fluoroscopy;
- (b) oximetry;
- (c) dye dilution curves;
- (d) cardiac output measurements by any method;
- (e) shunt detection;
- (f) exercise stress test;

other than a service associated with a service to which item 38200, 38203, 38244, 38247, 38248, 38249, 38251, 38252 or 38254 applies (Anaes.)

Explanatory Note: Discussions of the results, findings or interpretation of a study are reasonably expected to be part of a formal report. Discussion of these findings with a patient does not constitute a consult. Similarly, discussion(s) during the course of a study or to determine the safety or appropriateness of the study is part of the service and should not be claimed as a consult.

For investigations performed by a specialist paediatric cardiologist, co-claiming of a consultation with the investigation is permitted even when a consultation was not specifically requested when:

- the paediatric patient was referred for an investigation; and
- the paediatric patient was not known to the provider; and
- the paediatric patient was not under the care of another paediatric cardiologist; and
- the findings on the investigation appropriately warranted a consultation.

The paediatric co-claiming exception should not be applied to cardiologists treating or investigating adult congenital heart disease.

Billing requirement: Not claimable with items 38200, 38203, 38244, 38247, 38248, 38249, 38251, 38252 or 38254

MBS fee: \$668.70

Private Health Insurance Classifications:

Clinical Category: Heart and Vascular System

Procedure Type: Type A – Surgical

Amended item 38272 – Atrial septal defect or patent foramen ovale closure

Overview: This item has been amended to provide clarity around clinical indications for use and to include associated heart catheterisation as part of the procedure. In addition, same day co-claiming restrictions with the distinct heart catheterisation items have been applied.

Service/Descriptor: Atrial septal defect or patent foramen closure:

- (a) for congenital heart disease in a patient with documented evidence of right heart overload or paradoxical embolism; and
- (b) using a septal occluder or similar device, by transcatheter approach; and
- (c) including right or left heart catheterisation (or both);

other than a service associated with a service to which item 38200, 38203, 38206 or 38254 applies (Anaes.) (Assist.)

Explanatory Note:

This item may be claimed without evidence of right heart overload in highly rare paediatric conditions such as abnormal development of the right heart. Additionally, in patients under 16 years old, risk of paradoxical embolism is sufficient.

Billing requirement: Not claimable with items 38200, 38203, 38206 or 38254

MBS fee: \$949.25

Private Health Insurance Classifications:

Clinical Category: Heart and Vascular System

Procedure Type: Type A – Advanced Surgical and Type B – Non-band specific

Amended item 38274 – Ventricular septal defect

Overview: This item is amended to exclude imaging services as this would be provided by a different provider and billed separately.

Service/Descriptor: Ventricular septal defect, transcatheter closure of, with cardiac catheterisation, excluding imaging (H) (Anaes.) (Assist.)

MBS fee: \$777.60

Private Health Insurance Classifications:

Clinical Category: Heart and Vascular System

Procedure Type: Type A –Surgical

Amended item 38309 – Percutaneous transluminal rotational atherectomy

Overview: This item has been amended to include the consolidation of 4 atherectomy items (items 38309, 38312, 38315 and 38318) into a single atherectomy item, for use in conjunction with PCI items.

Service/Descriptor: Percutaneous transluminal rotational atherectomy of one or more coronary arteries, including all associated imaging, if:

- (a) the target stenosis within at least one coronary artery is heavily calcified and balloon angioplasty with or without stenting is not feasible without rotational atherectomy; and
- (b) the service is performed in conjunction with a service to which item 38307, 38308, 38310, 38311, 38313, 38314, 38316, 38317, 38319, 38320, 38322 or 38323 applies

Applicable only once on each occasion the service is performed (Anaes.) (Assist.)

Explanatory Note:

Percutaneous transluminal coronary rotational atherectomy is suitable for revascularisation of stenoses in heavily calcified coronary arteries in the absence of significant lesion angulation or vessel tortuosity in patients for whom coronary artery bypass graft surgery is not indicated.

Item 38309 describes an episode of service and can only be claimed once in a single episode.

Billing requirement: Only claimable once in an episode of care and claimed in association with a service to which items 38307, 38308, 38310, 38311, 38313, 38314, 38316, 38317, 38319, 38320, 38322 or 38323 apply.

MBS fee: \$1,250.70 (previously \$913.10 – the fee includes a weighted average of all 4 items being consolidated)

Private Health Insurance Classifications:

Clinical Category: Heart and Vascular System

Procedure Type: Type A – Advanced Surgical

Where can I find more information?

The full item descriptor(s) and information on other changes to the MBS will be available on 1 July 2021 on the MBS Online website at [MBS Online](#). You can also subscribe to future MBS updates by visiting [MBS Online](#) and clicking 'Subscribe'.

For questions relating to implementation, or to the interpretation of the changes to cardiac surgical MBS items prior to 1 July 2021, please email cardiacservices@health.gov.au. For questions after implementation on 1 July 2021, please email [askMBS](#).

For questions regarding the proposed PHI classifications, please email PHI@health.gov.au.

The Department of Health provides an email advice service for providers seeking advice on interpretation of the MBS items and rules and the Health Insurance Act and associated regulations. If you have a query relating exclusively to interpretation of the Schedule, you should email [askMBS](#).

Subscribe to '[News for Health Professionals](#)' on the Department of Human Services website and you will receive regular news highlights.

If you are seeking advice in relation to Medicare billing, claiming, payments, or obtaining a provider number, please go to the Health Professionals page on the Department of Human Services website or contact the Department of Human Services on the Provider Enquiry Line – 13 21 50.

The data file for software vendors is expected to become available by early June 2021 and can be accessed via the MBS Online website under the [Downloads](#) page.

Please note that the information provided is a general guide only. It is ultimately the responsibility of treating practitioners to use their professional judgment to determine the most clinically appropriate services to provide, and then to ensure that any services billed to Medicare fully meet the eligibility requirements outlined in the legislation.

This sheet is current as of the Last updated date shown above, and does not account for MBS changes since that date.

A person authorised under section 19(1) of the Oaths and Affirmations Act 2018 to take an affidavit.

HONEYSUCKLE HEALTH PRIVACY POLICY

This Privacy Policy was last updated July 2021.

1. Introduction

Honeysuckle Health Pty Ltd respects the privacy rights of our customers and other organisations with whom we interact with. We are committed to complying with all applicable privacy laws including the Privacy Act 1988 (Cth), Australian Privacy Principles and applicable State legislation.

Within this Privacy Policy, “we”, “our”, “us” and “Honeysuckle Health” refers to Honeysuckle Health Pty Ltd, ABN 55637339694.

This Privacy Policy tells you how Honeysuckle Health handles personal information.

2. Collection of Personal Information

I. What Personal Information Do We Collect?

Personal information means information or opinion that reasonably identifies you as an individual. The types of personal information we collect include your name, contact details and gender.

The types of personal information (including sensitive information) we collect will depend on your relationship and interaction with us. This includes whether you are:

- a Honeysuckle Health customer name, contact details, gender
- an authorised representative of a Honeysuckle Health customer – name and contact details
- job applicant – name, contact details and other information in your job application; or
- another third party (such as an existing or potential business partner) name, contact details, and the details of the business

Sensitive information is a subset of personal information that includes your health information (including medical history), genetic information, information about your racial or ethnic origin, political opinion, religious beliefs, sexual orientation and criminal record.

The types of sensitive health information that we may collect from you includes details about your medical conditions, treatment and care. We may also collect information on your cultural background when this is relevant to your care (e.g. to ensure culturally appropriate practices, and to identify cultural-specific programs that may be available to you).

II. How We Collect Your Personal Information

a. Information we collect from you

We collect your personal information during the course of providing you with health services. This includes where we enrol you in one of our health management programs.

Wherever possible, we will seek to obtain your consent prior to collecting your personal and sensitive health information.

This collection may occur in a variety of ways, including through the forms you complete in electronic or hard copy form, on our website or through email, when you enrol for our digital health programs on the relevant apps or where you provide us with information over the telephone.

You may nominate a representative to speak with Honeysuckle Health on your behalf and discuss your personal information and sensitive health information with us. Provided that you and your nominated representative both provide consent, we may collect, use and disclose your personal information and sensitive health information to your nominated representative.

b. Information about Authorised Representatives that we collect from Honeysuckle Health Customers

We may collect the personal information of nominated representatives. We collect this information in order for us to be able to verify the identity of the nominated representative and communicate with them about a patient's care.

c. Information we collect from third parties

We may collect personal information about you from third parties such as your doctor, treating hospital, health insurer, or other health service provider, if it is not reasonable or practicable to collect this information from you, or with your consent. This may also include other people or organisations who might be representing you, or any person assisting or representing us.

d. Publicly available resources

We may also collect your personal information from publicly available sources such as internet search engines and social networking services. When we do so, we ensure that we have a legal basis for using your personal information, such as to enable us to contact you and offer our products and services to you.

e. Information we collect from search engines and applications

Like many companies, we use technology and tools that tell us when a computer or device has visited or accessed our website content. Those tools include services from search engines and other companies that help us to tailor our products and services to better suit our customers and potential customers. Search engines provide facilities to allow you to indicate your preferences in relation to the use of those tools in connection with computers and other devices controlled or used by you. Our mobile applications may also collect precise location information from your device if you consent to the collection of this information, and we will always respect your preferences including if you choose to withdraw your consent at any time.

We strive to collect personal information directly from you with your knowledge and consent. However, if you do not consent and we do not have your personal information, we may not be able to process your requests or employment application or provide our services to you including providing health management programs or other assistance.

3. Remaining anonymous

You have the right to remain anonymous or use a pseudonym when interacting with us. However, it may not always be possible for us to provide a service to you if you choose to remain anonymous – for example, when need to liaise with your health insurer or treatment team we assess your suitability for a particular healthcare program or service. We will inform you if you are unable to remain anonymous when dealing with us.

4. Purposes for which we collect, hold, and use Your Personal Information

How we use your personal information depends on our relationship and interaction with you. Below are the main purposes for which we collect and use your information:

- to identify you, and respond to and process your requests for information
- to determine your eligibility to provide or receive a Honeysuckle Health product or service;
- to provide health management programs;
- to manage, deliver and administer services and programs that you participate in
- to offer and provide personalised health information, support and services;
- to provide you with communications and invitations and offers for products and services including new products or services that we or our third party business partners believe may be of interest to you, and to assist in developing new products and services (see further below); and
- to provide you with advice relating to your needs

Authorised Representative

- To verify your identity as the authorised representative for the Honeysuckle Health customer; and
- In the course of collecting, using and disclosing the personal information of the patient to whom you represent.

Third Parties / Business Partners

- to carry out a business or professional relationship we may have with you.

Job Applicant

- if you apply for employment with us, to consider your application and contact you.

Health Service Provider

- where you are a health service provider, to create and provide access for customers and other third parties to directory services.

We also use your personal information for the following internal purposes:

- to evaluate the effectiveness of our health management programs and the service we provide to our customers;
- to prepare internal reports for the purposes of improving our products, services and internal operations;
- to manage complaints and disputes, and report to dispute resolution bodies;
- to manage, train and develop our employees and representatives;
- to perform quality audits;

- to amend records to remove personal information; and
- for other everyday business purposes that involve the use of personal information.

We ensure that we have an appropriate legal basis to use your personal information in these ways, including:

- for our usual business functions and activities (such as managing our business operations, developing and improving the products and services we offer, company re-structure or selling part of our business);
- where we have clearly explained a proposed use and you have provided your consent; and
- where we have a legal or regulatory obligation that we must comply with or is in the substantial public interest (such as to prevent fraud or money laundering) or we need to use your personal information to establish, exercise or defend legal rights (such as debt recovery) or whenever courts are acting in their judicial capacity.

We do not conduct direct marketing, but we do conduct follow-up communications about the service/s you received. You may opt out of these follow-up communications at any time.

5. Use and Disclosure of Personal Information

We use and disclose your personal information and sensitive health information to relevant individuals, organisations and other contracted entities as is necessary for us to provide our services to you.

For example, we may disclose your personal information to:

- a person acting on your behalf including a person authorised by you or to whom you have granted a delegated authority;
- your private health insurer (if applicable);
- your medical specialists, your general practitioner and other allied health specialists;
- service providers that we use to carry out activities on our behalf, for example auditors, IT vendors and mailhouses;
- to others who may be involved in your care for example hospital discharge planners;
- where relevant, a third-party purchaser of our business or assets;
- where relevant, local registration boards and professional and industry bodies and associations, or to external dispute resolution bodies; and
- in additional ways you may also agree to.

We may also use and disclose your personal information and sensitive health information to comply with an Australian Law or if required by a court or tribunal order.

We may also use and disclose your personal information to the extent that we have another legitimate purpose such as to manage our business operations or to conduct data analytics to improve our offerings. We may also share with others and disclose deidentified personal information (including aggregated, anonymous or pseudonymised information) for business and marketing purposes.

We may use or disclose your personal information in circumstances where we consider that there is an immediate threat to the health or safety of our yourself, our patients, staff or the wider public.

6. Security of your Personal Information

We have systems and processes in place to securely store your personal information and sensitive health information. Some of our systems for storing your information include:

- electronic storage through computer systems
- paper records; and
- cloud storage.

We take steps to protect your personal information and sensitive health information from misuse, interference or loss and unauthorised access, modification and disclosure with appropriate safeguards and security measures. The measures that we take include:

- only allowing authorised personnel access to your personal and sensitive health information;
- ensuring your data is stored and accessed in a secure and safe manner;
- when we engage a third-party service provider, we leverage infrastructure hosted in Asia-Pacific public cloud regions, and in normal operating circumstances this will mean that your data is stored in Australia. We conduct supplier assurance activities to ensure your data is managed responsibly.

When you share information with us (such as over the internet, or sending us an email), it is at your own risk as factors beyond our control include the security of the device and/or program you use to communicate with us. If you reasonably believe that there has been unauthorised use or disclosure of your personal information, please contact us (see below).

Our website may contain links or references to other websites not subject to this Privacy Policy. You should check their own privacy policies before providing your personal information.

7. Disclosure to overseas recipients

We may need to provide your personal information and sensitive health information to an overseas service provider in circumstances where technical support is required. In such circumstances, we strictly control and limit how they can access your personal information. We also have contractual measures in place to ensure that the overseas recipient will comply with the Privacy Act and the Australian Privacy Principles.

8. Accessing and correcting your personal information

We use our best endeavours to ensure that the personal information we collect, use and disclose is accurate. Please let us know if there are any errors, or if there are changes to any of your personal information, such as a change of address.

Under the Privacy Act, we are required to provide you with access to the personal information we hold about you. You are also entitled to make an amendment request if you consider that the information we hold about you is inaccurate or incorrect.

We may require proof of identity before processing your access or correction request. We will respond to your request as soon as we reasonably can, including notifying you if we are unable to provide access (such as when we no longer hold the information) or if we are permitted by applicable law to refuse access.

Generally, we cannot impose a charge for making an access to your own personal information, unless permitted to do so by an Australian law, Court or Tribunal order. We may however charge you a reasonable fee for the retrieval costs associated with providing you with access.

9. Privacy Enquiries and Complaints

If you have any questions, concerns or complaints regarding the way that your personal information has been collected or handled by Honeysuckle Health, you can contact a customer care consultant on:

Email: enquiries@honeysucklehealth.com.au

Mail: Level 1, 6 Newcomen Street, Newcastle, NSW 2300.

Where required, our customer service consultants will escalate the matter to their team leader and/or our Privacy Officer. We will establish in consultation with you a reasonable process, including time frames provided by applicable laws, for seeking to resolve your complaint.

If you are not satisfied with our response you can contact or make a complaint to the Office of the Australian Information Commissioner.

Email: enquiries@oaic.gov.au

Telephone: 1300 363 992 (from overseas +61 2 9284 9749)

10. Changes to this Privacy Policy

This Privacy Policy is current at April 2021. We may review and change this Privacy Policy from time to time.

Previous changes:

Version	Month	Change
1.5	July 2021	Update to include digital health programs and apps as ways information is collected.
1.4	April 2021	Update to the language in the Disclosure to overseas recipients
1.3	October 2020	Wording on data storage locations to reflect potential disaster recovery / capacity issue scenarios. Added heading numbering
1.2	September 2020	Update of titles for health programs and applicability of the collection notice
1.1	August 2020	Include information handling procedures related to a nominated representative
1.0	April 2020	Initial version

Strategic Data Vision

Honeysuckle Health requires a best of breed data governance framework to ensure competitive advantage in a dynamic and fast paced environment. This framework should ensure that data is consistently stored, handled and ultimately leveraged to maximise its value to the organisation.

For Honeysuckle Health to meet it's strategic goals data must be leveraged to allow;

- the generation of insights,
- prediction of future healthcare risk,
- privacy preserving data linkages across multiple datasets,
- data-driven decision making of individuals and healthcare providers,
- and deliver healthcare interventions

Many aspects of data governance are key to ISO27001 certification and as a result a subset of artefacts will be audited annually while obtaining this certification.

What is Data Governance?

Data governance is the formal orchestration of people, process, and technology to enable an organization to leverage data as an enterprise asset.

Effective data governance will be key to Honeysuckle Health's ability to maximize the value of their own data while at the same time minimising the risk of adverse outcomes.

Aims of Data Governance

- Enable consistent, high quality business products and decisions based on trustworthy data
- Meet regulatory requirements by documenting the lineage of the data assets and the access controls related to the data
- Improve data security by establishing data ownership and related responsibilities
- Define and verify data distribution policies including the roles and accountabilities of involved internal and external entities
- Eliminate re-work by having data assets that are trusted, standardised and capable of serving multiple purposes
- Train management and staff to adopt common approaches to data issues

Data Governance Principles

1. **Integrity** - Data Governance participants will practice integrity with their dealings with each other; they will be truthful and forthcoming when discussing drivers, constraints, options, and impacts for data-related decisions.
2. **Transparency** - Data Governance and Stewardship processes will exhibit transparency; it should be clear to all participants and auditors how and when data-related decisions and controls were introduced into the processes.
3. **Auditability** - Decisions, processes, and controls related to Data Governance will be auditable; they will be accompanied by documentation to support compliance-based and operational auditing requirements.
4. **Accountability** - Data Governance will define accountabilities for cross-functional data-related decisions, processes, and controls.
5. **Stewardship** - Data Governance will define accountabilities for stewardship activities that are the responsibilities of individual contributors, as well as accountabilities for groups of Data Stewards.

6. **Checks-and-Balances** - Data Governance will define accountabilities in a manner that introduces checks-and-balances between business and technology teams as well as between those who create/collect information, those who manage it, those who use it, and those who introduce standards and compliance requirements.
7. **Standardisation** - Data Governance will introduce and support standardization of enterprise data.
8. **Change Management** - Data Governance will support proactive and reactive Change Management activities for reference data values and the structure/use of master data and metadata.

Roles and Responsibilities

Name	Description / Purpose
Head of Data & Technology	<ul style="list-style-type: none"> • Demonstrate and communicate management commitment for effective data governance • Approve major initiatives to enhance data governance
Information Security Manager	<ul style="list-style-type: none"> • Ensure that a register of information assets is maintained
Information Security Team	<ul style="list-style-type: none"> • Formulation of policy and procedure to support Honeysuckle Health's data governance requirements
Owners / Trustees	<ul style="list-style-type: none"> • Fostering a culture of value and protection of personal information in their business area
Stewards	<ul style="list-style-type: none"> • Data evangelism, find ways to create new ROI from data assets
Analysts / Scientists	<ul style="list-style-type: none"> • Consideration of correct usage of data
Software Developers / Data Engineers	<ul style="list-style-type: none"> • Considerations regarding the safe use, transmission and storage of data • Secure software development to protect data
Consumers	<ul style="list-style-type: none"> • Consideration of correct usage of data
All Staff / Contractors	<ul style="list-style-type: none"> • Awareness of data governance and relevant information security policies • Reporting data breaches to the Information Security Team

Data Classification and Handling

All Honeysuckle Health data sources are to be classified according to the [Information Classification and Handling policy](#) which also details the requirements for the handling of information.

Data Access

Access to Honeysuckle Health data is controlled according to the [Access Control Policy](#).

Any systems containing Confidential data are required to log all queries/data accessed in an auditable fashion.

Data Usage

Conditions relating to the usage of client data for various purposes is covered in the [Privacy Impact Assessment](#), statements of work, customer and vendor contracts.

These documents cover for example the approved use cases for personally identifiable data points which are far more restrictive than the de-identified datasets.

Some external dataset such as the Medicare Benefits Schedule, Prostheses Schedule and purchased IHPA ICD10/ACHI code lists also have restrictions on their usage which is made available to staff as required.

Lineage of Data

To fully understand how we are using various data sets and the source of data that makes it into the aggregate tables in our data warehouse a data lineage graph must be maintained across all data transformation projects.

To achieve this Honeysuckle Health will:

- Develop a convention for the naming of objects in the data warehouse that includes a way of identifying the owner of the data (E.G. "customer_")
- Create unique databases for each unique data source (E.G. Client, internal, purchased data set) that follow the agreed naming convention
- Utilise an industry standard build tool that can create lineage documentation through automation
- Where appropriate separate data transformation projects into logical code repositories
- Combine all data transformation projects into 1 central documentation source that includes data lineage graphs for all projects.

Data Asset Identification and Ownership

To spread responsibility of making sure that data is used correctly an ownership program will be established in line with our ISMS processes for information asset identification. A unique information asset will be identified for each dataset (E.g. customer, third party, internal) this owner will be responsible for the development and transformation of that data inside the data warehouse.

Honeysuckle Health will maintain an ISO 27001 compliant [Information Asset Register](#) to support the identification of assets and their owners.

Ownership for datasets will be included as a part of the metadata in the data lineage documentation to allow for easy identification. A process for the handover of data ownership will be developed to allow for the business to remain agile.

Data Quality

The quality and outcomes of the products and services that Honeysuckle Health offers is heavily dependent of the quality of the data that we have to work with. Either from customers, collected through our data collection platform or created through the delivery of Health Programs. Honeysuckle Health need to have a standardised and measurable way of maintaining the quality of our data. To meet this requirement Honeysuckle Health will:

- Develop a Data Quality Framework that considers the following dimensions:
 - Completeness
 - Consistency
 - Conformity
 - Accuracy
 - Integrity
 - Timeliness
- Regularly review the framework for consistency and alignment with business requirements

Data Transfer

[Information Security policies](#) have been defined to govern the way Honeysuckle Health staff are to share information with external and internal parties. These can be found in our [IT & Network Operations Policy](#).

Honeysuckle Health will work directly with external parties to agree on a secure data transfer method that meets the following requirements:

- Data is encrypted during transmission and at rest
- Access to data is strictly controlled
- Audit trails are maintained on both sides of the transfer process

Data Breach

Data breach events will be handled according to the Honeysuckle [Health Joint Data Breach Response](#) plan.

This plan covers the agreed roles, responsibilities and actions that are required by Honeysuckle Health, Honeysuckle Health shareholders and clients if an instance of data breach should occur.

Legal and Regulatory Compliance

We work across several jurisdictions in our delivery of services. Each state in Australia has their own privacy legislation. At a minimum all data usage must comply with:

- [Australian Privacy Act 1988](#)
- [Australian Privacy Principles](#)

All staff are required to complete compliance training to ensure familiarity with the relevant legislation.

As Honeysuckle Health begins to operate in more jurisdictions an appropriately skilled consultant will be engaged to outline any differences or risks to be aware of in terms of legal and regulatory compliance.

Data Retention and Disposal

There will be varying retention requirements for different information assets throughout the company. These will primarily be driven by legislative requirements or contractual obligations. The following is not an exhaustive list of information assets by the type of data that they contain.

Our [Data Retention and Disposal Policy](#) details out requirements for retention and destruction of data.

Information Security Policies

Overview

It is critical that our clients and customers have confidence in the way we handle confidential information when providing them with services. We do this by leveraging industry standard security solutions and best practices, keeping our customers well informed, and quickly responding to security issues when they arise.

This information security policy outlines the behaviour required by us all to protect the information of our clients, customers and the company. We ask that you take time to understand its contents and act accordingly.

Management's direction

Information security is important to us. Providing access to correct information in a timely manner to those authorised to access them enables our organisation to achieve its strategic objectives.

We are committed to implementing the policies, standards and procedures that will define our approach to managing the security of our information. These artefacts support our Information Security Management System (ISMS), that is closely aligned with industry standard ISO 27001:2013.

Our security objectives

Security objectives set measurable goals that can be monitored in order to evaluate the successful implementation of our policies. We have identified the following security objectives aligned with our ISMS objectives:

- Customers maintain confidence in the business
- Company growth is underpinned by secure processes and governance
- Processes are scalable as the business grows
- A culture of good security practice supports business
- Conformance expectations are met efficiently

Compliance with Regulation / Legislation

We are committed to complying with the applicable legislator and regulatory requirements in line with legislation and regulators detailed in Clause 4 of our ISMS Framework documentation.

Commitment to Continual Improvement

Honeysuckle Health recognise that a good management system requires continual improvement through performance evaluation and regular review.

Application

This policy is mandatory for all employees, contractors, consultants and other individuals performing work for us or on our behalf and is supported by a set of policies that apply to specific audience. Please refer to the table below:

Policy	Audience	Alignment with ISO Annex A
Information security (this policy) InfoSec Policy: Acceptable Use of IT InfoSec Policy: Information classification and handling InfoSec Policy: Remote Working InfoSec Policy: Clear Desk / Screen InfoSec Policy: Data privacy	All staff	A.5 A.6 A.8.2 A.9.3 A.11.2.8 A.11.2.9

InfoSec Policy: Personnel security InfoSec Policy: Security aspects of business continuity InfoSec Policy: Employee Screening InfoSec Policy: Employee Departure Procedure	HR and managers	A.7 A.17
InfoSec Policy: Data privacy	Customers, Partners, and Staff	A.18.1.4

Roles and responsibilities

Information security is everyone's responsibility, but some may have more responsibilities than others. The table below provides the details.

Role	Responsibilities
Leadership team, as the ISMS sponsor	<ul style="list-style-type: none"> To manage organisation-wide risks, which include information security risks. To ensure that a culture of security exists within the organisation
Information Security Manager, as the ISMS owner	To ensure that security controls continually reflect security policies across the organisation
Managers	To regularly review the policies for changes to compliance requirements
All personnel	To ensure that information security policies are adhered to

Policy framework

To be able to communicate them adequately, policies must be succinct and stable over time. Consequently, they will be supported by additional documents that will be relevant for you to read at the appropriate time.

Type	
Standards	Define an authorised approach to implementing a policy. For example: <ul style="list-style-type: none"> Disk wiping standard OS build standard
Procedures	Define an established method used to achieve a particular result. For example: <ul style="list-style-type: none"> Password reset
Guidelines	Provide additional details and context on a specific topic. For example: <ul style="list-style-type: none"> How to spot a phishing email

Compliance

Violation or failure to comply with this policy may result in disciplinary action. Any breach of this policy must be reported to the leadership team.

Exceptions

If you believe there is a business justification at an acceptable risk to this or any supporting policy, you may seek such exception by contacting the leadership team.

Policy Approval

Approved By	Head of Data & Technology

Application for authorisation under section 88(1) of the *Competition and Consumer Act 2010* (Cth)

Lodged by: Honeysuckle Health Pty Ltd

on behalf of itself and nib health funds limited

Confidential version

1. **Background**
- 1.1 This application is made to the Australian Competition and Consumer Commission (**ACCC**) by **Honeysuckle Health Pty Ltd (HH)** on behalf of itself and nib health funds limited (**nib**) (**Applicants**).
- 1.2 HH provides services to healthcare payers in Australia and New Zealand. These services currently include health analytics (e.g. measurement of impact of health interventions, population risk stratification and provider benchmarking), health management programs (e.g. telephonic programs to support patients transition from hospital and manage chronic diseases) and contract negotiation and management services for nib. HH is a joint venture between nib and Cigna. Both Cigna and nib own 50% of HH.
- 1.3 Cigna is a global health services company dedicated to improving the health, wellbeing and peace of mind of the customers it serves. All products and services are provided exclusively by or through operating subsidiaries of Cigna Corporation. Such products and services include an integrated suite of health services, such as medical, dental, behavioural health, pharmacy, vision, supplemental benefits, and other related products including group life, accident and disability insurance. nib is an Australian private health insurer with approximately 10% market share in Australia and provides health insurance products to three main market segments - Australian residents, international workers and international students. nib underwrites insurance products for several other brands including GU Health, Suncorp (APIA, AAMI and Suncorp) and Qantas.
- 1.4 From 1 October 2020, nib appointed HH to act as its agent to provide data analytics, contract negotiation, procurement and administration services in relation to nib's contracts with hospitals, medical specialists, general practitioners and allied health professionals (the contracting services). HH and nib seek authorisation for HH to provide the contracting services to additional health care payers and form a joint buying group (**HH Buying Group**) for the purposes of collective bargaining with providers to purchase health services. The Proposed Conduct does not involve a collective boycott. This application is made for the benefit of any healthcare payer who joins the HH Buying Group (**Participant**) which may include:
 - a) private health insurers registered under the *Private Health Insurance (Prudential Supervision) Act 2015* (Cth);
 - b) international medical and travel insurance companies;
 - c) government and semi-government payers of healthcare services such as workers' compensation and transport accident scheme operators and Department of Veterans Affairs scheme (**DVA**); and
 - d) any other payer of health services as notified by HH to the ACCC(**healthcare payers**).
- 1.5 In the short term, the most likely Participants are private health insurers. Currently, the four largest health insurers, Medibank, Bupa, HCF and HBF, undertake the contracting services as an internal function.¹ The remaining health insurers engage in collective bargaining through one of two buying groups, the Australian Health Services Alliance (**AHSA**) and the Australian Regional Health Group (**ARHG**). Of the 36 private health insurers, the AHSA represents 27 and the ARHG represents four. The Applicant anticipates that private health insurers that currently outsource their contracting services to AHSA or ARHG are the healthcare payers that are most likely to join the HH Buying Group. The major health insurers are unlikely to join the HH Buying Group but may be interested in purchasing bespoke parts of the contracting services to supplement their internal contracting function. nib was previously a member of AHSA and it withdrew from AHSA in 2011 when it built its own internal contracting function.

¹ Honeysuckle Health's understanding is that HBF contract directly with hospitals in WA and indirectly through the AHSA for all other states

- 1.6 Health insurers pay benefits for health services under health insurance policies issued to individuals. Customers generally make claims for benefits on-the-spot with a Provider at the time they are receiving treatment (eg. through electronic claiming system or at a private hospital). The Provider receives benefits directly from the insurer and may collect any additional amounts from the Customer (known as 'gaps').
- 1.7 Under contracting arrangements between health insurers and Providers, Providers generally agree not to charge a gap to the Customer (for some or all services) and health insurers agree to pay more in benefits. This creates a network of Providers that health insurers can promote as being health services where their Customers can receive a no gap or known gap experience.
- 1.8 For other types of healthcare payers such as international medical, travel and life insurance companies, as well as government and semi-government payers of healthcare services (Other Healthcare Payers), payment to Providers usually occurs pursuant to the terms of the insurance policy or the liability scheme, and the fee is usually paid in full by these types of healthcare payers. Accordingly, there is less likely to be a 'gap' exposure for consumers and therefore, less likely for these types of insurers to negotiate contract arrangements with Providers. As a result, we do not expect these types of healthcare payers to form a material portion of the HH Buying Group.

2. Parties to the proposed conduct

2.1 Applicant for authorisation:

- (a) Honeysuckle Health Pty Ltd (ACN 637 339 694)

Address (registered address)	Contact person	Description of business activities
1/6 Newcomen St, Newcastle NSW 2300	Rhod McKensy Chief Executive Officer +61 406 380 017 r.mckensy@honeysucklehealth.com.au	Honeysuckle Health provides services to health payers in Australia and New Zealand including the contracting services, health data analytics, health measurement programs and health management programs.

- (b) nib health funds limited (ACN 000 124 381)

Address (registered address)	Contact person	Description of business activities
22 Honeysuckle Drive, Newcastle NSW 2300	Roslyn Toms General Counsel +61 408 733 740 R.Toms@nib.com.au	nib is an Australian health insurer with approximately 10 per cent market share in Australia. It provides insurance to three predominant markets: Australian residents, international workers and international students. nib underwrites GU Health, Suncorp and Qantas health insurance.

2.3 Details of other classes of persons on whose behalf authorisation is sought

2.4 The class of persons who may engage in the Proposed Conduct other than the Applicant, are healthcare payers who wish to become Participants.

2.5 Description of the Proposed Conduct

Structure of HH Buying Group

2.6 HH is seeking authorisation to undertake the contracting services, for healthcare payers in relation to hospitals, medical specialists, general practitioners and allied health professionals (**Providers**), as further described below (the **Proposed Conduct**).

2.7 HH intends to negotiate a bilateral participation agreement with each Participant to undertake the contracting services in relation to some or all of the Providers. Participants can opt to purchase some or all of the different categories of contracting services.

2.8 In relation to negotiated contracts (with hospitals and medical specialists), HH proposes to implement the Proposed Conduct by using nib's existing contracts with Providers, with the consent of the Providers. HH will negotiate with Providers to purchase their services on behalf of the Participants using the same base agreement that the Provider has negotiated with nib. HH will then negotiate new contracts on behalf of Participants as the nib-based contracts expire or enter into contracts with new Providers. The Participants will unilaterally determine whether to enter into an agreement with each Provider based on the negotiated terms and conditions. If they choose to do so, Participants will execute an agreement with the Provider. HH will not be party to the agreement. HH will then undertake contract administration services for that agreement.

2.9 If Participants do not wish to enter into an agreement on the negotiated terms and conditions, Participants will still be permitted to negotiate directly with Providers and enter into agreements independently of the HH Buying Group on their own terms and conditions. This could either be completed between the provider and the fund or, alternatively, with HH acting as an agent for the fund but outside of the buying group terms, conditions and offer. Furthermore, the Proposed Conduct will not prevent Providers from offering healthcare services to other insurers, buying groups or healthcare payers that are not participating in the HH buying group, and will not restrict the terms and conditions on which the Provider is entitled to enter those agreements. Providers will also not be prevented from contracting with Participants individually, or with a different set of participants than that proposed by the HH buying group.

2.10 For contracts with Providers based on standard terms and conditions (medical gap scheme and general treatment networks), HH proposes to extend these schemes to the Participants and would provide sufficient notice to Providers to enable Providers to operationalise the change.

2.11 Authorisation is not sought for the HH Buying Group to engage in the collective boycott of any services of a Provider.

Nature of contracting relationships with Providers

2.12 The Proposed Conduct will involve the provision of four broad categories of contracts including hospital contracting, medical specialist contracting, medical gap scheme and general treatment contracting. These are described in detail below.

Hospital contracting

2.13 Hospital contracting involves agreements between healthcare payers and private hospitals (occasionally public hospitals) under which the parties agree on the rates and other terms and

conditions for the provision of hospital treatment to the healthcare payer's customers (**Customers**). In the private health insurance industry, the agreements are referred to as hospital purchaser provider agreements (**HPPAs**). Under HPPAs, hospitals agree not to charge out-of-pocket costs to Customers and are used by health insurers to provide financial certainty to its Customers.

- 2.14 nib has a network of private hospitals that have HPPAs with nib and HH is providing contracting services for that network on behalf of nib.

Medical specialist contracting

- 2.15 Medical specialist contracting refers to agreements between healthcare payers and medical specialists such as radiologists, pathologists and surgeons. The parties agree on rates and other terms and conditions for the provision of the medical specialists' professional services during the hospital admission of Customers. In the private health insurance industry, the agreements are referred to as medical purchaser provider agreements (**MPPAs**). MPPAs are used by health insurers to provide financial certainty to its Customers in relation to potential out-of-pocket costs for professional services. The network of MPPAs that nib currently has in place falls into two categories – MPPAs with radiologists and pathologists and the MPPAs for the Clinical Partners Program.

- 2.16 nib's MPPAs with radiologists and pathologists are entered into with radiologists and pathologists that provide services such as x-rays, ultrasounds and blood tests to Customers during their admission at a private hospital that is part of nib's network (ie. nib has an HPPA with that private hospital). These services are not included in the scope of services that are provided to Customers by the private hospital. They are services provided directly to the Customer by the radiologist or pathologist under separate contractual arrangements with the Customer. Without an MPPA, Customers may incur out-of-pocket expenses for the radiology and pathology services received during a hospital admission.

- 2.17 Under nib's Clinical Partners program, nib has entered into MPPAs with orthopaedic surgeons, anaesthetists and assistant surgeons for the provision of their professional services for orthopaedic joint replacements provided to Customers. Under these MPPAs, the medical specialists agree on fees paid by nib for their services and agree not to charge Customers any gap for their professional services. The medical specialists are paid a higher fee than what they would otherwise be entitled under nib's medical gap scheme. The medical specialists also agree on data sharing and quality target requirements. Unlike nib's medical gap scheme, Clinical Partners Providers cannot choose to opt-out of the program on a patient-by-patient basis. This provides certainty that all nib customers will have a no gap experience with these medical specialists.

Medical gap scheme

- 2.18 Under medical gap schemes, health insurers offer to pay medical specialists a set fee for each type of professional service they provide to Customers in hospital, in accordance with a standard set of terms and conditions. The set fees are higher than what insurers are otherwise required to pay under the PHI Act and medical specialists agree not to charge Customers an out-of-pocket amount or agree to limit the amount the Customer is charged at a fixed amount (eg. \$500) in the case of known gap schemes.
- 2.19 Medical specialists registered under a medical gap scheme are permitted to opt-in or opt-out of the scheme on a case by case basis (per treatment and Customer). By opting-in, the medical specialist agrees to be bound by the terms and conditions of the medical gap scheme.
- 2.20 Currently, HH acts on behalf of nib in the management and administration of the nib MediGap scheme (no-gap scheme) that applies to nib, Qantas and Suncorp-branded health insurance policies and the GU Health Medical Gap Network (no-gap or known gap scheme) that applies to GU Health-branded health insurance policies.

General treatment networks

- 2.21 General treatment networks are arrangements with Providers for services that are not provided in hospital. These providers generally include physiotherapists, dentists, optometrists and chiropractors which are covered under the 'extras' component of private health insurance products. It also includes a network of general practitioners and medical specialists providing professional services out-of-hospital for international students and international workers covered under international health products (health insurers are prohibited from covering these services for Australian residents).
- 2.22 Providers that are registered with a general treatment network, agree to a standard set of terms and conditions and schedule of rates for each type of service.

HH acts on behalf of nib in the management and administration of its general treatment network branded as the First Choice Network. nib has two bespoke agreements with optical and dental providers under which the providers operate nib-branded centres. HH also manages these agreements.

Nature of Proposed Conduct

- 2.23 In relation to the four types of contracts, the Proposed Conduct will involve HH engaging in the following types of services:
- (a) for hospital and medical specialist contracting, contract negotiations with Providers;
 - (b) for the medical gap scheme and general treatment network, management and administration of the schemes; and
 - (c) for all four types of contracting, data analytics, contract management and dispute resolution.

Data analytics and contract negotiations

- 2.24 HH will initially engage in collective negotiations with Providers that currently have HPPAs and MPPAs with nib in order to agree to new contracts with the Participants based on the Provider's existing agreement with nib.
- 2.25 On an ongoing basis, HH will negotiate new HPPAs and MPPAs on behalf of nib and all Participants as the current agreements expire or with new Providers. HH will act as the lead agent in the negotiations after consultation with the Participants. This will involve:
- (a) aggregation of Participant claims data for the Provider and undertaking data analytics to establish benchmarks relating to quality of service, price and application of services (see further details below);
 - (b) conducting collective commercial negotiations on behalf of Participants based on information of the HH Buying Group. HH will negotiate one set of terms and conditions including price schedules, business rules for payment of benefits and quality and performance targets for all Participants for each HPPA or MPPA with a Provider; and
 - (c) once HH receives instructions that a Participant wishes to enter into an HPPA or MPPA on the negotiated terms and conditions, coordinate the execution of the HPPA or MPPA between the Participant and the Provider (or execute the contract if HH has signing authority).
- 2.26 The HH Buying Group will be voluntary and the Participants will unilaterally determine whether to enter into an HPPA or MPPA based on the terms and conditions negotiated by HH.

Extension and management of medical gap scheme and general treatment network

- 2.27 HH will initially engage with Providers registered in the nib MediGap Scheme, GU Health Medical Gap Network and the First Choice Network to notify them of the extension of these schemes to the Participants.

- 2.28 HH intends to replace the nib Medigap scheme and the GU Health Medical Gap Network with a new HH scheme which will have some variations in the terms and conditions.
- 2.29 For general treatment networks, HH intends to create new specific networks tailored to meet a Participant or group of Participants' individual requirements such as the requirement to have a strong network of Providers in a regional area or to have a fee structure that is more suited to the manner in which some Participants pay benefits.
- 2.30 On an ongoing basis, HH will manage the medical gap scheme and general treatment networks, review the schedules of rates and terms and conditions and actively manage the registered Providers of the schemes and networks. This includes ensuring adherence to requirements around registration, qualification and other terms and conditions of the schemes and networks.

Contract management and dispute resolution

- 2.31 HH will offer to provide the Participants with contract administration and management services and dispute resolution services on behalf of nib and all Participants for the contracting services that they engaged HH to undertake which may include:
- (a) all HPPAs and MPPAs that were entered into by the Participants based on the terms and conditions negotiated by HH; and
 - (b) the agreements between Participants and Providers registered in the medical gap scheme and/or general treatment network,

(Managed Agreements).

- 2.32 This will involve HH acting as agent for the HH Buying Group to facilitate:
- (a) administration of, and compliance with, the terms and conditions of the Managed Agreements;
 - (b) dispute resolution and management of disputes between Participants and Providers arising under the Managed Agreements;
 - (c) management and investigation of Customer complaints relating to Providers party to the Managed Agreements;
 - (d) collection and management of data submission from Providers to Participants under the Managed Agreements; and
 - (e) reporting and oversight of the parties' adherence to terms and conditions of the Managed Agreements and performance and quality targets.

Data analytics

- 2.33 HH will provide the Participants with data analytic services as part of contract negotiations but also on an ongoing basis to assess the performance of each Provider and benchmark their performance for each Participant against the aggregated data for the HH Buying Group including an assessment of:
- (a) Provider quality (e.g. rate of hospital acquired complication, length of hospital stay, unplanned readmission to theatre, conversion to ICU, etc.)
 - (b) Provider Compliance (e.g. accuracy of claims, compliance with the contract terms, complaints, etc.);
 - (c) benefits paid to the Provider by Participants (e.g. cost per episode against national peer groups, change in cost over time, cost variability reporting across the Provider network, etc);

- (d) access to the Provider's services (e.g. network coverage, member access issues, etc); and
 - (e) efficiency and value of treatment provided by the Provider (e.g. establishment of quality scoring of Providers and ranking of value and efficiency against quality).
- 2.34 Subject to confidentiality and privacy obligations, HH would also share information pertaining to one Participant with the HH Buying Group to the extent the information is related to the Managed Agreements or services provided by HH to the Participants. This may include the sharing of information on issues such as a breach of contract by a Provider or the discovery of fraudulent claims made by a Provider in relation to the Managed Agreement of one Participant which would be relevant to other Participants who contract with that Provider.
- 2.35 Provisions of the CCA which may apply to the Proposed Conduct
- 2.36 The relevant provisions of the CCA which may apply to the Proposed Conduct include:
- (a) making or giving effect to a contract, arrangement or understanding that may include a cartel provision (Division 1 of Part IV);
 - (b) making or giving effect to a contract, arrangement or understanding that has the purpose or would have the effect, or likely effect, of substantially lessening competition (section 45(1)(a) and (b));
 - (c) engaging with one or more persons in a concerted practice that has the purpose or has or is likely to have the effect, of substantially lessening competition (section 45(1)(c));
 - (d) a corporation that has a substantial degree of power in a market engaging in conduct that has the purpose, or has or is likely to have the effect, of substantially lessening competition (section 46(1)); and / or
 - (e) engaging in the practice of exclusive dealing (section 47(1)).
- 2.37 Rationale for the Proposed Conduct
- 2.38 The rationale for the Proposed Conduct is to enable Participants to streamline contract negotiation, procurement and management procedures. The streamlined processes will improve efficiencies by virtue of the reduced transactional and administrative costs, and increase information sharing and data analytical capabilities resulting in better health outcomes and reduced premiums for Customers.
- 2.39 Term of authorisation sought and reasons for seeking this period of time
- 2.40 Authorisation for the Proposed Conduct is sought for 10 years from the date of final determination by the ACCC.
- 2.41 Given it is common practice for HPPAs and MPPAs to be 3 years duration, authorisation for 10 years will enable the HH Buying Group to continue to operate across two renewal cycles. It will also allow sufficient time for HH to implement innovative models of funding of healthcare that focus on driving quality and providing value, and for Participants and their Customers to realise the cost, quality and efficiency benefits of engaging in the HH Buying Group.
- 2.42 Provide documents submitted to the applicant's board or prepared by or for the applicant's senior management for purposes of assessing or making a decision in relation to the proposed conduct and any minutes or record of the decision made
- 2.43 None.
- 2.44 Names of persons or classes of persons who may be impacted by the Proposed Conduct and details of how / why they might be impacted

2.45 The class of persons potentially affected by the Proposed Conduct are:

- (a) private health insurers that do not join the HH Buying Group;
- (b) private hospitals;
- (c) medical specialists and general practitioners; and
- (d) allied health providers such as physiotherapists, dentists, optometrists, chiropractors.

Please refer to section 4 below as to how each class of persons may be impacted.

3. Market information and concentration

3.1 Describe the products and/or services, and the geographic areas, supplied by the applicants. Identify all products and services in which two or more parties to the proposed conduct overlap (compete with each other) or have a vertical relationship (e.g. supplier-customer).

3.2 The Applicants submit that the relevant markets are:

- (a) national market for private health insurance;
- (b) national market for international medical and travel insurance;
- (c) State-based or localised market for hospital services;
- (d) localised market for medical specialist services for each specialty practice; and
- (e) localised market for each type of allied health service (eg. physiotherapists, dentists, optometrists, chiropractors, etc).

3.3 nib and the Participants compete with each other as purchasers of health services in the markets set out in paragraphs (c) to (e) above and as suppliers of private health insurance.

Private health insurance market

3.4 The market share of each private health insurer, measured as a share of total hospital policies as at June 2019 are set out in the table below.² The table also sets out which party undertakes contracting services for each private health insurer.³

Insurer	Party that undertakes contracting services	National Market Share Hospital Policies June 2019
Medibank	Medibank	26.0%
Bupa	Bupa	25.1%
HCF	HCF	11.7%
nib	HH	9.5%
HBF	HBF and AHSA	6.9% ⁴
Australian Unity	AHSA	2.9%
Teachers Health	AHSA	2.7%

² *Operations of Private Health Insurers Annual Report 2018-2019*, published by APRA on 5 November 2019.

³ Sourced from market knowledge and information available on AHSA's and ARHG's websites respectively.

⁴ HBF contract directly with hospitals in WA and indirectly through the AHSA for all other States and Territories. HBF's policyholders in WA represent a national market share of 6.14%. HBF's policyholders in other States and Territories represent a national market share of 0.72%.

GMHBA	AHSA	2.5%
Defence Health	AHSA	2.2%
CBHS Health	AHSA	1.7%
HIF	AHSA	0.8%
Westfund	AHSA	0.7%
Queensland Teachers	AHSA	0.6%
health.com.au	AHSA	0.6%
Health Partners	AHSA	0.6%
CUA	AHSA	0.6%
Peoplecare	AHSA	0.5%
Queensland Country Health	AHSA	0.5%
Railway & Transport	AHSA	0.4%
Doctors' Health Fund	AHSA	0.4%
Police Health	AHSA	0.3%
Navy Health	AHSA	0.3%
MO Health	AHSA	0.2%
Phoenix Health	AHSA	0.2%
National Health Benefits Australia	AHSA	0.1%
Health Care Insurance	AHSA	0.1%
Transport Health	AHSA	0.1%
ACA Health	AHSA	0.1%
Nurses & Midwives Health	AHSA	0.1%
Reserve Bank Health	AHSA	0.0%
Emergency Services Health	AHSA	0.0%
CBHS Corporate Health	AHSA	0.0%
Latrobe Health	ARHG	0.8%
St Lukes Health	ARHG	0.5%
Mildura District Hospital Fund	ARHG	0.2%
Cessnock District Health	ARHG	0.0%

3.5 Market shares as purchasers of health services is shown in the table below. Note that our understanding is that HBF contract directly with hospitals in WA and indirectly through the AHSA for all other States and Territories.

Party undertaking contracting services	Participating health insurers' market share based on 2019 hospital policies
Medibank	26.0%
Bupa	25.1%
AHSA	20.0%
HCF	11.7%
Honeysuckle Health	9.5%
HBF	6.1%
ARHG	1.5%

3.6 We have also provided in Annexure A market shares based on total policies and revenue.

Market for Other Healthcare Payers

3.7 A useful lens through which to define the market for private healthcare is examining the sources of health expenditure funds. The Australian Institute of Health and Welfare (**AIHW**) publish detailed data on this topic. A key table from their 2018-2019 health expenditure data is shown below.

Table A3: Total health expenditure, current prices, by area of expenditure and source of funds, 2018-19 (\$ million)

Area of expenditure	Government						Non-government				Total health expenditure
	Australian Government				State and local	Total	HIF	Individuals	Other	Total	
	DVA	Health and other	Premium rebates	Total							
Hospitals	1,321	23,702	3,332	28,354	33,280	61,634	9,689	3,689	4,036	17,415	79,049
Public hospital services	579	23,582	342	24,504	32,229	56,732	995	1,444	2,630	5,068	61,801
Private hospitals	741	120	2,989	3,851	1,051	4,902	8,694	2,246	1,407	12,347	17,248

.. not applicable

— rounded to zero

Source: <https://www.aihw.gov.au/reports/health-welfare-expenditure/health-expenditure-australia-2018-19/data>

3.8 Focusing on the \$17,248 million expenditure on private hospitals, reallocating the Premium rebates column (which represents the Australian Government's contribution to private health insurance premiums through the Australian Government Rebate) back to health insurance and including a breakdown of the "Other" column from Table 3.16 of the same report to include Workers compensation insurers and transport accident insurers produces the following table:

Private hospital funder	\$ millions	Share
Private health insurers	11,683	67.7%
Individuals	2,246	13.0%
State and local government	1,051	6.1%
DVA	741	4.3%
Workers' compensation insurers	400	2.3%
Transport accident insurers	256	1.5%
Other Federal government	120	0.7%
Unknown	751	4.4%
	17,248	100.0%

- 3.9 Private health insurers and individuals account for 80.7% of revenue received by private hospital operators. DVA represents 4.3%, workers compensation insurers throughout Australia 2.3% and transport accident insurers 1.5%. There is a remaining Unknown percentage of 4.4%.

Market for travel insurance and short-term International Private Medical Insurance

- 3.10 Included in either the Individuals spend of \$2.2 billion or the Unknown spend of \$751 million, is hospitalisation for overseas tourists and short-term overseas workers. Typically, tourists and short-term workers take out insurance in their home country before travelling to Australia. Given their lack of scale in the Australian market, the overseas domiciled insurer will usually not have negotiated network access arrangements in Australia.
- 3.11 If the traveller requires medical services whilst in Australia, they will be required to pay the “rack rate” for the service out-of-pocket and then seek reimbursement from their insurer when they arrive home. One of the issues this creates is a bad debt risk for the hospital provider. Due to the lack of a certainty of payment, hospital providers embed within the “rack rate” a loading to offset the risk of the overseas visitor leaving the country without paying their bill. For international travel insurers, without the volume and local knowledge to develop networks, the increased “cost of production” is passed through to travellers in the form of higher insurance premiums.
- 3.12 nib has been approached by a number of these companies over the last 4-5 years seeking to negotiate “network access” arrangements. The size of these potential contracts is small - combined these groups would represent less than 0.5% of the total market for private hospital services.

Department of Veterans Affairs (DVA) scheme

- 3.13 Under the DVA scheme, eligible veterans are able to receive hospital services free with no gap expenses. The DVA arrangements represent a 4.3% share of the total expenditure on private hospitals and involve contracting directly with private hospitals through a tender process for the provision of the healthcare services. For GPs and medical specialists, the DVA maintains their own no-gap scheme. This involves contracting individually with these types of Providers.
- 3.14 DVA policyholders are not required to make any co-payment to medical specialists or hospitals. The average age of the DVA population is rapidly increasing and, consequently this segment of the market is reducing in activity and relevance with hospital providers. As this reduction continues it will place increasing price pressure on DVA as they lose market share and power to obtain competitive rates.

Workers compensation schemes

- 3.15 Each of the eight Australian states and territories has their own workers' compensation scheme and the Commonwealth has three separate schemes. As per the table above, workers compensation schemes in total represent 2.3% of total private hospital funding. New South Wales has the largest scheme and would represent approximately 0.7% of total private hospital funding.

- 3.16 Each scheme manages their own contracts with medical and hospital providers. For example, the NSW scheme, administered by icare, has recently experienced significant increases in medical costs. icare is required to pay surgical fees that are gazetted by the State Insurance Regulatory Authority (**SIRA**). These gazetted rates are set by SIRA at 150% of the Australian Medical Association's (**AMA**) recommended rate.
- 3.17 This is higher than any other Australian workers compensation scheme and much higher than private health insurer and DVA scheme. For example, nib's Medigap scheme is set at an average of 50% of the AMA's recommended rates and the DVA scheme is set at 52%.
- 3.18 Ultimately these higher specialist fees are passed through to NSW companies in the form of higher workers' compensation premiums.

Transport Accident Schemes

- 3.19 Each Australian state runs its own compulsory transport accident insurance scheme. In NSW, Queensland, South Australia and the ACT, drivers can choose from a panel of compulsory third party (**CTP**) providers. In the other States, transport accident schemes are provided by a state-owned or government-licensed insurer. As per the table above, transport accident insurers represent 1.5% of total private hospital funding. Similar to workers compensation schemes, transport accident insurers typically manage their own contracts with medical and hospital providers.

Private hospital market

- 3.20 The table below shows the market shares of private hospital provider large groups.⁵

Hospital Provider Group	Market share
Ramsay	21.6%
Healthscope	13.7%
Healthcare	9.3%
St John of God	5.5%
St Vincents Health	3.4%
Mater Misericordiae Limited	3.1%
Little Company of Mary	3.1%

- 3.21 Describe the relevant industry or industries. Where relevant, describe the sales process, the supply chains of any products or services involved, and the manufacturing process.
- 3.22 Please refer to section 1 (Background).
- 3.23 In respect of the overlapping products and/or services identified, provide estimated market shares for each of the parties where readily available.
- 3.24 Please refer to section 3 for market shares of nib and potential Participants.
- 3.25 In assessing an application for authorisation, the ACCC takes into account competition faced by the parties to the proposed conduct. Describe the factors that would limit or prevent any ability for the parties involved to raise prices, reduce quality or choice, reduce innovation, or coordinate rather than compete vigorously. For example, describe: existing competitors, likely entry by new

⁵ Compiled by nib based on publicly available sources.

competitors, any countervailing power of customers and/or suppliers; and any other relevant factors.

- 3.26 Please refer to section 6 (Public Detriments) for an analysis of each health services market and any potential impacts on competition from the Proposed Conduct.
- 3.27 In relation to the market for private health insurance, insurers are highly regulated and any increase in premiums is subject to approval by the Commonwealth Minister for Health on an annual basis. The Minister has an expectation that the industry will limit premium increases to a target percentage which places pressure on health insurers to keep costs down and they have limited ability to increase premiums in response to health inflation. Therefore, coordination among competitors in the HH Buying Group will not lead to premium increases for Consumers and will in fact do the opposite and drive down costs (administrative and benefit outlays) to support Participants in keeping premium increases low.

4. Public benefits

- 4.1 Describe the benefits to the public that are likely to result from the proposed conduct. Provide information, data, documents or other evidence relevant to the ACCC's assessment of the public benefits.
- 4.2 The Proposed Conduct will generate public benefits in the form of transaction costs savings and efficiencies for healthcare payers, healthcare providers and members, encouraging transition towards value based contracting and information sharing resulting in better health outcomes for consumers at a lower cost resulting in more efficient pricing for hospital services and ultimately, reduced premiums for consumers. As private health insurers constitute the vast majority of purchasers of private health care (around 70% of private hospital services according to AIHW data), we will focus on public benefits in the private health insurance industry.

Transaction costs savings and increased efficiencies

- 4.3 Authorisation for HH to engage in collective bargaining will result in significant transactional and administrative cost savings for Participants. nib's network of Providers consists of:
- (a) 565 private hospitals;
 - (b) 21,764 medical specialists;
 - (c) 3,049 general treatment clinics and over 15,900 providers.

This requires nib to:

- (d) negotiate over 500 contracts per year; and
 - (e) manage over 3,500 agreements.
- 4.4 The negotiation of HPPAs in particular can be time consuming and at times, protracted with some HPPAs taking up to 16 months to negotiate and the average large hospital group negotiation taking between 6 to 8 months. The process involves complex negotiation on legislative issues, terms and conditions relating to payment structures, audit, recoveries and obligations by both parties as well as the associated business rules and clauses which detail the nature of how payments are made for health care services (which are volatile in nature due to each individual's condition). Some hospital group HPPAs involve up to 70 hospitals. In addition to negotiating the general contractual terms, each hospital in a hospital group will have an individual rate schedule (list of prices for hospital treatment) and each is negotiated individually with the requisition commercial modelling to be done at the individual level and then "rolled up" to understand both party's (fund and hospital groups) material change in value of the contract. As the business rules and contractual terms impact this modelling the processes generally involves a number of in-person meetings (in particular at commencement of negotiation) before weekly meetings to cover off specific areas and issues. A working document (contract) is created and a separate issues log maintained on the negotiation. The working document is exchanged periodically between the

parties and is marked up with comments, issues, requested changes etc. Once the contract terms are close to finalisation the rate modelling commences with each hospital and these rate schedules are exchanged in a similar manner to allow each organisation to model the predicted impact in change of terms (contract clauses), payment models for each service (daily rate to Diagnosis Related Grouping) and price. The modelling is generally conducted on an agreed period of 12 months of previous activity. Once all parties are satisfied with the outcome the negotiation is finalised and contracts executed. On issues which cannot be resolved, these are generally escalated by one or both parties to more senior staff and or executives to resolve. Once a position has been agreed at this higher level it is then briefed back to the negotiation teams who work together to ensure it is adequately reflected in the contractual terms.

- 4.5 Historically, nib's health services contracting function required approximately 25 staff and cost approximately \$5 million per annum to operate. The size and cost of this function is largely independent of the size of the health insurer. Any health insurer that has national coverage and maintains its own health services contracting function would need to support a function of a similar size due to the breadth of the Provider networks.
- 4.6 The HH Buying Group would reduce the need for duplication of the resources and processes involved in the contracting services and reduce costs for Participants. Economies of scale and scope would be realised as each Participant joins the HH Buying Group and greater efficiencies achieved. Under the HH Buying Group, it is proposed that the fee for Participants would correlate with transactional costs so that any savings that arise as Participant numbers increase, would be distributed between Participants under the Participation Agreement through reduced fees.
- 4.7 The formation of the HH Buying Group to perform the contracting services will create significant administrative cost savings as each Participant does not need to replicate the same infrastructure. As HH is currently undertaking this function, the marginal cost of HH performing the contracting services for each Participant would be low. HH would distribute the cost of undertaking nib's contracting services across the Participants, thereby significantly reducing each Participant's costs and presenting an opportunity for transaction cost savings and increased efficiencies. We have set out in Annexure B an example of how the participation fee for the HH Buying Group would decline as Participants join.
- 4.8 These efficiencies can be realised with health insurers that are already part of the AHSA or ARHG buying groups. HH modelling suggests that the participation fee for the HH Buying Group will be competitive with the AHSA's or ARHG's membership fees and would provide a broader scope of services particularly in relation to data analytics. In any case, the HH participation fees would be substantially lower than running an effective internal function. We have set out in Annexure C the basis of the modelling undertaken by HH in comparing the competitiveness of the participation fee for the HH Buying Group with other buying groups.
- 4.9 The Proposed Conduct will also create the following benefit for the Providers (albeit more limited if most of the Participants were previous members of AHSA or ARHG):
 - (a) simplifies backend billing processes as the Participants would have the same contract, rates and billing rules which results in significant reduction to the operational and administrative costs for Providers;
 - (b) consistent funding agreements enable Providers to more easily establish care pathways and work with medical specialists on improving the quality and cost of health care; and
 - (c) reduced cost to negotiate and manage relationships with health insurers. Negotiation of agreements, particularly HPPAs, create a significant burden and cost to Providers and having reduced numbers of negotiations allow Providers to reduce the costs associated with establishing, negotiating and managing contracts with health insurers.

Greater choice of buying group

- 4.10 The HH Buying Group would provide health insurers with an alternative buying group to the AHSA and provide greater choice. ARHG is not a viable alternative to AHSA for health insurers because

of their lack of scale and ability to implement more sophisticated contracting mechanisms. Increased competition between different buying groups would also foster greater innovation and incentivise the buying groups to provide better value and quality of services to its participants.

- 4.11 The HH Buying Group would provide a differentiated model of funding such as value-based contracting, as further described below, and a buying group model that has been authorised by the ACCC.

Better health outcomes at a lower cost

- 4.12 HH intends to work collaboratively with Providers to implement more efficient "value-based" contracting relationships. In relation to hospital contracting, this type of contracting involves comparing health outcomes with costs of services to determine the value of the service. The agreed contracting price for healthcare services will be informed by the value of the service, rather than on the existing cost base. This transition from "fee-for-service" to "value-based" contracting aligns with many other health systems globally which have seen improvements in health outcomes and reduced costs from the transition. As an example, in the United States, Cigna created its first commercial value-based model in 2008. Today, 67% of Cigna's claim spend in the United States has shifted to value-based models. Cigna continues to grow its value-based models and expects to have over 1,000 value-based arrangements across hospitals, specialists, and general practitioner groups in 2021.
- 4.13 As a result of its shift to value-based contracting, Cigna has been able to improve cost outcomes and quality outcomes over time. From 2010 to 2018, Cigna had the lowest reported medical cost trend in the US at 3.6% (key competitors were between 5.5% and 6.0%). By 2021, Cigna is ambitiously targeting to manage medical cost trend to the same level as CPI. Value-based reimbursement arrangements have been a key component of that success.
- 4.14 More specifically, Cigna has seen very strong results in its top performing value-based arrangements:
- 11% better quality scores than market for primary care providers;
 - 14% improved costs for specialist groups; and
 - 2% lower readmission rates for hospitals.
- 4.15 Value based contracting takes many forms. In its most simple form, HH would initially compare the value of services from a particular Provider against peers in the local region, state as well as nationally. Based on the outcomes and quality of care achieved by the Provider, the cost of the services would be adjusted (either through price or structure) to match the value being delivered by the Provider. If the Provider achieves higher than standard quality outcomes, then the insurers would pay more to the Provider and if the standard quality outcomes were below average, insurers would pay less for these services. The mechanism for this adjustment would form part of the commercial negotiations process and could take a number of forms including price adjustment to reflect the quality of service, payment of performance incentives if agreed benchmark outcomes are exceeded or changes to payment structures which drive improved efficiency to match the outcomes associated with the Provider.
- 4.16 Current approaches to contracting generally focus solely on cost of care of the services and most funds, and buying groups such as the AHSA and ARHG, have historically focused on cost of care to determine payment structure and price of services. Larger funds tend to have greater access to the complex analytics and data science required to support the development of value-based funding models. Through the HH Buying Group for small and medium funds, it will effectively improve and normalise the Participants' ability to manage benefit outlay and match larger more mature competitors in accessing value based contracting services.
- 4.17 Health systems that have moved to value-based contracting, which by definition, better aligns incentives between the payer and provider, have seen both improvements in health outcomes and lower costs. This shift is fundamentally underpinned by broad data and mature and sophisticated

data science capabilities. The establishment of outcomes data is complex by its nature and requires the collection of sufficient data for statistical relevance (which is difficult, if not exclusionary requirement for small insurers), the establishment of outcome measures and quality based on relevant clinical and international literature, and the normalisation and risk adjustment of the patient population to ensure like-for-like comparison in the provision of services.

- 4.18 HH intends to collect and aggregate claims data and Hospital Casemix Protocol (HCP) data of Participants to establish benchmarks on the outcome of services in relation to both procedures and Diagnosis Related Grouping (DRG). This outcomes-based data would then be normalised and risk-adjusted for the variances in patient population (e.g. age, co-morbidities and demographic factors including gender) and a relative outcome scale established for each Provider at a procedure level. This would include quality data and information such as Hospital Acquired Complications as well as efficiency data such as excessive bed days or excessive use of Medicare Benefits Schedule (**MBS**) item numbers.
- 4.19 Once the quality scoring is established, HH will be able to use this benchmarking to assign a relative value score to each Provider at a procedure or DRG level as well as an aggregated weighted average for the Provider. This will then inform the basis for price and payment structure negotiations of HPPAs and will drive improved outcomes for Participants through more appropriate pricing at a procedure level for hospitals service purchased. Ultimately this will drive improved outcomes for Customers as they benefit from improvements in the quality of service from Providers or through more sustainable and affordable private health insurance due to better control by Participants of benefit outlay.
- 4.20 Additionally, the Proposed Conduct will encourage greater involvement by Providers in the lifecycle of the contracting process. The potential size and calibre of the HH Buying Group will drive uptake of value-based contracting by encouraging healthcare providers to be more engaged in innovative funding models that improve outcomes for Customers.
- 4.21 In relation to general treatment networks, such as dental networks, the ability to collectively acquire these services on behalf of a number of insurers will see improved volume provided to the Providers of these services who have been selected based on quality criteria, while pairing this with better pricing and value for Customers and the healthcare payers. As the health insurance products which cover these services typically pay a percentage of the cost, any price negotiation and discount is of benefit to both the payer and Customers who hold the insurance policy.
- 4.22 The key advantage of driving value-based contracting through the HH Buying Group rather than nib alone is that HH will be able to get more buy-in from Providers if HH is representing a larger Customer base. Value-based funding, by its nature, allows Providers to be more innovative and considered in the application of care. This allows a Provider to ensure that quality is maintained or increased while efficiency and cost of service delivery is improved. To make this viable for Provider to invest in, and operationally develop, providers require a reasonable volume of care to occur through these mechanisms. By forming a buying group for the development and purchasing of value-based funding mechanism, HH will provide enough scale to Providers to validate the investment and opportunity.
- 4.23 Likewise, the scale of smaller health insurance funds is likely to be insufficient to develop and implement value-based funding as stand-alone funds. By forming the HH buying group this will provide opportunity to small Participant funds to be involved in more modern and effective health procurement funding models which will ultimately translate into better affordability for members.

Access to data analytics and Information

- 4.24 Generally, only larger health insurers have access to the body of information and data analytics capabilities required to support the development of value-based contracting. The Proposed Conduct will provide Participants, who are likely to be smaller health insurers, with access to data analytics tools and technology. HH's data analytics undertaken as part of its contracting services will use claims and HCP data of all Participants. This will reduce information asymmetry and allow smaller insurers to obtain insights from information analysed across all Participants, that

they would otherwise not have. This will assist smaller insurers to more effectively engage in the contracting process and increase access for them to value-based contracting.

- 4.25 In addition to the benefits in relation to hospital services, data analytics and information sharing would allow HH to develop reliable and efficient networks of medical specialists and extras providers across various speciality groups and geographic networks. Increased information sharing and access to data analytics will increase use of efficient providers who deliver improved standards of care and allow participant funds the ability to provide better and more transparent information to members, which will result in a better informed and empowered consumer of health care services.

No gap experience for Customers

- 4.26 The uncertainty around the extent of gaps that Customers face in the private healthcare system is one of the major concerns or causes of dissatisfaction for Customers. For example, according to IPSOS' 2019 Healthcare & Insurance Australia Study, the most important driver for customer satisfaction with respect to their health insurer is 'Rebates on Services' (i.e. out-of-pocket costs) with the average fund scoring 5.8 out of 9 on this aspect. This uncertainty is partly derived from the multitude of contractual relationships that are created when a Customer receives hospital treatment – separate contracts between the Customer and the private hospital, medical specialist, anaesthetist, assistant surgeon, radiologist, pathologist, etc.
- 4.27 The HH Buying Group would broaden access to nib's Clinical Partners Program which is a unique industry offering where nib engages with the surgeon, assistant surgeon and anaesthetists to bring a zero-gap experience for Customers for knee and hip replacements. The HH Buying Group would allow this offering to be made available to Customers of Participants. It also provides HH with a larger Customer base to be able to engage with a broader group of medical specialists so that the program can be expanded to cover more types of treatment (the program currently only covers hip and knee replacements) and more geographical areas.
- 4.28 The development and expansion of the Clinical Partners Program will focus on efficient and effective Providers who provide quality standards of care based on the available hospital quality and outcomes data. The establishment of MPPAs with these Providers will drive more volume to them (as health insurers will be able to actively promote the financial certainty for Customers and referrers) and will also serve to place pressure on non-participants specialists to moderate their out-of-pocket practices due to the risk of loss of patient volume. Ultimately, in both instances the Customer is better protected from excessive out-of-pocket exposure when undergoing large and complex surgical procedures.
- 4.29 The HH Buying Group would also have the additional scale to expand its network of private hospitals with HPPAs and health professionals participating in the medical gap scheme and general treatment network which would also contribute to more no gap experiences for Customers.
- 4.30 The public benefit of an expanded Clinical Partners Program and the creation of potentially further no gap funding initiatives is that a greater number of Customers would have the benefit of the certainty of a no gap hospital or health experience. It would also go some way towards addressing a key concern of Customers and encourage further Australians to use the private healthcare system, alleviating the pressure on the public system.

Countervailing hospital bargaining power

- 4.31 Some Providers have much stronger bargaining power in the negotiation of agreements with healthcare payers which can impede the parties from achieving efficient pricing outcomes for health services. This is particularly the case in the private hospital market where the 5 largest hospital provider groups account for over 50% of the market.
- 4.32 Some of the smaller private hospitals can also have a high degree of bargaining power due to their iconic status and reputation, or due to their location in regional and remote communities.

- 4.33 This leads to inconsistencies in pricing for the same hospital procedure across different hospitals with the more powerful hospital groups being paid higher prices without any commensurate in value for the Customer. Two examples of this are procedures for cataracts (MBS item 42702) and oocyte retrieval (MBS item 13212) where the median cost charged by large hospital groups is 181% and 149% of the national median cost respectively.
- 4.34 This results in hospital pricing that is above the competitive and efficient price for treatment in particular hospitals.
- 4.35 The Proposed Conduct will enable the HH Buying Group to improve its bargaining position to countervail the power of some of the hospital groups which would lead to more efficient hospital pricing.

Reduced healthcare costs and premiums for members

- 4.36 The public benefits outlined above have the combined effect of increasing the value of the benefits paid by healthcare payers for health services and reducing overall spend particularly in relation to hospital benefits. This will be achieved in the short term through more efficient pricing and in the longer term through increased quality of care which will reduce the volume of health services being purchased. In FY19 the private health insurance industry paid \$15.7 billion in hospital benefits which represented 74%6 of all benefits paid by private health insurers for that period.
- 4.37 The reduction in healthcare costs is of particular importance to the smaller health insurers who are likely to be Participants and have more limited access to capital. It would ease the current pressure on health insurers struggling with escalating healthcare costs and inflation coupled with increased cost of regulatory compliance and changes to capital adequacy requirements.
- 4.38 The flow on effect of reductions in benefit outlays and transactional costs savings from the HH Buying Group is that it reduces pressure on premium increases for health insurance policies by the Participants, whilst also improving patient outcomes through value-based contracting and incentivised performance based outcomes. Reduced premium increases encourages participation in private health insurance and reduces pressure on the public health system.

Public benefits for Other Healthcare Providers

- 4.39 Hospital and medical purchasing is at a significantly lower scale for other purchasers of private medical services compared to private health insurers. This creates an opportunity to partner with these purchasers to increase their sophistication and better align incentives with health care providers.
- 4.40 Similar to insurers, Other Healthcare Providers will benefit from transaction costs savings as a result of the Proposed Conduct particularly those that have ongoing arrangements with health service providers akin to insurers. This will enable schemes such as the Department of Veteran's Affairs hospital cover scheme to pass on greater benefits to veterans, or reduce general expenditure. Furthermore, for those that do not have arrangements with health service providers and instead rely on the established rates for services will gain access to more efficient pricing models.
- 4.41 Importantly, and as noted above in respect of private health insurers, the Other Healthcare Providers will benefit from the data analytics and associated "value-based" contracting models. Only larger private health insurers will have access to the quantity and quality of data required to effectively engage with data analytics and achieve meaningful results. The Other Healthcare Providers will be able to benefit from the data sharing, and third party data analytics, in circumstances where they otherwise would not have the relevant data, finance or experience to implement. Furthermore, as a result of the Proposed Conduct the Other Healthcare Payers will be

⁶ *Operations of Private Health Insurers Annual Report 2018-2019*, published by APRA on 5 November 2019.

able to consider implementing "value-based" contracting with the ultimate goal of offering better quality of care, and accordingly improving the health of its members.

5. Public detriment (including likely competitive effects)

5.1 Describe any detriments to the public likely to result from the proposed conduct, including those likely to result from any lessening of competition. Provide information, data, documents, or other evidence relevant to the ACCC's assessment of the detriments.

5.2 The potential public detriments from the Proposed Conduct would be minimal (if any) in the markets for health services and would be outweighed by the public benefits set out above. The health insurers that are most likely to be Participants are members of existing buying groups. As insurers would be switching from one buying group to another, it would not substantially change the current market dynamics in the market for health services. The key difference being that nib would be a party to the HH Buying Group.

5.3 The other key reason that potential public detriments would be minimal is that the Providers have statutory rights (assigned from members) to be paid benefits from insurers and Medicare and do not rely wholly on agreements with health insurers. We consider each type of contracting service in turn.

5.4 In relation to the market for the supply of private health insurance to consumers, the potential public detriments from the Proposed Conduct (if any) would be very limited. The Proposed Conduct will not impact the way healthcare payers compete with one another in relation to the setting of premiums, the products they provide, or their sales strategy, rather it will only impact the way that healthcare payers engage with suppliers of health services as described above and the reduction in health care costs. Accordingly, there the Proposed Conduct will have very little impact on the way private health insurance is supplied to consumers other than easing the pressure on premium increases due to cost reductions. This position is supported by the fact that buying groups in respect of health services already exist and have not impacted or acted as a detriment to competition in the supply of private health insurance.

Hospital contracting

5.5 The market for private hospital services is likely to be State-based or local market as consumers are unlikely to travel long distances to acquire hospital services. As purchasers of hospital services, the HH Buying Group would potentially have a stronger bargaining position than if nib or each Participant negotiated agreements with private hospitals individually.

5.6 We have set out below the market share figures on a State and Territory basis for each private health insurer or buying group based on hospital policies as disclosed in APRA's *Operations of private health insurers annual report 2019*.

Contracting Group	NSW (including ACT)	NT	QLD	SA	TAS	VIC	WA	National
Medibank	22.60%	40.90%	30.70%	19.40%	26.90%	31.10%	21.40%	26.10%
Bupa	22.90%	36.20%	31.40%	47.80%	32.70%	23.10%	10.90%	25.10%
HCF	20.10%	5.90%	8.00%	8.90%	4.80%	7.50%	4.70%	11.70%
nib	15.20%	3.20%	6.80%	4.10%	3.00%	8.50%	3.90%	9.50%
HBF	0.80%	1.70%	0.70%	0.50%	0.70%	1.10%	49.70%	6.90%
AHSA	17.20%	11.60%	21.50%	18.40%	31.30%	27.00%	5.30%	19.20%
ARHG	1.20%	0.30%	0.90%	0.70%	0.60%	1.70%	3.90%	1.60%

In the unlikely event that every member of AHSA joined the HH Buying Group, market shares by State and Territory are likely to be as set out below.

Insurer	NSW (including ACT)	NT	QLD	SA	TAS	VIC	WA	National
HH Buying Group	34.0%	17.0%	29.6%	23.7%	14.4%	34.7%	13.2%	29.5%
Medibank	22.6%	40.9%	30.7%	19.4%	26.9%	31.1%	21.4%	26.1%
Bupa	22.9%	36.2%	31.4%	47.8%	32.7%	23.1%	10.9%	25.1%
HCF	20.1%	5.9%	8.0%	8.9%	4.8%	7.5%	4.7%	11.7%
HBF	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	49.7%	6.1%
ARHG	0.4%	0.1%	0.2%	0.2%	21.2%	3.6%	0.0%	1.5%

5.7 The most impacted State-based markets would be New South Wales and Victoria if all of AHSA's members joined the HH Buying Group as it would give the HH Buying Group the highest market share in those States.

5.8 The increased market share of the HH Buying Group would to some extent, countervail the strong bargaining position of the large hospital groups such as Ramsay and Healthscope that allows for supra-competitive prices for hospital services. We submit that the increase in HH Buying Group's market share will allow it to leverage its position in order to put pressure on hospital pricing so that it falls below supra-competitive and inefficient levels. The HH Buying Group is unlikely to have sufficient bargaining power or incentive to drive hospital pricing below competitive prices. Due to the national network of hospitals operated by the large hospital groups, the HH Buying Group will continue to be reliant on having an HPPA with them. This will also be the case for smaller iconic hospitals that the HH Buying Group must have in the hospital network due to demand from Customers.

5.9 Health insurers are effectively subject to a price floor under the PHI Act and Rules for hospital treatment. The legislative regime requires health insurers to pay benefits for hospital treatment at either the specified rates in the *Private Health Insurance (Benefit Requirements) Rules (Rules)* or rates calculated under the Rules for second-tier eligible hospitals. The latter rates are calculated by taking 85% of the average rate for that treatment in the insurer's HPPAs with comparable hospitals. If a hospital does not have an HPPA with the HH Buying Group, insurers must still pay these minimum benefit amounts. Customers of the HH Buying Group would still have the option of purchasing services from that hospital but are more likely to incur out-of-pocket expenses.

5.10 Based on nib's experience in moving from AHSA membership to undertaking its own HPPA negotiations, the Applicants submit that the increase is likely to assist the HH Buying Group to negotiate additional obligations relating to quality of treatment, performance, reporting and have more engagement from hospitals on innovative funding models. The Applicants expect that greater market share would incentivise hospitals to engage more collaboratively with the HH Buying Group during HPPA negotiations.

Medical specialist contracting

5.11 The impact of the HH Buying Group would be minimal in the market for medical specialist services which would be localised geographic areas of competition and a separate market for each specialty of practice.

5.12 The negotiation of MPPAs with medical specialists involves negotiating the rates that medical specialists would accept for not charging a gap to Customers.

5.13 The HH Buying Group is likely to increase the proportion of potential Customers of the medical specialist that are being represented in the MPPA negotiations. The Applicants submit, again on the basis of nib's experience as an AHSA member, that this will not change the negotiation dynamics in relation to price but is more likely to lead to greater engagement on innovative funding models such as the Clinical Partners Program. This is because MPPAs are not critical to

medical specialists but are seen as an optional arrangement. If a medical specialist was not prepared to enter into an MPPA with the HH Buying Group, they have statutory rights (assigned from members) to be paid for their professional services which would generally comprise of benefits paid by Medicare (75% of the Medicare Benefits Schedule fee for the service), benefits paid by the insurer (25% of the Medicare Benefits Schedule fee or more if the medical specialist participates in a medical gap scheme) and out-of-pocket expenses paid by the Customer (if any). Therefore, in MPPA negotiations, insurers often do not have strong bargaining power when negotiating with medical specialists despite the differential in size of the organisations as medical specialists are simply agreeing to cap their fees and relinquish their right to charge out-of-pocket expenses.

Medical gap scheme and general treatment network

- 5.14 In relation to the medical gap scheme and general treatment network, the HH Buying Group would not be negotiating agreements with Providers. Due to the large number of individual health providers in the industry (circa 50,000), the HH Buying Group will be managing schemes based on a standard schedule of rates and terms and conditions. nib's current scheme is determined on a state basis for dental and physiotherapy networks and a national basis for other types of general treatment networks and its medical gap scheme. Therefore, any changes to the buying power in the local markets for medical specialists or general treatment providers due to the HH Buying Group would not impact the setting of prices or terms and conditions for the medical gap scheme and general treatment network.
- 5.15 These schemes are voluntary, and Providers have the option to register to be part of these networks and receive additional benefits for agreeing to 'no gap' arrangements and other terms and conditions. General treatment providers also have the option of not being part of an insurer's network and will still be paid benefits in accordance with the policies of the health insurers. As discussed above, medical specialists have the option not to register with the medical gap schemes and continue to have statutory rights (assigned from members) to be paid benefits from Medicare and health insurers. Health insurers are incentivised to provide attractive rates to Providers under the medical gap scheme and general treatment networks to encourage participation.
- 5.16 The only agreements that are negotiated in this space are agreements relating to the operation of an insurer's branded optical or dental centres or potentially, agreements with networks of providers such as dentists that may be bespoke and negotiated. HH's involvement in the negotiation and management of such contracts would be undertaken on an individual basis for the relevant insurers.
- 5.17 The Applicants submit that the Proposed Conduct will have minimal (if any) detrimental impact on Customers or other classes of persons and that the substantial public benefits from the Proposed Conduct as set out in this application will result in a net public benefit.

Other Healthcare Payers

- 5.18 In relation to Other Healthcare Payers, the Applicant submits that there will no public detriments emerging from the Proposed Conduct. The relative bargaining power of the Other Healthcare Payers is small, accordingly their ability to achieve commercial and competitive results in negotiations with Providers is limited, resulting in some cases of inefficient pricing. Should the Other Healthcare Payers participate in the HH buying group, any increase in bargaining power will allow them to increase their bargaining power and accordingly, their negotiating position. As noted above, given the countervailing bargaining power of Providers is large any marginal increase in bargaining power for these types of healthcare payers will not significantly impact competition.
- 5.19 Similarly, travel and medical insurers make up a small percentage of the healthcare payer market. Accordingly, their joining the buying group will not materially alter the competitive position of Providers in such a way as to improperly displace the countervailing bargaining power in the market.

- 5.20 The Applicant recognises that government and semi-government healthcare payers form a large part of the healthcare payer market. However, in practice these schemes invest in and create their own Provider networks, and are subject to extensive public policy constraints when tendering and making agreements. Accordingly, in the Applicant's view these healthcare payers are less likely to join the HH Buying Group.

Future without the Proposed Conduct

- 5.21 In a future without the Proposed Conduct, nib will continue to use the contracting services offered by HH. nib along with other healthcare payers will, on an ongoing basis, incur high amounts of transaction costs associated with the time consuming and protracted negotiation of HPPAs. Similarly, Providers will continue to incur the administrative and cost burdens associated with the operational side of backend billing and the repeated negotiation and management of contracts with health insurers.
- 5.22 Other Healthcare Payers will also continue to pay inefficient prices and incur excessive transaction costs, resulting in increased premiums for customers and greater administrative costs for Providers. Significantly, without the Proposed Conduct healthcare payers will face great difficulty in implementing the more efficient "value based" contracting relationships. Smaller healthcare payers particularly will not have access to the type and scale of data required to transition away from a "fee for service" model. This is because the lack of data sharing will result in there being no data to form the basis of the price and payment structure of value based contracting. As a result, healthcare payers, Providers and customers will benefit from the more efficient quality and price of healthcare services. In addition, without the Proposed Conduct, the multitude of contractual relationships that exist when a customer attends a hospital will remain and accordingly, the basis on which the customer will be required to pay a gap will remain unclear resulting in continuing uncertainty for customers relating to the pricing of healthcare services.
- 5.23 Accordingly, in a future without the Proposed Conduct, the current costs model and associated expenses will remain for healthcare payers, Providers and customers. Healthcare payers will have less choice about which buying groups to participate in, reducing competition between buying groups, and will be less inclined to implement improved and innovative funding and service models, reducing the potential for cost savings. Without the scale provided by the HH Buying Group, HH may have greater difficulties engaging with Providers to implement and invest resources in transitioning to innovative funding models, particularly where Providers have guaranteed funding streams under private health insurance legislation and through Medicare.

6. Contact details of relevant market participants

- 6.1 Identify and/or provide names and, where possible, contact details (phone number and email address) for likely interested parties such as actual or potential competitors, key customers and suppliers, trade or industry associations and regulators.

6.2 Please see contact details in the Annexure D.

7. Additional information

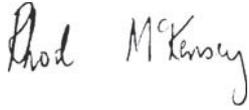

- 7.1 Provide any other information or documents you consider relevant to the ACCC's assessment of the application

7.2 None.

8. Declaration by applicant

- 8.1 The undersigned declare that, to the best of their knowledge and belief, the information given in response to questions in this form is true, correct and complete, that complete copies of documents required by this form have been supplied, that all estimates are identified as such and are their best estimates of the underlying facts, and that all the opinions expressed are sincere.

- 8.2 The undersigned undertake(s) to advise the ACCC immediately of any material change in circumstances relating to the application.
- 8.3 The undersigned are aware the giving false or misleading information is a serious offence and are aware of the provisions of sections 137.1 and 149.1 of the Criminal Code (Cth).

MELBOURNE VIC 3000

Dear Michael

Application for authorisation AA1000542-1: Questions for Applicants

We refer to your email of 31 March 2021, in which you sought responses to a number of questions to assist the ACCC in its assessment of the application for authorisation by nib health funds limited (**nib**) and Honeysuckle Health Ltd (**HH**) (together, the **Applicants**) dated 23 December 2020 (**Application**).

We have set out below the Applicants' responses to these questions, some of which contain information that is confidential to the Applicants. This confidential information has been highlighted in yellow. The Applicants request that the ACCC treat the highlighted information as strictly confidential and that it be redacted from this document prior to publication on the ACCC's public register.

Capitalised terms used in this letter are defined in the Application.

Parties to the Proposed Conduct

1. In their response to submissions from interested parties dated 19 February 2021, the Applicants acknowledge the concern that the Buying Group could represent 100% of all healthcare payers. The Applicants go on to state it would be reasonable for the ACCC to impose conditions to address this such as requiring HH to notify the ACCC of new participants in the buying group.

As an alternative to imposing conditions, and noting that the Applicants consider it extremely unlikely that the Buying Group would represent 100% of all healthcare payers, please advise whether the Applicants would be willing to address this issue at this stage of the process? For example, by amending the application to narrow the parties to the proposed conduct, or limiting the scope of the parties by reference to certain criteria.

- 1.1 The Applicants are willing to address the issue that the HH Buying Group could represent 100% of all healthcare payers by amending the Application to narrow the scope of the Proposed Conduct in relation to certain healthcare payers. We refer to the amended Application at Attachment A which addresses this issue.

2. **Please advise whether any healthcare payers have indicated that they are likely to join the Buying Group. If possible, it would be useful for us to know the identities of any parties who are likely to join.**

3. Please indicate whether any international medical and travel insurance companies currently participate in any Australian buying groups?

- 3.1 The Applicants are unaware of any buying groups for international medical and travel insurance companies. nib has agreements with some travel insurance companies under which it manages international travellers' access to health services if they become ill or are injured while travelling in Australia which includes accessing nib's network of providers for activation of services at the agreed nib rates.

Public benefits

4. Please provide an indication of how many participants would be required to join to make the HH Buying Group viable and increase the likelihood of the claimed public benefits being realised?

- 4.1 The Applicants submit that it is not possible to quantify in precise terms the number of participants required to increase the likelihood of any claimed public benefits being realised. However, in indicative terms, the Applicants make the following observations about the scope of participation that may be relevant in relation to the three categories of Proposed Conduct set out below.
- 4.2 In relation to the hospital contracting component of the Proposed Conduct, the Applicants consider that increasing the market share from the current 9.5% of the private health insurance market (nib's existing national market share) to 25% for the HH Buying Group would substantially increase the ability to realise the numerous claimed public benefits. This would enable a sufficient portion of the market to have a stronger value-based aspect, which the Applicants consider would deliver downward pressure on premium rate rises and ensure aspects of low value care are reduced and/or eliminated.
- 4.3 In relation to medical specialist contracting such as the Clinical Partners Program, the Applicants estimate that a minimum of approximately 20% of the private health insurance market is required to realise the claimed public benefits. The Applicants consider that for medical specialists to engage in discussions on new care pathways, they will need comfort that any proposed new models of care would apply to a reasonable number of their patients and should, ideally, apply to the majority of patients to allow them to consistently apply care. If the Clinical Partners Program covered a small proportion of patients, this would not diminish the return to the relevant medical specialist for those patients covered, but may translate into a barrier to engage effectively with specialists to onboard them to the new models of care.
- 4.4 In relation to the medical gap scheme and general treatment networks, the key public benefit is providing healthcare payers with access to efficient prices at low transaction costs which will reduce healthcare costs and ultimately, premiums for consumers. This public benefit would

increase incrementally as participants join and is not dependent on the number of participants that join the HH Buying Group.

- 4.5 The Applicants also highlight that the nature and quantity of public benefits able to be derived from these various components of Proposed Conduct is on a continuum, which may depend on the various circumstances at play and may vary over time.
- 5. Are private health insurers likely to seek to join more than one buying group, eg by joining the applicants' group while remaining in an existing buying group? Why/why not?**

- 5.1 The Applicants do not consider that current members of AHSA or ARHG would be able to join the HH Buying Group for only some contracting services and retain AHSA or ARHG for other services. The Applicants understand that AHSA and ARHG have relatively stringent rules on participation, which are essentially based on an "all or nothing" approach. If a participant is not willing to purchase all of their contracting services from AHSA, the Applicants understand that they would not be permitted to continue participating in that buying group. The AHSA standard HPPA is a tri-partite agreement (named a Business Partnership Agreement or BPA) and AHSA holds express rights as a party of this agreement to terminate the contract even if the health insurer and/or the hospital's preference is that the agreement remain in place. The Applicants understand that AHSA is willing to exercise those termination rights if a participant does not comply with the rules of the buying group, for example, by not purchasing exclusively from AHSA.

- 5.2 nib is aware of a circumstance where a health insurer made an alternative purchasing decision for a particular contracting service and AHSA responded by actively terminating all agreements that the health insurer had with AHSA and the relevant Providers, requiring the health insurer to extricate itself from AHSA. When nib acquired GU Health, AHSA set a six month limit on the transition for nib from AHSA hospital contracts to nib hospital contracts, after which time the AHSA would actively terminate any remaining HPPAs on foot.

- 5.3 On this basis, the Applicants consider it very unlikely that the AHSA would permit a fund to purchase certain contracting services from the AHSA, and other services from another buying group because the BPAs currently in place effectively act as a "lock-in" mechanism for the AHSA.

- 5.4 This is not the model that HH intends to put in place. HH's proposed model will give participants a greater degree of flexibility and HH would not be a party to agreements with Providers in its own right with separate termination rights. HH intends to allow participants to purchase some of its contracting services (e.g. the Clinical Partners Program) and to purchase other services directly from Providers or through another buying group.

- 6. Assuming that private health insurers will only participate in one buying group, please comment on the proposition that the claimed public benefit of improved bargaining power for the HH Buying Group would result in reduced bargaining power for the existing buying groups (AHSA and ARHG).**

- 6.1 The Applicants do not consider that a reduction in the number of participants in AHSA and ARHG would necessarily reduce their bargaining power in negotiations with Providers. Firstly, this is because the Applicants do not anticipate that the introduction of the HH Buying Group would lead to AHSA's current national market share in the private health insurance market of 20% to reduce drastically to below the current market share of nib at 9.5%. Secondly, a key determinant of bargaining power with Providers is being able to demonstrate value for them and offer innovative funding models that benefit all parties. The Applicants submit that since nib's acquisition of GU Health from Australian Unity (an AHSA fund), nib has negotiated more robust hospital contracts and achieved better rates and value for hospitals and consumers than the AHSA. This demonstrates that capability is just as important as market share in relation to achieving outcomes in the hospital contracting space, and introduction of the HH Buying Group would drive existing buying groups to continue to improve their capability. The Applicants submit that the authorisation of the Application would allow the HH Buying Group to combine capability with AHSA's level of market share, which would realise greater public benefits than currently exists.

- 6.2 Even if the existing buying groups are not able to maintain their bargaining power through continuous improvement, the Applicants do not consider that this will result in the overall dilution of public benefits. As discussed in part 2 of the Applicants' response to submissions from interested parties dated 9 March 2021, the HH Buying Group would provide an alternative and unique opportunity for health insurers that are currently part of an existing buying group. The diverse and innovative public benefits to be realised by the HH Buying Group are additional to

those provided by existing buying groups and would not diminish the overall available public benefits. Further, the Applicants consider that increased competition in the buying group market is likely to improve the performance of all parties and drive better outcomes for Customers. **The Applicants have been informed that the AHSA has already responded to the news of the development of a competitor buying group with a revised strategy and an increased focus on the needs of their members.**

7. Which of the claimed public benefits would be exclusively achieved through the HH Buying Group that are not currently realised through the two existing buying groups?

7.1 The Applicants consider that the innovative contracting services and contracting funding available through the HH Buying Groups will result in significant public benefits that are not currently realised through the AHSA and ARHG. As described in the Application, the HH Buying Group will offer value-based contracting which will result in better health outcomes for consumers at a lower cost. HH and nib have displayed evidence of value-based contracting through the medical contracting approach adopted in the Clinical Partners Program. Under this Program, nib engages with medical specialists including surgeons and anaesthetists to provide a zero-gap offering for Customers for knee and hip replacements. As discussed below, the Applicants intend to broaden access to the Program and make it available to Customers of Participants in the HH Buying Group.

7.2 The public benefits to be realised by these innovative functions and contracting services can be achieved by virtue of the HH Buying Group's access to sophisticated data analytics, which the Applicants consider are superior to existing offerings. HH is a health data science company with significant capability in data science, analytics and forecasting. It is able to use these skills and tools in its provision of value-based contracting, for example by analysing the quality of healthcare provided based on hospital quality and outcomes data.

8. The Applicants submit that the HH Buying Group would broaden access to nib's Clinical Partners Program and would allow this offering to be made available to customers of participants in the HH Buying Group. Please clarify how this would work in practice.

8.1 The Applicants propose to broaden access to the Clinical Partners Program by negotiating with the medical specialists participating in the program to add members of the new participants of the HH Buying Group to the program. The medical specialists would sign an MPPA with the new participant on the same terms and conditions that nib has in place with the specialists. The medical specialist will be paid the same rates as under the nib MPPA and members of the new participants in the HH Buying Group would have access to the no-gap experience for their hospital treatment.

8.2 If a participant does not purchase hospital contracting services from HH and has its own network of private hospitals (e.g. Medibank, Bupa or HCF), the MPPA would apply in relation to hospitals in respect of which the participant also has an HPPA. We refer to the diagram attached to this letter at Attachment B, which sets out the steps involved in the expansion of the Clinical Partners Program.

8.3 The expansion of the Clinical Partners Program does not require any change to the terms and conditions of the new participants' health insurance policies. Under health insurance policies, members are generally entitled to benefits for in-hospital medical services at 25% of the MBS fee. 75% of the MBS fee is payable by Medicare. As medical specialists generally charge above the MBS fee, any further benefits paid by health insurers to cover these amounts are dependent on agreements between the health insurers and medical specialists (either under a medical gap scheme or MPPAs).

8.4 The broadening of access to the Clinical Partners Program will provide HH with a larger customer base which will ultimately facilitate the engagement with a broader group of medical specialists so that the program can be expanded to cover additional types of treatment, and more geographical areas. Contrary to the submissions of interested parties, the Applicants submit that the success of the Clinical Partners Program has proven that value-based care is achievable in Australia, and is worthwhile. The program has achieved high quality health outcomes for consumers and has had the dual benefit of reducing health care system costs to the funder and to the consumer. The Applicants consider that the expansion of the Program by including other healthcare payers will broaden the public benefits by facilitating access to the no-gap services to more consumers, and ensuring a high quality of care.

Please let us know if you would like to discuss any aspect of this letter.

Yours faithfully
MinterEllison

8 April 2021

Application for authorisation under section 88(1) of the *Competition and Consumer Act 2010* (Cth)

Lodged by: Honeysuckle Health Pty Ltd

on behalf of itself and nib health funds limited

Confidential version

1. **Background**
- 1.1 This application is made to the Australian Competition and Consumer Commission (**ACCC**) by **Honeysuckle Health Pty Ltd (HH)** on behalf of itself and nib health funds limited (**nib**) (**Applicants**).
- 1.2 HH provides services to healthcare payers in Australia and New Zealand. These services currently include health analytics (e.g. measurement of impact of health interventions, population risk stratification and provider benchmarking), health management programs (e.g. telephonic programs to support patients transition from hospital and manage chronic diseases) and contract negotiation and management services for nib. HH is a joint venture between nib and Cigna. Both Cigna and nib own 50% of HH.
- 1.3 Cigna is a global health services company dedicated to improving the health, wellbeing and peace of mind of the customers it serves. All products and services are provided exclusively by or through operating subsidiaries of Cigna Corporation. Such products and services include an integrated suite of health services, such as medical, dental, behavioural health, pharmacy, vision, supplemental benefits, and other related products including group life, accident and disability insurance. nib is an Australian private health insurer with approximately 10% market share in Australia and provides health insurance products to three main market segments - Australian residents, international workers and international students. nib underwrites insurance products for several other brands including GU Health, Suncorp (APIA, AAMI and Suncorp) and Qantas.
- 1.4 From 1 October 2020, nib appointed HH to act as its agent to provide data analytics, contract negotiation, procurement and administration services in relation to nib's contracts with hospitals, medical specialists, general practitioners and allied health professionals (the **contracting services**). HH and nib seek authorisation for HH to provide the contracting services to additional health care payers and form a joint buying group (**HH Buying Group**) for the purposes of collective bargaining with providers to purchase health services. The Proposed Conduct does not involve a collective boycott. This application is made for the benefit of any healthcare payer who joins the HH Buying Group (**Participant**) which may include:
- a) private health insurers registered under the *Private Health Insurance (Prudential Supervision) Act 2015* (Cth) [except for certain private health insurers in the circumstances specified in paragraph 2.24](#);
 - b) international medical and travel insurance companies;
 - c) government and semi-government payers of healthcare services such as workers' compensation and transport accident scheme operators and Department of Veterans Affairs scheme (**DVA**); and
 - d) any other payer of health services as notified by HH to the ACCC
- (**healthcare payers**).

1.5 In the short term, the most likely Participants are private health insurers. Currently, the four largest health insurers, Medibank, Bupa, HCF and HBF, undertake the contracting services as an internal function.¹ The remaining health insurers engage in collective bargaining through one of two buying groups, the Australian Health Services Alliance (**AHSA**) and the Australian Regional Health Group (**ARHG**). Of the 36 private health insurers, the AHSA represents 27 and the ARHG represents four. The Applicant anticipates that private health insurers that currently outsource their contracting services to AHSA or ARHG are the healthcare payers that are most likely to join the HH Buying Group. The major health insurers are unlikely to join the HH Buying Group but may be interested in purchasing bespoke parts of the contracting services to supplement their

¹ Honeysuckle Health's understanding is that HBF contract directly with hospitals in WA and indirectly through the AHSA for all other states

internal contracting function. nib was previously a member of AHSA and it withdrew from AHSA in 2011 when it built its own internal contracting function.

4.5

- 1.6 Health insurers pay benefits for health services under health insurance policies issued to individuals. Customers generally make claims for benefits on-the-spot with a Provider at the time they are receiving treatment (eg. through electronic claiming system or at a private hospital). The Provider receives benefits directly from the insurer and may collect any additional amounts from the Customer (known as 'gaps').
- 1.7 Under contracting arrangements between health insurers and Providers, Providers generally agree not to charge a gap to the Customer (for some or all services) and health insurers agree to pay more in benefits. This creates a network of Providers that health insurers can promote as being health services where their Customers can receive a no gap or known gap experience.
- 1.8 For other types of healthcare payers such as international medical, travel and life insurance companies, as well as government and semi-government payers of healthcare services (Other Healthcare Payers), payment to Providers usually occurs pursuant to the terms of the insurance policy or the liability scheme, and the fee is usually paid in full by these types of healthcare payers. Accordingly, there is less likely to be a 'gap' exposure for consumers and therefore, less likely for these types of insurers to negotiate contract arrangements with Providers. As a result, we do not expect these types of healthcare payers to form a material portion of the HH Buying Group.

2. Parties to the proposed conduct

2.1 Applicant for authorisation:

(a) Honeysuckle Health Pty Ltd (ACN 637 339 694)

Address (registered address)	Contact person	Description of business activities
1/6 Newcomen St, Newcastle NSW 2300	Rhod McKensy Chief Executive Officer +61 406 380 017 r.mckensy@honeysucklehealth.com.au	Honeysuckle Health provides services to health payers in Australia and New Zealand including the contracting services, health data analytics, health measurement programs and health management programs.

(b) nib health funds limited (ACN 000 124 381)

Address (registered address)	Contact person	Description of business activities
22 Honeysuckle Drive, Newcastle NSW 2300	Roslyn Toms General Counsel +61 408 733 740 R.Toms@nib.com.au	nib is an Australian health insurer with approximately 10 per cent market share in Australia. It provides insurance to three predominant markets: Australian residents, international workers and international students.

2.3 Details of other classes of persons on whose behalf authorisation is sought

2.4 The class of persons who may engage in the Proposed Conduct other than the Applicant, are healthcare payers who wish to become Participants [except for certain private health insurers in the circumstances specified in paragraph 2.24](#).

2.5 Description of the Proposed Conduct

Structure of HH Buying Group

2.6 HH is seeking authorisation to undertake the contracting services, for healthcare payers in relation to hospitals, medical specialists, general practitioners and allied health professionals (**Providers**), as further described, [and with the limitations specified](#) -below (the **Proposed Conduct**).

2.7 HH intends to negotiate a bilateral participation agreement with each Participant to undertake the contracting services in relation to some or all of the Providers. Participants can opt to purchase some or all of the different categories of contracting services.

2.8 In relation to negotiated contracts (with hospitals and medical specialists), HH proposes to implement the Proposed Conduct by using nib's existing contracts with Providers, with the consent of the Providers. HH will negotiate with Providers to purchase their services on behalf of the Participants using the same base agreement that the Provider has negotiated with nib. HH will then negotiate new contracts on behalf of Participants as the nib-based contracts expire or enter into contracts with new Providers. The Participants will unilaterally determine whether to enter into an agreement with each Provider based on the negotiated terms and conditions. If they choose to do so, Participants will execute an agreement with the Provider. HH will not be party to the agreement. HH will then undertake contract administration services for that agreement.

2.9 If Participants do not wish to enter into an agreement on the negotiated terms and conditions, Participants will still be permitted to negotiate directly with Providers and enter into agreements independently of the HH Buying Group on their own terms and conditions. This could either be completed between the provider and the fund or, alternatively, with HH acting as an agent for the fund but outside of the buying group terms, conditions and offer. Furthermore, the Proposed Conduct will not prevent Providers from offering healthcare services to other insurers, buying groups or healthcare payers that are not participating in the HH buying group, and will not restrict the terms and conditions on which the Provider is entitled to enter those agreements. Providers will also not be prevented from contracting with Participants individually, or with a different set of participants than that proposed by the HH buying group.

2.10 For contracts with Providers based on standard terms and conditions (medical gap scheme and general treatment networks), HH proposes to extend these schemes to the Participants and would provide sufficient notice to Providers to enable Providers to operationalise the change.

2.11 Authorisation is not sought for the HH Buying Group to engage in the collective boycott of any services of a Provider.

Nature of contracting relationships with Providers

- 2.12 The Proposed Conduct will involve the provision of four broad categories of contracts including hospital contracting, medical specialist contracting, medical gap scheme and general treatment contracting. These are described in detail below.

Hospital contracting

- 2.13 Hospital contracting involves agreements between healthcare payers and private hospitals (occasionally public hospitals) under which the parties agree on the rates and other terms and conditions for the provision of hospital treatment to the healthcare payer's customers (**Customers**). In the private health insurance industry, the agreements are referred to as hospital purchaser provider agreements (**HPPAs**). Under HPPAs, hospitals agree not to charge out-of-pocket costs to Customers and are used by health insurers to provide financial certainty to its Customers.
- 2.14 nib has a network of private hospitals that have HPPAs with nib and HH is providing contracting services for that network on behalf of nib.

Medical specialist contracting

- 2.15 Medical specialist contracting refers to agreements between healthcare payers and medical specialists such as radiologists, pathologists and surgeons. The parties agree on rates and other terms and conditions for the provision of the medical specialists' professional services during the hospital admission of Customers. In the private health insurance industry, the agreements are referred to as medical purchaser provider agreements (**MPPAs**). MPPAs are used by health insurers to provide financial certainty to its Customers in relation to potential out-of-pocket costs for professional services. The network of MPPAs that nib currently has in place falls into two categories – MPPAs with radiologists and pathologists and the MPPAs for the Clinical Partners Program.
- 2.16 nib's MPPAs with radiologists and pathologists are entered into with radiologists and pathologists that provide services such as x-rays, ultrasounds and blood tests to Customers during their admission at a private hospital that is part of nib's network (ie. nib has an HPPA with that private hospital). These services are not included in the scope of services that are provided to Customers by the private hospital. They are services provided directly to the Customer by the radiologist or pathologist under separate contractual arrangements with the Customer. Without an MPPA, Customers may incur out-of-pocket expenses for the radiology and pathology services received during a hospital admission.
- 2.17 Under nib's Clinical Partners program, nib has entered into MPPAs with orthopaedic surgeons, anaesthetists and assistant surgeons for the provision of their professional services for orthopaedic joint replacements provided to Customers. Under these MPPAs, the medical specialists agree on fees paid by nib for their services and agree not to charge Customers any gap for their professional services. The medical specialists are paid a higher fee than what they would otherwise be entitled under nib's medical gap scheme. The medical specialists also agree on data sharing and quality target requirements. Unlike nib's medical gap scheme, Clinical Partners Providers cannot choose to opt-out of the program on a patient-by-patient basis. This provides certainty that all nib customers will have a no gap experience with these medical specialists.

Medical gap scheme

- 2.18 Under medical gap schemes, health insurers offer to pay medical specialists a set fee for each type of professional service they provide to Customers in hospital, in accordance with a standard set of terms and conditions. The set fees are higher than what insurers are otherwise required to pay under the PHI Act and medical specialists agree not to charge Customers an out-of-pocket amount or agree to limit the amount the Customer is charged at a fixed amount (eg. \$500) in the case of known gap schemes.

- 2.19 Medical specialists registered under a medical gap scheme are permitted to opt-in or opt-out of the scheme on a case by case basis (per treatment and Customer). By opting-in, the medical specialist agrees to be bound by the terms and conditions of the medical gap scheme.
- 2.20 Currently, HH acts on behalf of nib in the management and administration of the nib MediGap scheme (no-gap scheme) that applies to nib, Qantas and Suncorp-branded health insurance policies and the GU Health Medical Gap Network (no-gap or known gap scheme) that applies to GU Health-branded health insurance policies.

General treatment networks

- 2.21 General treatment networks are arrangements with Providers for services that are not provided in hospital. These providers generally include physiotherapists, dentists, optometrists and chiropractors which are covered under the 'extras' component of private health insurance products. It also includes a network of general practitioners and medical specialists providing professional services out-of-hospital for international students and international workers covered under international health products (health insurers are prohibited from covering these services for Australian residents).
- 2.22 Providers that are registered with a general treatment network, agree to a standard set of terms and conditions and schedule of rates for each type of service.
- 2.23 HH acts on behalf of nib in the management and administration of its general treatment network branded as the First Choice Network. nib has two bespoke agreements with optical and dental providers under which the providers operate nib-branded centres. HH also manages these agreements.

Excluded health insurers for certain contracting services

- 2.24 The Applicants do not seek authorisation for the following conduct which is not part of the Proposed Conduct:

(a) the provision of any of the contracting services by HH to:

(i) HBF Health Limited (HBF) in relation to its contractual arrangements with healthcare providers in Western Australia;

(ii) Medibank Private Limited (Medibank), Bupa HI Pty Limited (Bupa) and The Hospitals Contribution Fund of Australia Limited (HCF) in relation to their contractual arrangements in all States and Territories,

except for the provision of medical specialist contracting services described in paragraphs 2.15 to 2.17.

- 2.25 For the avoidance of doubt, the Proposed Conduct does include:

(a) the provision of contracting services by HH to HBF in relation to its contractual arrangements with healthcare providers in all States and Territories other than Western Australia. The Applicants understand that HBF currently engages AHSA to provide these services; and

(b) the provision of medical specialist contracting services to HBF, Medibank, Bupa and HCF such as including these funds in the Clinical Partners Program. This would give these funds the option of entering into MPPAs on the same terms and conditions as nib with some or all of the medical specialists involved in the Clinical Partners Program. The medical specialists would then extend the provision of a zero-gap experience for members of these funds.

Nature of Proposed Conduct

~~2.23~~2.26 In relation to the four types of contracts, the Proposed Conduct will involve HH engaging in the following types of services:

- (a) for hospital and medical specialist contracting, contract negotiations with Providers;
- (b) for the medical gap scheme and general treatment network, management and administration of the schemes; and
- (c) for all four types of contracting, data analytics, contract management and dispute resolution.

Data analytics and contract negotiations

~~2.24~~2.27 HH will initially engage in collective negotiations with Providers that currently have HPPAs and MPPAs with nib in order to agree to new contracts with the Participants based on the Provider's existing agreement with nib.

~~2.25~~2.28 On an ongoing basis, HH will negotiate new HPPAs and MPPAs on behalf of nib and all Participants as the current agreements expire or with new Providers. HH will act as the lead agent in the negotiations after consultation with the Participants. This will involve:

- (a) aggregation of Participant claims data for the Provider and undertaking data analytics to establish benchmarks relating to quality of service, price and application of services (see further details below);
- (b) conducting collective commercial negotiations on behalf of Participants based on information of the HH Buying Group. HH will negotiate one set of terms and conditions including price schedules, business rules for payment of benefits and quality and performance targets for all Participants for each HPPA or MPPA with a Provider; and
- (c) once HH receives instructions that a Participant wishes to enter into an HPPA or MPPA on the negotiated terms and conditions, coordinate the execution of the HPPA or MPPA between the Participant and the Provider (or execute the contract if HH has signing authority).

~~2.26~~2.29 The HH Buying Group will be voluntary and the Participants will unilaterally determine whether to enter into an HPPA or MPPA based on the terms and conditions negotiated by HH.

Extension and management of medical gap scheme and general treatment network

~~2.27~~2.30 HH will initially engage with Providers registered in the nib MediGap Scheme, GU Health Medical Gap Network and the First Choice Network to notify them of the extension of these schemes to the Participants.

~~2.28~~2.31 HH intends to replace the nib Medigap scheme and the GU Health Medical Gap Network with a new HH scheme which will have some variations in the terms and conditions.

~~2.29~~2.32 For general treatment networks, HH intends to create new specific networks tailored to meet a Participant or group of Participants' individual requirements such as the requirement to have a strong network of Providers in a regional area or to have a fee structure that is more suited to the manner in which some Participants pay benefits.

~~2.30~~2.33 On an ongoing basis, HH will manage the medical gap scheme and general treatment networks, review the schedules of rates and terms and conditions and actively manage the registered Providers of the schemes and networks. This includes ensuring adherence to requirements around registration, qualification and other terms and conditions of the schemes and networks.

Contract management and dispute resolution

~~2.34~~2.34 HH will offer to provide the Participants with contract administration and management services and dispute resolution services on behalf of nib and all Participants for the contracting services that they engaged HH to undertake which may include:

- (a) all HPPAs and MPPAs that were entered into by the Participants based on the terms and conditions negotiated by HH; and
- (b) the agreements between Participants and Providers registered in the medical gap scheme and/or general treatment network,

(Managed Agreements).

~~2.32~~2.35 This will involve HH acting as agent for the HH Buying Group to facilitate:

- (a) administration of, and compliance with, the terms and conditions of the Managed Agreements;
- (b) dispute resolution and management of disputes between Participants and Providers arising under the Managed Agreements;
- (c) management and investigation of Customer complaints relating to Providers party to the Managed Agreements;
- (d) collection and management of data submission from Providers to Participants under the Managed Agreements; and
- (e) reporting and oversight of the parties' adherence to terms and conditions of the Managed Agreements and performance and quality targets.

Data analytics

~~2.33~~2.36 HH will provide the Participants with data analytic services as part of contract negotiations but also on an ongoing basis to assess the performance of each Provider and benchmark their performance for each Participant against the aggregated data for the HH Buying Group including an assessment of:

- (a) Provider quality (e.g. rate of hospital acquired complication, length of hospital stay, unplanned readmission to theatre, conversion to ICU, etc.)
- (b) Provider Compliance (e.g. accuracy of claims, compliance with the contract terms, complaints, etc.);
- (c) benefits paid to the Provider by Participants (e.g. cost per episode against national peer groups, change in cost over time, cost variability reporting across the Provider network, etc);
- (d) access to the Provider's services (e.g. network coverage, member access issues, etc); and
- (e) efficiency and value of treatment provided by the Provider (e.g. establishment of quality scoring of Providers and ranking of value and efficiency against quality).

~~2.34~~2.37 Subject to confidentiality and privacy obligations, HH would also share information pertaining to one Participant with the HH Buying Group to the extent the information is related to the Managed Agreements or services provided by HH to the Participants. This may include the sharing of information on issues such as a breach of contract by a Provider or the discovery of fraudulent claims made by a Provider in relation to the Managed Agreement of one Participant which would be relevant to other Participants who contract with that Provider.

~~2.35~~2.38 Provisions of the CCA which may apply to the Proposed Conduct

~~2.36~~2.39 The relevant provisions of the CCA which may apply to the Proposed Conduct include:

- (a) making or giving effect to a contract, arrangement or understanding that may include a cartel provision (Division 1 of Part IV);
- (b) making or giving effect to a contract, arrangement or understanding that has the purpose or would have the effect, or likely effect, of substantially lessening competition (section 45(1)(a) and (b));
- (c) engaging with one or more persons in a concerted practice that has the purpose or has or is likely to have the effect, of substantially lessening competition (section 45(1)(c));
- (d) a corporation that has a substantial degree of power in a market engaging in conduct that has the purpose, or has or is likely to have the effect, of substantially lessening competition (section 46(1)); and / or
- (e) engaging in the practice of exclusive dealing (section 47(1)).

~~2.37~~2.40 Rationale for the Proposed Conduct

~~2.38~~2.41 The rationale for the Proposed Conduct is to enable Participants to streamline contract negotiation, procurement and management procedures. The streamlined processes will improve efficiencies by virtue of the reduced transactional and administrative costs, and increase information sharing and data analytical capabilities resulting in better health outcomes and reduced premiums for Customers.

~~2.39~~2.42 Term of authorisation sought and reasons for seeking this period of time

~~2.40~~2.43 Authorisation for the Proposed Conduct is sought for 10 years from the date of final determination by the ACCC.

~~2.41~~2.44 Given it is common practice for HPPAs and MPPAs to be 3 years duration, authorisation for 10 years will enable the HH Buying Group to continue to operate across two renewal cycles. It will also allow sufficient time for HH to implement innovative models of funding of healthcare that focus on driving quality and providing value, and for Participants and their Customers to realise the cost, quality and efficiency benefits of engaging in the HH Buying Group.

~~2.42~~2.45 Provide documents submitted to the applicant's board or prepared by or for the applicant's senior management for purposes of assessing or making a decision in relation to the proposed conduct and any minutes or record of the decision made

~~2.43~~2.46 None.

~~2.44~~2.47 Names of persons or classes of persons who may be impacted by the Proposed Conduct and details of how / why they might be impacted

~~2.45~~2.48 The class of persons potentially affected by the Proposed Conduct are:

- (a) private health insurers that do not join the HH Buying Group;
- (b) private hospitals;
- (c) medical specialists and general practitioners; and
- (d) allied health providers such as physiotherapists, dentists, optometrists, chiropractors.

Please refer to section 4 below as to how each class of persons may be impacted.

3. Market information and concentration

- 3.1 Describe the products and/or services, and the geographic areas, supplied by the applicants. Identify all products and services in which two or more parties to the proposed conduct overlap (compete with each other) or have a vertical relationship (e.g. supplier-customer).
- 3.2 The Applicants submit that the relevant markets are:
- national market for private health insurance;
 - national market for international medical and travel insurance;
 - State-based or localised market for hospital services;
 - localised market for medical specialist services for each specialty practice; and
 - localised market for each type of allied health service (eg. physiotherapists, dentists, optometrists, chiropractors, etc).
- 3.3 nib and the Participants compete with each other as purchasers of health services in the markets set out in paragraphs (c) to (e) above and as suppliers of private health insurance.

Private health insurance market

- 3.4 The market share of each private health insurer, measured as a share of total hospital policies as at June 2019 are set out in the table below.² The table also sets out which party undertakes contracting services for each private health insurer.³

Insurer	Party that undertakes contracting services	National Market Share Hospital Policies June 2019
Medibank	Medibank	26.0%
Bupa	Bupa	25.1%
HCF	HCF	11.7%
nib	HH	9.5%
HBF	HBF and AHSA	6.9% ⁴
Australian Unity	AHSA	2.9%
Teachers Health	AHSA	2.7%
GMHBA	AHSA	2.5%
Defence Health	AHSA	2.2%
CBHS Health	AHSA	1.7%
HIF	AHSA	0.8%
Westfund	AHSA	0.7%
Queensland Teachers	AHSA	0.6%
health.com.au	AHSA	0.6%
Health Partners	AHSA	0.6%
CUA	AHSA	0.6%

St Lukes Health	ARHG	0.5%
Mildura District Hospital Fund	ARHG	0.2%
Cessnock District Health	ARHG	0.0%

3.5 Market shares as purchasers of health services is shown in the table below. Note that our understanding is that HBF contract directly with hospitals in WA and indirectly through the AHSA for all other States and Territories.

Party undertaking contracting services	Participating health insurers' market share based on 2019 hospital policies
Medibank	26.0%
Bupa	25.1%
AHSA	20.0%
HCF	11.7%
Honeysuckle Health	9.5%
HBF	6.1%
ARHG	1.5%

3.6 We have also provided in Annexure A market shares based on total policies and revenue.

Market for Other Healthcare Payers

3.7 A useful lens through which to define the market for private healthcare is examining the sources of health expenditure funds. The Australian Institute of Health and Welfare (AIHW) publish detailed data on this topic. A key table from their 2018-2019 health expenditure data is shown below.

Table A3: Total health expenditure, current prices, by area of expenditure and source of funds, 2018–19 (\$ million)

Area of expenditure	Government					Non-government					Total health expenditure
	Australian Government				State and local	Total	HIF	Individuals	Other	Total	
	DVA	Health and other	Premium rebates	Total							
Hospitals	1,321	23,702	3,332	28,354	33,280	61,634	9,689	3,689	4,036	17,415	79,049
Public hospital services	579	23,582	342	24,504	32,229	56,732	995	1,444	2,630	5,068	61,801

Source: <https://www.aihw.gov.au/reports/health-welfare-expenditure/health-expenditure-australia-2018-19/data>

3.8 Focusing on the \$17,248 million expenditure on private hospitals, reallocating the Premium rebates column (which represents the Australian Government's contribution to private health insurance premiums through the Australian Government Rebate) back to health insurance and including a breakdown of the "Other" column from Table 3.16 of the same report to include Workers compensation insurers and transport accident insurers produces the following table:

Private hospital funder	\$ millions	Share
Private health insurers	11,683	67.7%
Individuals	2,246	13.0%
State and local government	1,051	6.1%
DVA	741	4.3%
Workers' compensation insurers	400	2.3%
Transport accident insurers	256	1.5%
Other Federal government	120	0.7%
Unknown	751	4.4%
	17,248	100.0%

3.9 Private health insurers and individuals account for 80.7% of revenue received by private hospital operators. DVA represents 4.3%, workers compensation insurers throughout Australia 2.3% and transport accident insurers 1.5%. There is a remaining Unknown percentage of 4.4%.

Market for travel insurance and short-term International Private Medical Insurance

- 3.10 Included in either the Individuals spend of \$2.2 billion or the Unknown spend of \$751 million, is hospitalisation for overseas tourists and short-term overseas workers. Typically, tourists and short-term workers take out insurance in their home country before travelling to Australia. Given their lack of scale in the Australian market, the overseas domiciled insurer will usually not have negotiated network access arrangements in Australia.
- 3.11 If the traveller requires medical services whilst in Australia, they will be required to pay the “rack rate” for the service out-of-pocket and then seek reimbursement from their insurer when they arrive home. One of the issues this creates is a bad debt risk for the hospital provider. Due to the lack of a certainty of payment, hospital providers embed within the “rack rate” a loading to offset the risk of the overseas visitor leaving the country without paying their bill. For international travel insurers, without the volume and local knowledge to develop networks, the increased “cost of production” is passed through to travellers in the form of higher insurance premiums.
- 3.12 nib has been approached by a number of these companies over the last 4-5 years seeking to negotiate “network access” arrangements. The size of these potential contracts is small - combined these groups would represent less than 0.5% of the total market for private hospital services.

Department of Veterans Affairs (DVA) scheme

- 3.13 Under the DVA scheme, eligible veterans are able to receive hospital services free with no gap expenses. The DVA arrangements represent a 4.3% share of the total expenditure on private hospitals and involve contracting directly with private hospitals through a tender process for the provision of the healthcare services. For GPs and medical specialists, the DVA maintains their own no-gap scheme. This involves contracting individually with these types of Providers.
- 3.14 DVA policyholders are not required to make any co-payment to medical specialists or hospitals. The average age of the DVA population is rapidly increasing and, consequently this segment of the market is reducing in activity and relevance with hospital providers. As this reduction continues it will place increasing price pressure on DVA as they lose market share and power to obtain competitive rates.

Workers compensation schemes

- 3.15 Each of the eight Australian states and territories has their own workers’ compensation scheme and the Commonwealth has three separate schemes. As per the table above, workers compensation schemes in total represent 2.3% of total private hospital funding. New South Wales has the largest scheme and would represent approximately 0.7% of total private hospital funding.
- 3.16 Each scheme manages their own contracts with medical and hospital providers. For example, the NSW scheme, administered by icare, has recently experienced significant increases in medical costs. icare is required to pay surgical fees that are gazetted by the State Insurance Regulatory Authority (**SIRA**). These gazetted rates are set by SIRA at 150% of the Australian Medical Association’s (**AMA**) recommended rate.
- 3.17 This is higher than any other Australian workers compensation scheme and much higher than private health insurer and DVA scheme. For example, nib’s Medigap scheme is set at an average of 50% of the AMA’s recommended rates and the DVA scheme is set at 52%.
- 3.18 Ultimately these higher specialist fees are passed through to NSW companies in the form of higher workers' compensation premiums.

Transport Accident Schemes

- 3.19 Each Australian state runs its own compulsory transport accident insurance scheme. In NSW, Queensland, South Australia and the ACT, drivers can choose from a panel of compulsory third party (**CTP**) providers. In the other States, transport accident schemes are provided by a state-owned or government-licensed insurer. As per the table above, transport accident insurers represent 1.5% of total private hospital funding. Similar to workers compensation schemes,

transport accident insurers typically manage their own contracts with medical and hospital providers.

Private hospital market

3.20 The table below shows the market shares of private hospital provider large groups.⁵

Hospital Provider Group	Market share
Ramsay	21.6%
Healthscope	13.7%
Healthe Care	9.3%
St John of God	5.5%
St Vincents Health	3.4%
Mater Misericordiae Limited	3.1%
Little Company of Mary	3.1%

3.21 Describe the relevant industry or industries. Where relevant, describe the sales process, the supply chains of any products or services involved, and the manufacturing process.

3.22 Please refer to section 1 (Background).

3.23 In respect of the overlapping products and/or services identified, provide estimated market shares for each of the parties where readily available.

3.24 Please refer to section 3 for market shares of nib and potential Participants.

3.25 In assessing an application for authorisation, the ACCC takes into account competition faced by the parties to the proposed conduct. Describe the factors that would limit or prevent any ability for the parties involved to raise prices, reduce quality or choice, reduce innovation, or coordinate rather than compete vigorously. For example, describe: existing competitors, likely entry by new competitors, any countervailing power of customers and/or suppliers; and any other relevant factors.

3.26 Please refer to section 6 (Public Detriments) for an analysis of each health services market and any potential impacts on competition from the Proposed Conduct.

3.27 In relation to the market for private health insurance, insurers are highly regulated and any increase in premiums is subject to approval by the Commonwealth Minister for Health on an annual basis. The Minister has an expectation that the industry will limit premium increases to a target percentage which places pressure on health insurers to keep costs down and they have limited ability to increase premiums in response to health inflation. Therefore, coordination among competitors in the HH Buying Group will not lead to premium increases for Consumers and will in fact do the opposite and drive down costs (administrative and benefit outlays) to support Participants in keeping premium increases low.

4. Public benefits

4.1 Describe the benefits to the public that are likely to result from the proposed conduct. Provide information, data, documents or other evidence relevant to the ACCC’s assessment of the public benefits.

⁵ Compiled by nib based on publicly available sources.

- 4.2 The Proposed Conduct will generate public benefits in the form of transaction costs savings and efficiencies for healthcare payers, healthcare providers and members, encouraging transition towards value based contracting and information sharing resulting in better health outcomes for consumers at a lower cost resulting in more efficient pricing for hospital services and ultimately, reduced premiums for consumers. As private health insurers constitute the vast majority of purchasers of private health care (around 70% of private hospital services according to AIHW data), we will focus on public benefits in the private health insurance industry.

Transaction costs savings and increased efficiencies

- 4.3 Authorisation for HH to engage in collective bargaining will result in significant transactional and administrative cost savings for Participants. nib's network of Providers consists of:
- (a) 565 private hospitals;
 - (b) 21,764 medical specialists;
 - (c) 3,049 general treatment clinics and over 15,900 providers.

This requires nib to:

- (d) negotiate over 500 contracts per year; and
 - (e) manage over 3,500 agreements.
- 4.4 The negotiation of HPPAs in particular can be time consuming and at times, protracted with some HPPAs taking up to 16 months to negotiate and the average large hospital group negotiation taking between 6 to 8 months. The process involves complex negotiation on legislative issues, terms and conditions relating to payment structures, audit, recoveries and obligations by both parties as well as the associated business rules and clauses which detail the nature of how payments are made for health care services (which are volatile in nature due to each individual's condition). Some hospital group HPPAs involve up to 70 hospitals. In addition to negotiating the general contractual terms, each hospital in a hospital group will have an individual rate schedule (list of prices for hospital treatment) and each is negotiated individually with the requisition commercial modelling to be done at the individual level and then "rolled up" to understand both party's (fund and hospital groups) material change in value of the contract. As the business rules and contractual terms impact this modelling the processes generally involves a number of in-person meetings (in particular at commencement of negotiation) before weekly meetings to cover off specific areas and issues. A working document (contract) is created and a separate issues log maintained on the negotiation. The working document is exchanged periodically between the parties and is marked up with comments, issues, requested changes etc. Once the contract terms are close to finalisation the rate modelling commences with each hospital and these rate schedules are exchanged in a similar manner to allow each organisation to model the predicted impact in change of terms (contract clauses), payment models for each service (daily rate to Diagnosis Related Grouping) and price. The modelling is generally conducted on an agreed period of 12 months of previous activity. Once all parties are satisfied with the outcome the negotiation is finalised and contracts executed. On issues which cannot be resolved, these are generally escalated by one or both parties to more senior staff and or executives to resolve. Once a position has been agreed at this higher level it is then briefed back to the negotiation teams who work together to ensure it is adequately reflected in the contractual terms.
- 4.5 Historically, nib's health services contracting function required approximately 25 staff and cost approximately \$5 million per annum to operate. The size and cost of this function is largely independent of the size of the health insurer. Any health insurer that has national coverage and maintains its own health services contracting function would need to support a function of a similar size due to the breadth of the Provider networks.
- 4.6 The HH Buying Group would reduce the need for duplication of the resources and processes involved in the contracting services and reduce costs for Participants. Economies of scale and scope would be realised as each Participant joins the HH Buying Group and greater efficiencies

achieved. Under the HH Buying Group, it is proposed that the fee for Participants would correlate with transactional costs so that any savings that arise as Participant numbers increase, would be distributed between Participants under the Participation Agreement through reduced fees.

- 4.7 The formation of the HH Buying Group to perform the contracting services will create significant administrative cost savings as each Participant does not need to replicate the same infrastructure. As HH is currently undertaking this function, the marginal cost of HH performing the contracting services for each Participant would be low. HH would distribute the cost of undertaking nib's contracting services across the Participants, thereby significantly reducing each Participant's costs and presenting an opportunity for transaction cost savings and increased efficiencies. We have set out in Annexure B an example of how the participation fee for the HH Buying Group would decline as Participants join.
- 4.8 These efficiencies can be realised with health insurers that are already part of the AHSA or ARHG buying groups. HH modelling suggests that the participation fee for the HH Buying Group will be competitive with the AHSA's or ARHG's membership fees and would provide a broader scope of services particularly in relation to data analytics. In any case, the HH participation fees would be substantially lower than running an effective internal function. We have set out in Annexure C the basis of the modelling undertaken by HH in comparing the competitiveness of the participation fee for the HH Buying Group with other buying groups.
- 4.9 The Proposed Conduct will also create the following benefit for the Providers (albeit more limited if most of the Participants were previous members of AHSA or ARHG):
- (a) simplifies backend billing processes as the Participants would have the same contract, rates and billing rules which results in significant reduction to the operational and administrative costs for Providers;
 - (b) consistent funding agreements enable Providers to more easily establish care pathways and work with medical specialists on improving the quality and cost of health care; and
 - (c) reduced cost to negotiate and manage relationships with health insurers. Negotiation of agreements, particularly HPPAs, create a significant burden and cost to Providers and having reduced numbers of negotiations allow Providers to reduce the costs associated with establishing, negotiating and managing contracts with health insurers.

Greater choice of buying group

- 4.10 The HH Buying Group would provide health insurers with an alternative buying group to the AHSA and provide greater choice. ARHG is not a viable alternative to AHSA for health insurers because of their lack of scale and ability to implement more sophisticated contracting mechanisms. Increased competition between different buying groups would also foster greater innovation and incentivise the buying groups to provide better value and quality of services to its participants.
- 4.11 The HH Buying Group would provide a differentiated model of funding such as value-based contracting, as further described below, and a buying group model that has been authorised by the ACCC.

Better health outcomes at a lower cost

- 4.12 HH intends to work collaboratively with Providers to implement more efficient "value-based" contracting relationships. In relation to hospital contracting, this type of contracting involves comparing health outcomes with costs of services to determine the value of the service. The agreed contracting price for healthcare services will be informed by the value of the service, rather than on the existing cost base. This transition from "fee-for-service" to "value-based" contracting aligns with many other health systems globally which have seen improvements in health outcomes and reduced costs from the transition. As an example, in the United States, Cigna created its first commercial value-based model in 2008. Today, 67% of Cigna's claim spend in the United States has shifted to value-based models. Cigna continues to grow its value-based models

and expects to have over 1,000 value-based arrangements across hospitals, specialists, and general practitioner groups in 2021.

- 4.13 As a result of its shift to value-based contracting, Cigna has been able to improve cost outcomes and quality outcomes over time. From 2010 to 2018, Cigna had the lowest reported medical cost trend in the US at 3.6% (key competitors were between 5.5% and 6.0%). By 2021, Cigna is ambitiously targeting to manage medical cost trend to the same level as CPI. Value-based reimbursement arrangements have been a key component of that success.
- 4.14 More specifically, Cigna has seen very strong results in its top performing value-based arrangements:
- 11% better quality scores than market for primary care providers;
 - 14% improved costs for specialist groups; and
 - 2% lower readmission rates for hospitals.
- 4.15 Value based contracting takes many forms. In its most simple form, HH would initially compare the value of services from a particular Provider against peers in the local region, state as well as nationally. Based on the outcomes and quality of care achieved by the Provider, the cost of the services would be adjusted (either through price or structure) to match the value being delivered by the Provider. If the Provider achieves higher than standard quality outcomes, then the insurers would pay more to the Provider and if the standard quality outcomes were below average, insurers would pay less for these services. The mechanism for this adjustment would form part of the commercial negotiations process and could take a number of forms including price adjustment to reflect the quality of service, payment of performance incentives if agreed benchmark outcomes are exceeded or changes to payment structures which drive improved efficiency to match the outcomes associated with the Provider.
- 4.16 Current approaches to contracting generally focus solely on cost of care of the services and most funds, and buying groups such as the AHSA and ARHG, have historically focused on cost of care to determine payment structure and price of services. Larger funds tend to have greater access to the complex analytics and data science required to support the development of value-based funding models. Through the HH Buying Group for small and medium funds, it will effectively improve and normalise the Participants' ability to manage benefit outlay and match larger more mature competitors in accessing value based contracting services.
- 4.17 Health systems that have moved to value-based contracting, which by definition, better aligns incentives between the payer and provider, have seen both improvements in health outcomes and lower costs. This shift is fundamentally underpinned by broad data and mature and sophisticated data science capabilities. The establishment of outcomes data is complex by its nature and requires the collection of sufficient data for statistical relevance (which is difficult, if not exclusionary requirement for small insurers), the establishment of outcome measures and quality based on relevant clinical and international literature, and the normalisation and risk adjustment of the patient population to ensure like-for-like comparison in the provision of services.
- 4.18 HH intends to collect and aggregate claims data and Hospital Casemix Protocol (HCP) data of Participants to establish benchmarks on the outcome of services in relation to both procedures and Diagnosis Related Grouping (DRG). This outcomes-based data would then be normalised and risk-adjusted for the variances in patient population (e.g. age, co-morbidities and demographic factors including gender) and a relative outcome scale established for each Provider at a procedure level. This would include quality data and information such as Hospital Acquired Complications as well as efficiency data such as excessive bed days or excessive use of Medicare Benefits Schedule (**MBS**) item numbers.
- 4.19 Once the quality scoring is established, HH will be able to use this benchmarking to assign a relative value score to each Provider at a procedure or DRG level as well as an aggregated weighted average for the Provider. This will then inform the basis for price and payment structure negotiations of HPPAs and will drive improved outcomes for Participants through more

appropriate pricing at a procedure level for hospitals service purchased. Ultimately this will drive improved outcomes for Customers as they benefit from improvements in the quality of service from Providers or through more sustainable and affordable private health insurance due to better control by Participants of benefit outlay.

- 4.20 Additionally, the Proposed Conduct will encourage greater involvement by Providers in the lifecycle of the contracting process. The potential size and calibre of the HH Buying Group will drive uptake of value-based contracting by encouraging healthcare providers to be more engaged in innovative funding models that improve outcomes for Customers.
- 4.21 In relation to general treatment networks, such as dental networks, the ability to collectively acquire these services on behalf of a number of insurers will see improved volume provided to the Providers of these services who have been selected based on quality criteria, while pairing this with better pricing and value for Customers and the healthcare payers. As the health insurance products which cover these services typically pay a percentage of the cost, any price negotiation and discount is of benefit to both the payer and Customers who hold the insurance policy.
- 4.22 The key advantage of driving value-based contracting through the HH Buying Group rather than nib alone is that HH will be able to get more buy-in from Providers if HH is representing a larger Customer base. Value-based funding, by its nature, allows Providers to be more innovative and considered in the application of care. This allows a Provider to ensure that quality is maintained or increased while efficiency and cost of service delivery is improved. To make this viable for Provider to invest in, and operationally develop, providers require a reasonable volume of care to occur through these mechanisms. By forming a buying group for the development and purchasing of value-based funding mechanism, HH will provide enough scale to Providers to validate the investment and opportunity.
- 4.23 Likewise, the scale of smaller health insurance funds is likely to be insufficient to develop and implement value-based funding as stand-alone funds. By forming the HH buying group this will provide opportunity to small Participant funds to be involved in more modern and effective health procurement funding models which will ultimately translate into better affordability for members.

Access to data analytics and Information

- 4.24 Generally, only larger health insurers have access to the body of information and data analytics capabilities required to support the development of value-based contracting. The Proposed Conduct will provide Participants, who are likely to be smaller health insurers, with access to data analytics tools and technology. HH's data analytics undertaken as part of its contracting services will use claims and HCP data of all Participants. This will reduce information asymmetry and allow smaller insurers to obtain insights from information analysed across all Participants, that they would otherwise not have. This will assist smaller insurers to more effectively engage in the contracting process and increase access for them to value-based contracting.
- 4.25 In addition to the benefits in relation to hospital services, data analytics and information sharing would allow HH to develop reliable and efficient networks of medical specialists and extras providers across various speciality groups and geographic networks. Increased information sharing and access to data analytics will increase use of efficient providers who deliver improved standards of care and allow participant funds the ability to provide better and more transparent information to members, which will result in a better informed and empowered consumer of health care services.

No gap experience for Customers

- 4.26 The uncertainty around the extent of gaps that Customers face in the private healthcare system is one of the major concerns or causes of dissatisfaction for Customers. For example, according to IPSOS' 2019 Healthcare & Insurance Australia Study, the most important driver for customer satisfaction with respect to their health insurer is 'Rebates on Services' (i.e. out-of-pocket costs) with the average fund scoring 5.8 out of 9 on this aspect. This uncertainty is partly derived from the multitude of contractual relationships that are created when a Customer receives hospital

treatment – separate contracts between the Customer and the private hospital, medical specialist, anaesthetist, assistant surgeon, radiologist, pathologist, etc.

- 4.27 The HH Buying Group would broaden access to nib's Clinical Partners Program which is a unique industry offering where nib engages with the surgeon, assistant surgeon and anaesthetists to bring a zero-gap experience for Customers for knee and hip replacements. The HH Buying Group would allow this offering to be made available to Customers of Participants. It also provides HH with a larger Customer base to be able to engage with a broader group of medical specialists so that the program can be expanded to cover more types of treatment (the program currently only covers hip and knee replacements) and more geographical areas.
- 4.28 The development and expansion of the Clinical Partners Program will focus on efficient and effective Providers who provide quality standards of care based on the available hospital quality and outcomes data. The establishment of MPPAs with these Providers will drive more volume to them (as health insurers will be able to actively promote the financial certainty for Customers and referrers) and will also serve to place pressure on non-participants specialists to moderate their out-of-pocket practices due to the risk of loss of patient volume. Ultimately, in both instances the Customer is better protected from excessive out-of-pocket exposure when undergoing large and complex surgical procedures.
- 4.29 The HH Buying Group would also have the additional scale to expand its network of private hospitals with HPPAs and health professionals participating in the medical gap scheme and general treatment network which would also contribute to more no gap experiences for Customers.
- 4.30 The public benefit of an expanded Clinical Partners Program and the creation of potentially further no gap funding initiatives is that a greater number of Customers would have the benefit of the certainty of a no gap hospital or health experience. It would also go some way towards addressing a key concern of Customers and encourage further Australians to use the private healthcare system, alleviating the pressure on the public system.

Countervailing hospital bargaining power

- 4.31 Some Providers have much stronger bargaining power in the negotiation of agreements with healthcare payers which can impede the parties from achieving efficient pricing outcomes for health services. This is particularly the case in the private hospital market where the 5 largest hospital provider groups account for over 50% of the market.
- 4.32 Some of the smaller private hospitals can also have a high degree of bargaining power due to their iconic status and reputation, or due to their location in regional and remote communities.
- 4.33 This leads to inconsistencies in pricing for the same hospital procedure across different hospitals with the more powerful hospital groups being paid higher prices without any commensurate in value for the Customer. Two examples of this are procedures for cataracts (MBS item 42702) and oocyte retrieval (MBS item 13212) where the median cost charged by large hospital groups is 181% and 149% of the national median cost respectively.
- 4.34 This results in hospital pricing that is above the competitive and efficient price for treatment in particular hospitals.
- 4.35 The Proposed Conduct will enable the HH Buying Group to improve its bargaining position to countervail the power of some of the hospital groups which would lead to more efficient hospital pricing.

Reduced healthcare costs and premiums for members

- 4.36 The public benefits outlined above have the combined effect of increasing the value of the benefits paid by healthcare payers for health services and reducing overall spend particularly in relation to hospital benefits. This will be achieved in the short term through more efficient pricing and in the longer term through increased quality of care which will reduce the volume of health

services being purchased. In FY19 the private health insurance industry paid \$15.7 billion in hospital benefits which represented 74%⁶ of all benefits paid by private health insurers for that period.

- 4.37 The reduction in healthcare costs is of particular importance to the smaller health insurers who are likely to be Participants and have more limited access to capital. It would ease the current pressure on health insurers struggling with escalating healthcare costs and inflation coupled with increased cost of regulatory compliance and changes to capital adequacy requirements.
- 4.38 The flow on effect of reductions in benefit outlays and transactional costs savings from the HH Buying Group is that it reduces pressure on premium increases for health insurance policies by the Participants, whilst also improving patient outcomes through value-based contracting and incentivised performance based outcomes. Reduced premium increases encourages participation in private health insurance and reduces pressure on the public health system.

Public benefits for Other Healthcare Providers

- 4.39 Hospital and medical purchasing is at a significantly lower scale for other purchasers of private medical services compared to private health insurers. This creates an opportunity to partner with these purchasers to increase their sophistication and better align incentives with health care providers.
- 4.40 Similar to insurers, Other Healthcare Providers will benefit from transaction costs savings as a result of the Proposed Conduct particularly those that have ongoing arrangements with health service providers akin to insurers. This will enable schemes such as the Department of Veteran's Affairs hospital cover scheme to pass on greater benefits to veterans, or reduce general expenditure. Furthermore, for those that do not have arrangements with health service providers and instead rely on the established rates for services will gain access to more efficient pricing models.
- 4.41 Importantly, and as noted above in respect of private health insurers, the Other Healthcare Providers will benefit from the data analytics and associated "value-based" contracting models. Only larger private health insurers will have access to the quantity and quality of data required to effectively engage with data analytics and achieve meaningful results. The Other Healthcare Providers will be able to benefit from the data sharing, and third party data analytics, in circumstances where they otherwise would not have the relevant data, finance or experience to implement. Furthermore, as a result of the Proposed Conduct the Other Healthcare Payers will be able to consider implementing "value-based" contracting with the ultimate goal of offering better quality of care, and accordingly improving the health of its members.

5. Public detriment (including likely competitive effects)

- 5.1 Describe any detriments to the public likely to result from the proposed conduct, including those likely to result from any lessening of competition. Provide information, data, documents, or other evidence relevant to the ACCC's assessment of the detriments.
- 5.2 The potential public detriments from the Proposed Conduct would be minimal (if any) in the markets for health services and would be outweighed by the public benefits set out above. The health insurers that are most likely to be Participants are members of existing buying groups. As insurers would be switching from one buying group to another, it would not substantially change the current market dynamics in the market for health services. The key difference being that nib would be a party to the HH Buying Group.
- 5.3 The other key reason that potential public detriments would be minimal is that the Providers have statutory rights (assigned from members) to be paid benefits from insurers and Medicare and do not rely wholly on agreements with health insurers. We consider each type of contracting service in turn.

⁶ *Operations of Private Health Insurers Annual Report 2018-2019*, published by APRA on 5 November 2019.

- 5.4 In relation to the market for the supply of private health insurance to consumers, the potential public detriments from the Proposed Conduct (if any) would be very limited. The Proposed Conduct will not impact the way healthcare payers compete with one another in relation to the setting of premiums, the products they provide, or their sales strategy, rather it will only impact the way that healthcare payers engage with suppliers of health services as described above and the reduction in health care costs. Accordingly, there the Proposed Conduct will have very little impact on the way private health insurance is supplied to consumers other than easing the pressure on premium increases due to cost reductions. This position is supported by the fact that buying groups in respect of health services already exist and have not impacted or acted as a detriment to competition in the supply of private health insurance.

Hospital contracting

- 5.5 The market for private hospital services is likely to be State-based or local market as consumers are unlikely to travel long distances to acquire hospital services. As purchasers of hospital services, the HH Buying Group would potentially have a stronger bargaining position than if nib or each Participant negotiated agreements with private hospitals individually.
- 5.6 We have set out below the market share figures on a State and Territory basis for each private health insurer or buying group based on hospital policies as disclosed in APRA's *Operations of private health insurers annual report 2019*.

Contracting Group	NSW (including ACT)	NT	QLD	SA	TAS	VIC	WA	National
Medibank	22.60%	40.90%	30.70%	19.40%	26.90%	31.10%	21.40%	26.10%
Bupa	22.90%	36.20%	31.40%	47.80%	32.70%	23.10%	10.90%	25.10%
HCF	20.10%	5.90%	8.00%	8.90%	4.80%	7.50%	4.70%	11.70%
nib	15.20%	3.20%	6.80%	4.10%	3.00%	8.50%	3.90%	9.50%
HBF	0.80%	1.70%	0.70%	0.50%	0.70%	1.10%	49.70%	6.90%
AHSA	17.20%	11.60%	21.50%	18.40%	31.30%	27.00%	5.30%	19.20%
ARHG	1.20%	0.30%	0.90%	0.70%	0.60%	1.70%	3.90%	1.60%

In the unlikely event that every member of AHSA joined the HH Buying Group, market shares by State and Territory are likely to be as set out below.

Insurer	NSW (including ACT)	NT	QLD	SA	TAS	VIC	WA	National
HH Buying Group	34.0%	17.0%	29.6%	23.7%	14.4%	34.7%	13.2%	29.5%
Medibank	22.6%	40.9%	30.7%	19.4%	26.9%	31.1%	21.4%	26.1%
Bupa	22.9%	36.2%	31.4%	47.8%	32.7%	23.1%	10.9%	25.1%
HCF	20.1%	5.9%	8.0%	8.9%	4.8%	7.5%	4.7%	11.7%
HBF	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	49.7%	6.1%
ARHG	0.4%	0.1%	0.2%	0.2%	21.2%	3.6%	0.0%	1.5%

- 5.7 The most impacted State-based markets would be New South Wales and Victoria if all of AHSA's members joined the HH Buying Group as it would give the HH Buying Group the highest market share in those States.

- 5.8 The increased market share of the HH Buying Group would to some extent, countervail the strong bargaining position of the large hospital groups such as Ramsay and Healthscope that allows for supra-competitive prices for hospital services. We submit that the increase in HH Buying Group's market share will allow it to leverage its position in order to put pressure on hospital pricing so that it falls below supra-competitive and inefficient levels. The HH Buying Group is unlikely to have sufficient bargaining power or incentive to drive hospital pricing below competitive prices. Due to the national network of hospitals operated by the large hospital groups, the HH Buying Group will continue to be reliant on having an HPPA with them. This will also be the case for smaller iconic hospitals that the HH Buying Group must have in the hospital network due to demand from Customers.
- 5.9 Health insurers are effectively subject to a price floor under the PHI Act and Rules for hospital treatment. The legislative regime requires health insurers to pay benefits for hospital treatment at either the specified rates in the *Private Health Insurance (Benefit Requirements) Rules (Rules)* or rates calculated under the Rules for second-tier eligible hospitals. The latter rates are calculated by taking 85% of the average rate for that treatment in the insurer's HPPAs with comparable hospitals. If a hospital does not have an HPPA with the HH Buying Group, insurers must still pay these minimum benefit amounts. Customers of the HH Buying Group would still have the option of purchasing services from that hospital but are more likely to incur out-of-pocket expenses.
- 5.10 Based on nib's experience in moving from AHSA membership to undertaking its own HPPA negotiations, the Applicants submit that the increase is likely to assist the HH Buying Group to negotiate additional obligations relating to quality of treatment, performance, reporting and have more engagement from hospitals on innovative funding models. The Applicants expect that greater market share would incentivise hospitals to engage more collaboratively with the HH Buying Group during HPPA negotiations.

Medical specialist contracting

- 5.11 The impact of the HH Buying Group would be minimal in the market for medical specialist services which would be localised geographic areas of competition and a separate market for each specialty of practice.
- 5.12 The negotiation of MPPAs with medical specialists involves negotiating the rates that medical specialists would accept for not charging a gap to Customers.
- 5.13 The HH Buying Group is likely to increase the proportion of potential Customers of the medical specialist that are being represented in the MPPA negotiations. The Applicants submit, again on the basis of nib's experience as an AHSA member, that this will not change the negotiation dynamics in relation to price but is more likely to lead to greater engagement on innovative funding models such as the Clinical Partners Program. This is because MPPAs are not critical to medical specialists but are seen as an optional arrangement. If a medical specialist was not prepared to enter into an MPPA with the HH Buying Group, they have statutory rights (assigned from members) to be paid for their professional services which would generally comprise of benefits paid by Medicare (75% of the Medicare Benefits Schedule fee for the service), benefits paid by the insurer (25% of the Medicare Benefits Schedule fee or more if the medical specialist participates in a medical gap scheme) and out-of-pocket expenses paid by the Customer (if any). Therefore, in MPPA negotiations, insurers often do not have strong bargaining power when negotiating with medical specialists despite the differential in size of the organisations as medical specialists are simply agreeing to cap their fees and relinquish their right to charge out-of-pocket expenses.

Medical gap scheme and general treatment network

- 5.14 In relation to the medical gap scheme and general treatment network, the HH Buying Group would not be negotiating agreements with Providers. Due to the large number of individual health providers in the industry (circa 50,000), the HH Buying Group will be managing schemes based on a standard schedule of rates and terms and conditions. nib's current scheme is determined on a state basis for dental and physiotherapy networks and a national basis for other types of general treatment networks and its medical gap scheme. Therefore, any changes to the buying power in

the local markets for medical specialists or general treatment providers due to the HH Buying Group would not impact the setting of prices or terms and conditions for the medical gap scheme and general treatment network.

- 5.15 These schemes are voluntary, and Providers have the option to register to be part of these networks and receive additional benefits for agreeing to 'no gap' arrangements and other terms and conditions. General treatment providers also have the option of not being part of an insurer's network and will still be paid benefits in accordance with the policies of the health insurers. As discussed above, medical specialists have the option not to register with the medical gap schemes and continue to have statutory rights (assigned from members) to be paid benefits from Medicare and health insurers. Health insurers are incentivised to provide attractive rates to Providers under the medical gap scheme and general treatment networks to encourage participation.
- 5.16 The only agreements that are negotiated in this space are agreements relating to the operation of an insurer's branded optical or dental centres or potentially, agreements with networks of providers such as dentists that may be bespoke and negotiated. HH's involvement in the negotiation and management of such contracts would be undertaken on an individual basis for the relevant insurers.
- 5.17 The Applicants submit that the Proposed Conduct will have minimal (if any) detrimental impact on Customers or other classes of persons and that the substantial public benefits from the Proposed Conduct as set out in this application will result in a net public benefit.

Other Healthcare Payers

- 5.18 In relation to Other Healthcare Payers, the Applicant submits that there will no public detriments emerging from the Proposed Conduct. The relative bargaining power of the Other Healthcare Payers is small, accordingly their ability to achieve commercial and competitive results in negotiations with Providers is limited, resulting in some cases of inefficient pricing. Should the Other Healthcare Payers participate in the HH buying group, any increase in bargaining power will allow them to increase their bargaining power and accordingly, their negotiating position. As noted above, given the countervailing bargaining power of Providers is large any marginal increase in bargaining power for these types of healthcare payers will not significantly impact competition.
- 5.19 Similarly, travel and medical insurers make up a small percentage of the healthcare payer market. Accordingly, their joining the buying group will not materially alter the competitive position of Providers in such a way as to improperly displace the countervailing bargaining power in the market.
- 5.20 The Applicant recognises that government and semi-government healthcare payers form a large part of the healthcare payer market. However, in practice these schemes invest in and create their own Provider networks, and are subject to extensive public policy constraints when tendering and making agreements. Accordingly, in the Applicant's view these healthcare payers are less likely to join the HH Buying Group.

Future without the Proposed Conduct

- 5.21 In a future without the Proposed Conduct, nib will continue to use the contracting services offered by HH. nib along with other healthcare payers will, on an ongoing basis, incur high amounts of transaction costs associated with the time consuming and protracted negotiation of HPPAs. Similarly, Providers will continue to incur the administrative and cost burdens associated with the operational side of backend billing and the repeated negotiation and management of contracts with health insurers.
- 5.22 Other Healthcare Payers will also continue to pay inefficient prices and incur excessive transaction costs, resulting in increased premiums for customers and greater administrative costs for Providers. Significantly, without the Proposed Conduct healthcare payers will face great difficulty in implementing the more efficient "value based" contracting relationships. Smaller healthcare payers particularly will not have access to the type and scale of data required to

transition away from a "fee for service" model. This is because the lack of data sharing will result in there being no data to form the basis of the price and payment structure of value based contracting. As a result, healthcare payers, Providers and customers will benefit from the more efficient quality and price of healthcare services. In addition, without the Proposed Conduct, the multitude of contractual relationships that exist when a customer attends a hospital will remain and accordingly, the basis on which the customer will be required to pay a gap will remain unclear resulting in continuing uncertainty for customers relating to the pricing of healthcare services.

- 5.23 Accordingly, in a future without the Proposed Conduct, the current costs model and associated expenses will remain for healthcare payers, Providers and customers. Healthcare payers will have less choice about which buying groups to participate in, reducing competition between buying groups, and will be less inclined to implement improved and innovative funding and service models, reducing the potential for cost savings. Without the scale provided by the HH Buying Group, HH may have greater difficulties engaging with Providers to implement and invest resources in transitioning to innovative funding models, particularly where Providers have guaranteed funding streams under private health insurance legislation and through Medicare.

6. Contact details of relevant market participants

- 6.1 Identify and/or provide names and, where possible, contact details (phone number and email address) for likely interested parties such as actual or potential competitors, key customers and suppliers, trade or industry associations and regulators.

6.2 Please see contact details in the Annexure D.

7. Additional information

- 7.1 Provide any other information or documents you consider relevant to the ACCC's assessment of the application

7.2 None.

8. Declaration by applicant

- 8.1 The undersigned declare that, to the best of their knowledge and belief, the information given in response to questions in this form is true, correct and complete, that complete copies of documents required by this form have been supplied, that all estimates are identified as such and are their best estimates of the underlying facts, and that all the opinions expressed are sincere.
- 8.2 The undersigned undertake(s) to advise the ACCC immediately of any material change in circumstances relating to the application.
- 8.3 The undersigned are aware the giving false or misleading information is a serious offence and are aware of the provisions of sections 137.1 and 149.1 of the Criminal Code (Cth).

Application for authorisation under section 88(1) of the *Competition and Consumer Act 2010* (Cth)

Lodged by: Honeysuckle Health Pty Ltd

on behalf of itself and nib health funds limited

Confidential version

1. **Background**
- 1.1 This application is made to the Australian Competition and Consumer Commission (**ACCC**) by **Honeysuckle Health Pty Ltd (HH)** on behalf of itself and nib health funds limited (**nib**) (**Applicants**).
- 1.2 HH provides services to healthcare payers in Australia and New Zealand. These services currently include health analytics (e.g. measurement of impact of health interventions, population risk stratification and provider benchmarking), health management programs (e.g. telephonic programs to support patients transition from hospital and manage chronic diseases) and contract negotiation and management services for nib. HH is a joint venture between nib and Cigna. Both Cigna and nib own 50% of HH.
- 1.3 Cigna is a global health services company dedicated to improving the health, wellbeing and peace of mind of the customers it serves. All products and services are provided exclusively by or through operating subsidiaries of Cigna Corporation. Such products and services include an integrated suite of health services, such as medical, dental, behavioural health, pharmacy, vision, supplemental benefits, and other related products including group life, accident and disability insurance. nib is an Australian private health insurer with approximately 10% market share in Australia and provides health insurance products to three main market segments - Australian residents, international workers and international students. nib underwrites insurance products for several other brands including GU Health, Suncorp (APIA, AAMI and Suncorp) and Qantas.
- 1.4 From 1 October 2020, nib appointed HH to act as its agent to provide data analytics, contract negotiation, procurement and administration services in relation to nib's contracts with hospitals, medical specialists, general practitioners and allied health professionals (the **contracting services**). HH and nib seek authorisation for HH to provide the contracting services to additional health care payers and form a joint buying group (**HH Buying Group**) for the purposes of collective bargaining with providers to purchase health services. The Proposed Conduct does not involve a collective boycott. This application is made for the benefit of any healthcare payer who joins the HH Buying Group (**Participant**) which may include:
 - a) private health insurers registered under the *Private Health Insurance (Prudential Supervision) Act 2015* (Cth) except for certain private health insurers in the circumstances specified in paragraph 2.8;
 - b) international medical and travel insurance companies;
 - c) government and semi-government payers of healthcare services such as workers' compensation and transport accident scheme operators and Department of Veterans Affairs scheme (**DVA**); and
 - d) any other payer of health services as notified by HH to the ACCC(**healthcare payers**).
- 1.5 In the short term, the most likely Participants are private health insurers. Currently, the four largest health insurers, Medibank, Bupa, HCF and HBF, undertake the contracting services as an internal function.¹ The remaining health insurers engage in collective bargaining through one of two buying groups, the Australian Health Services Alliance (**AHSA**) and the Australian Regional Health Group (**ARHG**). Of the 36 private health insurers, the AHSA represents 27 and the ARHG represents four. The Applicant anticipates that private health insurers that currently outsource their contracting services to AHSA or ARHG are the healthcare payers that are most likely to join the HH Buying Group. The major health insurers are unlikely to join the HH Buying Group but may be interested in purchasing bespoke parts of the contracting services to supplement their

¹ Honeysuckle Health's understanding is that HBF contract directly with hospitals in WA and indirectly through the AHSA for all other states

internal contracting function. nib was previously a member of AHSA and it withdrew from AHSA in 2011 when it built its own internal contracting function.

- 1.6 Health insurers pay benefits for health services under health insurance policies issued to individuals. Customers generally make claims for benefits on-the-spot with a Provider at the time they are receiving treatment (eg. through electronic claiming system or at a private hospital). The Provider receives benefits directly from the insurer and may collect any additional amounts from the Customer (known as 'gaps').
- 1.7 Under contracting arrangements between health insurers and Providers, Providers generally agree not to charge a gap to the Customer (for some or all services) and health insurers agree to pay more in benefits. This creates a network of Providers that health insurers can promote as being health services where their Customers can receive a no gap or known gap experience.
- 1.8 For other types of healthcare payers such as international medical, travel and life insurance companies, as well as government and semi-government payers of healthcare services (Other Healthcare Payers), payment to Providers usually occurs pursuant to the terms of the insurance policy or the liability scheme, and the fee is usually paid in full by these types of healthcare payers. Accordingly, there is less likely to be a 'gap' exposure for consumers and therefore, less likely for these types of insurers to negotiate contract arrangements with Providers. As a result, we do not expect these types of healthcare payers to form a material portion of the HH Buying Group.

2. Parties to the proposed conduct

2.1 Applicant for authorisation:

- (a) Honeysuckle Health Pty Ltd (ACN 637 339 694)

Address (registered address)	Contact person	Description of business activities
1/6 Newcomen St, Newcastle NSW 2300	Rhod McKensy Chief Executive Officer +61 406 380 017 r.mckensy@honeysucklehealth.com.au	Honeysuckle Health provides services to health payers in Australia and New Zealand including the contracting services, health data analytics, health measurement programs and health management programs.

- (b) nib health funds limited (ACN 000 124 381)

Address (registered address)	Contact person	Description of business activities
22 Honeysuckle Drive, Newcastle NSW 2300	Roslyn Toms General Counsel +61 408 733 740 R.Toms@nib.com.au	nib is an Australian health insurer with approximately 10 per cent market share in Australia. It provides insurance to three predominant markets: Australian residents, international workers and international students. nib underwrites GU Health, Suncorp and Qantas health insurance.

2.2 Email address for service of documents in Australia

Noelia Boscana, Partner, MinterEllison

noelia.boscana@minterellison.com

2.3 Details of other classes of persons on whose behalf authorisation is sought

2.4 The class of persons who may engage in the Proposed Conduct other than the Applicant, are healthcare payers who wish to become Participants except for certain private health insurers in the circumstances specified in paragraph 2.8.

2.5 Description of the Proposed Conduct

2.6 The Applicants seek authorisation for the following conduct, with the exception of the conduct in paragraph 2.8 (**Proposed Conduct**):

- (a) the creation of a joint buying group consisting of the following payers of health services (**HH Buying Group**):
 - (i) private health insurers registered under the *Private Health Insurance (Prudential Supervision) Act 2015* (Cth) except for certain private health insurers in the circumstances specified in paragraph 2.8;
 - (ii) international medical and travel insurance companies;
 - (iii) government and semi-government payers of healthcare services such as workers' compensation and transport accident scheme operators and Department of Veterans Affairs scheme; and
 - (iv) any other payer of health services notified by HH to the ACCC,

(**Participants**); and
- (b) the provision of some or all of the following services by HH to some or all of the Participants collectively through the HH Buying Group, and the acquisition of those services by the Participants from HH, in relation to arrangements between the Participants and hospitals, medical specialists, general practitioners, allied health professionals or other health providers (**Providers**) for the funding of health services:
 - (i) contract negotiations and drafting;
 - (ii) contract administration and management;
 - (iii) dispute resolution;
 - (iv) data analytics;
 - (v) administration and management of medical gap schemes and the general treatment networks;
 - (vi) performance and compliance assessment of Providers; or
 - (vii) any other service notified by HH to the ACCC,

(**contracting services**).

- 2.7 All reference to 'health services' or 'healthcare services' in paragraph 2.6 above or in this application also include any goods that may be provided as part of the provision of such services.
- 2.8 The Applicants do not seek authorisation for HH to provide any contracting services (other than the contracting services relating to the Broad Clinical Partners Program defined in paragraph 2.9) to:
- (a) HBF Health Limited (**HBF**) in relation to its contractual arrangements with Providers in Western Australia; or
 - (b) Medibank Private Limited (**Medibank**), Bupa HI Pty Limited (**Bupa**), and the Hospitals Contribution Fund of Australia Limited (**HCF**) in relation to their contractual arrangements in all States and Territories.
- 2.9 For the avoidance of doubt, the Applicants seek authorisation for HH to provide contracting services that relate to HH's program under which HH enters into agreements with medical specialists to ensure that customers are not charged out-of-pocket costs for medical services provided during an episode of hospital treatment (for joint replacement surgery or otherwise) (**Broad Clinical Partners Program**) to the following Participants:
- (a) HBF in relation to its contractual arrangements with healthcare providers in all States and Territories other than Western Australia; and
 - (b) Medibank, Bupa and HCF.
- 2.10 The Applicants are open to the imposition of a condition on the exception in paragraph 2.8 that requires the Applicants to ensure that prior to agreeing to provide contracting services relating to the Broad Clinical Partners Program to HBF, Medibank, Bupa or HCF, it must ensure that the addition of that Participant will not result in HH providing the Broad Clinical Partner Program services to more than 80% of the national private health insurer market measured as a share of total hospital policies, based on the latest market share statistics published by APRA.
- 2.11 Authorisation is not sought for the HH Buying Group to engage in the collective boycott of any services of a Provider.

Structure of HH Buying Group

- 2.12 HH intends to negotiate a bilateral participation agreement with each Participant to undertake the contracting services in relation to some or all of the Providers. Participants can opt to purchase some or all of the different categories of contracting services.
- 2.13 In relation to negotiated contracts (with hospitals and medical specialists), HH proposes to implement the Proposed Conduct by using nib's existing contracts with Providers, with the consent of the Providers. HH will negotiate with Providers to purchase their services on behalf of the Participants using the same base agreement that the Provider has negotiated with nib. HH will then negotiate new contracts on behalf of Participants as the nib-based contracts expire or enter into contracts with new Providers. The Participants will unilaterally determine whether to enter into an agreement with each Provider based on the negotiated terms and conditions. If they choose to do so, Participants will execute an agreement with the Provider. HH will not be party to the agreement. HH will then undertake contract administration services for that agreement.
- 2.14 If Participants do not wish to enter into an agreement on the negotiated terms and conditions, Participants will still be permitted to negotiate directly with Providers and enter into agreements independently of the HH Buying Group on their own terms and conditions. This could either be completed between the provider and the fund or, alternatively, with HH acting as an agent for the fund but outside of the buying group terms, conditions and offer. Furthermore, the Proposed Conduct will not prevent Providers from offering healthcare services to other insurers, buying groups or healthcare payers that are not participating in the HH buying group, and will not restrict the terms and conditions on which the Provider is entitled to enter those agreements. Providers

will also not be prevented from contracting with Participants individually, or with a different set of participants than that proposed by the HH buying group.

- 2.15 For contracts with Providers based on standard terms and conditions (medical gap scheme and general treatment networks), HH proposes to extend these schemes to the Participants and would provide sufficient notice to Providers to enable Providers to operationalise the change.

Nature of contracting relationships with Providers

- 2.16 The Proposed Conduct will involve the provision of four broad categories of contracts including hospital contracting, medical specialist contracting, medical gap scheme and general treatment contracting. These are described in detail below.

Hospital contracting

- 2.17 Hospital contracting involves agreements between healthcare payers and private hospitals (occasionally public hospitals) under which the parties agree on the rates and other terms and conditions for the provision of hospital treatment to the healthcare payer's customers (**Customers**). In the private health insurance industry, the agreements are referred to as hospital purchaser provider agreements (**HPPAs**). Under HPPAs, hospitals agree not to charge out-of-pocket costs to Customers and are used by health insurers to provide financial certainty to its Customers.
- 2.18 nib has a network of private hospitals that have HPPAs with nib and HH is providing contracting services for that network on behalf of nib.

Medical specialist contracting

- 2.19 Medical specialist contracting refers to agreements between healthcare payers and medical specialists such as radiologists, pathologists and surgeons. The parties agree on rates and other terms and conditions for the provision of the medical specialists' professional services during the hospital admission of Customers. In the private health insurance industry, the agreements are referred to as medical purchaser provider agreements (**MPPAs**). MPPAs are used by health insurers to provide financial certainty to its Customers in relation to potential out-of-pocket costs for professional services. The network of MPPAs that nib currently has in place falls into two categories – MPPAs with radiologists and pathologists and the MPPAs for the Clinical Partners Program.
- 2.20 nib's MPPAs with radiologists and pathologists are entered into with radiologists and pathologists that provide services such as x-rays, ultrasounds and blood tests to Customers during their admission at a private hospital that is part of nib's network (ie. nib has an HPPA with that private hospital). These services are not included in the scope of services that are provided to Customers by the private hospital. They are services provided directly to the Customer by the radiologist or pathologist under separate contractual arrangements with the Customer. Without an MPPA, Customers may incur out-of-pocket expenses for the radiology and pathology services received during a hospital admission.
- 2.21 Under nib's Clinical Partners program, nib has entered into MPPAs with orthopaedic surgeons, anaesthetists and assistant surgeons for the provision of their professional services for orthopaedic joint replacements provided to Customers. Under these MPPAs, the medical specialists agree on fees paid by nib for their services and agree not to charge Customers any gap for their professional services. The medical specialists are paid a higher fee than what they would otherwise be entitled under nib's medical gap scheme. The medical specialists also agree on data sharing and quality target requirements. Unlike nib's medical gap scheme, Clinical Partners Providers cannot choose to opt-out of the program on a patient-by-patient basis. This provides certainty that all nib customers will have a no gap experience with these medical specialists.

Medical gap scheme

- 2.22 Under medical gap schemes, health insurers offer to pay medical specialists a set fee for each type of professional service they provide to Customers in hospital, in accordance with a standard set of terms and conditions. The set fees are higher than what insurers are otherwise required to pay under the PHI Act and medical specialists agree not to charge Customers an out-of-pocket amount or agree to limit the amount the Customer is charged at a fixed amount (eg. \$500) in the case of known gap schemes.
- 2.23 Medical specialists registered under a medical gap scheme are permitted to opt-in or opt-out of the scheme on a case by case basis (per treatment and Customer). By opting-in, the medical specialist agrees to be bound by the terms and conditions of the medical gap scheme.
- 2.24 Currently, HH acts on behalf of nib in the management and administration of the nib MediGap scheme (no-gap scheme) that applies to nib, Qantas and Suncorp-branded health insurance policies and the GU Health Medical Gap Network (no-gap or known gap scheme) that applies to GU Health-branded health insurance policies.

General treatment networks

- 2.25 General treatment networks are arrangements with Providers for services that are not provided in hospital. These providers generally include physiotherapists, dentists, optometrists and chiropractors which are covered under the 'extras' component of private health insurance products. It also includes a network of general practitioners and medical specialists providing professional services out-of-hospital for international students and international workers covered under international health products (health insurers are prohibited from covering these services for Australian residents).
- 2.26 Providers that are registered with a general treatment network, agree to a standard set of terms and conditions and schedule of rates for each type of service.
- 2.27 HH acts on behalf of nib in the management and administration of its general treatment network branded as the First Choice Network. nib has two bespoke agreements with optical and dental providers under which the providers operate nib-branded centres. HH also manages these agreements.

Nature of contracting services

- 2.28 In relation to the four types of contracts, the Proposed Conduct will involve HH engaging in the following types of services:
- (a) for hospital and medical specialist contracting, contract negotiations with Providers;
 - (b) for the medical gap scheme and general treatment network, management and administration of the schemes; and
 - (c) for all four types of contracting, data analytics, contract management and dispute resolution.

Data analytics and contract negotiations

- 2.29 HH will initially engage in collective negotiations with Providers that currently have HPPAs and MPPAs with nib in order to agree to new contracts with the Participants based on the Provider's existing agreement with nib.
- 2.30 On an ongoing basis, HH will negotiate new HPPAs and MPPAs on behalf of nib and all Participants as the current agreements expire or with new Providers. HH will act as the lead agent in the negotiations after consultation with the Participants. This will involve:
- (a) aggregation of Participant claims data for the Provider and undertaking data analytics to establish benchmarks relating to quality of service, price and application of services (see further details below);

- (b) conducting collective commercial negotiations on behalf of Participants based on information of the HH Buying Group. HH will negotiate one set of terms and conditions including price schedules, business rules for payment of benefits and quality and performance targets for all Participants for each HPPA or MPPA with a Provider; and
- (c) once HH receives instructions that a Participant wishes to enter into an HPPA or MPPA on the negotiated terms and conditions, coordinate the execution of the HPPA or MPPA between the Participant and the Provider (or execute the contract if HH has signing authority).

2.31 The HH Buying Group will be voluntary and the Participants will unilaterally determine whether to enter into an HPPA or MPPA based on the terms and conditions negotiated by HH.

Extension and management of medical gap scheme and general treatment network

2.32 HH will initially engage with Providers registered in the nib MediGap Scheme, GU Health Medical Gap Network and the First Choice Network to notify them of the extension of these schemes to the Participants.

2.33 HH intends to replace the nib Medigap scheme and the GU Health Medical Gap Network with a new HH scheme which will have some variations in the terms and conditions.

2.34 For general treatment networks, HH intends to create new specific networks tailored to meet a Participant or group of Participants' individual requirements such as the requirement to have a strong network of Providers in a regional area or to have a fee structure that is more suited to the manner in which some Participants pay benefits.

2.35 On an ongoing basis, HH will manage the medical gap scheme and general treatment networks, review the schedules of rates and terms and conditions and actively manage the registered Providers of the schemes and networks. This includes ensuring adherence to requirements around registration, qualification and other terms and conditions of the schemes and networks.

Contract management and dispute resolution

2.36 HH will offer to provide the Participants with contract administration and management services and dispute resolution services on behalf of nib and all Participants for the contracting services that they engaged HH to undertake which may include:

- (a) all HPPAs and MPPAs that were entered into by the Participants based on the terms and conditions negotiated by HH; and
- (b) the agreements between Participants and Providers registered in the medical gap scheme and/or general treatment network,

(Managed Agreements).

2.37 This will involve HH acting as agent for the HH Buying Group to facilitate:

- (a) administration of, and compliance with, the terms and conditions of the Managed Agreements;
- (b) dispute resolution and management of disputes between Participants and Providers arising under the Managed Agreements;
- (c) management and investigation of Customer complaints relating to Providers party to the Managed Agreements;
- (d) collection and management of data submission from Providers to Participants under the Managed Agreements; and

- (e) reporting and oversight of the parties' adherence to terms and conditions of the Managed Agreements and performance and quality targets.

Data analytics

- 2.38 HH will provide the Participants with data analytic services as part of contract negotiations but also on an ongoing basis to assess the performance of each Provider and benchmark their performance for each Participant against the aggregated data for the HH Buying Group including an assessment of:
- (a) Provider quality (e.g. rate of hospital acquired complication, length of hospital stay, unplanned readmission to theatre, conversion to ICU, etc.)
 - (b) Provider Compliance (e.g. accuracy of claims, compliance with the contract terms, complaints, etc.);
 - (c) benefits paid to the Provider by Participants (e.g. cost per episode against national peer groups, change in cost over time, cost variability reporting across the Provider network, etc);
 - (d) access to the Provider's services (e.g. network coverage, member access issues, etc); and
 - (e) efficiency and value of treatment provided by the Provider (e.g. establishment of quality scoring of Providers and ranking of value and efficiency against quality).
- 2.39 Subject to confidentiality and privacy obligations, HH would also share information pertaining to one Participant with the HH Buying Group to the extent the information is related to the Managed Agreements or services provided by HH to the Participants. This may include the sharing of information on issues such as a breach of contract by a Provider or the discovery of fraudulent claims made by a Provider in relation to the Managed Agreement of one Participant which would be relevant to other Participants who contract with that Provider.
- 2.40 Provisions of the CCA which may apply to the Proposed Conduct
- 2.41 The relevant provisions of the CCA which may apply to the Proposed Conduct include:
- (a) making or giving effect to a contract, arrangement or understanding that may include a cartel provision (Division 1 of Part IV);
 - (b) making or giving effect to a contract, arrangement or understanding that has the purpose or would have the effect, or likely effect, of substantially lessening competition (section 45(1)(a) and (b));
 - (c) engaging with one or more persons in a concerted practice that has the purpose or has or is likely to have the effect, of substantially lessening competition (section 45(1)(c)); and / or
 - (d) engaging in the practice of exclusive dealing (section 47(1)).
- 2.42 Rationale for the Proposed Conduct
- 2.43 The rationale for the Proposed Conduct is to enable Participants to streamline contract negotiation, procurement and management procedures. The streamlined processes will improve efficiencies by virtue of the reduced transactional and administrative costs, and increase information sharing and data analytical capabilities resulting in better health outcomes and reduced premiums for Customers.
- 2.44 Term of authorisation sought and reasons for seeking this period of time

- 2.45 Authorisation for the Proposed Conduct is sought for 10 years from the date of final determination by the ACCC.
- 2.46 Given it is common practice for HPPAs and MPPAs to be 3 years duration, authorisation for 10 years will enable the HH Buying Group to continue to operate across two renewal cycles. It will also allow sufficient time for HH to implement innovative models of funding of healthcare that focus on driving quality and providing value, and for Participants and their Customers to realise the cost, quality and efficiency benefits of engaging in the HH Buying Group.
- 2.47 Provide documents submitted to the applicant's board or prepared by or for the applicant's senior management for purposes of assessing or making a decision in relation to the proposed conduct and any minutes or record of the decision made
- 2.48 None.
- 2.49 Names of persons or classes of persons who may be impacted by the Proposed Conduct and details of how / why they might be impacted
- 2.50 The class of persons potentially affected by the Proposed Conduct are:
- (a) private health insurers that do not join the HH Buying Group;
 - (b) private hospitals;
 - (c) medical specialists and general practitioners; and
 - (d) allied health providers such as physiotherapists, dentists, optometrists, chiropractors.

Please refer to section 4 below as to how each class of persons may be impacted.

3. Market information and concentration

- 3.1 Describe the products and/or services, and the geographic areas, supplied by the applicants. Identify all products and services in which two or more parties to the proposed conduct overlap (compete with each other) or have a vertical relationship (e.g. supplier-customer).
- 3.2 The Applicants submit that the relevant markets are:
- (a) national market for private health insurance;
 - (b) national market for international medical and travel insurance;
 - (c) State-based or localised market for hospital services;
 - (d) localised market for medical specialist services for each specialty practice; and
 - (e) localised market for each type of allied health service (eg. physiotherapists, dentists, optometrists, chiropractors, etc).
- 3.3 nib and the Participants compete with each other as purchasers of health services in the markets set out in paragraphs (c) to (e) above and as suppliers of private health insurance.
- Private health insurance market*
- 3.4 The market share of each private health insurer, measured as a share of total hospital policies as at June 2019 are set out in the table below.² The table also sets out which party undertakes contracting services for each private health insurer.³

² *Operations of Private Health Insurers Annual Report 2018-2019*, published by APRA on 5 November 2019.

³ Sourced from market knowledge and information available on AHSA's and ARHG's websites respectively.

ARHG	1.5%

3.6 We have also provided in Annexure A market shares based on total policies and revenue.

Market for Other Healthcare Payers

3.7 A useful lens through which to define the market for private healthcare is examining the sources of health expenditure funds. The Australian Institute of Health and Welfare (**AIHW**) publish detailed data on this topic. A key table from their 2018-2019 health expenditure data is shown below.

Table A3: Total health expenditure, current prices, by area of expenditure and source of funds, 2018-19 (\$ million)

Area of expenditure	Government					Non-government				Total health expenditure	
	DVA	Health and other	Premium rebates	Total	State and local	Total	HIF	Individuals	Other		Total
Hospitals	1,321	23,702	3,332	28,354	33,280	61,634	9,689	3,689	4,036	17,415	79,049
Public hospital services	579	23,582	342	24,504	32,229	56,732	995	1,444	2,630	5,068	61,801

Source: <https://www.aihw.gov.au/reports/health-welfare-expenditure/health-expenditure-australia-2018-19/data>

- 3.8 Focusing on the \$17,248 million expenditure on private hospitals, reallocating the Premium rebates column (which represents the Australian Government's contribution to private health insurance premiums through the Australian Government Rebate) back to health insurance and including a breakdown of the "Other" column from Table 3.16 of the same report to include Workers compensation insurers and transport accident insurers produces the following table:

Private hospital funder	\$ millions	Share
Private health insurers	11,683	67.7%
Individuals	2,246	13.0%
State and local government	1,051	6.1%
DVA	741	4.3%
Workers' compensation insurers	400	2.3%
Transport accident insurers	256	1.5%
Other Federal government	120	0.7%
Unknown	751	4.4%
	17,248	100.0%

- 3.9 Private health insurers and individuals account for 80.7% of revenue received by private hospital operators. DVA represents 4.3%, workers compensation insurers throughout Australia 2.3% and transport accident insurers 1.5%. There is a remaining Unknown percentage of 4.4%.

Market for travel insurance and short-term International Private Medical Insurance

- 3.10 Included in either the Individuals spend of \$2.2 billion or the Unknown spend of \$751 million, is hospitalisation for overseas tourists and short-term overseas workers. Typically, tourists and short-term workers take out insurance in their home country before travelling to Australia. Given their lack of scale in the Australian market, the overseas domiciled insurer will usually not have negotiated network access arrangements in Australia.
- 3.11 If the traveller requires medical services whilst in Australia, they will be required to pay the "rack rate" for the service out-of-pocket and then seek reimbursement from their insurer when they arrive home. One of the issues this creates is a bad debt risk for the hospital provider. Due to the lack of a certainty of payment, hospital providers embed within the "rack rate" a loading to offset the risk of the overseas visitor leaving the country without paying their bill. For international travel insurers, without the volume and local knowledge to develop networks, the increased "cost of production" is passed through to travellers in the form of higher insurance premiums.
- 3.12 nib has been approached by a number of these companies over the last 4-5 years seeking to negotiate "network access" arrangements. The size of these potential contracts is small - combined these groups would represent less than 0.5% of the total market for private hospital services.

Department of Veterans Affairs (DVA) scheme

- 3.13 Under the DVA scheme, eligible veterans are able to receive hospital services free with no gap expenses. The DVA arrangements represent a 4.3% share of the total expenditure on private hospitals and involve contracting directly with private hospitals through a tender process for the provision of the healthcare services. For GPs and medical specialists, the DVA maintains their own no-gap scheme. This involves contracting individually with these types of Providers.
- 3.14 DVA policyholders are not required to make any co-payment to medical specialists or hospitals. The average age of the DVA population is rapidly increasing and, consequently this segment of the market is reducing in activity and relevance with hospital providers. As this reduction

continues it will place increasing price pressure on DVA as they lose market share and power to obtain competitive rates.

Workers compensation schemes

- 3.15 Each of the eight Australian states and territories has their own workers' compensation scheme and the Commonwealth has three separate schemes. As per the table above, workers compensation schemes in total represent 2.3% of total private hospital funding. New South Wales has the largest scheme and would represent approximately 0.7% of total private hospital funding.
- 3.16 Each scheme manages their own contracts with medical and hospital providers. For example, the NSW scheme, administered by icare, has recently experienced significant increases in medical costs. icare is required to pay surgical fees that are gazetted by the State Insurance Regulatory Authority (**SIRA**). These gazetted rates are set by SIRA at 150% of the Australian Medical Association's (**AMA**) recommended rate.
- 3.17 This is higher than any other Australian workers compensation scheme and much higher than private health insurer and DVA scheme. For example, nib's Medigap scheme is set at an average of 50% of the AMA's recommended rates and the DVA scheme is set at 52%.
- 3.18 Ultimately these higher specialist fees are passed through to NSW companies in the form of higher workers' compensation premiums.

Transport Accident Schemes

- 3.19 Each Australian state runs its own compulsory transport accident insurance scheme. In NSW, Queensland, South Australia and the ACT, drivers can choose from a panel of compulsory third party (**CTP**) providers. In the other States, transport accident schemes are provided by a state-owned or government-licensed insurer. As per the table above, transport accident insurers represent 1.5% of total private hospital funding. Similar to workers compensation schemes, transport accident insurers typically manage their own contracts with medical and hospital providers.

Private hospital market

- 3.20 The table below shows the market shares of private hospital provider large groups.⁵

Hospital Provider Group	Market share
Ramsay	21.6%
Healthscope	13.7%
Healthcare	9.3%
St John of God	5.5%
St Vincents Health	3.4%
Mater Misericordiae Limited	3.1%
Little Company of Mary	3.1%

- 3.21 Describe the relevant industry or industries. Where relevant, describe the sales process, the supply chains of any products or services involved, and the manufacturing process.
- 3.22 Please refer to section 1 (Background).

⁵ Compiled by nib based on publicly available sources.

- 3.23 In respect of the overlapping products and/or services identified, provide estimated market shares for each of the parties where readily available.
- 3.24 Please refer to section 3 for market shares of nib and potential Participants.
- 3.25 In assessing an application for authorisation, the ACCC takes into account competition faced by the parties to the proposed conduct. Describe the factors that would limit or prevent any ability for the parties involved to raise prices, reduce quality or choice, reduce innovation, or coordinate rather than compete vigorously. For example, describe: existing competitors, likely entry by new competitors, any countervailing power of customers and/or suppliers; and any other relevant factors.
- 3.26 Please refer to section 6 (Public Detriments) for an analysis of each health services market and any potential impacts on competition from the Proposed Conduct.
- 3.27 In relation to the market for private health insurance, insurers are highly regulated and any increase in premiums is subject to approval by the Commonwealth Minister for Health on an annual basis. The Minister has an expectation that the industry will limit premium increases to a target percentage which places pressure on health insurers to keep costs down and they have limited ability to increase premiums in response to health inflation. Therefore, coordination among competitors in the HH Buying Group will not lead to premium increases for Consumers and will in fact do the opposite and drive down costs (administrative and benefit outlays) to support Participants in keeping premium increases low.

4. Public benefits

- 4.1 Describe the benefits to the public that are likely to result from the proposed conduct. Provide information, data, documents or other evidence relevant to the ACCC's assessment of the public benefits.
- 4.2 The Proposed Conduct will generate public benefits in the form of transaction costs savings and efficiencies for healthcare payers, healthcare providers and members, encouraging transition towards value based contracting and information sharing resulting in better health outcomes for consumers at a lower cost resulting in more efficient pricing for hospital services and ultimately, reduced premiums for consumers. As private health insurers constitute the vast majority of purchasers of private health care (around 70% of private hospital services according to AIHW data), we will focus on public benefits in the private health insurance industry.

Transaction costs savings and increased efficiencies

- 4.3 Authorisation for HH to engage in collective bargaining will result in significant transactional and administrative cost savings for Participants. nib's network of Providers consists of:
- (a) 565 private hospitals;
 - (b) 21,764 medical specialists;
 - (c) 3,049 general treatment clinics and over 15,900 providers.

This requires nib to:

- (d) negotiate over 500 contracts per year; and
 - (e) manage over 3,500 agreements.
- 4.4 The negotiation of HPPAs in particular can be time consuming and at times, protracted with some HPPAs taking up to 16 months to negotiate and the average large hospital group negotiation taking between 6 to 8 months. The process involves complex negotiation on legislative issues, terms and conditions relating to payment structures, audit, recoveries and obligations by both parties as well as the associated business rules and clauses which detail the nature of how

payments are made for health care services (which are volatile in nature due to each individual's condition). Some hospital group HPPAs involve up to 70 hospitals. In addition to negotiating the general contractual terms, each hospital in a hospital group will have an individual rate schedule (list of prices for hospital treatment) and each is negotiated individually with the requisition commercial modelling to be done at the individual level and then "rolled up" to understand both party's (fund and hospital groups) material change in value of the contract. As the business rules and contractual terms impact this modelling the processes generally involves a number of in-person meetings (in particular at commencement of negotiation) before weekly meetings to cover off specific areas and issues. A working document (contract) is created and a separate issues log maintained on the negotiation. The working document is exchanged periodically between the parties and is marked up with comments, issues, requested changes etc. Once the contract terms are close to finalisation the rate modelling commences with each hospital and these rate schedules are exchanged in a similar manner to allow each organisation to model the predicted impact in change of terms (contract clauses), payment models for each service (daily rate to Diagnosis Related Grouping) and price. The modelling is generally conducted on an agreed period of 12 months of previous activity. Once all parties are satisfied with the outcome the negotiation is finalised and contracts executed. On issues which cannot be resolved, these are generally escalated by one or both parties to more senior staff and or executives to resolve. Once a position has been agreed at this higher level it is then briefed back to the negotiation teams who work together to ensure it is adequately reflected in the contractual terms.

- 4.5 Historically, nib's health services contracting function required approximately 25 staff and cost approximately \$5 million per annum to operate. The size and cost of this function is largely independent of the size of the health insurer. Any health insurer that has national coverage and maintains its own health services contracting function would need to support a function of a similar size due to the breadth of the Provider networks.
- 4.6 The HH Buying Group would reduce the need for duplication of the resources and processes involved in the contracting services and reduce costs for Participants. Economies of scale and scope would be realised as each Participant joins the HH Buying Group and greater efficiencies achieved. Under the HH Buying Group, it is proposed that the fee for Participants would correlate with transactional costs so that any savings that arise as Participant numbers increase, would be distributed between Participants under the Participation Agreement through reduced fees.
- 4.7 The formation of the HH Buying Group to perform the contracting services will create significant administrative cost savings as each Participant does not need to replicate the same infrastructure. As HH is currently undertaking this function, the marginal cost of HH performing the contracting services for each Participant would be low. HH would distribute the cost of undertaking nib's contracting services across the Participants, thereby significantly reducing each Participant's costs and presenting an opportunity for transaction cost savings and increased efficiencies. We have set out in Annexure B an example of how the participation fee for the HH Buying Group would decline as Participants join.
- 4.8 These efficiencies can be realised with health insurers that are already part of the AHSA or ARHG buying groups. HH modelling suggests that the participation fee for the HH Buying Group will be competitive with the AHSA's or ARHG's membership fees and would provide a broader scope of services particularly in relation to data analytics. In any case, the HH participation fees would be substantially lower than running an effective internal function. We have set out in Annexure C the basis of the modelling undertaken by HH in comparing the competitiveness of the participation fee for the HH Buying Group with other buying groups.
- 4.9 The Proposed Conduct will also create the following benefit for the Providers (albeit more limited if most of the Participants were previous members of AHSA or ARHG):
 - (a) simplifies backend billing processes as the Participants would have the same contract, rates and billing rules which results in significant reduction to the operational and administrative costs for Providers;

- (b) consistent funding agreements enable Providers to more easily establish care pathways and work with medical specialists on improving the quality and cost of health care; and
- (c) reduced cost to negotiate and manage relationships with health insurers. Negotiation of agreements, particularly HPPAs, create a significant burden and cost to Providers and having reduced numbers of negotiations allow Providers to reduce the costs associated with establishing, negotiating and managing contracts with health insurers.

Greater choice of buying group

- 4.10 The HH Buying Group would provide health insurers with an alternative buying group to the AHSA and provide greater choice. ARHG is not a viable alternative to AHSA for health insurers because of their lack of scale and ability to implement more sophisticated contracting mechanisms. Increased competition between different buying groups would also foster greater innovation and incentivise the buying groups to provide better value and quality of services to its participants.
- 4.11 The HH Buying Group would provide a differentiated model of funding such as value-based contracting, as further described below, and a buying group model that has been authorised by the ACCC.

Better health outcomes at a lower cost

- 4.12 HH intends to work collaboratively with Providers to implement more efficient "value-based" contracting relationships. In relation to hospital contracting, this type of contracting involves comparing health outcomes with costs of services to determine the value of the service. The agreed contracting price for healthcare services will be informed by the value of the service, rather than on the existing cost base. This transition from "fee-for-service" to "value-based" contracting aligns with many other health systems globally which have seen improvements in health outcomes and reduced costs from the transition. As an example, in the United States, Cigna created its first commercial value-based model in 2008. Today, 67% of Cigna's claim spend in the United States has shifted to value-based models. Cigna continues to grow its value-based models and expects to have over 1,000 value-based arrangements across hospitals, specialists, and general practitioner groups in 2021.
- 4.13 As a result of its shift to value-based contracting, Cigna has been able to improve cost outcomes and quality outcomes over time. From 2010 to 2018, Cigna had the lowest reported medical cost trend in the US at 3.6% (key competitors were between 5.5% and 6.0%). By 2021, Cigna is ambitiously targeting to manage medical cost trend to the same level as CPI. Value-based reimbursement arrangements have been a key component of that success.
- 4.14 More specifically, Cigna has seen very strong results in its top performing value-based arrangements:
 - 11% better quality scores than market for primary care providers;
 - 14% improved costs for specialist groups; and
 - 2% lower readmission rates for hospitals.
- 4.15 Value based contracting takes many forms. In its most simple form, HH would initially compare the value of services from a particular Provider against peers in the local region, state as well as nationally. Based on the outcomes and quality of care achieved by the Provider, the cost of the services would be adjusted (either through price or structure) to match the value being delivered by the Provider. If the Provider achieves higher than standard quality outcomes, then the insurers would pay more to the Provider and if the standard quality outcomes were below average, insurers would pay less for these services. The mechanism for this adjustment would form part of the commercial negotiations process and could take a number of forms including price adjustment to reflect the quality of service, payment of performance incentives if agreed benchmark outcomes

are exceeded or changes to payment structures which drive improved efficiency to match the outcomes associated with the Provider.

- 4.16 Current approaches to contracting generally focus solely on cost of care of the services and most funds, and buying groups such as the AHSA and ARHG, have historically focused on cost of care to determine payment structure and price of services. Larger funds tend to have greater access to the complex analytics and data science required to support the development of value-based funding models. Through the HH Buying Group for small and medium funds, it will effectively improve and normalise the Participants' ability to manage benefit outlay and match larger more mature competitors in accessing value based contracting services.
- 4.17 Health systems that have moved to value-based contracting, which by definition, better aligns incentives between the payer and provider, have seen both improvements in health outcomes and lower costs. This shift is fundamentally underpinned by broad data and mature and sophisticated data science capabilities. The establishment of outcomes data is complex by its nature and requires the collection of sufficient data for statistical relevance (which is difficult, if not exclusionary requirement for small insurers), the establishment of outcome measures and quality based on relevant clinical and international literature, and the normalisation and risk adjustment of the patient population to ensure like-for-like comparison in the provision of services.
- 4.18 HH intends to collect and aggregate claims data and Hospital Casemix Protocol (HCP) data of Participants to establish benchmarks on the outcome of services in relation to both procedures and Diagnosis Related Grouping (DRG). This outcomes-based data would then be normalised and risk-adjusted for the variances in patient population (e.g. age, co-morbidities and demographic factors including gender) and a relative outcome scale established for each Provider at a procedure level. This would include quality data and information such as Hospital Acquired Complications as well as efficiency data such as excessive bed days or excessive use of Medicare Benefits Schedule (**MBS**) item numbers.
- 4.19 Once the quality scoring is established, HH will be able to use this benchmarking to assign a relative value score to each Provider at a procedure or DRG level as well as an aggregated weighted average for the Provider. This will then inform the basis for price and payment structure negotiations of HPPAs and will drive improved outcomes for Participants through more appropriate pricing at a procedure level for hospitals service purchased. Ultimately this will drive improved outcomes for Customers as they benefit from improvements in the quality of service from Providers or through more sustainable and affordable private health insurance due to better control by Participants of benefit outlay.
- 4.20 Additionally, the Proposed Conduct will encourage greater involvement by Providers in the lifecycle of the contracting process. The potential size and calibre of the HH Buying Group will drive uptake of value-based contracting by encouraging healthcare providers to be more engaged in innovative funding models that improve outcomes for Customers.
- 4.21 In relation to general treatment networks, such as dental networks, the ability to collectively acquire these services on behalf of a number of insurers will see improved volume provided to the Providers of these services who have been selected based on quality criteria, while pairing this with better pricing and value for Customers and the healthcare payers. As the health insurance products which cover these services typically pay a percentage of the cost, any price negotiation and discount is of benefit to both the payer and Customers who hold the insurance policy.
- 4.22 The key advantage of driving value-based contracting through the HH Buying Group rather than nib alone is that HH will be able to get more buy-in from Providers if HH is representing a larger Customer base. Value-based funding, by its nature, allows Providers to be more innovative and considered in the application of care. This allows a Provider to ensure that quality is maintained or increased while efficiency and cost of service delivery is improved. To make this viable for Provider to invest in, and operationally develop, providers require a reasonable volume of care to occur through these mechanisms. By forming a buying group for the development and purchasing of value-based funding mechanism, HH will provide enough scale to Providers to validate the investment and opportunity.

- 4.23 Likewise, the scale of smaller health insurance funds is likely to be insufficient to develop and implement value-based funding as stand-alone funds. By forming the HH buying group this will provide opportunity to small Participant funds to be involved in more modern and effective health procurement funding models which will ultimately translate into better affordability for members.

Access to data analytics and Information

- 4.24 Generally, only larger health insurers have access to the body of information and data analytics capabilities required to support the development of value-based contracting. The Proposed Conduct will provide Participants, who are likely to be smaller health insurers, with access to data analytics tools and technology. HH's data analytics undertaken as part of its contracting services will use claims and HCP data of all Participants. This will reduce information asymmetry and allow smaller insurers to obtain insights from information analysed across all Participants, that they would otherwise not have. This will assist smaller insurers to more effectively engage in the contracting process and increase access for them to value-based contracting.
- 4.25 In addition to the benefits in relation to hospital services, data analytics and information sharing would allow HH to develop reliable and efficient networks of medical specialists and extras providers across various speciality groups and geographic networks. Increased information sharing and access to data analytics will increase use of efficient providers who deliver improved standards of care and allow participant funds the ability to provide better and more transparent information to members, which will result in a better informed and empowered consumer of health care services.

No gap experience for Customers

- 4.26 The uncertainty around the extent of gaps that Customers face in the private healthcare system is one of the major concerns or causes of dissatisfaction for Customers. For example, according to IPSOS' 2019 Healthcare & Insurance Australia Study, the most important driver for customer satisfaction with respect to their health insurer is 'Rebates on Services' (i.e. out-of-pocket costs) with the average fund scoring 5.8 out of 9 on this aspect. This uncertainty is partly derived from the multitude of contractual relationships that are created when a Customer receives hospital treatment – separate contracts between the Customer and the private hospital, medical specialist, anaesthetist, assistant surgeon, radiologist, pathologist, etc.
- 4.27 The HH Buying Group would broaden access to nib's Clinical Partners Program which is a unique industry offering where nib engages with the surgeon, assistant surgeon and anaesthetists to bring a zero-gap experience for Customers for knee and hip replacements. The HH Buying Group would allow this offering to be made available to Customers of Participants. It also provides HH with a larger Customer base to be able to engage with a broader group of medical specialists so that the program can be expanded to cover more types of treatment (the program currently only covers hip and knee replacements) and more geographical areas.
- 4.28 The development and expansion of the Clinical Partners Program will focus on efficient and effective Providers who provide quality standards of care based on the available hospital quality and outcomes data. The establishment of MPPAs with these Providers will drive more volume to them (as health insurers will be able to actively promote the financial certainty for Customers and referrers) and will also serve to place pressure on non-participants specialists to moderate their out-of-pocket practices due to the risk of loss of patient volume. Ultimately, in both instances the Customer is better protected from excessive out-of-pocket exposure when undergoing large and complex surgical procedures.
- 4.29 The HH Buying Group would also have the additional scale to expand its network of private hospitals with HPPAs and health professionals participating in the medical gap scheme and general treatment network which would also contribute to more no gap experiences for Customers.
- 4.30 The public benefit of an expanded Clinical Partners Program and the creation of potentially further no gap funding initiatives is that a greater number of Customers would have the benefit of the

certainty of a no gap hospital or health experience. It would also go some way towards addressing a key concern of Customers and encourage further Australians to use the private healthcare system, alleviating the pressure on the public system.

Countervailing hospital bargaining power

- 4.31 Some Providers have much stronger bargaining power in the negotiation of agreements with healthcare payers which can impede the parties from achieving efficient pricing outcomes for health services. This is particularly the case in the private hospital market where the 5 largest hospital provider groups account for over 50% of the market.
- 4.32 Some of the smaller private hospitals can also have a high degree of bargaining power due to their iconic status and reputation, or due to their location in regional and remote communities.
- 4.33 This leads to inconsistencies in pricing for the same hospital procedure across different hospitals with the more powerful hospital groups being paid higher prices without any commensurate in value for the Customer. Two examples of this are procedures for cataracts (MBS item 42702) and oocyte retrieval (MBS item 13212) where the median cost charged by large hospital groups is 181% and 149% of the national median cost respectively.
- 4.34 This results in hospital pricing that is above the competitive and efficient price for treatment in particular hospitals.
- 4.35 The Proposed Conduct will enable the HH Buying Group to improve its bargaining position to countervail the power of some of the hospital groups which would lead to more efficient hospital pricing.

Reduced healthcare costs and premiums for members

- 4.36 The public benefits outlined above have the combined effect of increasing the value of the benefits paid by healthcare payers for health services and reducing overall spend particularly in relation to hospital benefits. This will be achieved in the short term through more efficient pricing and in the longer term through increased quality of care which will reduce the volume of health services being purchased. In FY19 the private health insurance industry paid \$15.7 billion in hospital benefits which represented 74%⁶ of all benefits paid by private health insurers for that period.
- 4.37 The reduction in healthcare costs is of particular importance to the smaller health insurers who are likely to be Participants and have more limited access to capital. It would ease the current pressure on health insurers struggling with escalating healthcare costs and inflation coupled with increased cost of regulatory compliance and changes to capital adequacy requirements.
- 4.38 The flow on effect of reductions in benefit outlays and transactional costs savings from the HH Buying Group is that it reduces pressure on premium increases for health insurance policies by the Participants, whilst also improving patient outcomes through value-based contracting and incentivised performance based outcomes. Reduced premium increases encourages participation in private health insurance and reduces pressure on the public health system.

Public benefits for Other Healthcare Providers

- 4.39 Hospital and medical purchasing is at a significantly lower scale for other purchasers of private medical services compared to private health insurers. This creates an opportunity to partner with these purchasers to increase their sophistication and better align incentives with health care providers.
- 4.40 Similar to insurers, Other Healthcare Providers will benefit from transaction costs savings as a result of the Proposed Conduct particularly those that have ongoing arrangements with health service providers akin to insurers. This will enable schemes such as the Department of Veteran's

⁶ *Operations of Private Health Insurers Annual Report 2018-2019*, published by APRA on 5 November 2019.

Affairs hospital cover scheme to pass on greater benefits to veterans, or reduce general expenditure. Furthermore, for those that do not have arrangements with health service providers and instead rely on the established rates for services will gain access to more efficient pricing models.

- 4.41 Importantly, and as noted above in respect of private health insurers, the Other Healthcare Providers will benefit from the data analytics and associated "value-based" contracting models. Only larger private health insurers will have access to the quantity and quality of data required to effectively engage with data analytics and achieve meaningful results. The Other Healthcare Providers will be able to benefit from the data sharing, and third party data analytics, in circumstances where they otherwise would not have the relevant data, finance or experience to implement. Furthermore, as a result of the Proposed Conduct the Other Healthcare Payers will be able to consider implementing "value-based" contracting with the ultimate goal of offering better quality of care, and accordingly improving the health of its members.

5. Public detriment (including likely competitive effects)

- 5.1 Describe any detriments to the public likely to result from the proposed conduct, including those likely to result from any lessening of competition. Provide information, data, documents, or other evidence relevant to the ACCC's assessment of the detriments.
- 5.2 The potential public detriments from the Proposed Conduct would be minimal (if any) in the markets for health services and would be outweighed by the public benefits set out above. The health insurers that are most likely to be Participants are members of existing buying groups. As insurers would be switching from one buying group to another, it would not substantially change the current market dynamics in the market for health services. The key difference being that nib would be a party to the HH Buying Group.
- 5.3 The other key reason that potential public detriments would be minimal is that the Providers have statutory rights (assigned from members) to be paid benefits from insurers and Medicare and do not rely wholly on agreements with health insurers. We consider each type of contracting service in turn.
- 5.4 In relation to the market for the supply of private health insurance to consumers, the potential public detriments from the Proposed Conduct (if any) would be very limited. The Proposed Conduct will not impact the way healthcare payers compete with one another in relation to the setting of premiums, the products they provide, or their sales strategy, rather it will only impact the way that healthcare payers engage with suppliers of health services as described above and the reduction in health care costs. Accordingly, there the Proposed Conduct will have very little impact on the way private health insurance is supplied to consumers other than easing the pressure on premium increases due to cost reductions. This position is supported by the fact that buying groups in respect of health services already exist and have not impacted or acted as a detriment to competition in the supply of private health insurance.

Hospital contracting

- 5.5 The market for private hospital services is likely to be State-based or local market as consumers are unlikely to travel long distances to acquire hospital services. As purchasers of hospital services, the HH Buying Group would potentially have a stronger bargaining position than if nib or each Participant negotiated agreements with private hospitals individually.
- 5.6 We have set out below the market share figures on a State and Territory basis for each private health insurer or buying group based on hospital policies as disclosed in APRA's *Operations of private health insurers annual report 2019*.

Contracting Group	NSW (including ACT)	NT	QLD	SA	TAS	VIC	WA	National
Medibank	22.60%	40.90%	30.70%	19.40%	26.90%	31.10%	21.40%	26.10%
Bupa	22.90%	36.20%	31.40%	47.80%	32.70%	23.10%	10.90%	25.10%
HCF	20.10%	5.90%	8.00%	8.90%	4.80%	7.50%	4.70%	11.70%
nib	15.20%	3.20%	6.80%	4.10%	3.00%	8.50%	3.90%	9.50%
HBF	0.80%	1.70%	0.70%	0.50%	0.70%	1.10%	49.70%	6.90%
AHSA	17.20%	11.60%	21.50%	18.40%	31.30%	27.00%	5.30%	19.20%
ARHG	1.20%	0.30%	0.90%	0.70%	0.60%	1.70%	3.90%	1.60%

In the unlikely event that every member of AHSA joined the HH Buying Group, market shares by State and Territory are likely to be as set out below.

Insurer	NSW (including ACT)	NT	QLD	SA	TAS	VIC	WA	National
HH Buying Group	34.0%	17.0%	29.6%	23.7%	14.4%	34.7%	13.2%	29.5%
Medibank	22.6%	40.9%	30.7%	19.4%	26.9%	31.1%	21.4%	26.1%
Bupa	22.9%	36.2%	31.4%	47.8%	32.7%	23.1%	10.9%	25.1%
HCF	20.1%	5.9%	8.0%	8.9%	4.8%	7.5%	4.7%	11.7%
HBF	0.0%	0.0%	0.0%	0.0%	0.0%	0.0%	49.7%	6.1%
ARHG	0.4%	0.1%	0.2%	0.2%	21.2%	3.6%	0.0%	1.5%

- 5.7 The most impacted State-based markets would be New South Wales and Victoria if all of AHSA's members joined the HH Buying Group as it would give the HH Buying Group the highest market share in those States.
- 5.8 The increased market share of the HH Buying Group would to some extent, countervail the strong bargaining position of the large hospital groups such as Ramsay and Healthscope that allows for supra-competitive prices for hospital services. We submit that the increase in HH Buying Group's market share will allow it to leverage its position in order to put pressure on hospital pricing so that it falls below supra-competitive and inefficient levels. The HH Buying Group is unlikely to have sufficient bargaining power or incentive to drive hospital pricing below competitive prices. Due to the national network of hospitals operated by the large hospital groups, the HH Buying Group will continue to be reliant on having an HPPA with them. This will also be the case for smaller iconic hospitals that the HH Buying Group must have in the hospital network due to demand from Customers.
- 5.9 Health insurers are effectively subject to a price floor under the PHI Act and Rules for hospital treatment. The legislative regime requires health insurers to pay benefits for hospital treatment at either the specified rates in the *Private Health Insurance (Benefit Requirements) Rules (Rules)* or rates calculated under the Rules for second-tier eligible hospitals. The latter rates are calculated by taking 85% of the average rate for that treatment in the insurer's HPPAs with comparable hospitals. If a hospital does not have an HPPA with the HH Buying Group, insurers must still pay these minimum benefit amounts. Customers of the HH Buying Group would still have the option of purchasing services from that hospital but are more likely to incur out-of-pocket expenses.
- 5.10 Based on nib's experience in moving from AHSA membership to undertaking its own HPPA negotiations, the Applicants submit that the increase is likely to assist the HH Buying Group to

negotiate additional obligations relating to quality of treatment, performance, reporting and have more engagement from hospitals on innovative funding models. The Applicants expect that greater market share would incentivise hospitals to engage more collaboratively with the HH Buying Group during HPPA negotiations.

Medical specialist contracting

- 5.11 The impact of the HH Buying Group would be minimal in the market for medical specialist services which would be localised geographic areas of competition and a separate market for each specialty of practice.
- 5.12 The negotiation of MPPAs with medical specialists involves negotiating the rates that medical specialists would accept for not charging a gap to Customers.
- 5.13 The HH Buying Group is likely to increase the proportion of potential Customers of the medical specialist that are being represented in the MPPA negotiations. The Applicants submit, again on the basis of nib's experience as an AHSA member, that this will not change the negotiation dynamics in relation to price but is more likely to lead to greater engagement on innovative funding models such as the Clinical Partners Program. This is because MPPAs are not critical to medical specialists but are seen as an optional arrangement. If a medical specialist was not prepared to enter into an MPPA with the HH Buying Group, they have statutory rights (assigned from members) to be paid for their professional services which would generally comprise of benefits paid by Medicare (75% of the Medicare Benefits Schedule fee for the service), benefits paid by the insurer (25% of the Medicare Benefits Schedule fee or more if the medical specialist participates in a medical gap scheme) and out-of-pocket expenses paid by the Customer (if any). Therefore, in MPPA negotiations, insurers often do not have strong bargaining power when negotiating with medical specialists despite the differential in size of the organisations as medical specialists are simply agreeing to cap their fees and relinquish their right to charge out-of-pocket expenses.

Medical gap scheme and general treatment network

- 5.14 In relation to the medical gap scheme and general treatment network, the HH Buying Group would not be negotiating agreements with Providers. Due to the large number of individual health providers in the industry (circa 50,000), the HH Buying Group will be managing schemes based on a standard schedule of rates and terms and conditions. nib's current scheme is determined on a state basis for dental and physiotherapy networks and a national basis for other types of general treatment networks and its medical gap scheme. Therefore, any changes to the buying power in the local markets for medical specialists or general treatment providers due to the HH Buying Group would not impact the setting of prices or terms and conditions for the medical gap scheme and general treatment network.
- 5.15 These schemes are voluntary, and Providers have the option to register to be part of these networks and receive additional benefits for agreeing to 'no gap' arrangements and other terms and conditions. General treatment providers also have the option of not being part of an insurer's network and will still be paid benefits in accordance with the policies of the health insurers. As discussed above, medical specialists have the option not to register with the medical gap schemes and continue to have statutory rights (assigned from members) to be paid benefits from Medicare and health insurers. Health insurers are incentivised to provide attractive rates to Providers under the medical gap scheme and general treatment networks to encourage participation.
- 5.16 The only agreements that are negotiated in this space are agreements relating to the operation of an insurer's branded optical or dental centres or potentially, agreements with networks of providers such as dentists that may be bespoke and negotiated. HH's involvement in the negotiation and management of such contracts would be undertaken on an individual basis for the relevant insurers.

- 5.17 The Applicants submit that the Proposed Conduct will have minimal (if any) detrimental impact on Customers or other classes of persons and that the substantial public benefits from the Proposed Conduct as set out in this application will result in a net public benefit.

Other Healthcare Payers

- 5.18 In relation to Other Healthcare Payers, the Applicant submits that there will no public detriments emerging from the Proposed Conduct. The relative bargaining power of the Other Healthcare Payers is small, accordingly their ability to achieve commercial and competitive results in negotiations with Providers is limited, resulting in some cases of inefficient pricing. Should the Other Healthcare Payers participate in the HH buying group, any increase in bargaining power will allow them to increase their bargaining power and accordingly, their negotiating position. As noted above, given the countervailing bargaining power of Providers is large any marginal increase in bargaining power for these types of healthcare payers will not significantly impact competition.
- 5.19 Similarly, travel and medical insurers make up a small percentage of the healthcare payer market. Accordingly, their joining the buying group will not materially alter the competitive position of Providers in such a way as to improperly displace the countervailing bargaining power in the market.
- 5.20 The Applicant recognises that government and semi-government healthcare payers form a large part of the healthcare payer market. However, in practice these schemes invest in and create their own Provider networks, and are subject to extensive public policy constraints when tendering and making agreements. Accordingly, in the Applicant's view these healthcare payers are less likely to join the HH Buying Group.

Future without the Proposed Conduct

- 5.21 In a future without the Proposed Conduct, nib will continue to use the contracting services offered by HH. nib along with other healthcare payers will, on an ongoing basis, incur high amounts of transaction costs associated with the time consuming and protracted negotiation of HPPAs. Similarly, Providers will continue to incur the administrative and cost burdens associated with the operational side of backend billing and the repeated negotiation and management of contracts with health insurers.
- 5.22 Other Healthcare Payers will also continue to pay inefficient prices and incur excessive transaction costs, resulting in increased premiums for customers and greater administrative costs for Providers. Significantly, without the Proposed Conduct healthcare payers will face great difficulty in implementing the more efficient "value based" contracting relationships. Smaller healthcare payers particularly will not have access to the type and scale of data required to transition away from a "fee for service" model. This is because the lack of data sharing will result in there being no data to form the basis of the price and payment structure of value based contracting. As a result, healthcare payers, Providers and customers will benefit from the more efficient quality and price of healthcare services. In addition, without the Proposed Conduct, the multitude of contractual relationships that exist when a customer attends a hospital will remain and accordingly, the basis on which the customer will be required to pay a gap will remain unclear resulting in continuing uncertainty for customers relating to the pricing of healthcare services.
- 5.23 Accordingly, in a future without the Proposed Conduct, the current costs model and associated expenses will remain for healthcare payers, Providers and customers. Healthcare payers will have less choice about which buying groups to participate in, reducing competition between buying groups, and will be less inclined to implement improved and innovative funding and service models, reducing the potential for cost savings. Without the scale provided by the HH Buying Group, HH may have greater difficulties engaging with Providers to implement and invest resources in transitioning to innovative funding models, particularly where Providers have guaranteed funding streams under private health insurance legislation and through Medicare.

6. Contact details of relevant market participants

6.1 Identify and/or provide names and, where possible, contact details (phone number and email address) for likely interested parties such as actual or potential competitors, key customers and suppliers, trade or industry associations and regulators.

6.2 Please see contact details in the Annexure D.

7. Additional information

7.1 Provide any other information or documents you consider relevant to the ACCC's assessment of the application

7.2 None.

8. Declaration by applicant

8.1 The undersigned declare that, to the best of their knowledge and belief, the information given in response to questions in this form is true, correct and complete, that complete copies of documents required by this form have been supplied, that all estimates are identified as such and are their best estimates of the underlying facts, and that all the opinions expressed are sincere.

8.2 The undersigned undertake(s) to advise the ACCC immediately of any material change in circumstances relating to the application.

8.3 The undersigned are aware the giving false or misleading information is a serious offence and are aware of the provisions of sections 137.1 and 149.1 of the Criminal Code (Cth).

Feb 2021

nib health funds limited

**MEDICAL PURCHASER PROVIDER AGREEMENT
Short Stay No Gap**

Medical Purchaser Provider Agreement – Clinical Partners

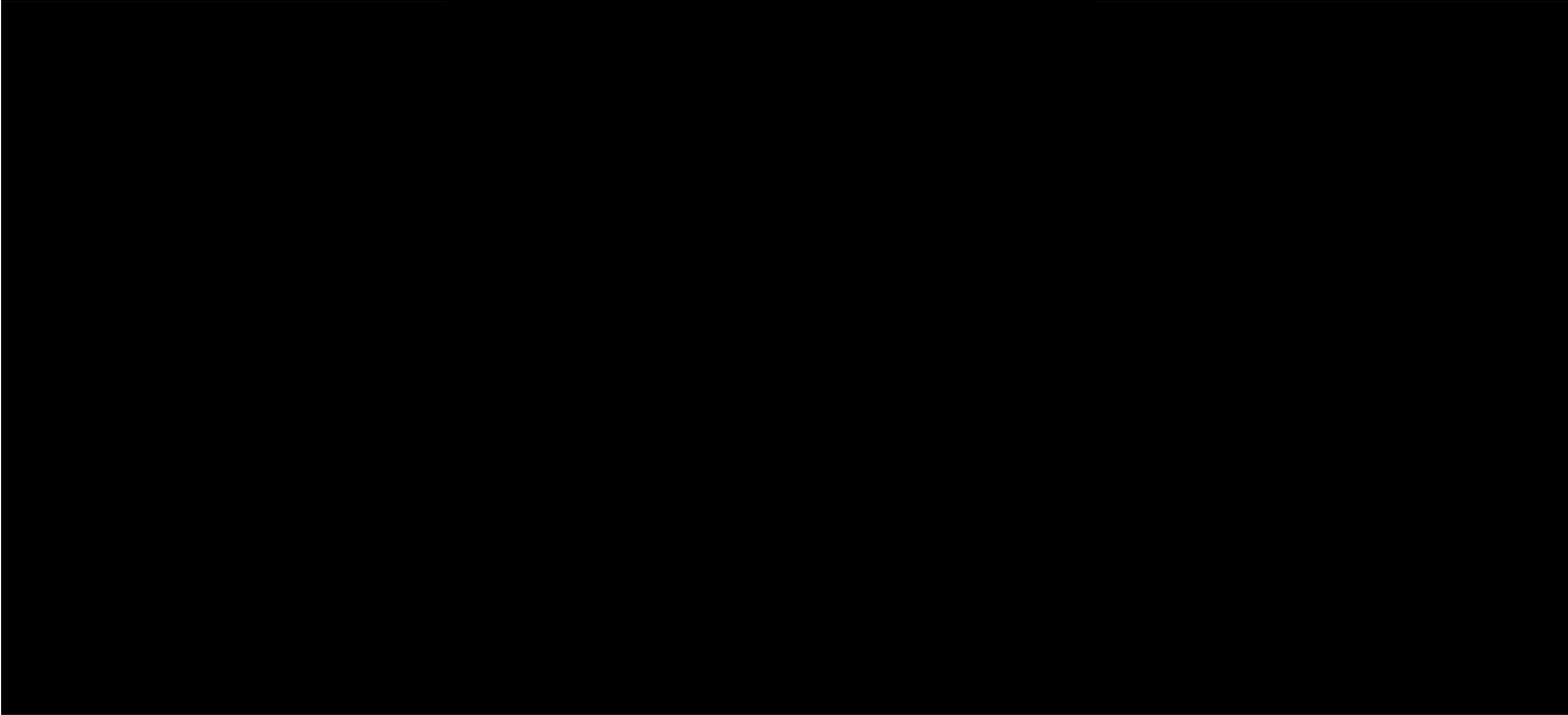

7. Provider's Undertakings8

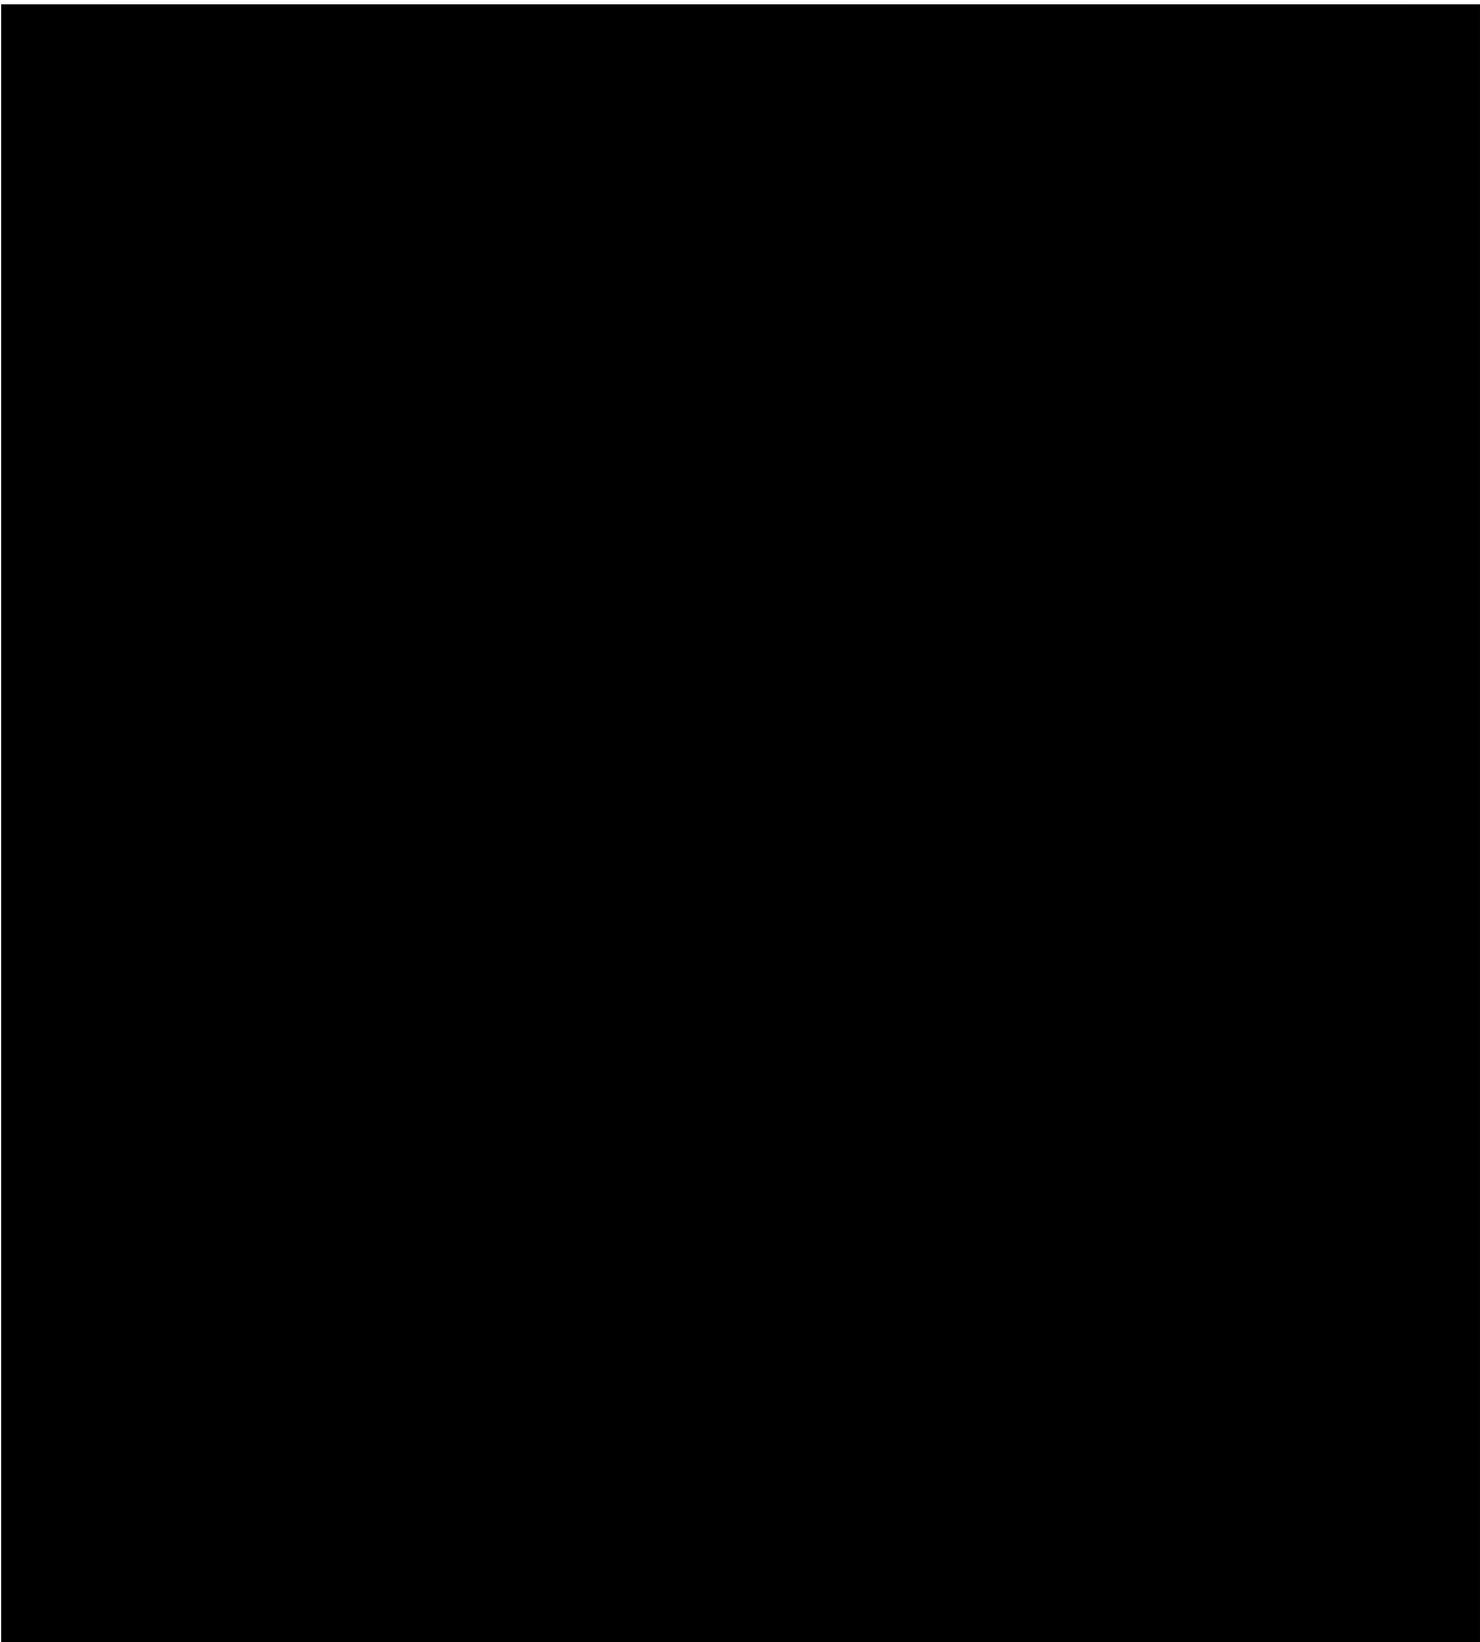

9. nib's Undertakings and Acknowledgments9

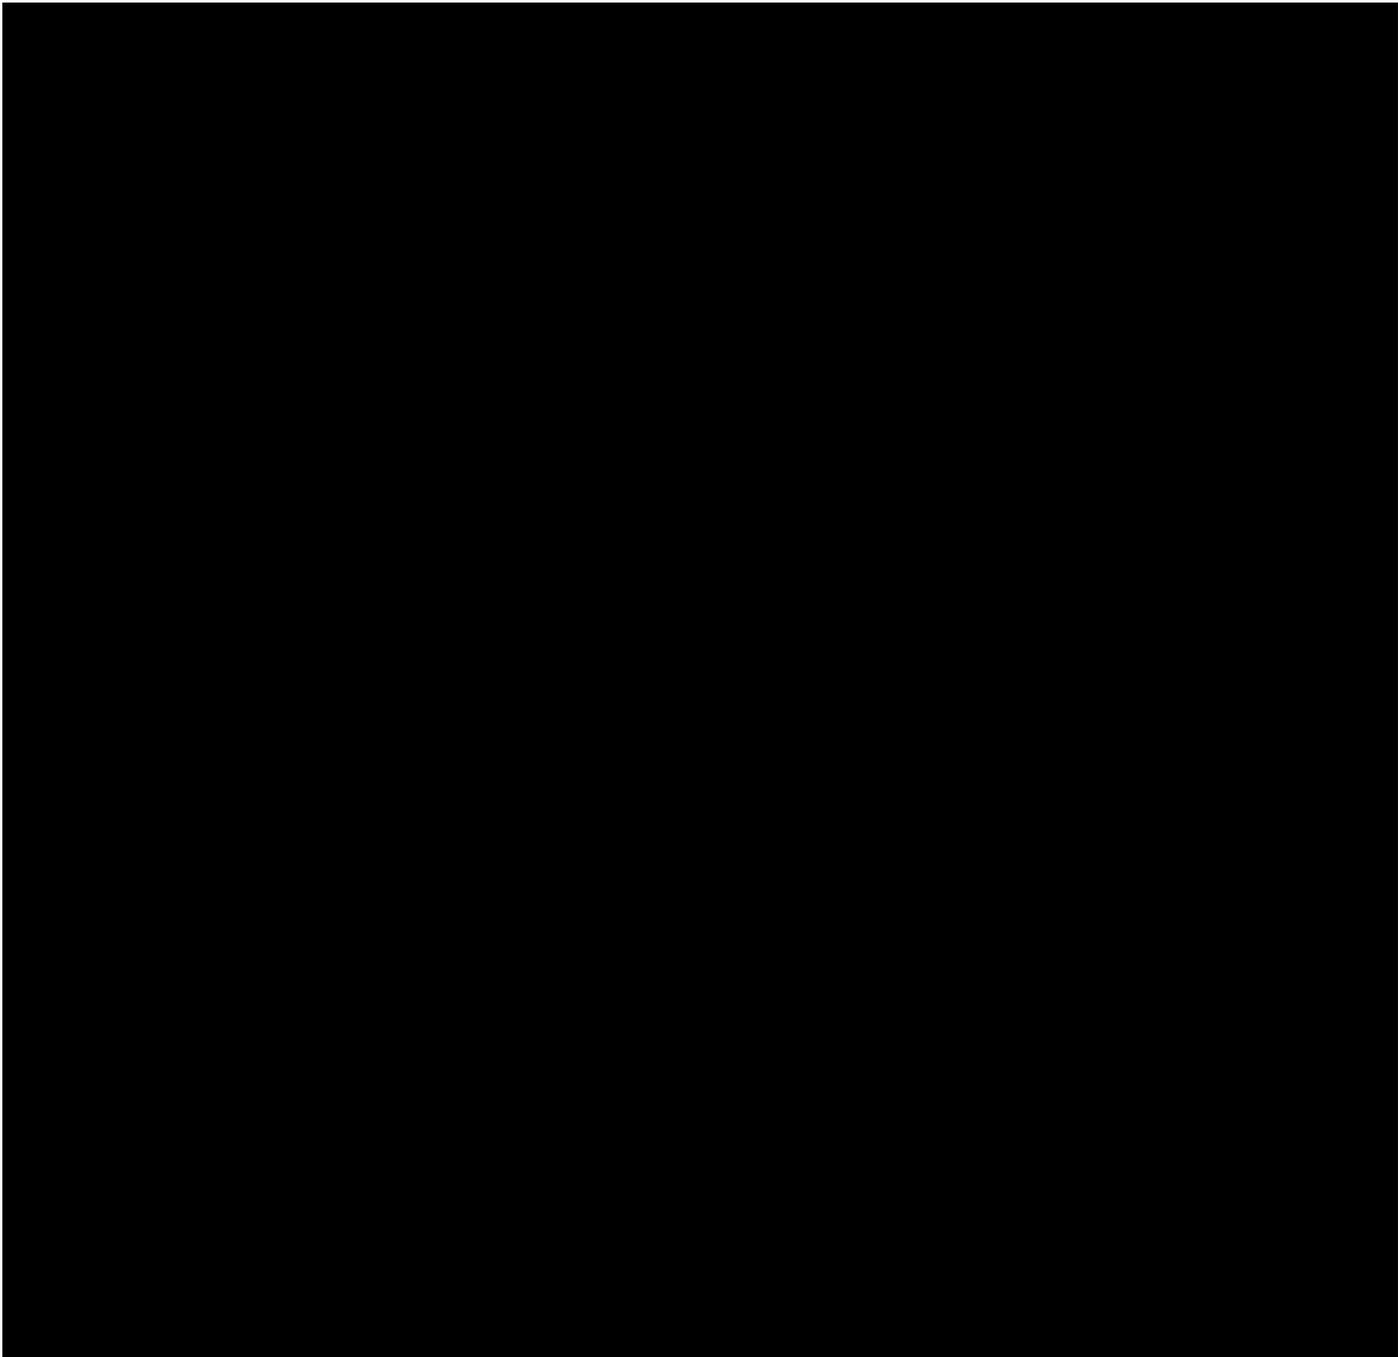

10. INDEPENDENCE10

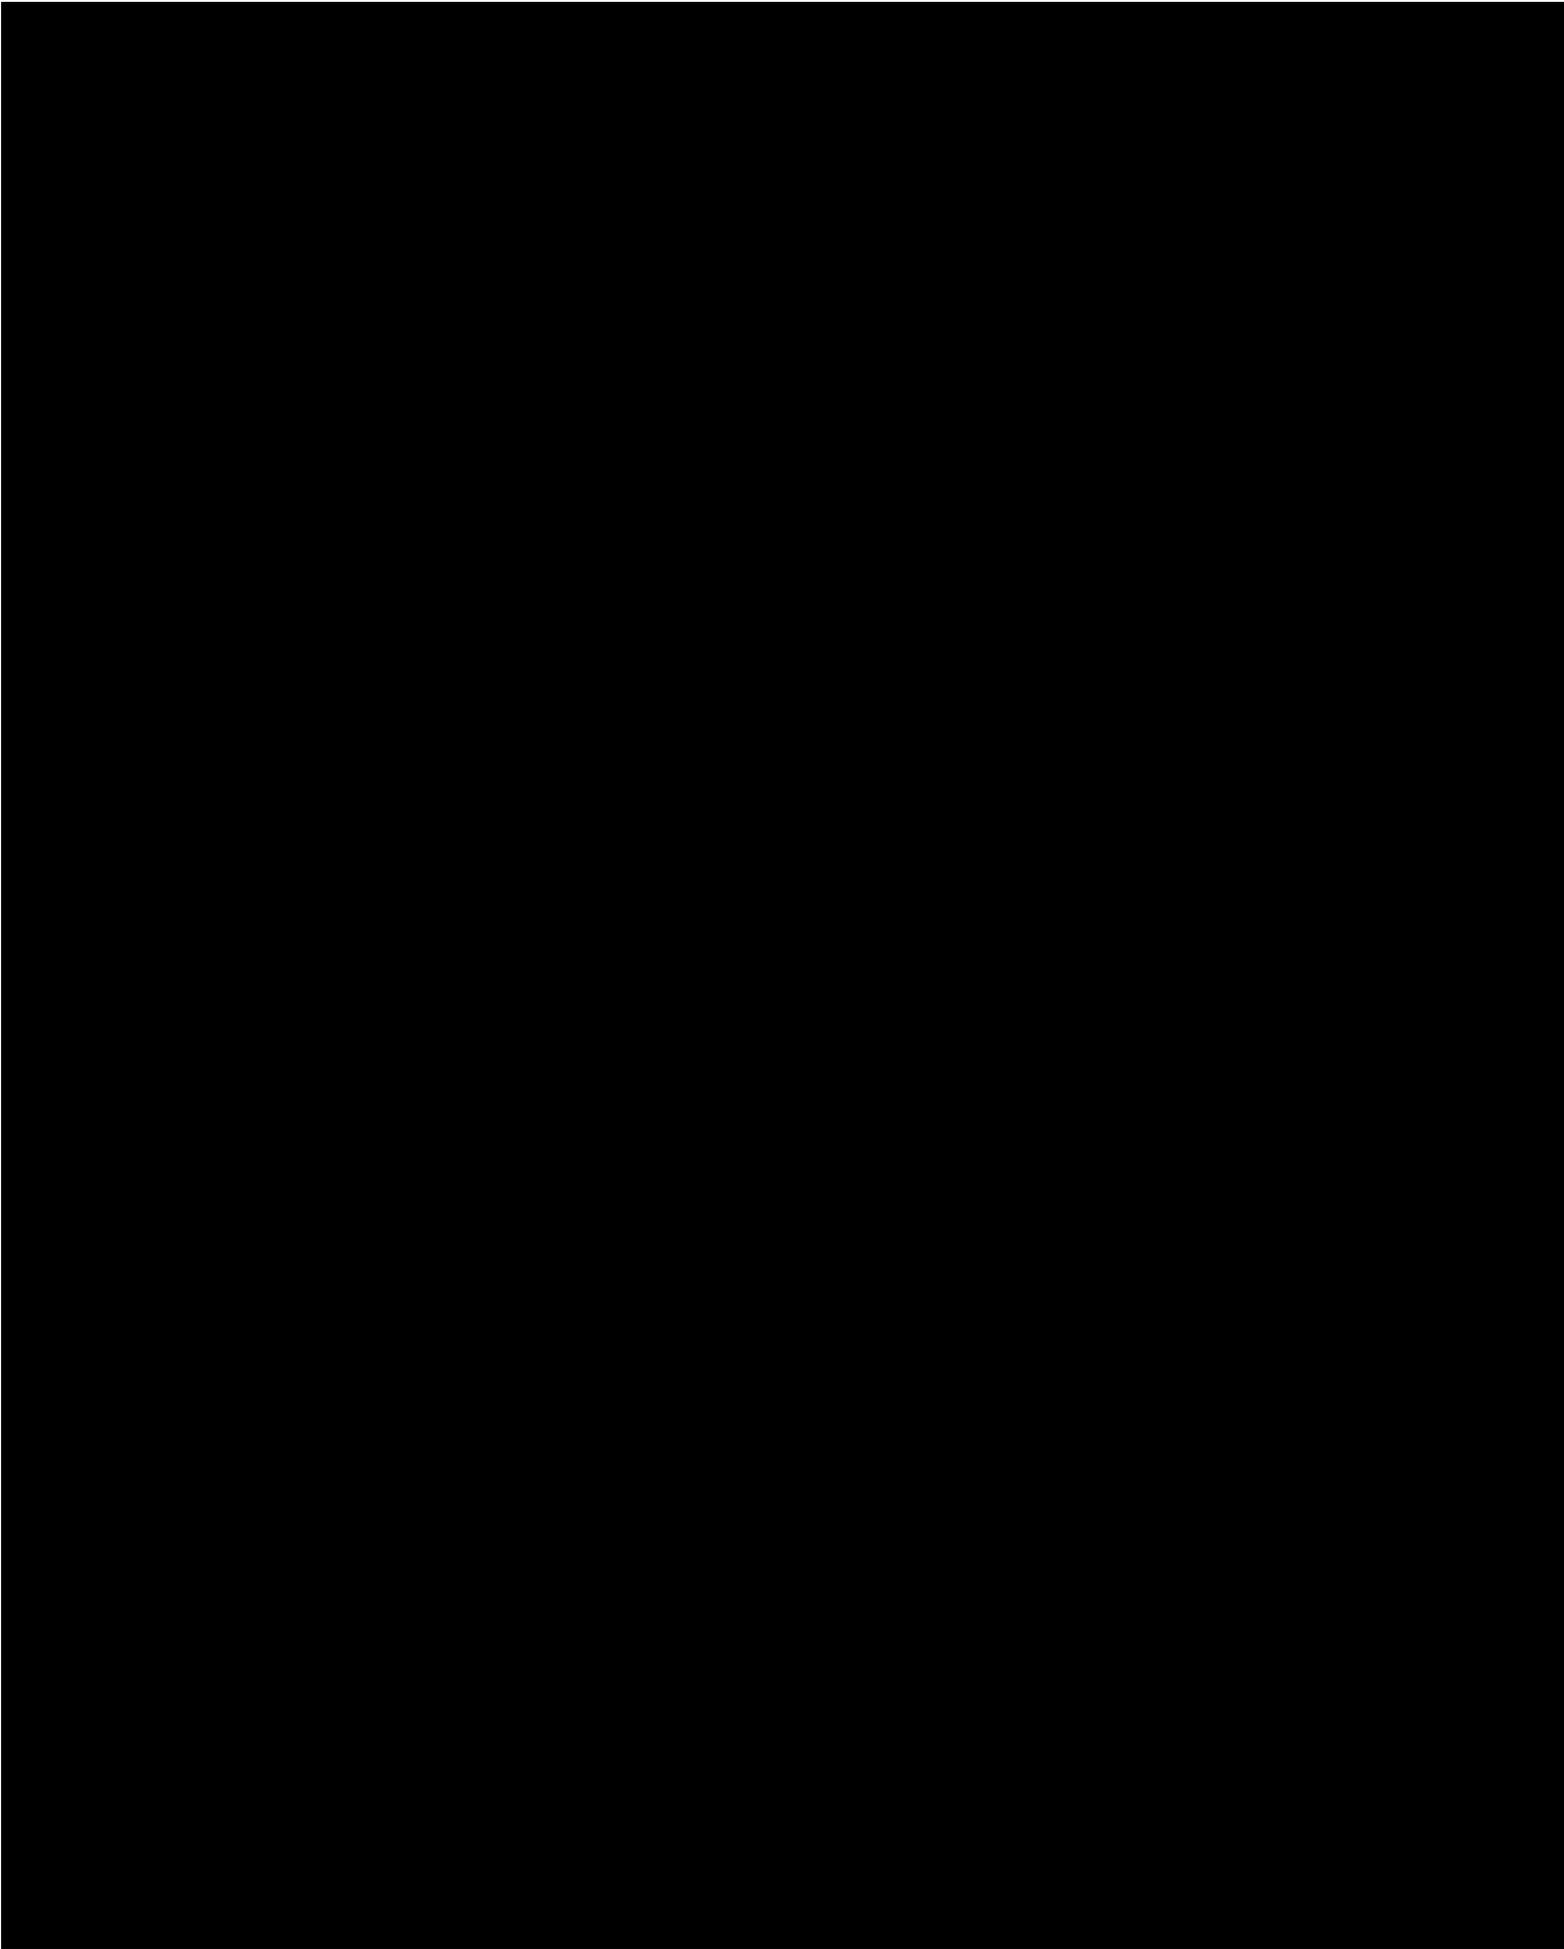

11. Fees FOR SPECIFIED SERVICES10

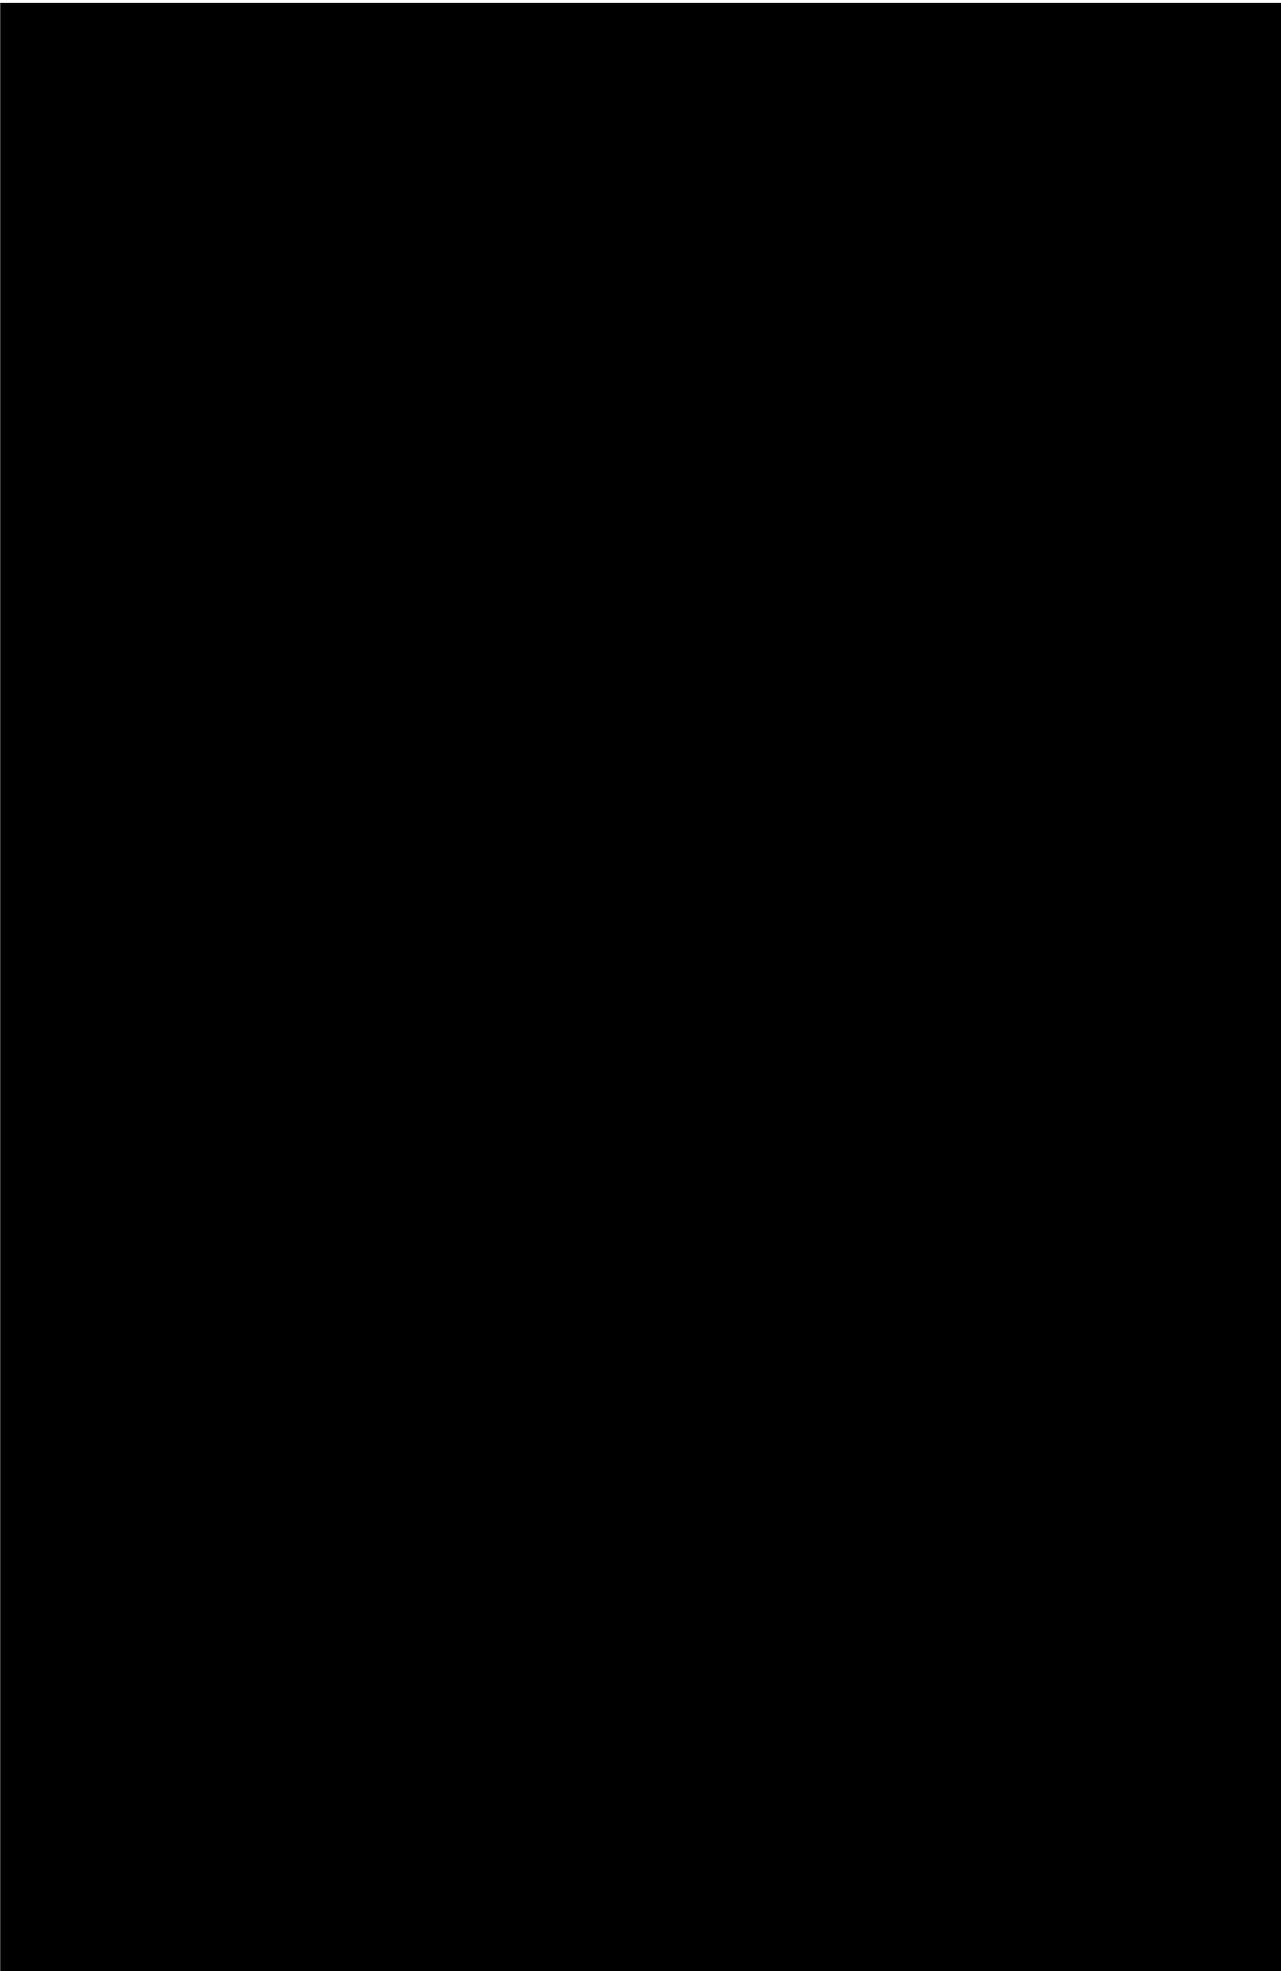

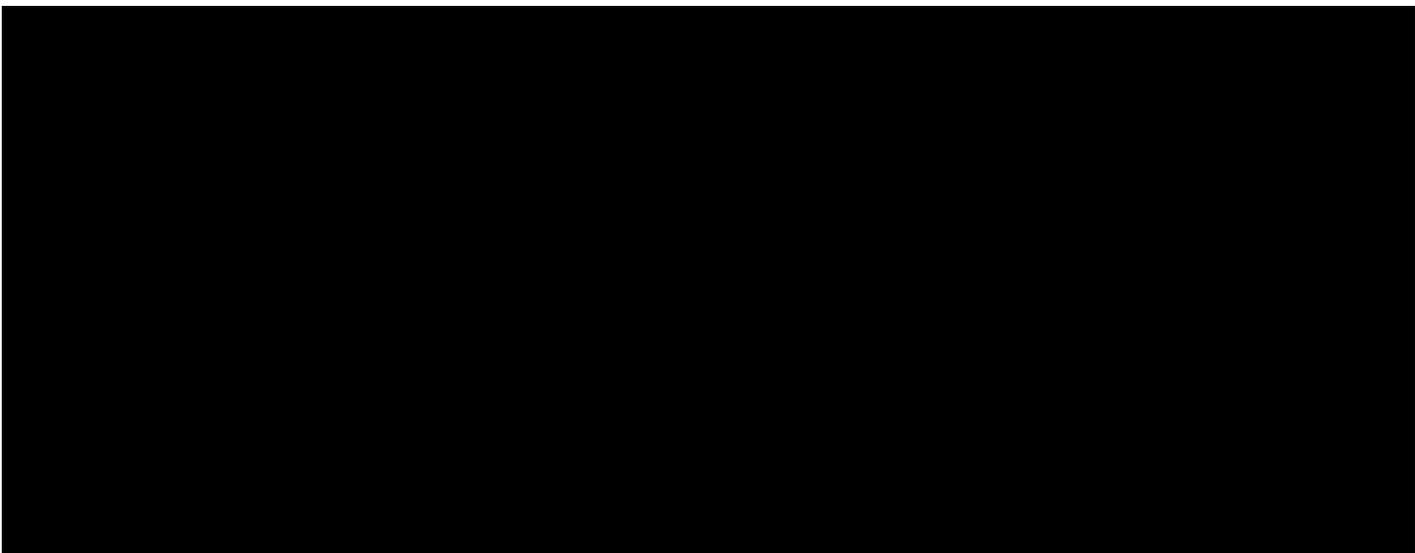

Medical Purchaser Provider Agreement – Clinical Partners

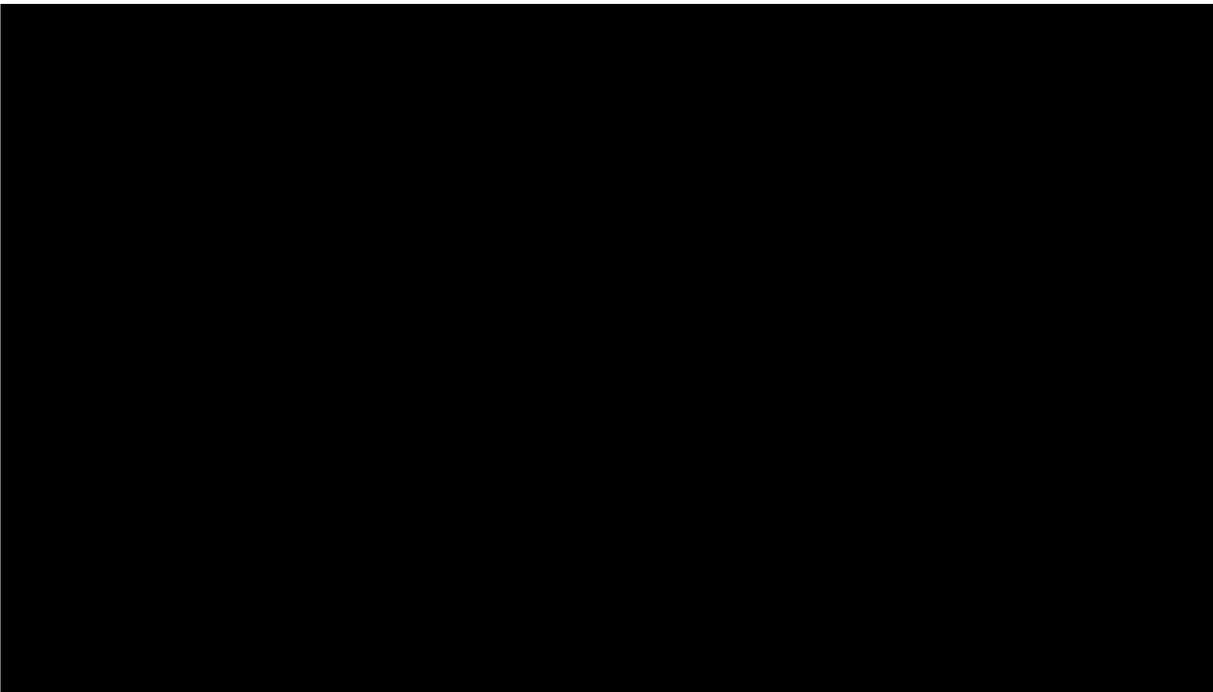

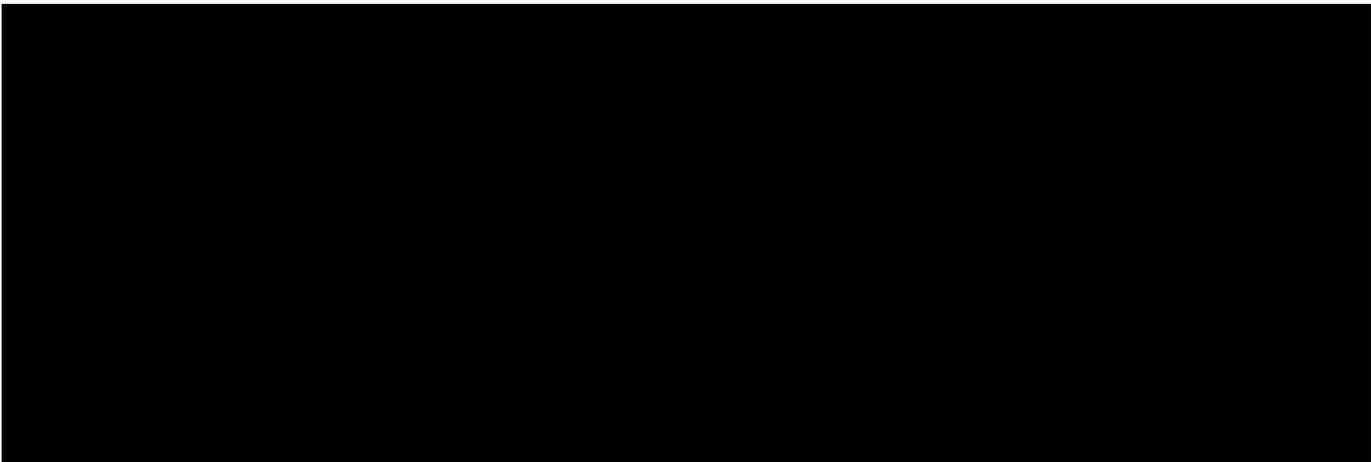

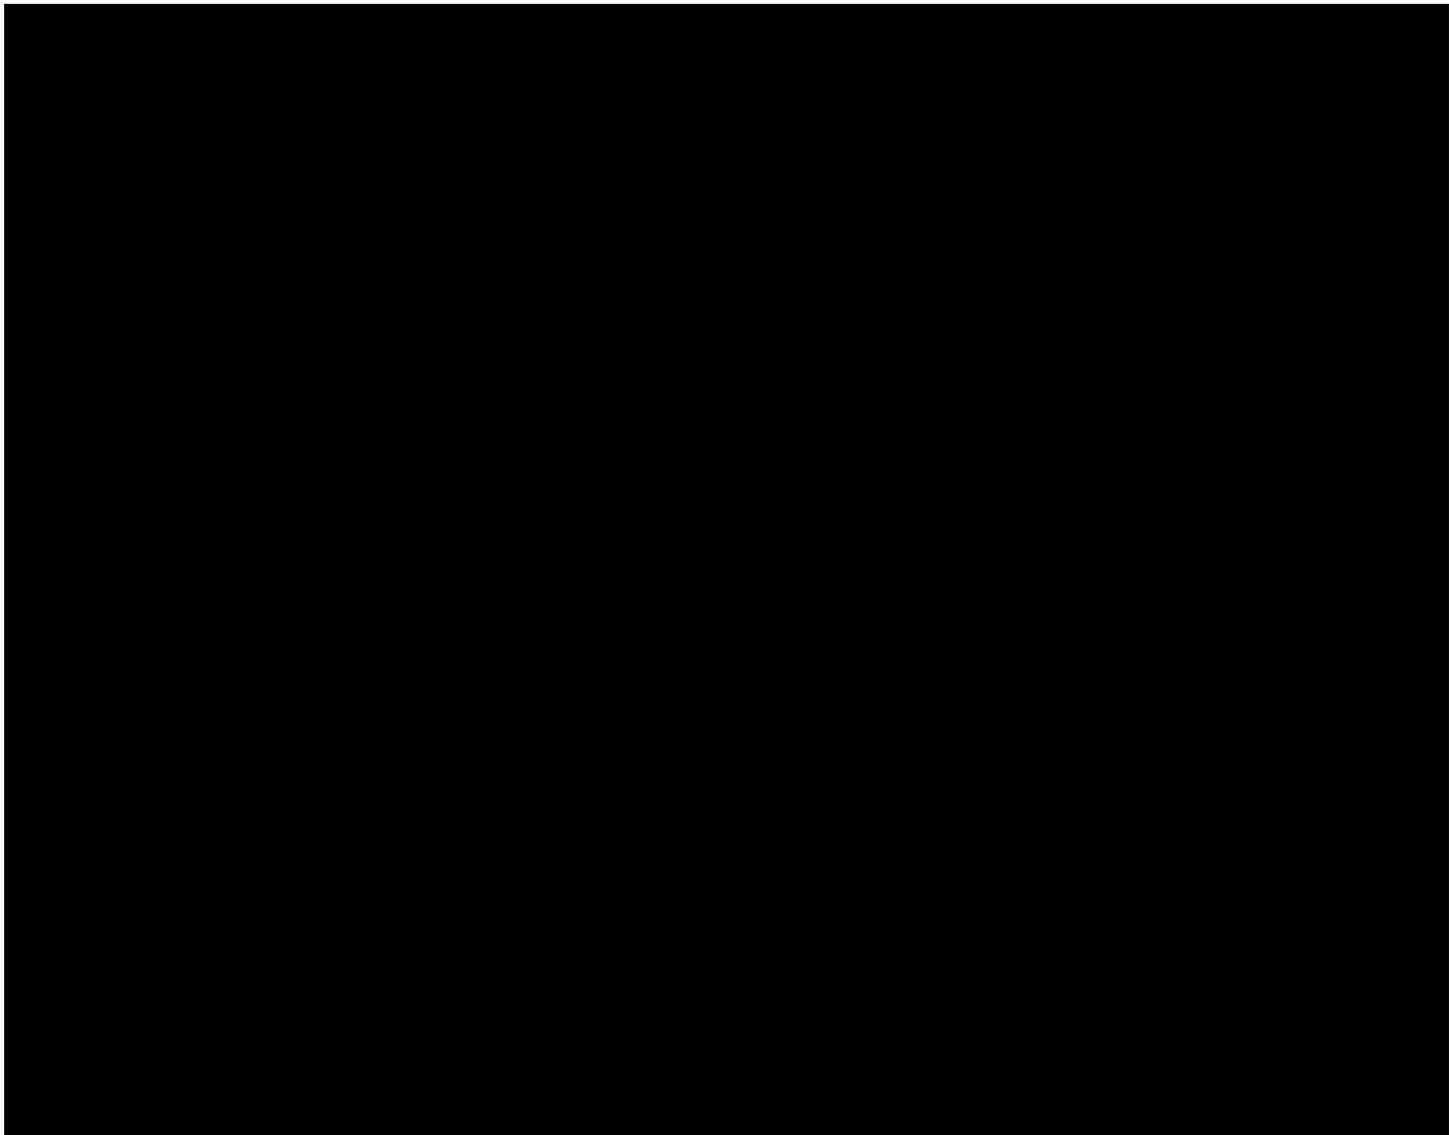

7. PROVIDER'S UNDERTAKINGS

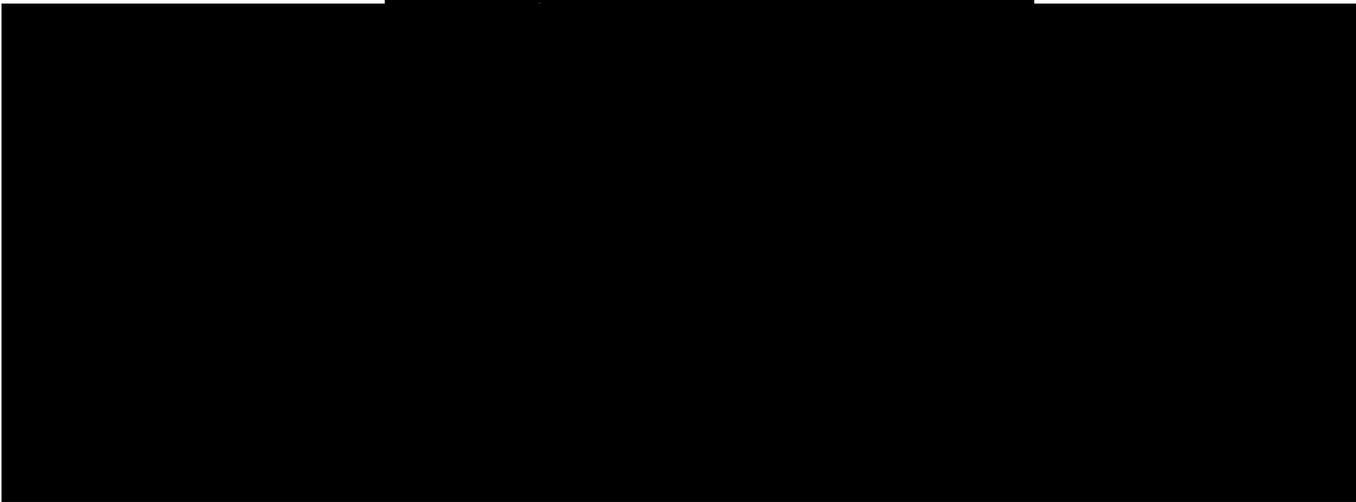

7.1. Provider General Obligations

The Provider must:

- 
- (g) admit all clinically appropriate Eligible Customers to undertake the post-surgery 'at home' Patient Rehabilitation Support Program;
- 

9. nib's UNDERTAKINGS AND ACKNOWLEDGMENTS

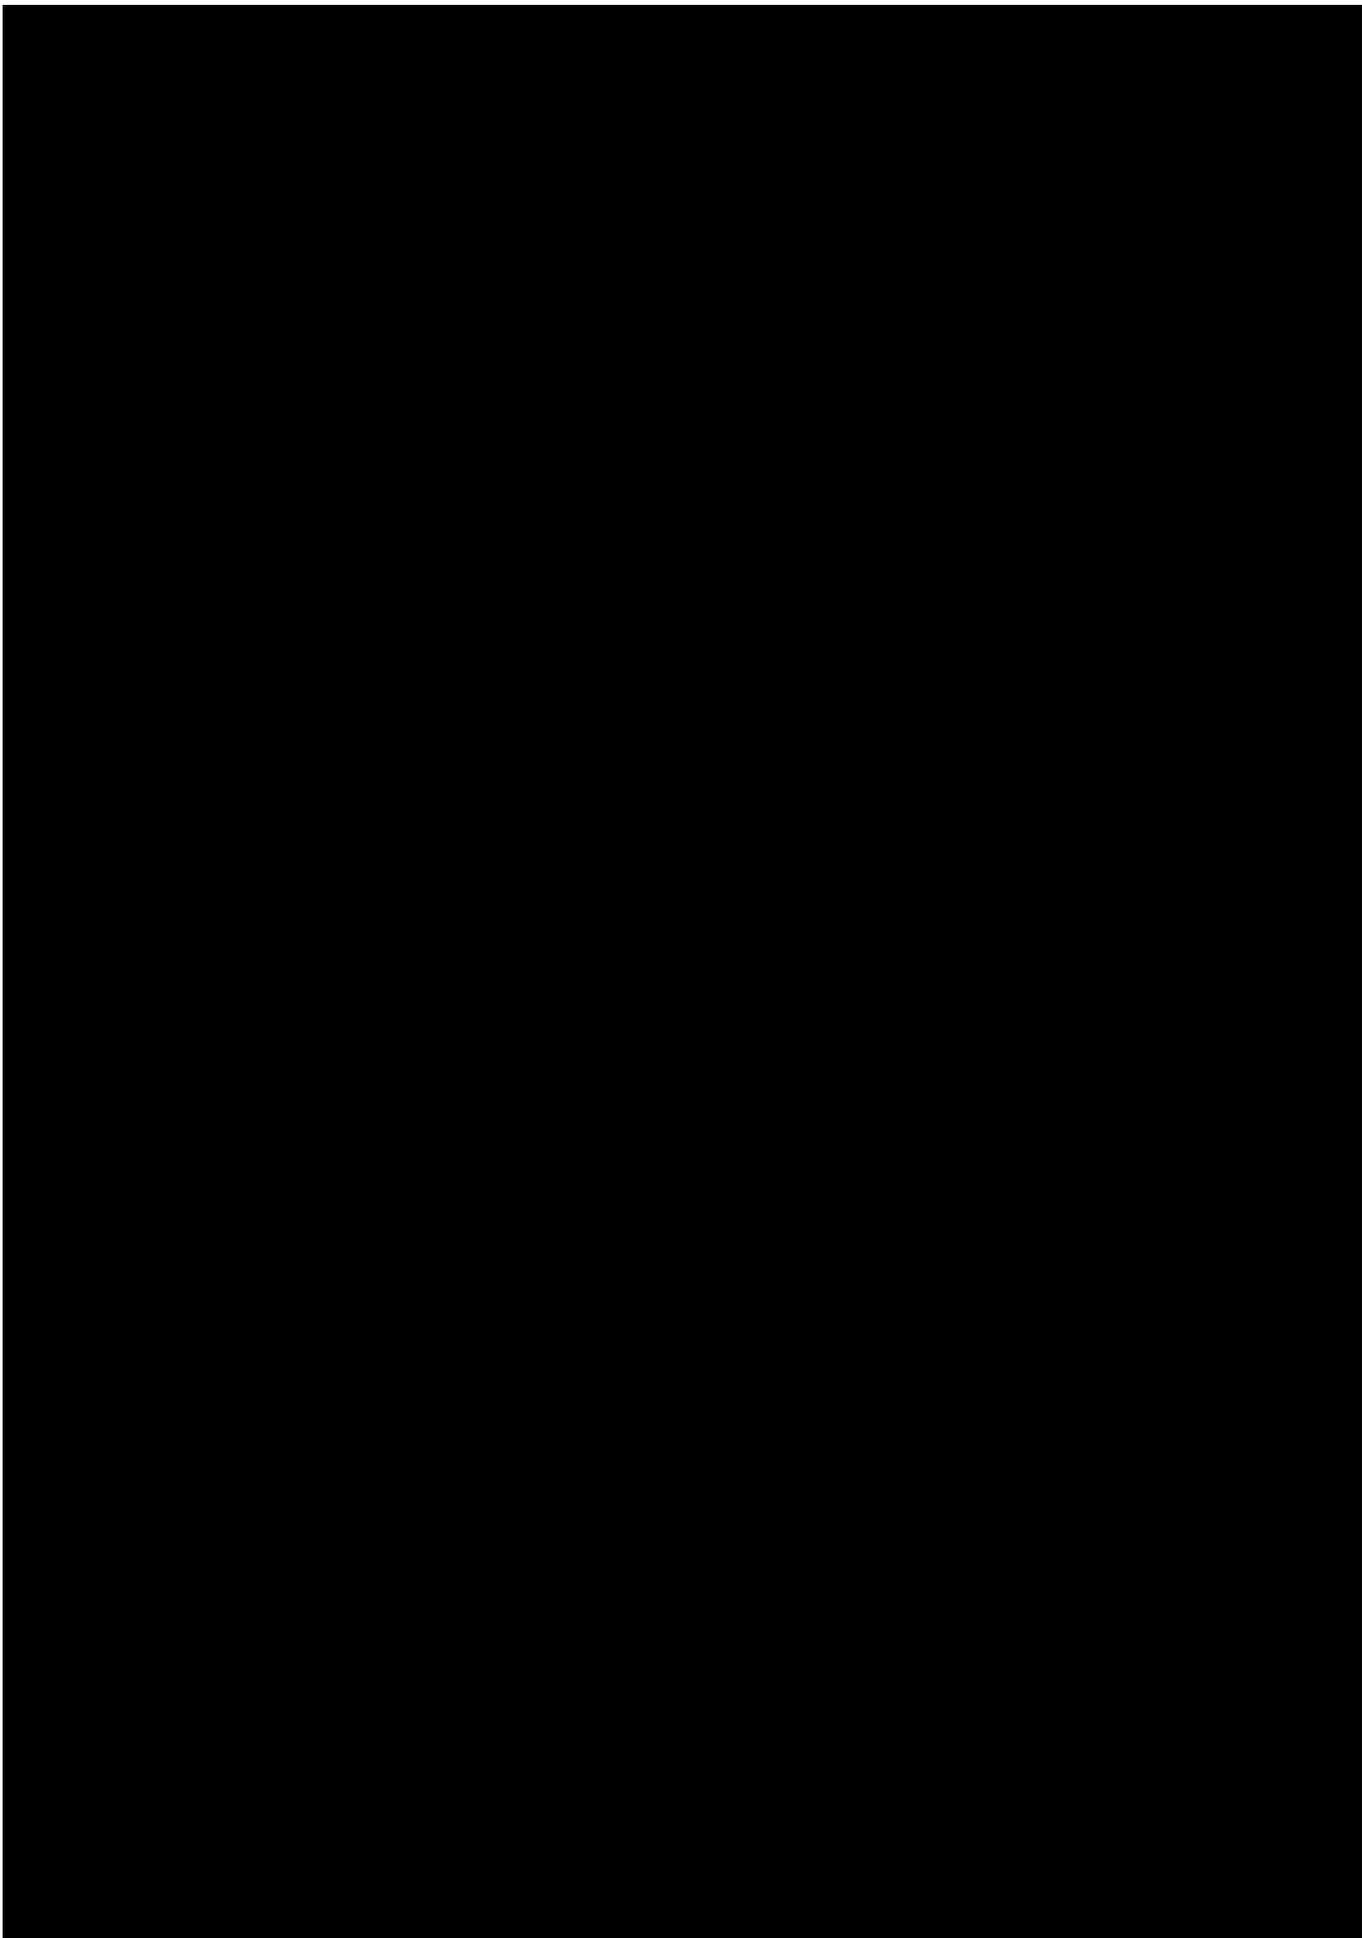

9.2. nib must pay to the Provider any amount which it is obliged in accordance with an Eligible Customer's entitlement to Benefits within twenty one (21) days of the date upon which it receives an invoice properly submitted in accordance with this MPPA.

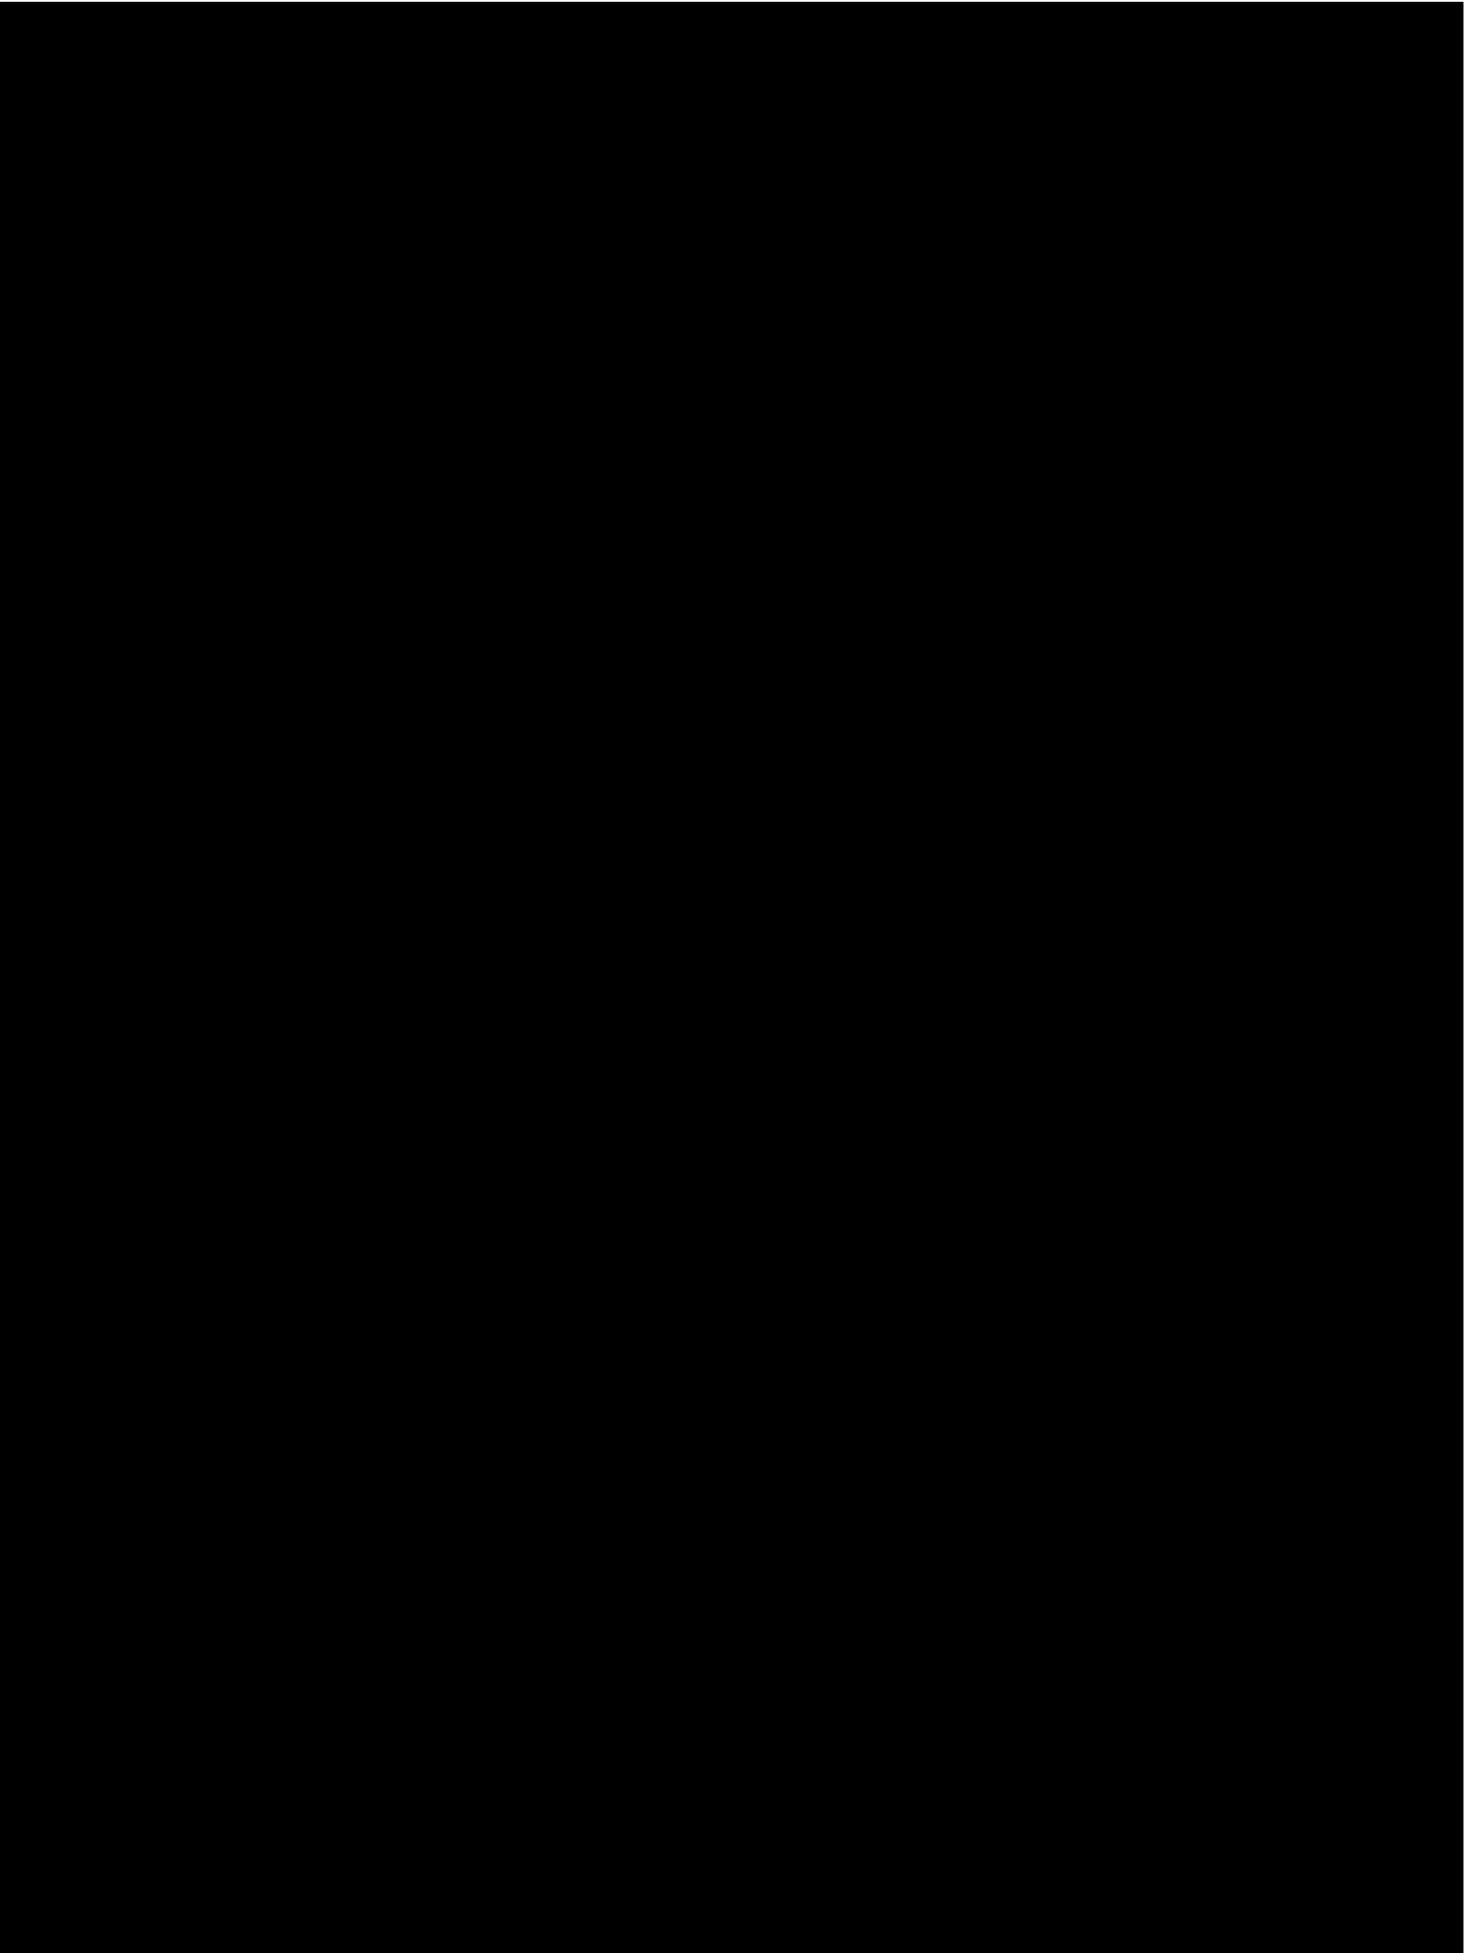

10. INDEPENDENCE

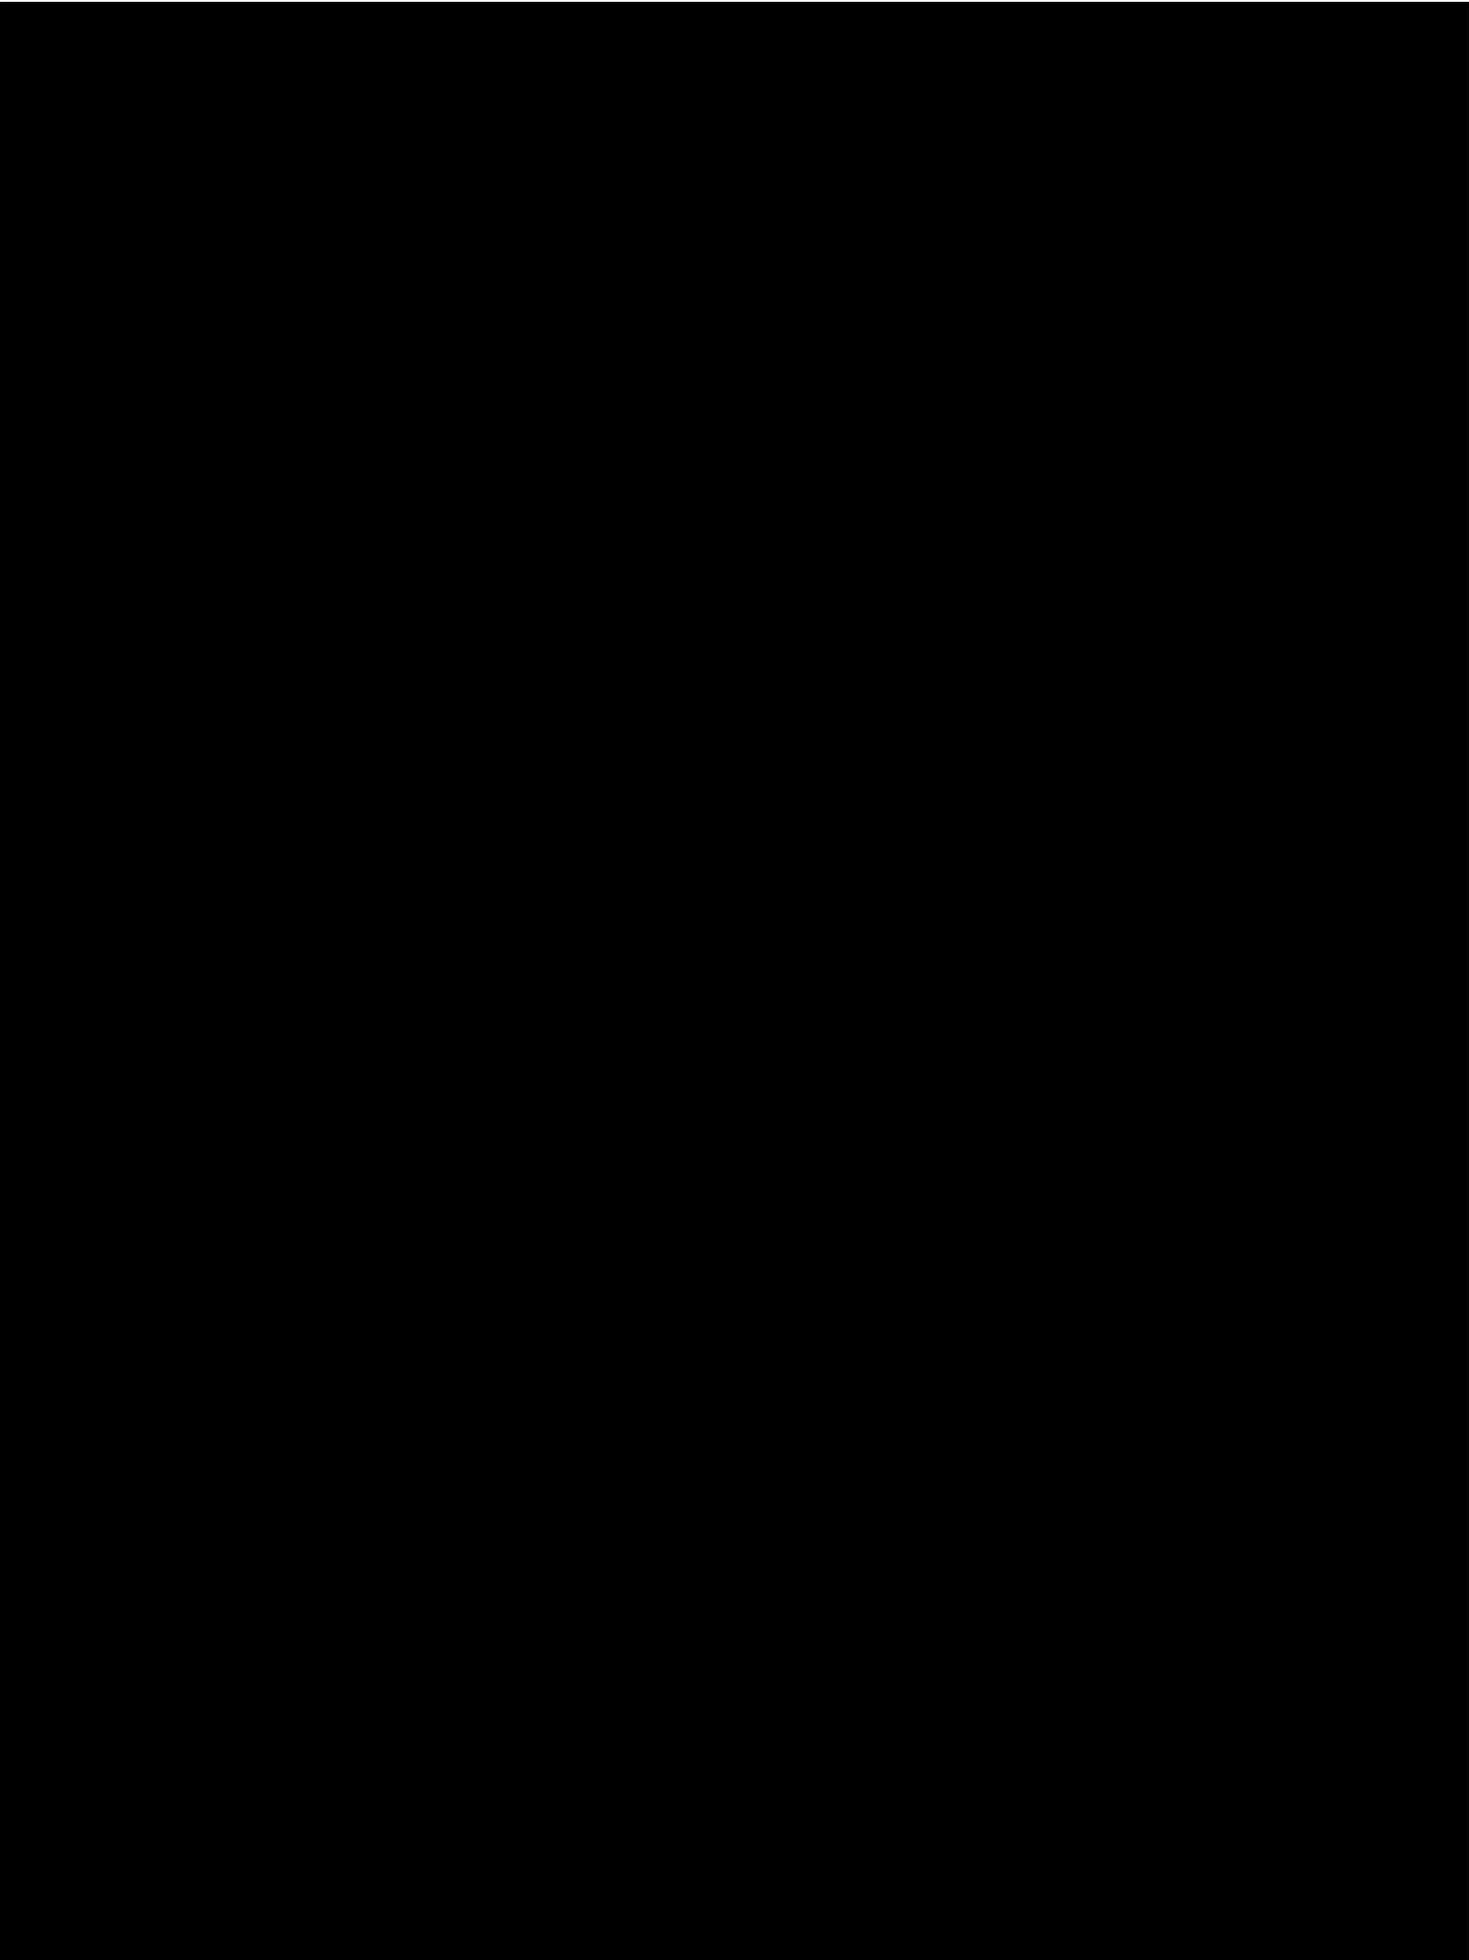

- 10.1. nib is not a health professional or practice and does not provide treatment to the Eligible Customer and shall at no time be deemed to provide any such treatment or services to the Provider's patients.
- 10.2. nib will not interfere with and acknowledges the independence of the Provider providing Specified Services to Eligible Customers under this MPPA. Nothing in this MPPA limits the Provider's professional freedom, within the scope of accepted clinical practice, to identify and provide appropriate treatments.
- 10.3. Without limiting the Provider's independence as set out in clause 10.2, the Provider agrees to follow clinical guidelines as nib may reasonably require from time to time, for the purpose of nib administering the Fund and the payment of claims under the Fund.

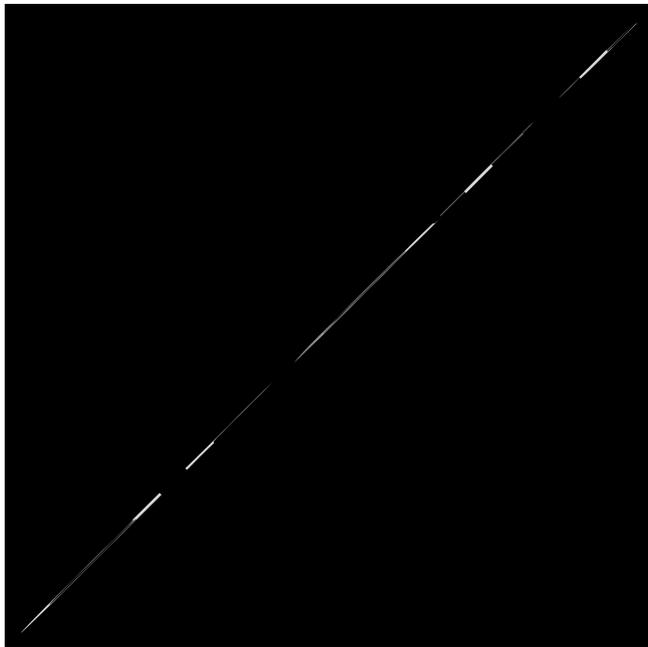

11. FEES FOR SPECIFIED SERVICES

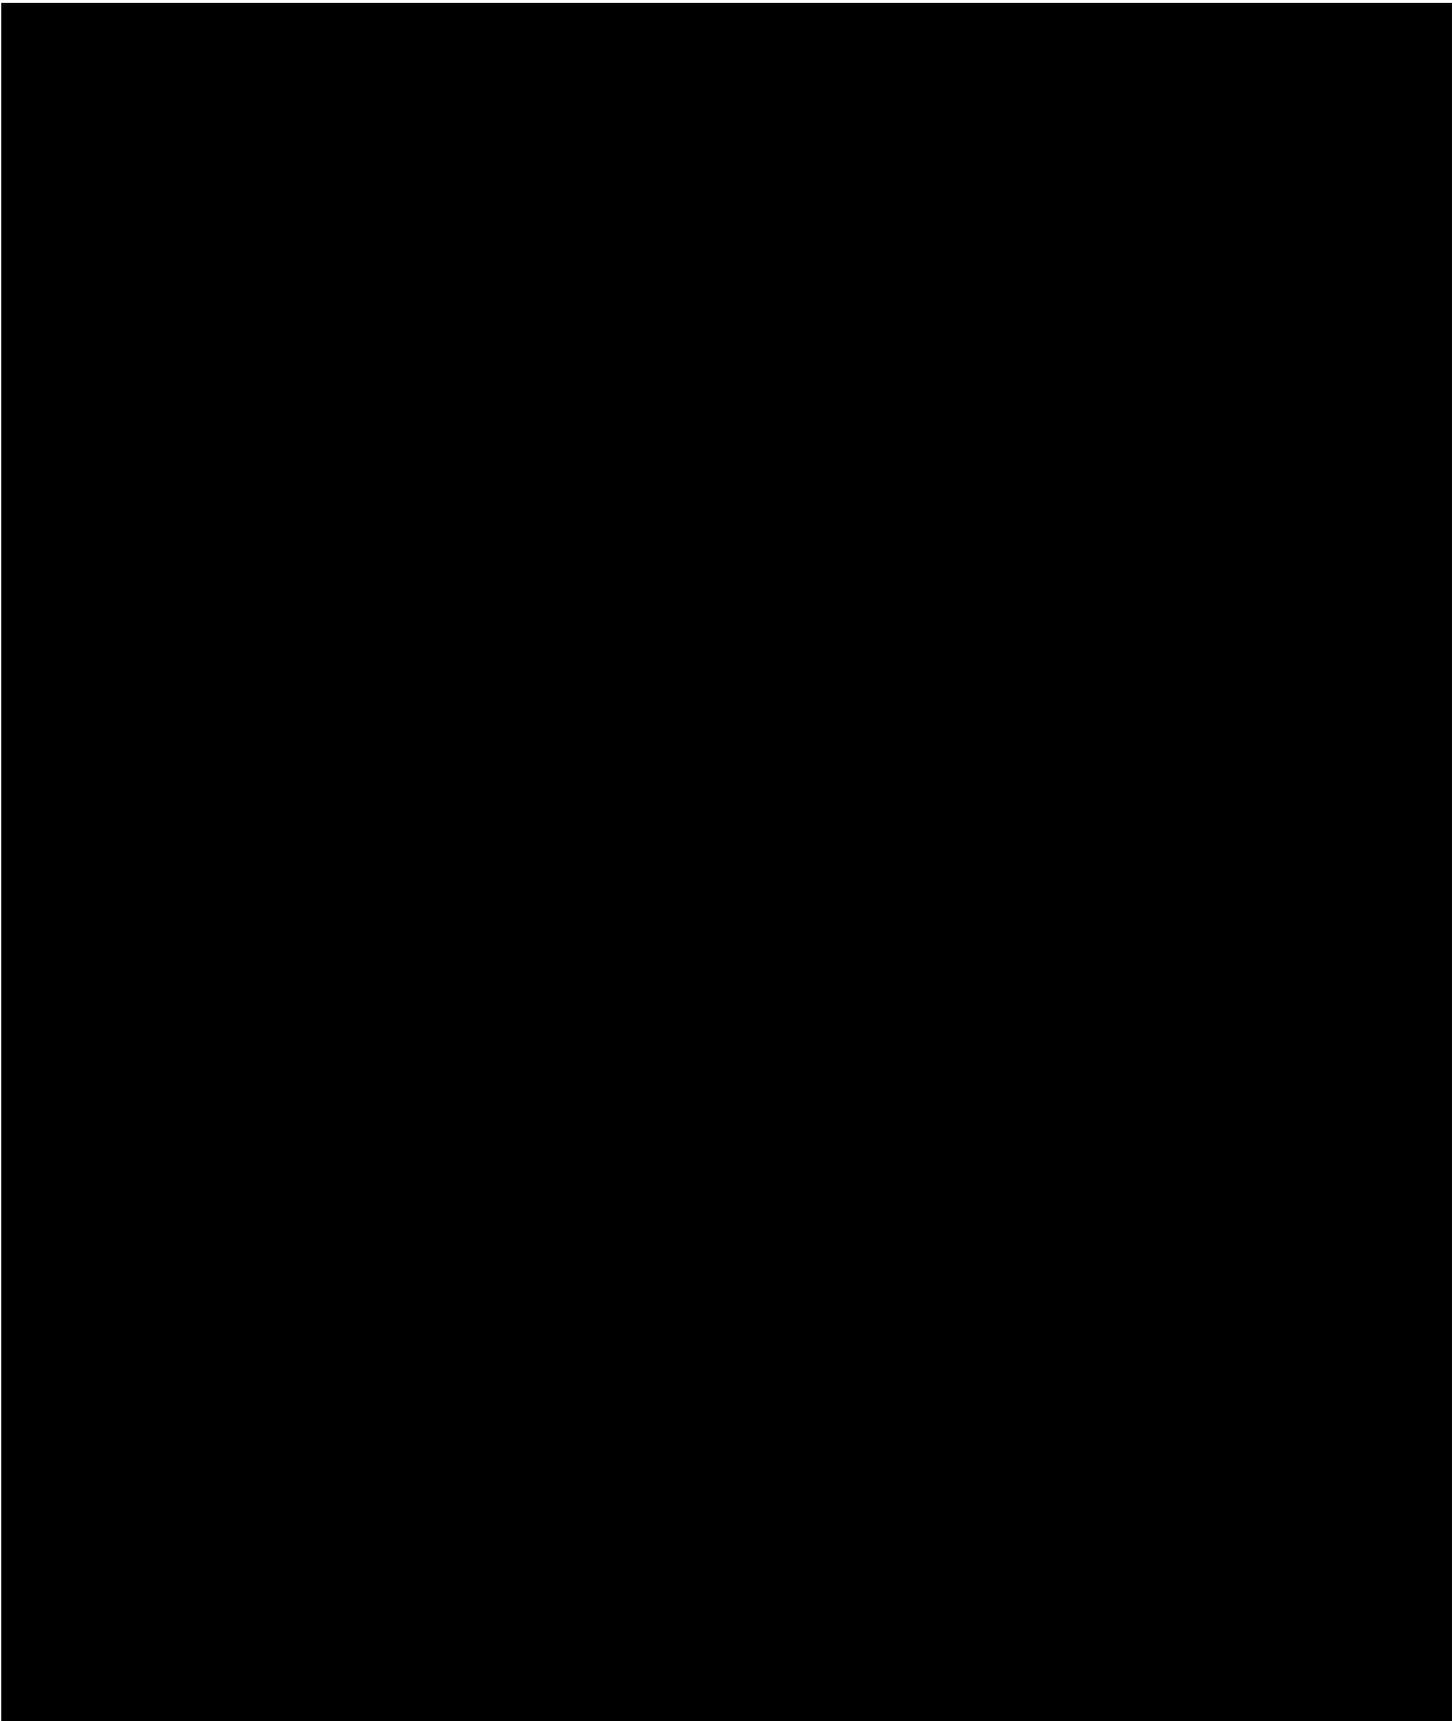

- 11.1. nib shall pay the Provider for Specified Services, the Benefits nib is required to pay for the relevant Professional Service in accordance with this MPPA.
- 11.2. The Provider accepts the Benefits paid by nib for the Professional Service as full and final payment of that service and the Provider must not charge the Eligible Customer any out-of-pocket charges for that service.
- 11.3. The Provider shall not, and must ensure that they do not, without prior written approval of nib, charge an Eligible Customer or nib:
 - (a) fees for Specified Services not listed in SCHEDULE 2 -; or
 - (b) a higher fee for Specified Services than the Maximum Fee; or
 - (c) any additional fees, charges or any amounts (other than those listed in SCHEDULE 2 -) in relation to a Specified Service including any deposits, booking, administration, technology or facility fees or any other such fees related to that Specified Service.

SCHEDULE 2 - Specified Services and Fees

Background

nib has created a new 'no-gap' funding arrangement with the Provider in regards to the Specified Services (primarily joint replacement surgery) and the commissioning of 'at home' patient support (the Program), which nib will offer to Eligible Members.

Program objectives

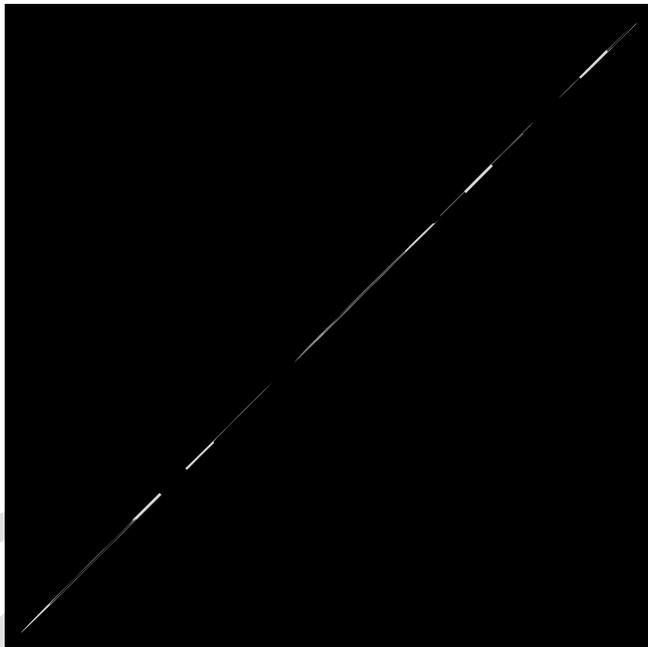

The initial phase of the Program will be conducted with select Providers and Eligible Members that are located in a catchment area to be determined by nib. The objectives of the Program are:

- a) the **primary objective** of the Program is to ensure that Eligible Members will have access to high-quality clinical practitioners in the catchment area to perform specialised joint replacement surgery, and in doing so, nib's Eligible Members will incur no out-of-pocket expenses for that surgery;
- b) the **secondary objective** of the Program is to establish a high-quality post-surgery 'at-home' patient rehabilitation and support program, and make that program available to the relevant Eligible Members, where clinically appropriate.

A list of the relevant Specified Services and Maximum Fees are set out as follows:

Specified Services

MBS item	Specified Service	Maximum Fee
1. 49518	KNEE, total replacement arthroplasty of	
2. 49521	KNEE, total replacement arthroplasty of, requiring major bone grafting to femur or tibia, including obtaining of graft	
3. 49318	HIP, total replacement arthroplasty of, including minor bone grafting	
4. 49321	HIP, total replacement arthroplasty of, including major bone grafting, including obtaining of graft	
5. 49519	KNEE, total replacement arthroplasty of, including associated minor grafting, if performed - bilateral	
6. 49319	HIP, total replacement arthroplasty of, including associated minor grafting, if performed - bilateral

1 Background

The Australian Commission on Safety and Quality in Health Care (the Commission) established the National Hand Hygiene Initiative (NHHI) in 2008 as part of a suite of initiatives to prevent and reduce healthcare-associated infections in Australia. The Commission contracted with Hand Hygiene Australia (HHA) at this time to coordinate and support implementation of the NHHI, in conjunction with the states and territories, and the private sector.

With the support of HHA and public and private health service organisations, there has been substantial progress in regard to increasing hand hygiene compliance in Australia. HHA has provided significant and valuable support for the NHHI through a range of educational resources, the support of auditing through resource development and training, and in the support of hand hygiene compliance reporting.

After 10 years, and significant success, HHA and the Commission have both agreed that the NHHI coordination and support role will be provided by the Commission. The Commission thanks HHA for its support for health service organisations during this time.

A stakeholder consultation process will form part of a review to advise on the way in which the NHHI can best contribute to the overall requirements of infection prevention and control strategies into the future. The Commission will consider the outcome of this consultation process, and the options for future arrangements, in liaison with states and territories and the private sector to ensure that there is continuity and sustainability of the NHHI. The review provides the opportunity to ensure that the NHHI remains responsive to the future needs of health service organisations.

From 1 November 2019 the Commission is coordinating and supporting all aspects of the NHHI.

For more information go to: <https://www.safetyandquality.gov.au/our-work/healthcare-associated-infection/hand-hygiene>.

1.1 About this Manual

This manual is part of the toolkit for implementing the NHHI. It contains recommendations based on the [World Health Organization \(WHO\) Guidelines on Hand Hygiene in Health Care](#), modified for the Australian setting. It includes information on hand hygiene and infection prevention and control practices associated with hand hygiene.

This manual does not address surgical hand hygiene. See [WHO Guidelines on Hand Hygiene in Health Care](#) for further information.

For more information on infection prevention and control in the Australian health care system see:

- [Australian Guidelines for the Prevention and Control of Infection in Healthcare](#)
- [National Safety and Quality Health Service Standards](#)
- [Australasian College of Infection Prevention and Control](#)

1.2 The effect of hand hygiene on healthcare-associated infection

There is convincing evidence that improved hand hygiene can reduce infection rates. Between 1977 and 2011, there were more than 20 hospital-based studies, including systematic reviews, on the impact of hand hygiene on the risk of HAI were published. Despite study limitations, almost all studies showed an association between improved hand hygiene practices and reduced infection and cross transmission rates. Research published in 2018, describing the effects of the NHHI after eight years, provides even stronger evidence of the association between improved compliance and decreased incidence of HAIs.

It is important to note that, although the introduction of an alcohol-based handrub was a key factor for improvement in nearly all the studies, improved hand hygiene compliance and reductions in HAIs are due to the overall effect of a multi-modal approach to improving hand hygiene promotion strategies. This includes the introduction of alcohol-based handrub, a marked and sustainable increase in hand hygiene compliance, and a significant reduction in HAIs.

1.3 Historical perspective on hand hygiene

Hand washing with soap and water has been used to improve personal hygiene for centuries. However, the link between hand washing and the spread of disease was only established in the mid 1800's.

Below is a summary of key historical events of relevance to hand hygiene and infection prevention and control:

- 1800's: an Austrian doctor, Ignaz Semmelweis, is considered to be the first person who established that hospital-acquired diseases were transmitted via the hands of healthcare workers (HCWs)
- 1980's: first national hand hygiene guidelines published in the USA
- 2000: Didier Pittet et al published a landmark study proving that a hand hygiene culture change program involving the introduction of alcohol-based handrub, education of staff and hand hygiene promotion can significantly improve HCW hand hygiene compliance, and in turn reduce HAIs
- 2002: alcohol-based handrub is defined as the gold standard of care for hand hygiene practices in healthcare settings, whereas hand washing is reserved for particular situations

only

- 2005: WHO released the Advanced Draft of the WHO Guidelines on Hand Hygiene in Health Care, which was based on the most extensive review of literature on hand hygiene in healthcare to date; in 2009, the final WHO Guidelines were released
- 2008: the Commission established the NHHI following endorsement by all Australian health ministers
- 2012: the NSQHS Standards (first edition) were released by the Commission, NSQHS Standard 3: Preventing and Controlling Healthcare Associated Infections included actions requiring health service organisations to have a hand hygiene program consistent with the NHHI and jurisdictional requirements
- 2017: Second edition of the NSQHS Standards released, which maintain the requirements in relation to hand hygiene programs in healthcare organisations
- 2018: HHA published the results of a study investigating the effects of the NHHI after eight years, which showed an association between the improvement of hand hygiene compliance rates in Australia's largest public hospitals and a decline in the incidence of healthcare-associated *Staphylococcus aureus* bacteraemia (SAB).

1.4 Transmission of organisms by hands

Transmission of healthcare-associated organisms from one patient to another via healthcare workers' (HCWs) hands requires five sequential steps:

1. Organisms are present on the patient's skin, or have been shed onto inanimate objects immediately surrounding the patient
2. Organisms must be transferred on the hands of HCWs
3. Organisms must be capable of surviving for at least several minutes on HCWs' hands
4. Hand hygiene by the HCW must be inadequate or entirely omitted, or the agent used for hand hygiene inappropriate
5. The contaminated hand or hands of the caregiver must come into direct contact with another patient or with an inanimate object that will come into direct contact with the patient.

Healthcare workers must perform hand hygiene before and after every patient contact to prevent patients becoming colonised with healthcare-associated organisms from other patients and the hospital environment. Emphasis must also be placed on preventing the transfer of organisms from a contaminated body site to a clean body site during patient care. Hand hygiene should also be performed after contact with inanimate objects, including medical charts and equipment in the immediate vicinity of the patient.

1.5 Barriers to hand hygiene

Poor hand hygiene practice among HCWs is strongly associated with HAI transmission and is a major factor in the spread of antibiotic-resistant organisms within hospitals.

Despite this, efforts to improve the rate of hand hygiene compliance have generally been ineffective or their efficacy poorly sustained. Numerous barriers to appropriate hand hygiene have been reported including:

- Hand hygiene agents causing skin irritation and dryness
- The perception that patient needs take priority over hand hygiene
- Hand washing sinks/basins inconveniently located and/or not available

- The perception that glove use dispenses with the need for additional hand hygiene
- Insufficient time for hand hygiene, due to high workload and understaffing
- Inadequate knowledge of guidelines, protocols or technique for hand hygiene
- Lack of positive role models and social norms
- Lack of recognition of the risk of cross-transmission of microbial pathogens
- Until recently, lack of scientific information showing a definitive impact of improved hand hygiene on healthcare associated infection rates
- Simple forgetfulness.

1.6 Other barriers to hand hygiene

1.6.1 Jewellery and watches

The wearing of jewellery and watches should not inhibit the ability of the HCW to perform correct hand hygiene. Several studies have shown that skin underneath rings is more heavily colonised than comparable areas of skin on fingers without rings. Wearing rings increases the carriage rate of gram-negative bacteria and Enterobacterales on the hands of HCWs.

Hand hygiene policies and education should include a section on appropriate jewellery to be worn in the workplace. The consensus recommendation from WHO is to strongly discourage the wearing of finger and wrist jewellery during healthcare. The wearing of a simple flat band during routine care may be acceptable, but in high risk settings all rings or other jewellery should be removed.

1.6.2 Fingernails, nail polish and artificial nails

Numerous studies have documented that subungual areas (under the nail) of the hand harbour high concentrations of bacteria. Freshly applied nail polish does not increase the number of bacteria recovered from periungual skin, but chipped nail polish may support the growth of larger numbers of organisms on fingernails. Even after careful hand washing or surgical scrubs, HCWs often harbour substantial numbers of potential pathogens in the subungual spaces.

Healthcare workers who wear artificial nails are more likely to harbour gram-negative pathogens on their fingertips than are those who have natural nails, both before and after hand washing. Whether the length of natural or artificial nails is a substantial risk factor is unknown, because the majority of bacterial growth occurs along the proximal 1 mm of the nail adjacent to the subungual skin. Long, sharp fingernails, either natural or artificial, can puncture gloves easily. They may also limit a HCW's performance in hand hygiene practices, and tear or scratch a patient's skin.

Artificial/painted nails refers to all types of nail coverings, including, but not limited to, polish, shellac, signature nail systems and acrylic nails.

Each healthcare facility should develop policies on the wearing of artificial fingernails or nail polish by healthcare workers.

The consensus recommendations from WHO are that HCWs do not wear artificial fingernails, extenders or nail polish when having direct contact with patients, and natural nails should be kept short ($\leq 0.5\text{cm}$ long).

1.7 The National Hand Hygiene Initiative

The NHHI is multi-faceted, and includes the use of alcohol-based handrub, monitoring hand hygiene compliance, education regarding hand hygiene and alcohol-based handrub, and measuring infection rates. Whilst the educational message is applicable to all healthcare settings, monitoring compliance and infection rates is specific to hospitals.

Key features of the NHHI include the following:

1.7.1 Use of alcohol-based handrub

Alcohol-based handrub should be placed at point-of-care including on the ends of patient beds, on trolleys and in clinical areas. Clear signage regarding appropriate use should be present. Ensuring alcohol-based handrub is readily available at the point-of-care can reduce many of the potential barriers to good hand hygiene.

Education should be provided clearly stating the advantages of alcohol-based handrub. Primarily, that it takes approximately 15–20 seconds to decontaminate hands, is less irritating and drying than soap and water, and does not require the use of paper towels. See Chapter 3 regarding specific alcohol-based handrub product selection.

1.7.2 Ensuring uniform hand hygiene education

To assist with improving HCWs' general knowledge about hand hygiene and infection prevention and control, a range of hand hygiene [online learning modules](#) has been designed for specific HCWs.

Executive endorsement of the hand hygiene learning modules as a compulsory requirement for all staff and students has proven successful in many institutions for improving hand hygiene compliance. The program assists with education, even in situations where there are high rates of staff turnover.

The delivery of any broader infection prevention and control education within a healthcare facility should also be used as an opportunity to reinforce the importance of hand hygiene.

The Commission also provides a suite of e-learning [infection prevention and control modules](#). These modules cover the fundamental principles of infection prevention and control and are freely available on the Commission's website.

1.7.3 Monitoring and performance feedback

Hand hygiene compliance is the established outcome for assessing the effectiveness of a hand hygiene program within facilities participating in the NHHI. Hand hygiene compliance auditing is conducted by auditors trained and validated as part of the standardised NHHI training program, using the same auditing tools. This allows for data comparison between Australian healthcare facilities.

For the purposes of national reporting, hand hygiene compliance auditing in health care facilities is currently measured continuously across three audit periods each year.

The number of acute inpatient beds at each facility will dictate the number of

observations to be undertaken once an initial pilot period has been completed (see Section 7.3). Local auditing of hand hygiene compliance can be conducted any time, according to the needs of each organisation, in addition to the national audits.

The standardised hand hygiene compliance audit form or mobile data entry via <https://nhhi.safetyandquality.gov.au/mobile> on a mobile device should be used for all audits (see Appendices 1, 2, 3, 4).

Hand hygiene compliance auditing may not be an appropriate outcome measure for facilities in the non-acute, primary care or mental health settings. A number of additional assessment tools are available for use when compliance auditing is not a suitable outcome measure.

1.7.4 Ensuring culture change

It is imperative that a hand hygiene program is not only about collection of hand hygiene audit data. To ensure culture change and improved hand hygiene behaviours of healthcare staff, a hand hygiene program must include appropriate access to hand hygiene facilities, training and education, promotion, auditing and feedback of results as a minimum. All components are equally important to achieve lasting changes. Healthcare organisations can track their progress and plan for improvement by using the WHO Hand Hygiene Self-Assessment Framework (see Section 8.3).

1.8 Outcomes of the first two years of the National Hand Hygiene Initiative

After two years 521 hospitals around Australia were participating in the NHHI with a national hand hygiene compliance rate of 68.3%. However, hand hygiene compliance before patient contact was 10%–15% lower than after patient contact. Among sites new to the [5 Moments audit tool](#), hand hygiene compliance improved from 43.6% at baseline to 67.8% ($P < 0.001$). Hand hygiene compliance was highest among nursing staff (73.6%) and lowest among medical staff (52.3%) after 2 years.

National incidence rates of methicillin-resistant SAB were stable for the 18 months before the NHHI commenced (July 2007 to 2008; $P = 0.366$), but declined after implementation (2009–2010; $P = 0.008$). Annual national rates of hospital-onset SAB per 10,000 patient-days were 1.004 and 0.995 in 2009 and 2010 respectively, of which about 75% were due to methicillin-susceptible *S. aureus*.

The NHHI was associated with widespread sustained improvements in hand hygiene compliance among Australian HCWs. Although specific linking of changes in SAB rates to the NHHI was not possible, further declines in national SAB rates were expected.

1.9 Effects of the Australian National Hand Hygiene Initiative after eight years on infection control practices, health-care worker education, and clinical outcomes: a longitudinal study

Eight years after the implementation of the NHHI, a longitudinal study of the effects of the national, standardised culture-change program showed that the NHHI had been associated with significant sustained improvement in hand hygiene compliance and a decline in the incidence of healthcare-associated SAB (HA-SAB).

The study showed that between 2009 and 2017, increases were observed in healthcare facility participation nationally from 105 hospitals in 2009 to 937 hospitals in 2017. Increases were also observed in overall hand hygiene compliance (36,213 [63.6%] of 56,978 Moments [95% CI 63.2–63.9] in 2009, compared with 494,673 [84.3%] of 586,559 Moments [84.2–84.4] in 2017; $p < 0.0001$).

Compliance also increased for each Moment type and for each HCW occupational group, including for medical staff (4,377 [50.5%] of 8,669 Moments [95% CI 49.4–51.5] in 2009 compared with 53,620 [71.7%] of 74,788 Moments [71.4–72.0]; $p < 0.0001$). Over the same period 1,989,713 NHHI online-learning programs were completed.

Over this period of time, improved hand hygiene compliance in Australia's major public hospitals ($n=132$) was associated with declines in the incidence of HA-SAB (incidence rate ratio 0.85; 95% CI 0.79–0.93; $p \leq 0.0001$): for every 10% increase in hand hygiene compliance, the incidence of HA-SAB decreased by 15%.

1.10 Who should participate in the National Hand Hygiene Initiative?

The NHHI is designed for all healthcare facilities. Product placement, staff education and program promotion are relevant in all healthcare settings whether an acute tertiary facility, or the local GP clinic. However, the hand hygiene compliance auditing has been designed specifically for acute healthcare facilities.

Routine hand hygiene compliance auditing is not recommended as an outcome measure in the non-acute, primary care, or mental health setting. However, all facilities should be aware of their jurisdictional requirements when planning a hand hygiene program, which may include auditing in these areas. If auditing is required, then it is recommended that it be performed in areas where one-on-one care is provided to a patient by a HCW, and areas where procedures are conducted.

Other program evaluation tools are recommended for use in the non-acute, primary care, or mental health services. These might include: staff hand hygiene knowledge surveys, hand hygiene technique audits, product placement/availability audits, and reports of online-learning program completion by staff. Visit the [NHHI website](#) for relevant audit tools.

WHO has published [Hand Hygiene in Outpatient and Home-based Care and Long-term Care Facilities: A Guide to the Application of the WHO Multimodal Hand Hygiene Improvement Strategy and the "My Five Moments for Hand Hygiene" Approach](#). This document explains the evidence of how the 5 Moments for Hand Hygiene can be incorporated into the non-acute setting. It also gives detailed examples in non-acute settings of how to audit according to the 5

1.10.1 National Safety and Quality Health Service Standards and the National Hand Hygiene Initiative

The primary aims of the National Safety and Quality Health Service (NSQHS) Standards are to protect the public from harm and to improve the quality of health service provision.

The [Preventing and Controlling Healthcare-Associated Infection Standard](#) includes Action 3.8, which requires health service organisations to have a hand hygiene program that:

- Is consistent with the current National Hand Hygiene Initiative, and jurisdictional requirements
- Addresses noncompliance or inconsistency with the current NHHI.

Supporting workbooks and implementation guides and a range of other information for health service organisations, dental practices, and mental health facilities is available on the Commission's [NHHI web page](#).

2 The 5 Moments for Hand Hygiene

2.1 Aim

To ensure all staff involved in the 5 Moments for Hand Hygiene culture change program understand the concepts of the 5 Moments for Hand Hygiene.

2.2 What are the 5 Moments for Hand Hygiene?

The [5 Moments for Hand Hygiene](#) is based on a theoretical model of how infectious agents can be transferred between a HCW and patients. It is inclusive of all occasions where a patient's safety can be endangered by the care given by a HCW, where opportunity exists for transfer of infectious agents between HCW, patient and the healthcare environment.

The levels of evidence that support the 5 Moments for Hand Hygiene are as follows:

- 1A - Strongly recommended for implementation and strongly supported by well- designed experimental, clinical, or epidemiological studies
- 1B - Strongly recommended for implementation and supported by some experimental, clinical, or epidemiological studies and a strong theoretical rationale.

The 5 Moments for Hand Hygiene and associated levels of evidence are:

- **Moment 1:** Before touching a patient (1B)
- **Moment 2:** Before a procedure (1B)
- **Moment 3:** After a procedure or body fluid exposure risk (1A)
- **Moment 4:** After touching a patient (1B)
- **Moment 5:** After touching a patient's surroundings (1B).

2.2.1 Key terms within the 5 Moments for Hand Hygiene

Patient

Includes any part of the patient, their clothes, or any medical device that is connected to the patient.

If the patient were to get up out of bed and walk off, what would still be attached? These items become part of the "patient".

Procedure

Is an act of care for a patient where there is a risk of direct introduction of a pathogen

into the patient's body.

Body fluid exposure risk

Any situation where contact with body fluids may occur. Such contact may pose a contamination risk to either healthcare worker or the environment.

Patient zone

Includes the patient and the patient's immediate surroundings.

The patient zone is a space dedicated to an individual patient for that patient's stay. This area is cleaned between the discharge of one patient and the arrival of the next to minimise the risk of transmission of organisms between patients. Assumptions are generally made that within the patient zone the patient flora rapidly contaminates the entire patient zone; and the patient zone is cleaned between patients.

Within the patient zone there are two critical sites: the clean site (for example, intravenous [IV] access point) that needs to be protected against microorganisms; and the body fluid site (for example, indwelling catheter) that leads to the HCW's hands being exposed to body fluid.

Healthcare zone

Refers to all regions outside of the patient zone. This includes the curtains, partitions and doors between separate patient areas.

The healthcare zone can include shared patient areas as these areas are not cleaned between patients. Assumptions are generally made that within the healthcare zone there are organisms foreign and potentially harmful to all patients, and that transmission of these pathogens to the patient results in exogenous infection.

Curtains

Patient bed curtains are outside the patient zone and are frequently contaminated with microorganisms foreign to the patient inside.

Touching the curtains after caring for a patient is considered to be equivalent to leaving the patient zone.

Hand hygiene should be performed between touching the curtains and touching the patient and vice versa.

2.3 The 5 Moments for Hand Hygiene: detail

Moment 1 – Before touching a patient

WHEN:

Perform hand hygiene on *entering the patient zone before touching the patient*

WHY:

To protect the patient against acquiring foreign organisms from the hands of the HCW.

Hand Hygiene Before:

Examples:

Touching a patient in any way:	Shaking hands, assisting a patient to move, touching any medical device <i>connected</i> to the patient (e.g. IV pump, indwelling catheter), allied health interventions
Any personal care activities:	Bathing, dressing, brushing hair, putting on personal aids such as glasses
Any non-invasive observations:	Checking the patient's pulse rate, blood pressure, oxygen saturation, or temperature. chest auscultation, abdominal palpation, applying ECG electrodes, cardiocography
Any non-invasive treatment:	Applying an oxygen mask or nasal cannulae, fitting slings/braces, application of incontinence aids (including condom drainage)
Preparation and administration of oral medications:	Oral medications, nebulised medications
Oral care and feeding	Feeding a patient, brushing teeth or dentures

TO PREVENT: Patient colonisation with healthcare microorganisms

Healthcare workers are likely to have microorganisms on their hands. Performing hand hygiene before touching a patient prevents these microorganisms being transferred to the patient during patient contact.

Moment 2 – Before a procedure

WHEN:

Immediately before a procedure. Once hand hygiene has been performed, nothing else in the patient's environment should be touched prior to the procedure starting

WHY:

To protect the patient from potential organisms (including their own) from entering their body during a procedure.

Hand Hygiene Before:

Examples:

Insertion of a needle into a patient's skin, or into an invasive medical device:

Venepuncture, blood glucose level, arterial blood gas, subcutaneous or intramuscular injections, IV flush

Preparation and administration of any medications given via an invasive medical device, or preparation of a sterile field:

IV medication, nasogastric (NG), tube feeds, percutaneous endoscopic (PEG) feeds, baby NG/gavage feeds, set up of a dressing trolley

Administration of medications where there is direct contact with mucous membranes:

Eye drop instillation, suppository insertion, vaginal pessary insertion

Insertion of, or disruption to, the circuit of an invasive medical device:

Procedures involving the following: endotracheal tube, tracheostomy, nasopharyngeal airway devices, suctioning of airways, urinary catheter, colostomy/ileostomy, vascular access systems, invasive monitoring devices, wound drains, PEG tubes, NG tubes, secretion aspiration

Any assessment, treatment and patient care where contact is made with non-intact skin or mucous membranes:

Wound dressings, burns dressings, surgical procedures, digital rectal examination, invasive obstetric and gynaecological examinations and procedures, digital assessment of newborn palate

TO PREVENT: Endogenous and exogenous infections in patients

Healthcare workers are likely to have microorganisms on their hands, or may pick up microorganisms from the patient's skin, performing hand hygiene immediately before a procedure prevents these microorganisms entering the patient's body during the procedure.

Moment 3 – After a procedure or body fluid exposure risk

WHEN:

Hand hygiene immediately after a procedure or body fluid exposure risk as hands could be contaminated with body fluid

Even if you have had gloves on you should still perform hand hygiene after removing them as gloves are not always a complete impermeable barrier. Hands may also have been contaminated in the process of removing the gloves.

WHY:

To protect yourself and the healthcare surroundings from becoming contaminated by the transmission of potential organisms from the patient.

Hand Hygiene After:

Examples:

After any Procedure:

See Moment 2

After any potential body fluid exposure:

Contact with a used urinary bottle / bedpan, contact with sputum either directly or indirectly via a cup or tissue, contact with used specimen jars / pathology samples, cleaning dentures, cleaning spills of blood, urine, faeces or vomit from patient surroundings, after touching the outside of a drain tube or drainage bottle

Contact with any of the following:
blood, saliva, mucous, semen, tears, wax, breast milk, colostrum urine, faeces, vomitus, pleural fluid, cerebrospinal fluid, ascites fluid, lochia, meconium, pus, bone marrow, bile, organic body samples e.g. biopsy samples, cell samples

TO PREVENT: Colonisation/Infection in HCWs, contamination of the healthcare environment, and transmission of microorganisms from a colonised site to a clean site on the same patient or another patient.

After touching a patient, the HCW will have the patient's microorganisms on their hands; these microorganisms can be transmitted to the next patient/surface that the HCW touches.

Moment 4 – After touching a patient

WHEN:

After touching a patient. Perform hand hygiene before you leave the patient zone.

WHY:

To protect yourself and the healthcare surroundings from becoming contaminated with potential organisms from the patient.

Hand Hygiene After:

EXAMPLES:

After any Moment 1 except where there has been a potential exposure to body fluids:

See Moment 1 and 2

TO PREVENT: Colonisation/Infection in HCW, and contamination of the healthcare environment

After touching a patient, the HCW has the patient's microorganisms on their hands; these microorganisms can be transmitted to the next patient/surface the healthcare worker touches.

Moment 5 – After Touching a Patient's Surroundings

WHEN:

Hand hygiene *after touching a patient's surroundings* even when the patient has not been touched. Always perform hand hygiene before leaving the patient's room.

WHY:

To protect yourself and the healthcare surroundings from becoming contaminated with potential organisms from the patient's surroundings.

Hand Hygiene After:

EXAMPLES:

After touching the patient's immediate surroundings when the patient has **not** been touched:

Patient surroundings include: bed, bedrails, linen, table, bedside chart, bedside locker, call bell/TV remote control, light switches, personal belongings (including books, mobility aids) chair, foot stool, monkey bar

TO PREVENT: Colonisation/Infection in HCWs, and contamination of the healthcare environment

After touching the patient's environment, the HCW will have microorganisms on their hands; these microorganisms can be transmitted to the next patient/surface the HCW touches.

2.4 Two patients within the same patient zone

Two or more patients may be in such close contact that they occupy the same physical space and touch each other frequently. For example, a mother and her newborn child, or twins occupying the same cot. The two close patients may be viewed as occupying a single patient zone. Hand hygiene is still required when entering or leaving the common patient zone, and before and after procedures on the individual patients, but the indication for hand hygiene when moving between the two patients is little preventative value because they are likely to share the same microbial flora.

3 Alcohol-based handrubs

3.1 Aim

To successfully implement and sustain a hand hygiene program a major factor is to ensure the choice of hand hygiene solution is acceptable to the users, and that all logistical issues in product installation have been addressed.

A well-planned and well-executed installation of hand hygiene products is an essential step in any program to enhance hand hygiene adherence.

Before deciding on the selection and placement of alcohol-based handrub for your facility, it may be useful to provide healthcare workers with the opportunity to evaluate these products.

To gain better compliance, the selection strategy requires input from a multi-disciplinary team.

3.2 Why use an alcohol-based handrub?

Research has demonstrated that alcohol-based handrubs are better than traditional soap and water because they:

- Result in a **significantly** greater reduction in bacterial numbers than soap and water in many clinical situations, (see Figure 3.2 below)
- Require **less time** than handwashing
- Are gentler on skin and cause **less skin irritation** and dryness than frequent soap and water washes, since all handrubs contain skin emollient (moisturisers)
- Can be made readily **accessible** to healthcare workers
- Are more cost effective.

Both soap and alcohol-based handrub products are necessary for the introduction of a hand hygiene program; a soap and water wash is required if hands are visibly soiled, and either product can be used if hands are visibly clean.

As wet hands can more readily acquire and spread microorganisms, the proper drying of hands is an integral part of routine hand hygiene. Single-use paper towels are the most effective way to dry hands and reduce the risk of the transmission of viruses. Evidence indicates that paper towels help minimise the spread of viruses including ones associated with various diseases, including those causing gastro-intestinal infections such as Norovirus and Rotavirus.

In a study published in 2016, Kimmitt identified that jet air dryer produced over 60

times more viral plaques than a warm air dryer and over 1300 times more than paper towels. Air dryers should not be placed in clinical or patient areas due to the possible risks associated with their use. Hand dryers may be considered in non-clinical areas, such as public toilets.

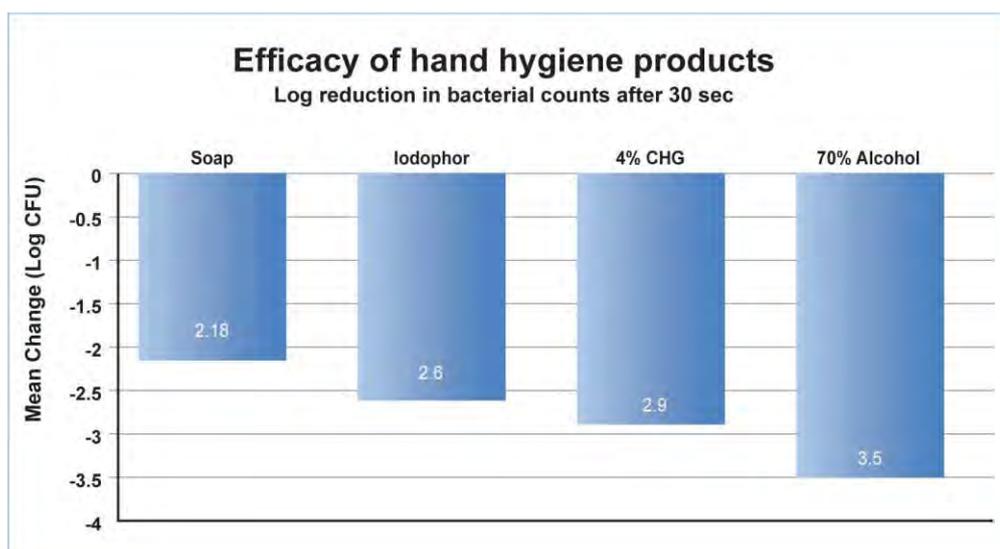

3.2.1 Alcohol-based handrub is the product of choice

Alcohol-based handrub is the gold standard of care for hand hygiene practice in healthcare settings, whereas hand washing is reserved for situations when the hands are visibly soiled, or when caring for a patient with *Clostridioides difficile* or a non-enveloped virus (for example, norovirus).

Alcohol-based handrub is the hand hygiene product of choice for all standard aseptic technique procedures. Surgical scrub is required for surgical aseptic technique. For definitions on standard vs. surgical aseptic technique see Section 3.1.6 of the 2019 [Australian Guidelines for the Prevention and Control of Infections in Healthcare](#).

Alcohol-based handrub is also the recommended product for the prevention of intravascular catheter related infections.

Figure 3.2 Effectiveness of different hand hygiene products

Original data from: Ayliffe GAJ et al. J Hosp Infection. 1988; 11:226

With the exception of non-medicated soaps, every new formulation for hand hygiene should be tested for its antimicrobial efficacy to demonstrate that:

- It has superior efficacy over normal soap, or
- It meets an agreed performance standard.

3.3 Product selection

When selecting an alcohol-based handrub product, it is recommended that:

- The product meets the EN1500 testing standard for bactericidal effect (see Section 3.4.1)

- The Product has Therapeutic Goods Administration (TGA) approval as a hand hygiene product for a healthcare setting.

Other factors that should also be considered include:

- Dermal tolerance
- Practical considerations, such as availability, convenience, functioning of dispenser, and ability to prevent contamination
- Aesthetic preferences such as fragrance, colour, texture and ease of use
- Cost issues.

Please note that the above information on product selection is a recommendation only. The NHHI does not promote specific products. Product selection is ultimately the choice of each healthcare facility.

The following information is the current evidence available to assist healthcare facilities in choosing an appropriate alcohol-based handrub.

3.4 Alcohol-based handrub performance testing (in vivo laboratory based tests)

3.4.1 EN 1500 (European Committee for Standardisation)

Testing requires 18–22 subjects, and a culture of *Escherichia coli*. Subjects are randomly assigned to two groups, where one uses the test handrub, and the other a standard reference solution (60% v/v isopropanol). The groups then reverse roles (cross over design). The mean acceptable reduction with a test formulation shall not be significantly inferior to that with the reference handrub.

3.4.2 ASTM E-1174-13 (ASTM International – used by USA and Canada)

Testing requires two groups of 54 subjects. The indicator organism (*Serratia marcescens* or *E. coli*) is applied and rubbed over hands. The test handrub is then applied. The efficacy criteria are a 2- \log_{10} reduction of the indicator organism on each hand within five minutes after the first use, and a 3- \log_{10} reduction of the indicator organism on each hand within 5 minutes after the tenth use.

3.4.3 Comparison of alcohol-based handrub test procedures

The performance criteria in the above tests are not the same; therefore, a product could meet one criterion but not the other. The level of reduction in microbial counts needed to produce a meaningful drop in the hand-borne spread of HAIs remains unknown.

It is recommended that products tested using the EN 1500 criteria are selected, as this test more closely reflects the use of an alcohol-based handrub in a typical clinical situation. The efficacy criteria for the ASTM E-1174-13 are extremely low, with non-medicated soap and water being able to achieve a 3- \log_{10} reduction of the indicator organism within 1 minute. Furthermore, five minutes is too long to wait between patients after using an alcohol-based handrub.

3.5 The activity of alcohol-based handrubs

The activity of alcohol-based handrubs against bacteria, fungi and viruses is affected by a number of factors, as detailed in Table 5, and including:

3.5.1 Type of alcohol

Isopropanol and ethanol both have in-vitro activity against bacteria, fungi and viruses. When tested at the same concentration, isopropanol is more efficacious than ethanol; however, ethanol has greater activity against viruses than isopropanol.

3.5.2 Alcohol-only alcohol-based handrub *versus* alcohol-chlorhexidine alcohol-based handrub

Although alcohols are rapidly germicidal when applied to the skin, they have no appreciable persistent or residual activity. The addition of a low concentration of chlorhexidine to an alcohol-based handrub results in significantly greater residual activity than alcohol alone and therefore potentially improves efficacy.

Notably, most published clinical studies that have demonstrated reductions in HAIs with the use of alcohol-based handrub, have been associated with the use of alcohol-based handrub that contains at least 70% alcohol (isopropanol), 0.5% chlorhexidine and a skin emollient.

To date there has been one published clinical study showing that alcohol-only alcohol-based handrub is effective in reducing HAIs (indeed, it is one of the formulations recommended by WHO). However, this study was conducted in a developing healthcare setting using a product that has higher concentrations of alcohol than what is currently available on the Australian market.

3.5.3 Alcohol concentration

There is a clear positive association between the extent of bacterial reduction and the concentration of alcohol contained in alcohol-based handrub products.

Furthermore, the concentration for maximum efficacy is different for isopropanol than ethanol. For example, alcohol-based handrub containing 60% isopropanol is associated with similar cutaneous bactericidal activity as alcohol-based handrub that contains 77% ethanol.

When comparing alcohol concentrations, it is important to look at the unit of measure, not just the numerical value of the concentration. Alcohol concentrations can be reported in a number of ways:

- Volume/Volume (V/V)
- Weight/Weight (w/w)
- Weight/Volume (w/V)

These different measures of alcohol concentration are not equivalent. For example, a sample of ethanol labelled with a concentration of 70% V/V is equivalent to an ethanol sample labelled as 62.39% w/w.

Significant differences in the efficacy of alcohol-based handrubs appear to be due to a product's overall concentration of alcohol with higher concentrations being more effective.

3.5.4 Alcohol absorption

The selection of an alcohol-based handrub may be influenced by religious factors. According to some religions, alcohol consumption is prohibited. Recent studies have demonstrated minimal rates of cutaneous alcohol absorption such that there should be no concern for healthcare workers. An Australian study suggested that isopropanol might be less likely to be absorbed than ethanol. Thus, healthcare workers concerned about absorption for religious reasons may elect to use an alcohol-based handrub that contains isopropanol rather than ethanol. An awareness of commonly held religious and cultural beliefs is vital when introducing new concepts to today's multicultural healthcare community.

When implementing a hand hygiene campaign with an alcohol-based handrub in a healthcare setting where religious groups are represented, it is important to include focus groups on this topic to allow HCWs raise concerns about the use of alcohol-based handrubs, help them to understand the evidence underlying this recommendation, and to identify possible solutions to overcome obstacles. The same process should be used when implementing alcohol-based handrubs into areas where there may be concerns about misuse of alcohol.

3.5.5 Solutions versus gels versus foams

Laboratory studies have found that alcohol-based handrub solutions are more effective than alcohol-based handrub gels that contain an equivalent concentration of alcohol. Historically, gels contain approximately 10% less effective alcohol than a similar solution. For example, an alcohol-based handrub gel containing 60% alcohol has similar effective alcohol activity as a 50% alcohol-based handrub solution.

Technically it has proven difficult to develop alcohol-based handrub gels that contain $\geq 70\%$ alcohol without the gel becoming less viscous and more solution-like. Thus, the first generations of gel formulations have reduced antimicrobial efficacy compared with solutions.

There is some evidence to suggest gels are preferred to solutions, and have a trend towards improved compliance. Evidence suggests that the efficacy of alcohol-based gels may depend mainly on concentration and type of alcohol in the formulation, rather than on product consistency.

Alcohol-based handrub foams are also available, but to date are used less frequently. There is currently minimal clinical evidence available for the use of alcohol-based foams.

Recommendations for product selection are outlined in Section 3.3; it does not matter if the product chosen is a solution, gel or foam.

3.5.6 Alcohol-based handrub volume and drying time

The volume of hand rub dispensed is important. One ml of alcohol has been shown to be substantially less effective than 3 ml. The effective volume of alcohol-based handrub (2–3 ml; 1–2 squirts from most alcohol-based handrub dispensers) generally takes 15–20 seconds to dry on hands. Hence, alcohol-based handrub drying time is a convenient indicator that sufficient alcohol-based handrub has been applied. It is important to follow the recommendations of the manufacturer, which are usually found on the alcohol-based handrub bottle.

In clinical practice often smaller volumes are used than what is recommended in the

testing of alcohol-based handrubs. Unless high concentration products are used, there is no significant reduction in contaminants with small volumes of alcohol-based handrub.

It is essential that the team in charge of implementing the alcohol-based handrub educate their staff about the correct use of the product. Specific education is required to ensure the correct dose is administered: it is important to follow manufacturer's instructions for use, and to recognise that the number of squirts required for the alcohol-based handrub to be effective may differ between products, or the size of the healthcare worker's hands. Alcohol-based handrub should never be applied to gloves or to inanimate objects as a cleaning agent.

3.5.7 If hands are wet when alcohol-based handrub is applied

The antimicrobial efficacy of alcohol is very sensitive to dilution with water and is therefore vulnerable to inactivation, especially if only small volumes of alcohol-based handrub are applied. For instance, if 60% isopropanol were rubbed onto wet hands in two portions of 3 ml (each for 1 minute), the mean log bacterial reduction achieved is 3.7, as compared to 4.3 with dry hands. Thus, it is recommended that alcohol-based handrub be applied to dry hands.

Group	Gram-positive bacteria	Gram-negative bacteria	Mycobacteria	Fungi	Viruses	Speed of action	Comments
Alcohols	+++	+++	+++	+++	+++	Fast	Optimum concentration 60-90%; non-persistent activity
Chlorhexidine (2% and 4% aqueous)	+++	++	+	+	+++	Intermediate	Persistent activity; rare allergic reactions
Iodine Compounds	+++	+++	+++	++	+++	Intermediate	Causes skin burns; usually too irritating for hand hygiene
Iodophors	+++	+++	+	++	++	Intermediate	Less irritating than iodine; acceptance varies
Phenol Derivatives	+++	+	+	+	+	Intermediate	Activity neutralised by non-ionic surfactants
Triclosan	+++	++	+	-	+++	Intermediate	Acceptability on hands varies
Quarternary ammonium compounds	+	++	-	-	+	Slow	Used only in combination with alcohols; ecologic concerns

3.6 Alcohol-based handrub limitations

3.6.1 Bacterial spores

Alcohol has virtually no activity against bacterial spores. Washing hands with soap and water is preferred in this situation because it is the best method of physically removing spores from the hands. However, the vegetative form of *Clostridium difficile* (CDI) is highly sensitive to alcohol-based handrub.

The November 2018 [ASID/ACIPC position statement – Infection Control Guidelines for Patients with *Clostridium difficile* Infection in healthcare facilities](#) recommends the primary use of alcohol-based handrub in accordance with the WHO 5 Moments for Hand Hygiene when caring for patients with CDI. Gloves should be used during the care of patients with CDI, to minimise spore contamination, and if hands become soiled, or gloves have not been used, then hands must be washed with soap and water.

3.6.2 Non-enveloped (non-lipophilic) viruses

Alcohol has poor activity against some non-enveloped viruses; for example, rotavirus, norovirus, polio, Hepatitis A. However, there is conflicting evidence suggesting that alcohol-based handrub is more effective than soaps in reducing virus titres on finger pads. Thus, unless gloves have been worn, soap and water hand hygiene is preferred.

3.6.3 Other organisms

Alcohol has a poor activity against tropical parasites, and protozoan oocysts. Hand washing is preferred.

3.6.4 Alcohol tolerance

In an article published in August 2018 some findings were reported regarding the tolerance of *Enterococcus faecium* to alcohol. The study found that some strains of *E.faecium* collected after 2010 were more tolerant to a 23% alcohol solution when compared to older *E.faecium* strains, suggesting a potential increase of tolerance to low concentrations of alcohol. As highlighted in a letter to the editor published in The Lancet Infectious Diseases in September 2018, these study findings are likely to have minimal implication in terms of hand hygiene and the use of alcohol-based hand rubs as these formulations contain much higher alcohol concentrations; for example, 60%–90%. It should be noted that in the same study the authors found no difference between newer and older isolates in bacterial log reduction found when exposed to a 70% alcohol solution. The study findings emphasise the importance of ensuring appropriate selection of alcohol-based handrub for the clinical setting as well as maintaining high rates of hand hygiene compliance. For product recommendations, see Section 3.3.

3.7 Repeated alcohol-based handrub use

There is no maximum number of times that alcohol-based handrub can be used before hands need to be washed with soap and water.

3.8 Glove use

Inappropriate glove use often undermines efforts to sustain correct hand hygiene according to the 5 Moments and has been shown to increase the risk of transmission of HAIs. Wearing gloves does not replace the need for hand hygiene.

Wearing gloves does not replace the need for hand hygiene.

Gloves do not provide complete protection against hand contamination. Microorganisms may gain access to the HCWs' hands via small defects in gloves, or by contamination of the hands during glove removal. Microorganisms colonising patients may be recovered from the hands of approximately 30% of HCWs who wear gloves during patient contact.

Gloves can protect both patients and HCWs from exposure to infectious agents that may be carried on hands. As part of standard precautions single use gloves must be worn for:

- Contact with sterile sites and non-intact skin or mucous membranes
- Any activity that has been assessed as carrying a risk of exposure to blood, body substances, secretions and excretions.

The recommendation to wear gloves during an entire episode of care for a patient who requires contact precautions, without considering indications for their removal, such as for hand hygiene, could lead to the transmission of microorganisms. Hayden and colleagues found that HCWs seldom enter patient rooms without touching the environment, and that 52% of HCWs whose hands were free of vancomycin-resistant Enterococci (VRE) upon entering rooms contaminated their hands or gloves with VRE after touching the environment without touching the patient.

Hand hygiene products and gloves should be made available inside isolation/contact precaution rooms to allow for appropriate hand hygiene to occur during the care of a patient.

When should gloves be changed?

- Between episodes of care for different patients, to prevent transmission of microorganisms
- During the care of a single patient, to prevent cross-contamination between body sites
- If the patient interaction involves touching portable computer keyboards or other mobile equipment that is transported from room to room.

Sterile gloves must be used for surgical aseptic procedures and contact with sterile sites. Single use gloves should always be discarded.

Hand hygiene is required with glove use:

- Hand hygiene should be performed before putting on gloves
- Hand hygiene should be performed after removing gloves
- Gloves should be removed to perform hand hygiene during the care of a single patient as indicated by the 5 Moments for Hand Hygiene
- Single use gloves should not be washed, but discarded.

Prolonged and indiscriminate use of gloves should be avoided as it may cause adverse reactions and skin sensitivity.

For more information on gloves, refer to the [Australian Guidelines for the Prevention and Control of Infection in Healthcare](#) (Section 3.3 Personal Protective Equipment).

Always ask yourself:

- Why am I wearing gloves?
- Am I wearing gloves instead of cleaning my hands?
- Who am I trying to protect?
- Would frequent hand hygiene be better?

3.9 Alcohol-based handrub placement for improved hand hygiene compliance

Critical to the success of the program is having alcohol-based handrub readily available to HCWs in their work area and near the patient, at the point of care. Dispensers act as a visual cue for hand hygiene behaviour, and their strategic and ubiquitous placement makes the product highly accessible for frequent use. Placement of alcohol-based handrub needs to be consistent and reliable. Clinical staff should assist with the decision-making process, as they generally best understand the workflow in their area. Although this may be time consuming the benefit of behavioural adherence will be marked.

Where possible, alcohol-based handrub should be placed at the foot of every bed, or within each patient cubicle. An article by Traore (2007) concluded that “availability of a handrub at the point of care increased hand hygiene compliance independently of the type of product used, time of day, professional category and other confounders”.

The placement of alcohol-based handrub can have a significant effect on the hand hygiene compliance of HCWs. Medical staff have been found to have a hand hygiene compliance rate of 54% when the alcohol-based handrub was in their line of sight on entering a patient’s room, compared to 11.5% when they couldn’t see the alcohol-based handrub dispenser. When designing new healthcare facilities, consideration should be given to appropriate placement of alcohol-based handrubs.

The placement of dispensers next to sinks is strongly discouraged as this can cause confusion for some HCWs who may think they need to rinse their hands with water after using alcohol-based handrub.

Where alcohol-based handrub should be placed

Ensuring alcohol-based handrub is available at the point-of-care improves hand hygiene compliance.

Point-of-care is the place where three elements come together:

- The patient
- The HCW
- The care or treatment involving contact with the patient.

A hand hygiene product should be easily accessible generally within arm's reach of where patient care or treatment is taking place. Products should be accessible without having to leave the patient zone.

The placement of alcohol-based hand rub needs to be aligned with a risk assessment of the patient population. For further information please refer to the [alcohol-based handrub](#) section of the NHHI website for the generic risk assessment form.

The following alcohol-based handrub placement locations are suggested:

- On the end of every patient bed (fixed or removable brackets)
- Affixed to mobile work trolleys (for example, intravenous, medication and dressing trolleys)
- High staff traffic areas (for example, nurse's station, pan room, medication room and patient room entrance)
- Other multi-use patient-care areas, such as examination rooms and outpatient consultation rooms
- Entrances to each ward, outpatient clinic or Department
- Public areas (for example, waiting rooms, receptions areas, hospital foyers, near elevator doors in high traffic areas).

A clear decision needs to be made about whose responsibility it will be to replace empty alcohol-based handrub bottles. Workplace agreements or job descriptions may need to be changed to accommodate prompt replacement of these bottles. Never pour alcohol-based handrub from one bottle into another as this may lead to contamination of the bottle and its contents, and will mix different production batches. Most alcohol-based handrub approved for use within Australian healthcare facilities are registered as a pharmaceutical product, with a batch number to enable tracking of the product should it be required.

3.10 Safe alcohol-based handrub placement

There are a number of risks to patients and staff associated with the use of alcohol-based handrub. However, the benefits in terms of its use far outweigh the risks. A risk assessment should be undertaken and a management plan put in place. This particularly applies to clinical areas managing patients with alcohol use disorders, and patients at risk of self-harm (see Appendix 5).

3.10.1 Placement recommendations

- The maximum size of an individual alcohol-based handrub dispenser should not exceed 500mls
- No more than 80 individual alcohol-based handrub dispensers (each with a maximum capacity of 500ml) should be installed within a single smoke compartment
- In corridors that are at least 1.8m wide, there should be at least 150cm between each alcohol-based handrub dispenser
- Dispensers should not project more than 15cm into corridor egress
- Wall mounted brackets should be located at a height of between 92cms and 122 cm above the floor (avoid placing at eye level)
- Dispensers should not be located over carpeted areas, unless the area is protected by active sprinklers
- Dispensers should not be located over, or directly adjacent to ignition sources (for example, electrical switches, power points, call buttons, or monitoring equipment)
- Alcohol-based handrub dispensers should be separated from heat sources and electric motors
- Dispensers should be installed according to manufacturer's recommendations and to minimise leaks or spills
- Regular maintenance of dispensers and brackets should occur in accordance with manufacturer's guidelines
- Product usage signs should be clearly visible and laminated
- Regular monitoring of each area is recommended for misuse, or removal of product
- Each facility should take adequate care regarding the placement of each dispenser so as to protect vulnerable populations, for example in psychiatric units, drug and alcohol units, paediatric units and units caring for cognitively impaired patients
- Alcohol-based handrub bottles should be designed so as to minimise evaporation due to the volatile nature of alcohols
- Site-specific instructions should be developed to manage adverse events, such as alcohol-based handrub ingestion, eye splashes or allergic reactions.

3.10.2 Clinical area placement considerations

Special consideration is necessary when locating alcohol-based handrub in clinical areas where ingestion or accidental splashing of alcohol-based handrub is a particular risk. Accidental ingestion of alcohol-based handrub has been reported, but is uncommon.

Such areas include:

- Paediatrics – in general, alcohol-based handrub should be located within the point-of-care when caring for children (See Section 3.11)
- Mental Health/Dementia Units – alcohol-based handrub should be located within the point-of-care when caring for mentally ill patients, patients

undergoing alcohol- or drug-withdrawal, or where there are cognitively impaired patients

- Public areas - alcohol-based handrub placement in high traffic areas requires clear signage addressing appropriate use and the need for parents to carefully supervise their children

Bracket design is important since alcohol-based handrub placement may be affected if alcohol-based handrub brackets are ill-fitting (for example, varying sizes of bed rails can affect the efficacy of some alcohol-based handrub brackets). Consider brackets that are removable, or product that can be removed from brackets easily in case short term patient demands warrant it. Take into account bracket availability and installation costs, since these expenses can be substantial.

Small personal bottles that HCWs carry with them may be more appropriate in some of the above areas.

3.11 Soap and water hand hygiene placement

The design of healthcare facilities can influence the transmission of HAIs. Easy access to hand hygiene products can assist in promotion of their use.

The Australasian Health Facility Guidelines have been written to “help disseminate current industry knowledge regarding good health facility design and accepted clinical practice”. These guidelines contain practical information and resources regarding health facility infrastructure, with specific guidance on hand hygiene, hand basin types and uses, and hand hygiene schedule and placement in Part D.

3.12 Paediatric exposure to alcohol

Alcohol-based handrub can be placed in paediatric wards/facilities. The placement of alcohol-based handrub within neonatal intensive care unit (NICU), special care nursery (SCN), maternity wards, and on cots should follow the recommendations above for product placement at point-of-care.

The placement within general paediatric wards should remain within the point-of-care, except where a child may have an intellectual disability or cognitive impairment or where the child could intentionally or unintentionally harm themselves. Personal bottles of alcohol-based handrub could be used in any area where alcohol-based handrub cannot be placed at the point-of-care.

Recent research has shown increasing use of alcohol-based handrubs in the home and community settings, which have corresponded with an increase in the number of calls to poisons centres regarding children misusing the products. However, Miller et al in 2009 report that alcohol-based handrubs appear relatively safe when misused by children under six years of age as the exposure invariably occurred as a brief ‘taste’ or accidental ocular or dermal exposure, resulting in little or no toxicity. This is supported by anecdotal evidence from Australian Poisons Centres, and recent publications from an American Poison’s centre.

Further research has shown that use of an alcohol-based handrub by children in day care centres is safe. Even though children put their hands in their mouth or in contact with other mucous membranes directly after alcohol-based handrub use, there was

nil measurable alcohol detected by breathalyser in any of the children tested.

3.13 Alcohol-based handrub and sterilisation departments

AS/NZS 4187:2014 is the Australian standard for sterilisation departments. Section 5.6.12 Hand Hygiene states that there should be sufficient hand hygiene facilities available and accessible in all work areas. The hand hygiene products for use can be **either** alcohol-based hand rubs or liquid soaps. Hand creams shall not be used when performing reprocessing activities.

3.14 Staff preference

The level of HCW acceptance of alcohol-based handrubs is a crucial factor in the success of any hand hygiene program. The following features can influence alcohol-based handrub acceptability:

- Product availability: product should be readily available within the point of care (for example, bedside) and in all patient-care areas
- The emollient agent(s) in the alcohol-based handrub should prevent skin drying and irritant skin reactions, but not leave a sticky residue on hands
- Risk of skin irritation and dryness. Proactive and sympathetic management of this problem is vital (see Section 3.15)
- Drying characteristics: in general, alcohol-based handrub solutions have lower viscosity than gels and therefore tend to dry quicker
- Fragrance and colour: these may increase the initial appeal but may cause allergic reactions, and are therefore discouraged
- There is some evidence to suggest that gels are preferred to solutions, however it is important for staff to evaluate products themselves prior to implementation where possible.

3.15 Hand care issues

Intact skin is a first line defence mechanism against infection. Damaged skin can not only lead to infection in the host, but can also harbour higher numbers of microorganisms than intact skin and hence increase the risk of transmission to others. Damaged skin on HCWs is an important issue and needs to be seriously addressed.

The vast majority of skin problems among HCWs that are related to hand hygiene are due to irritant contact dermatitis. Irritant contact dermatitis is primarily due to frequent and repeated use of hand hygiene products - especially soaps, other detergents, and paper towel use, which result in skin drying. The initial use of alcohol-based handrub among such healthcare workers often results in a stinging sensation. However, recent studies have suggested that the ongoing use of emollient-containing alcohol-based handrub leads to improvement in irritant contact dermatitis in approximately 70% of affected healthcare workers. Also, the use of an oil-containing lotion or a barrier cream three times a shift can substantially protect the hands of vulnerable healthcare workers against drying and chemical irritation,

preventing skin breakdown.

It is important to ensure that the selected alcohol-based handrub, soaps, and moisturising lotions are chemically compatible to minimise skin reactions among staff.

The following information was developed and provided by The Occupational Dermatology Research & Education Centre, Skin & Cancer Foundation Inc.:

Occupational contact dermatitis is an inflammatory skin condition which occurs when workplace substances damage the skin. Usually the hands of healthcare workers are affected, although other exposed skin may be involved, such as the arms, face and neck.

There are three main types of contact dermatitis: irritant contact dermatitis (ICD), allergic contact dermatitis (ACD) and contact urticaria.

Irritant contact dermatitis (ICD) is the most common form of dermatitis experienced by healthcare workers. It often starts with dryness in the web spaces between the fingers.

Common causes of ICD affecting healthcare workers include:

- Repeated exposure to water, including hand washing and scrubbing
- Skin cleaners, antiseptic washes, detergents, liquid and bar soaps
- Drying of the skin using paper towels
- Heat from hot water
- Sweating, especially when wearing occlusive gloves for extended periods of time
- Glove powder
- Low humidity: hands often get drier in winter

Once ICD has developed, the penetration of allergens (substances that cause allergy) through the damaged skin barrier is facilitated. Similarly, the damaged skin barrier is more prone to transmit infection, so it is important to both prevent ICD and treat it early. The use of alcohol hand rubs reduces the exposure of the skin to irritants when compared to traditional hand washing (incorporating warm water, use of skin cleansers and paper towels), and can reduce the likelihood of developing ICD.

Allergic contact dermatitis (ACD) is a delayed type of allergy that causes dermatitis on areas of the skin exposed to allergens. Allergy is very individual; one person may be allergic to a substance that another person can use without problems.

ACD can occur at any time, after someone has been using the same product for many years or for just a few weeks. Dermatitis generally develops some hours or even 1-2 days after contact with the allergen, but does not occur the very first time an individual is exposed to the substance. People may not have had a history of allergies before and in fact are probably less likely to be 'allergic' types. The clinical features of ACD cannot be reliably differentiated from ICD.

ACD will often complicate pre-existing ICD, when the skin barrier has become damaged. Once an allergy to a substance has developed, it is generally life-long.

Special note: The preservative methylisothiazolinone is currently causing very high rates of ACD. All healthcare workers with contact dermatitis should check the ingredients of their own products and avoid it where possible. Methylisothiazolinone may be found in some liquid soaps, shampoos, sunscreens, hair products, moisturisers and disposable wipes, particularly baby wipes.

Contact urticaria is a different type of allergic skin reaction, occurring immediately rather than being delayed. Allergy to latex, or natural rubber protein, is a form of contact urticaria and healthcare workers are exposed to latex in many brands of disposable gloves but also in other medical products.

Powdered latex gloves also increase the risk for latex allergy as the powder facilitates the transfer of the latex allergen to the skin and also aerolises it, so latex proteins that have attached to the powder can be inhaled, or enter the skin via cracks and splits in the skin.

Factors that may contribute to dermatitis include:

- Fragrances and preservatives. Commonly the cause of contact allergies; these should be kept to a minimum or eliminated when selecting an alcohol-based handrub
- Washing hands regularly with soap and water immediately before or after using an alcohol-based handrub is not only unnecessary, but may lead to dermatitis
- Donning gloves while hands are still wet from either hand washing or applying alcohol-based handrub increase the risk of skin irritation
- Using hot water for hand washing
- Failure to use supplementary moisturisers
- Quality of paper towels.

The management of hand care problems associated with the use of hand hygiene products requires early recognition and a systematic approach to ensure success.

Strategies for minimising occupational hand dermatitis include:

- Use of a hand hygiene product that contains skin emollient to minimise the risk of skin irritation and drying. Several studies have demonstrated that such products are tolerated better by healthcare workers and are associated with better skin condition when compared to plain or antimicrobial soap
- Use the hand hygiene and hand care products supplied by the healthcare facility. The suite of products should be compatible, and less likely to cause irritation due to chemical interaction
- Educating staff on the correct use of hand hygiene products
- Educating staff on caring for their hands, including the regular use of skin moisturisers both at work and at home - such moisturising skin-care products need to be compatible with alcohol-based handrub
- Providing a supportive attitude towards staff with skin problems.

Alcohol-based handrub produces the lowest incidence of irritant contact dermatitis of all the hand hygiene products currently available. True allergy to alcohol-based handrub is rare and allergy to alcohol alone has not been reported to date.

Although some reports have suggested that irritant contact dermatitis can occur in up to 30% of healthcare workers; the incidence of this problem among a recent study of Victorian healthcare workers was extremely low (0.47%), representing one cutaneous adverse event per 72 years of healthcare worker exposure. Minimisation of irritant contact dermatitis is essential for improved hand hygiene compliance.

Healthcare workers should notify the hand hygiene representative if skin irritation occurs following the use of alcohol-based handrub. All complaints should be taken seriously and a review process instigated.

All healthcare facilities should have access to referral for follow up that may include: an Occupational Dermatologist, local Doctor, or emergency department for HCWs with persistent skin problems. See Appendix 6 for an example of a skin care questionnaire for healthcare workers; alternatively go to [the generic skin care assessment form](#).

3.15.1 WHO consensus recommendations on skin care

The WHO consensus recommendations on skin care:

- Include information regarding hand care practices designed to reduce the risk of irritant contact dermatitis and other skin damage in education program for HCWs
- Provide alternative hand hygiene products for HCWs with confirmed allergies or adverse reactions to standard products used in the healthcare setting
- Provide HCWs with hand lotions or creams to minimise the occurrence of irritant contact dermatitis associated with hand antiseptics or hand washing
- Advise that, when alcohol-based handrub is available in the healthcare facility for hygienic hand antiseptics, the use of antimicrobial soap is not recommended
- Recommend that soap and alcohol-based handrub should not be used concomitantly.

For levels of evidence on consensus recommendations please see WHO Guidelines on Hand Hygiene in Health Care.

3.16 Fire safety

A number of studies have confirmed the safety of alcohol-based handrub. Despite many years of use, there have been no documented fires directly related to the presence of alcohol-based handrub in hospital wards in Australia, and only one documented in the USA. To further reduce the risk of fire following the application of alcohol-based handrub, hands should be rubbed together until dry and all alcohol is evaporated (See Appendix 5).

3.17 Ingestion

Accidental and intentional ingestion of alcohol-based products used for hand hygiene have been reported. Alcohol toxicity can occur after ingestion, but the effects depend on the amount ingested, and the age/size of the person ingesting it.

Symptoms and signs of alcohol intoxication include: dizziness, lack of coordination, hypoglycaemia, abdominal pain, nausea, vomiting, and haematemesis. Signs of severe toxicity include respiratory depression, hypotension and coma.

With careful consideration of alcohol-based handrub product placement, and securing product in fixed or lockable brackets in high risk areas (for example, mental health, alcohol detoxification units), the risk of this potential problem can be minimised.

As with any intervention, the availability and use of alcohol-based handrub, while being associated with major benefits in terms of reduced risk of acquiring HAIs, may also occasionally be associated with some small risks. Thus, a carefully considered Risk Management strategy should be employed for the safe use of these products (see Appendix 5).

3.18 Storage and safety

Ensure a material safety data sheet (MSDS) for alcohol-based handrub is available in areas where product is stored (check with local occupational, health and safety regulations).

All alcohol-based handrub products are flammable with flash-points ranging from 21°C to 24°C, depending on the type and concentration of alcohol present. They should be stored away from high temperatures or flames.

When considering the requirements for minor storage, the total quantities of all flammable liquids must be considered. Minor storage of all flammable liquids should be consistent with AS1940:2017 (the storage and handling of flammable and combustible liquids).

For further product safety information contact your product supplier or local fire service.

3.19 Cost

The promotion of hand hygiene is highly cost effective, and the introduction of a waterless system for hand hygiene is a cost-effective measure. While the purchase price of alcohol-based handrub is an important factor in product selection, it is far less important than the acceptability of the alcohol-based handrub to healthcare workers. There is little point having a cheap alcohol-based handrub available that has poor healthcare worker acceptance and is therefore rarely used, resulting in poor rates of hand hygiene compliance.

The key driver for alcohol-based handrub selection should not be simple purchase cost. However, a study in the dental setting has reported that use of alcohol-based handrub is more cost-effective than antimicrobial soap, and the expenditure on alcohol-based handrub products when compared with excess hospital costs associated with healthcare associated infection can easily be justified.

Cost is an important consideration on set-up, and the ongoing funding source within the health service needs to be clearly identified for the sustainable success of the program.

3.20 Detergent wipes for hand hygiene

Detergent wipes or alcohol wipes should not be used for hand hygiene as they are no more effective than washing hands with soap and water. Detergent impregnated wipes are the recommended cleaning product for shared patient equipment. They should be used to wipe over equipment between patients, for example the blood pressure cuff.

3.21 Non-alcohol based handrubs

Use of handrubs other than alcohol-based handrubs is not recommended. This is because of the superiority of alcohol-based handrubs in terms of acceptability and tolerability by HCWs, and activity against a broad range of microorganisms.

In addition, products should meet the EN1500 testing standard for bactericidal activity and be approved by the TGA for hand hygiene use in healthcare settings.

4 Hand Hygiene Promotion and Healthcare Worker Education

4.1 Aim

To develop and maintain an ongoing education program to initiate and sustain hand hygiene behaviour change. All HCWs and support staff should be included in educational activities.

Education is critical to the success of the culture change program and careful planning is essential.

To achieve a high rate of hand hygiene compliance, healthcare workers need education, clear guidelines, some understanding of modes of disease transmission, and acceptable hand hygiene products.

4.2 Education about hand hygiene and the patient

Patients who develop HAIs can potentially have a lengthy recovery process, require further treatment, delayed return to work, and suffer emotional and financial burdens.

Patients receiving care in the healthcare environment expect clean hands on the people caring for them, however most would feel uncomfortable asking a healthcare worker if they had clean hands, or to clean them before beginning their care. Hand hygiene should be performed in front of your patient so that they know you have clean hands prior to their care.

Although HAIs cannot be entirely eliminated, there are strategies which have been proven to significantly reduce their occurrence.

The [Australian Charter of Healthcare Rights](#) states that all people have a right to receive safe and high quality health care that meets national standards and be cared for in an environment that is safe and makes them feel safe. Hand hygiene is one strategy to meet this requirement.

Hand hygiene is the single most important strategy to reduce HAIs and applies to everyone - staff, patients and their visitors.

4.3 Online Learning Management System (LMS)

Hand hygiene education and assessment can play a key role in sustaining good hand hygiene practice and maintaining the NHHI. The implementation of education and assessment will vary between healthcare facilities. An online hand hygiene learning package has been shown to be effective in supporting this process.

The NHHI online learning modules have been developed to increase knowledge regarding hand hygiene practices.

All modules and associated information can be accessed [here](#).

The online learning modules include a series of educational slides, followed by questions, and provide immediate feedback after each section is answered. Users can only move to the next section after they have selected the correct answers. A user is considered “educated in basic hand hygiene theory” on completion of a module.

4.3.1 Hand hygiene online modules

There are a number of online learning modules to assist with education on hand hygiene for different professional groups. The modules developed include:

Allied health module

Target audience: All allied health professionals. An allied health professional is a general term that covers most health professionals who are not doctors, dentists or nurses.

Dental module

Target audience: All dental/oral health staff and students

Medical module

Target audience: All medical practitioners

Non-clinical module

Target audience: Healthcare facility support staff. This includes all staff and volunteers who enter patient areas, but do not provide clinical care for patients.

Nursing/midwifery module

Target audience: All staff performing nursing/midwifery duties.

Renal/dialysis module

Target audience: All staff working within the dialysis clinical setting

Royal Australasian College of Surgeons module

Target audience: All candidates in a surgical training program provided by the Royal Australasian College of Surgeons.

Standard theory module

Target audience: Any person requiring hand hygiene knowledge who does not associate with the other packages available.

Student health practitioner

Target audience: All students who will work as a part of their training within clinical areas of a healthcare facility.

There is also a hand dermatitis learning module, which is hosted on behalf of the Occupational Dermatology Research & Education Centre, at the Skin & Cancer Foundation, Melbourne. This module is aimed at healthcare workers and student health practitioners who would like to learn more about hand care in the clinical environment.

4.3.2 Individual users of the learning management system

The NHHI LMS is freely accessible to anyone wishing to complete online training in hand hygiene.

In order to access a training module, each individual is required to register as a learner the first time they use the system. Once registered, each learner will be provided with a unique login in order to access their training modules, training history, and certificates.

For further information, please see the [LMS Instructions for Learners](#).

4.3.3 Registration of organisations to use the learning management system

Any healthcare facility can become a registered organisation for the NHHI LMS. Registering an organisation provides the ability to report on numbers of staff who have completed the education package.

For information on registering your healthcare organisation, please review the [NHHI online learning frequently asked questions](#).

It is recommended that a hand hygiene learning module be included in the mandatory training competencies for all HCWs. Links to the NHHI LMS could be made available to staff via local training systems, or during orientation programs for new staff.

Ideally new employees should complete a hand hygiene learning module on commencement of employment, or as soon as possible after. This condition could be written into employment contracts, and made a requirement for all student healthcare workers prior to commencement of clinical placements.

Monitoring the completion of these modules can be monitored by the LMS administrators for each individual organisation.

4.3.4 Administrators of the learning management system

On registration of an organisation in the NHHI LMS, an individual is required to be nominated as administrator. This person will have access to the reporting and administration tasks for an individual organisation. There can be more than one individual nominated for this role.

The person who is nominated as the administrator may differ depending on the size of the healthcare organisation. This may be the hand hygiene lead, the education

and training officer, human resources, quality department, or an administrative assistant.

There are two levels of administrator in the NHHI LMS:

4.3.4.1 Organisation administrator

The organisation administrator has access to reporting and administrative tasks for an organisation in the NHHI LMS.

If you have organisation administrator access, please see the [Instructions for Organisation Administrators](#) for further information.

4.3.4.2 Region administrator

The *region administrator* has access to reporting and administrative tasks for one or more organisations in the same region in the NHHI LMS. A region is a group of healthcare organisations (for example a health service with multiple hospitals).

If you have *region administrator* access, please see the [Instructions for Region Administrators](#) for further information.

4.3.5 Troubleshooting

For assistance with questions from learners regarding the NHHI LMS, see:

[Having trouble logging in?](#)

[Frequently Asked Questions](#)

4.4 Education for all healthcare workers

Healthcare worker education is a key component of any multi-modal intervention strategy. Basic education sessions for all healthcare workers should include the following:

- Definition, impact and burden of HAIs
- Common pathways for disease transmission, specifically the role of hands
- Prevention of HAIs and the role of hand hygiene
- 5 Moments for Hand Hygiene – with key messages
 - When to perform hand hygiene
 - How to perform hand hygiene, using alcohol-based handrub or soap and water
 - Use of alcohol-based handrubs
 - Use at point of care
 - Use of clinical scenarios to teach the 5 Moments will improve understanding and uptake in clinical work.

4.4.1 Delivery of hand hygiene education

There can be a high turnover of staff in healthcare facilities. Therefore, as well as introductory education sessions, a program with regular updates should be planned. These could take the form of specific orientation programs, in-service lectures or special workshops. Where possible, hand hygiene coordinators should work with education departments in their facility to identify the most appropriate methods specific to the audience and facility.

On a day-to-day basis in healthcare facilities, many opportunities arise for informal education. These opportunities may include:

- Medical and nursing rounds
- Nurse Unit Manager/clinical unit meetings
- Ward "walkabouts"
- Increased presence on the ward by the hand hygiene program coordinator and infection prevention and control staff
- Program staff acting as a resource for all staff
- Working one-on-one with staff to improve hand hygiene practices
- Corridor/tearoom conversation
- Prompt feedback of hand hygiene compliance results, including rewards/incentives for good results
- Individual HCW performance feedback is encouraged during the audit cycle. This will promote individual behaviour change. If individual feedback is given it is important to stop auditing that individual for that session.

High profile promotional activities are also recommended to raise awareness of hand hygiene. For example, these can be planned to coincide with World Hand Hygiene Day on 5 May each year, or International Infection Prevention Week during October each year.

4.4.2 Using hand hygiene compliance data to target education

Hand hygiene compliance data should be utilised as an educational tool for all healthcare workers. Hand hygiene compliance reports (see Section 7.8 on Reporting Results) give individual facilities the ability to develop targeted education aimed at specific HCW groups or departments. These reports include data on the hand hygiene performance of a number of HCW groups, and will assist with identifying priority areas for education.

Hand hygiene compliance rates are both a useful outcome measure for the hand hygiene program, and a valuable educational tool for HCWs. Reporting local hand hygiene audit results to HCWs is an essential element of a multi-modal strategy. Timely feedback and discussion assists in engaging HCWs in effective cultural change and in developing locally relevant improvement initiatives.

The overall ward reports should be given to the managers of the wards, with subsequent reporting to all ward staff followed by further training as indicated from the audits.

The overall facility reports should be presented to the healthcare organisation management at regular intervals, and should become a standard agenda item for hospital executive and quality and safety meetings.

4.4.3 Staff ownership

Staff ownership of the program should be encouraged and supported through:

- Regular and timely feedback to ward staff of hand hygiene compliance rates – national, state and hospital rates, but specifically their own ward data
- Recognition of each ward/department's achievements
- Enthusiastic ward/department staff should be appointed as hand hygiene "liaison officers" or "ward champions" to take responsibility for hand hygiene promotion in the ward/department
- Ensuring each ward/department nominates a staff member to be accountable for the hand hygiene portfolio (see Section 4.4.1)
- The use of education tools and displays
- Provision of audit tools to ward staff to assess product availability (Appendix 7)
- Staff completion of the NHHI online learning modules. It is recommended that all employees complete the appropriate package on employment and on an annual basis
- Ward-based promotional activities

4.4.1 Hand hygiene program liaison officers

The appointment of ward/department-based hand hygiene liaison officers or champions is helpful in linking the ward and the hand hygiene program and assist with the NHHI.

This role involves:

- Acting as role models for all staff
- Motivating staff
- Facilitating involvement and ownership of the project by healthcare workers in each ward
- Presenting outcome data to staff
- Monitoring product placement and availability by conducting audits
- Assisting with promotional activities in their ward
- Assisting HCWs in their ward to complete the online learning package
- Educating new staff in hand hygiene, including ward/department orientation to hand hygiene product placement, correct usage and storage
- (Optional) hand hygiene compliance auditing as long as the hand hygiene liaison person has been trained as an auditor and is able to be released from their normal duties to conduct audits.

4.5 Education of medical staff

Some of the strategies suggested above may not be appropriate for medical staff. Numerous published studies suggest that medical staff repeatedly under-perform in hand hygiene compliance and can be difficult to reach with education to generate behaviour change. Results from the NHHI demonstrate that medical staff have lower hand hygiene compliance than most other healthcare workers.

Hand hygiene medical champions should become involved and encourage medical staff to act as role models for all others. Although a multi-modal approach is likely to be most effective, one-on-one discussions with key/high profile medical officers are especially valuable, particularly for senior medical staff.

Successful programs should:

- Identify those willing to be role models
- Discuss any potential challenges to implementation with medical staff
- Identify medical opinion leaders, clinical champions and department/unit heads
- Regular attendance by infection prevention and control staff at medical ward rounds, enables informal hand hygiene education to senior and junior medical staff during these rounds
- As with all HCWs, medical staff should be regularly assessed for their rates of HHC and be provided with rapid feedback of results
- Regular scientific presentations at surgical and medical meetings, including

Grand Rounds are especially important

- Target interns and resident medical officers during formal education sessions and orientations that are a required component of all medical training programs
- Encourage all medical staff to complete an online learning module annually.

There are two online learning modules tailored specifically for medical and surgical staff which can be found [here](#).

4.6 Education of student healthcare practitioners

Performing hand hygiene in a healthcare setting is a learned behaviour. To achieve genuine hand hygiene culture change it is imperative that healthcare student education becomes a high priority. The student health practitioner hand hygiene online education module consists of:

- A hand hygiene module giving evidence-based education on all aspects of hand hygiene in healthcare
- Links to extended scope hand hygiene information
- A hand hygiene program implementation checklist for teaching facilities.

Hand hygiene education should ideally be part of the core educational content of all health-related courses. It is important to include students and their mentors in all your hand hygiene education sessions in all healthcare settings.

4.7 Hand hygiene educational tools

There is an array of [NHHI promotional materials](#) available to assist educational sessions as outlined above:

- [Hand hygiene online learning modules](#)
- [Video clips](#)
- A 10 min educational video on “The 5 Moments Explained”, which includes a demonstration of each of the 5 Moments individually, or as a continuous video “The 5 Moments in Action”:
- [Generic slide presentations](#):
 - Targeting specific groups of HCWs on hand hygiene
 - The 5 Moments

4.8 Education of auditors

The education sessions suggested above will not be adequate to equip staff to audit compliance with the 5 Moments for Hand Hygiene. This requires specific training, and may not be suitable for some groups of HCWs (for example, non-clinical staff).

Auditor training can only be provided by the Commission’s endorsed NHHI provider or a coordinator who has passed the required assessments at a Gold Standard Auditor training workshop. Refer to Section 5.6 for details on auditor training.

4.9 Promotion of hand hygiene

Promotion of hand hygiene in each hospital can be undertaken in many ways. The following are a few popular suggestions:

4.8.1 *Talking Walls* campaign

A popular method to assist with staff ownership is the Geneva *Talking Walls* Model.

The principle of *Talking Walls* is to use art and humour to reinforce the principles of infection control and prevention through improved hand hygiene among staff. Staff from each ward can be invited to help design a poster featuring their own hand hygiene message. The resulting posters can then be placed throughout the hospital acknowledging the ward's creativity. This promotes program ownership and reinforces the NHHI by directly involving local HCWs.

4.8.2 Other promotional activities

Many promotional activities can be conducted for little or no cost to the hospital.

- Awards for the best performing ward/HCW category
 - Measure and graph hand hygiene compliance for each ward/department or HCW category around the organisation and award prizes for the best performance, or most improved
 - If you have a network of hospitals together the award could be at a hospital level
- Program Awareness via:
 - Internal magazines/newsletters
 - Pay slip notices
 - Screen savers
- Rewarding individual hand hygiene compliance
 - During hand hygiene observation sessions, awarding staff observed to be highly compliant with hand hygiene with praise/stickers/chocolates
- Competitions
 - Quizzes, crosswords, word search
 - Slogan competitions
- Involve local community
 - Encourage schools/kindergartens to promote hand hygiene
 - Patient involvement in the hand hygiene program

5 Local Implementation of the National Hand Hygiene Initiative

5.1 Aim

To form a multidisciplinary team to lead the implementation of the NHHI at each healthcare facility.

5.2 Program implementation model

Once your facility has identified the need to participate in the NHHI and the hand hygiene compliance auditing program, the following steps are recommended for program implementation:

- Choosing a steering committee, including a hand hygiene coordinator and medical champion who, along with the infection prevention and control team and/or the safety and quality team, will be the core team responsible for the project
- The coordinator should have an understanding of hand hygiene and infection control issues and ideally a broader experience in quality and safety; he/she should be able to access high level management staff within the facility
- The hand hygiene coordinator should attend a Gold Standard Auditor training workshop. Bookings can be made via the [NHHI website](#).
- After successful completion of auditor training a new organisation will be set up for your facility in the NHHI [Hand Hygiene Compliance Application](#) (HHCApp) database to enable hand hygiene compliance data collection
- Choose auditing staff (see Section 5.5) who have time available to assist in the auditing process and are able to attend auditor training
- Conduct a baseline hand hygiene compliance audit in a pilot ward (see Section 5.7 on department selection)
- Introduce an alcohol-based handrub or evaluate a current product on selected pilot wards.
- Place hand hygiene product in the pilot department as per product placement information (see Section 3.9–3.11)
- Educate all staff on the pilot wards on the 5 Moments for Hand Hygiene (see Chapter 2)
- Audit the pilot department and evaluate the impact of the program by comparing

pre and post implementation hand hygiene compliance audit data

- Expand the hand hygiene education and product placement to the departments chosen for NHHI hand hygiene compliance data submission
- Expand the hand hygiene education and product placement to the whole of the healthcare facility
- Monitor the key outcome measure of hand hygiene compliance
- Use the hand hygiene compliance data to guide the hand hygiene program improvement cycle (see Chapter 8)
- Use the WHO Self-Assessment Tool for Program Evaluation (see Section 8.3)

5.3 Forming a hand hygiene project team

The hospital executive can demonstrate commitment and support for the hand hygiene program through interest, participation and regular reporting on the hand hygiene program at executive meetings, and to the hospital board.

5.3.1 Selecting a steering committee

Identifying key members of a health service is a critical element for engaging clinical and non-clinical staff in the project, and for supporting the core hand hygiene program team.

It is important that an executive sponsor is identified and that they are a part of the steering committee. Staff from the departments of infection prevention and control, infectious diseases, microbiology and pharmacy (where available) should have an active role in the program implementation throughout the organisation, and should be the key drivers of the steering committee.

The following list identifies some potential members for this committee:

Project Officer/Program Coordinator	Microbiology laboratory representative	Clinical education representative
Executive member/sponsor	Medical and/or surgical representative	Patient representative/consumer
Medical Champion	Quality Improvement representative	Supply/Stores Department
Infection Control Consultant(s)	Human resources	Allied Health
Pharmacist	OH&S representative	Environmental Services representative
Infectious Diseases Physician(s)	HH program representative from each pilot ward (ward champion)	Public relations/corporate development representative

5.3.2 Allocate roles and responsibilities for the steering committee

Areas for consideration include:

- Line of reporting for committee members
- Staff and patient education
- Hand hygiene program marketing
- Collection of hand hygiene compliance data
- Hand hygiene product selection, including alcohol-based handrub
- Hand hygiene product placement: a well organised and executed plan for installation of hand hygiene products is an essential step in any program to enhance hand hygiene adherence in healthcare settings
- Implementation of policies and procedures including hand hygiene guidelines, participation in hand hygiene education, work, health and safety (WHS) management of alcohol-based handrub (Appendix 5).

5.4 Development of policies and protocols

To embed the change in hand hygiene practices into the culture of each healthcare institution a number of policies need to be developed:

- Hand hygiene policy recommending the use of alcohol-based handrub by all HCWs
- Education of healthcare workers with formal assessment of knowledge about hand hygiene; support for this by hospital executive can greatly assist with its implementation
- Clear documented guidelines about wearing jewellery and acrylic/false nails in clinical areas due to increased risk of microbial colonisation
- Guidelines for management of healthcare workers with dermatitis potentially associated with hand hygiene product use (see Appendix 6)
- Clear guidelines on placement of alcohol-based handrub in healthcare facilities (see Section 3.9–3.11)
- Work, health and safety policy on storage of alcohol-based handrub (as per alcohol-based handrub MSDS from company supplying product) (see Section 3.18)
- Work health and safety risk assessment for product placement (see Appendix 5)
- Protocols for management of accidental ingestion, or splash injury from alcohol-based hand rub.
- Education and evaluation of hand hygiene auditors on knowledge of hand hygiene compliance assessment (see Section 5.6), including yearly requirements for re-validation

- Identify staff in the facility responsible for replacing empty alcohol-based handrub containers, and those responsible for the installation, maintenance and replacement of brackets for alcohol-based handrub.

Alcohol-based handrub products within at the point of care will improve hand hygiene compliance, but multidisciplinary strategies are required to implement and monitor hand hygiene recommendations in the long term.

For other infection prevention guidelines please refer to the [Australian Guidelines for the Prevention and Control of Infection in Healthcare](#).

For information on a 'bare below the elbows' policy see Section 9.4.

5.5 Selecting auditors

Careful thought and planning is required to choose the most suitable people to conduct hand hygiene compliance audits. The appropriate people will vary between facilities.

The number of auditors needed to collect the required amount of hand hygiene compliance data for submission to the Commission's NHHI database will vary depending on healthcare facility size (see Section 7.3).

Points to consider when selecting auditors include:

- Have time available to conduct audits
- Have a background as a clinical health professional
- Availability to attend NHHI auditor training
- Have a good understanding of auditing/feedback/education processes
- Acknowledge and understand safety and privacy concerns of patients and staff
- Have the ability to provide immediate feedback to staff for good hand hygiene practices, and educate on correct hand hygiene practice
- Auditors from a variety of health professions could promote widespread acceptance/ownership/participation in activities to improve hand hygiene within their area

5.6 Hand hygiene auditor training

There are two types of training offered as part of the NHHI: Gold Standard Auditor (GSA) and General Auditor (GA) training.

To ensure consistency of the auditing program and to ensure validation of auditors, GSA training is only available via specific workshops, which will be coordinated by the Commission.

Table 5.6

	Taught by	Can provide hand hygiene education	Can conduct audits	Can train new general auditors
Gold Standard	ACSQHC	Yes	Yes	Yes
General Auditor	Gold Standard	Yes	Yes	No

5.6.1 Auditor training requirements

5.6.1.1 Gold Standard Auditor

To become a GSA, participation is required in a workshop run by either the Commission, or a specific jurisdictional coordinator. GSA workshop content is standardised nationally.

The states and territories participation in GSA training to date should allow for sufficient audit capacity to the end of 2019. Following the transfer of support for the NHHI to the Commission from 1 November 2019, further consultation with the states and territories and the private sector will occur to determine the existing number and distribution of GSAs and a method for projecting the demand for GSAs. The Commission will then establish a training model, which will aim to increase access and develop a sustainable approach to meeting requirements of each jurisdiction. In the meantime, requests for GSA training in 2020 can be made via the NHHI [website](#), or by contacting your jurisdictional coordinator.

Once qualified as a GSA, attendees are given login access to the training resources via the [NHHI LMS](#), which allows access to all teaching materials and marking guides required to conduct GA workshops in their own facilities. If you are a qualified GSA and do not have a login please contact the [NHHI Helpdesk](#).

You are required to provide proof of your currency as a validated GSA before access can be given to the training resources.

5.6.1.2 General Auditor

The mandatory content of the GA training program is identical to parts of the GSA training, as all auditors need to collect data in a standardised manner to ensure the validity of data.

To be a GA, individuals must:

- Complete the Auditor pre-workshop online learning module on the NHHI learning management system (<https://nhhi.southrock.com>),
- Attend and pass a workshop conducted by a GSA. There is a minimum of 5 hours content that must be presented.

See the [Auditor training](#) section of the NHHI website for detailed instructions.

5.6.1.3 Successful completion requirements

All workshop attendees must pass a written and DVD quiz. The pass mark is $\geq 90\%$. Attendees must also show competence in hand hygiene compliance auditing in the practical session.

Gold Standard Auditors must follow a standardised procedure for non-successful participants to gain auditor qualifications. This procedure is available to GSAs via the [Auditor Training](#) pages of the NHHI website.

5.6.2 Inter-rater reliability and validation

Inter-rater reliability should be addressed in the auditor training programs by pairing hand hygiene auditors for observations of the same session and then comparing observations recorded, using the trained and validated person as the gold standard.

Each hand hygiene auditor should be paired with each of the other validated auditors (if more than two observers). Until there is $>90\%$ inter-rater agreement in all recordings (for example, type of HCW, HCW activity, hand hygiene Moment, hand hygiene performance), the official data collection process should not begin.

Intra-rater reliability should be addressed through use of the NHHI 5 Moments training DVD. This DVD should be observed on at least two occasions, with data recorded on the appropriate DVD quiz form or mobile device. The rate of agreement for all recordings is then calculated. If there is less than 90% agreement, hand hygiene observers should seek further training.

If regular auditing is not done, practice sessions are recommended prior to each data collection period to ensure reliable results. Careful attention is required to ensure that observations are recorded correctly and there is consistent reporting, not only by the individual auditors (intra-rater reliability) but also between the various auditors (inter-rater reliability). The hand hygiene team should discuss issues as they arise and reach a united approach.

5.6.3 Annual auditor validation

Annual validation is a method of ensuring all auditors remain up-to-date with their knowledge of the 5 Moments definitions and audit practices. This in turn ensures valid and reliable data being submitted as a part of the NHHI.

All trained auditors, both GSAs and GAs, need to complete annual validation to

maintain their auditor status. This is a NHHI requirement, and if not met will result in the auditor being removed from the HHCApp, and unable to enter data.

It is the responsibility of each hand hygiene program lead to ensure all auditors in their organisation(s) are validated. It is also the responsibility of each GSA to ensure that auditors they have trained have completed their annual validation online learning program and are registered on the [NHHI Auditor Register](#).

This validation is standard for both GSA and GA and requires:

- The annual collection of a minimum of 100 moments; the 100 moments must be entered into HHCApp against the auditor's name.

Hand Hygiene Lead instructions:

- Run the Auditors and Sessions report in HHCApp to provide a list of all auditors attached to your organisation.
- Select the previous 12 months using the Start and End Date.
- Leave the Audit periods at 'All'.
- Check the box to include auditors with no data.
- Review the 'total moments' column.

- The annual completion of the Annual Auditor Validation module. This is required 12 months after the successful completion of the Auditor PreWorkshop Quiz, which is a mandatory component of an auditor training workshop, and can be accessed via: [NHHI Online Learning Modules](#)

Hand Hygiene Lead instructions:

- Run Custom Role Reports 'Any Status/All Learners/Multiple Courses/Result in the NHHI learning management system
- Select 'Annual Auditor Validation' and 'Auditor PreWorkshop' Quizzes
- Select the previous 12 months in the completion date field.
- See [LMS Reporting Instructions](#) for further assistance

5.6.4 Lapsed auditor revalidation

If a period of 12 months or more has elapsed between auditing periods for any auditor, then prior to submitting data they are required to

- Complete the Annual Auditor Validation online learning program
- Contact their facility GSA/hand hygiene program manager. If you are the only auditor in your facility, contact your NHHI jurisdictional co-ordinator
- Undertake a NHHI training DVD quiz
- Forward completed quiz to their hand hygiene lead or NHHI jurisdictional co-ordinator
- Undertake auditing in the clinical setting alongside a current auditor

Auditors who do not collect any data following their training for a period of two years are required to attend another auditor training workshop.

5.7 Selection of departments for auditing

Selection of one department is recommended to start the pilot implementation of the program. It is important to choose a department where motivation and interest is high, and the improvement gain is likely to be substantial, thus impacting on the roll out to subsequent areas.

By piloting the program in one department, any initial problems with product placement or supply, staff motivation and education can be addressed prior to rolling out the program to the rest of the hospital.

Several factors need to be considered when determining which departments should be audited. As hand hygiene is the single most important element of strategies to prevent HAIs, departments known to have greater potential for high infection rates should be targeted. Improvements in hand hygiene compliance rates in these areas will have the greatest impact on the prevention of infection and provide a safer environment for patients. Generally, these departments also have the greatest staff/patient activity and interaction, which results in higher numbers of Moments being audited in shorter time periods.

Auditing departments where there is little staff/patient activity and interaction (for example, non-acute settings) will result in a small number of moments being observed and resources required to undertake auditing may be better utilised measuring other aspects of a hand hygiene program such as product placement and education.

The selection of departments should occur in conjunction with the appropriate committee at the hospital (for example, infection prevention and control, hand hygiene, quality improvement) and with executive approval.

Once a hand hygiene program has been established and hand hygiene compliance is audited regularly, hospitals should ensure all wards/departments participate in the program throughout the year. Auditing and reporting results to each ward/department encourages ownership of the program by the whole hospital.

5.7.1 Department selection for hand hygiene compliance auditing

All eligible departments should be audited a minimum of once per year (ideally each National Audit Period). At least 100–200 moments should be collected for each high risk area each year.

Eligible departments:

Eligible areas provide acute care. For the purposes of the NHHI, they are further stratified into high risk and standard risk:

High risk eligible departments include:

Critical care, neonatal care, oncology/haematology, transplantation, renal. High risk departments may also include those with known or suspected high rates of HAIs, high prevalence of patients with multi-resistant organisms, crowded accommodation, and previous low hand hygiene compliance.

Standard eligible departments include:

Surgical, medical, mixed, maternity, paediatrics, acute aged care, perioperative, emergency departments, radiology, sub-acute.

Other departments that can be included:

The following departments within an acute organisation could be included in National Audits (based on a risk assessment): Ambulatory care, dental, mental health, palliative care, and long term care.

Departments that should not be included:

CSSD, kitchen, laundry, other areas where there are no patients.

6 Auditing hand hygiene compliance

6.1 Aim

To accurately assess hand hygiene compliance in accordance with published guidelines using a standardised hand hygiene observation assessment tool.

6.2 Auditing with the 5 Moments for Hand Hygiene tool

Hand hygiene compliance auditing is the established outcome measure for assessing the effectiveness of a hand hygiene program within the NHHI. Hand hygiene compliance is a valid and reliable measure within the acute care sector, in both public and private hospitals throughout Australia. Data are currently submitted to the NHHI database by the majority of Australian acute hospitals.

The NHHI hand hygiene compliance auditing method is by direct observation of HCWs. Direct observation by trained and validated observers is the gold standard to monitor compliance with the 5 Moments for Hand Hygiene.

Table # Rules for auditing the 5 Moments

Rules	Extended Definition
Moment 1	HH Moment 1 is recorded only once the HCW touches the patient.
Moment 2	HH Moment 2 is recorded <u>immediately</u> prior to any procedure <ul style="list-style-type: none"> Once Hand Hygiene has been performed, nothing in the patient's environment can be touched prior to the procedure starting.
Moment 3	HH Moment 3 is recorded <u>immediately</u> after a procedure of body fluid exposure risk: <ul style="list-style-type: none"> Nothing else should be touched prior to performing hand hygiene Touching the outside of a drain or drainage bag (eg urinary catheter, wound drain, chest tube drain, CSF drain), even when the circuit is not broken, is considered a body fluid exposure risk Can be recorded as a stand alone HH Moment when there is a body fluid exposure risk, but no patient contact - e.g. cleaning a spill of vomit, urine or faeces.
Moment 4	HH Moment 4 is recorded after touching the patient <ul style="list-style-type: none"> Touching the patient surroundings after touching the patient is recorded as a single Moment 4. If after Moment 3 there is touching of the patient surroundings before leaving the patient zone this is recorded as a Moment 4.
Moment 5	HH Moment 5 is recorded when the HCW leaves the patient zone after touching the patient's immediate surroundings and the patient has not been touched. <ul style="list-style-type: none"> When multiple items in the patient surroundings are touched, only one Moment 5 is recorded.
Notes	
Before/After Moments	Generally for every 'before' Moment there should be an 'after' Moment recorded, unless the auditor does not witness the action. <ul style="list-style-type: none"> Moment 1 is generally followed either a Moment 3 or Moment 4 Moment 2 is generally followed by Moment 3 Moment 5 is a stand alone Moment as there is no patient contact. There are a few situations when two "afters" may be recorded sequentially, however you will <u>never</u> have a M1 and a M2 in a row.
Action missed if not observed	The HCW must be observed to perform HH as they approach the patient. If HH is not observed it should be recorded as a "missed" action (i.e. HH not performed).
Only audit what you observe	No "before" Moment can be recorded if auditing commences after a HCW is already touching a patient, or in the process of performing a procedure. No "after" Moment can be recorded unless the Moment is observed.
Curtains	Patient bed curtains are outside the patient zone and are frequently contaminated. Touching the curtains is equivalent to leaving the patient zone. HH should be performed between touching the curtains and touching the patient, and vice versa.
Double Moments	Two moments for HH can occur simultaneously e.g. when moving directly from one patient to another without touching anything in between. In this situation, a single HH action covers the two moments for HH, as Moments 4 and 1 coincide. When moving from touching a patient to performing a procedure on that same patient Moments 4 and Moment 2 coincide. When auditing in either situation, both Moments should be recorded as individual Moments on the data collection form.
When not to record a Moment	HHC is audited by HCW compliance with the 5 Moments; it is not audited by HCW performing a HH action. HH actions not corresponding to a recognised Moment are not recorded, e.g. when a HCW walks into a patient's room, does HH and walks out without touching anything. In this case no Moment had occurred, despite HH taking place, so no Moment can be recorded.

HH = Hand Hygiene; HCW = Healthcare Worker; HHC = Hand Hygiene Compliance

6.3 One action - two Moments

Often two moments for hand hygiene will coincide. Typically, this occurs when moving directly from one patient to another without touching anything in between. In this situation a single hand hygiene action will cover two moments for hand hygiene, as Moments 4 and 1 coincide:

For example, moving from touching one patient to another patient:

- Hand hygiene is performed after touching patient A = Moment 4
- HCW goes to the next patient area and touches patient B on the shoulder = Moment 1
- The one hand hygiene action after touching a patient counts as the hand hygiene for before touching a patient also.

Another example is when moving from touching a patient to performing a procedure on that same patient:

- After touching the patient, hand hygiene performed = Moment 4
- HCW changes the IV fluid bag on the same patient = Moment 2
- The one hand hygiene action after touching the patient counts as the hand hygiene before the procedure.

When auditing in either situation, both Moments are recorded as separate Moments on the audit tool.

If the hand hygiene action (rub/wash) is missed in either of the above situations the Moments are still recorded the same, however both the actions will be entered as "missed".

6.4 When not to record a Moment

Hand hygiene compliance is audited by Moments; it is not audited by hand hygiene action.

It is important to understand that hand hygiene actions not corresponding to an opportunity (or reason for hand hygiene), and therefore are additional and not required, should not be audited by the observer. For example, HCW walks into a patient's room, does hand hygiene then walks out without touching anything – no Moment is recorded.

6.5 Overcoming bias in auditing

Observer bias is introduced by inter-observer variation in the observation. The NHHI training schedule of validation of auditors has been created to minimise this bias.

Selection bias is introduced by selecting HCWs, care settings, and observation times with specific hand hygiene behaviour. In practical terms, this bias can be

minimised by randomly choosing locations (from your set reporting wards) and times of the day to audit.

When HCWs know hand hygiene compliance is being measured, they often initially attempt to behave correctly. This is known as the Hawthorne effect. Evidence suggests that the Hawthorn effect may only increase compliance in areas that already have good compliance rates, but there will be no noticed effect on wards starting with low compliance. This indicates that people who know when hand hygiene should occur will improve their practice under auditing conditions. However, people who don't know the correct hand hygiene Moment to perform cannot improve their performance without further education.

However, with repeated observations, HCWs generally grow accustomed to the observer and are less affected by their presence, particularly if they know the auditor and are comfortable being observed.

6.6 Preparation for collection of hand hygiene compliance data

To ensure valid and reliable data collection, only people trained and validated by the NHHI auditor training program are able to collect data for submission to the NHHI database.

6.6.1 Equipment required to conduct a hand hygiene audit

The following equipment is required to conduct an audit:

- Mobile device with internet access to [NHHI HHCApp](#) or
- [Copies of NHHI audit forms](#) (see Appendix 1)
- [NHHI coding sheet](#) (see Appendix 2)
- [NHHI audit ward summary sheet](#) (see Appendix 9)

6.6.2 Healthcare worker (HCW) parent codes required for auditing

Table 6.6.2.1: Standard codes

HCW Code	Type of HCW	Extended Definition
N	Nurse/Midwife	All nurses – RN, Div 1, Div 2/EN, Midwives, Agency Staff, Domiciliary nurses, Psychiatric
DR	Medical Doctor	All doctors – Consultants, Registrars, Residents, Interns, Visiting Consultants, GPs
PC	Personal Care staff	PSA, AIN, PCW, wardsmen, orderly, warders, ward/nursing assistants
AH	Allied Health	Physiotherapists, Occupational therapists, Dieticians, Speech Pathologists, Radiographers, Pharmacists, P&O, Allied Health Assistants, Podiatrists, Music/Play therapists, Audiologists, Plaster technicians, ECG technicians
D	Domestic staff	Staff engaged in the provision of food and cleaning services, maintenance people
AC	Administrative and Clerical staff	Ward clerks, admissions officers
BL	Invasive Technician	Phlebotomists, Dialysis technicians
SN, SAH, SDR, SPC	Students	Students of N, AH, DR, PC
O	Other	Persons not categorised elsewhere
AMB	Ambulance	Ambulance workers, patient transport

Table 6.6.2.2: Dental codes

HCW Code	Type of HCW	Extended Definition
DO	Dentist	All dentists, specialist dentists
DT	Dental Therapist	Dental therapists, dental hygienist, dental prosthetist, oral health therapists
DA	Dental Assistant	Dental assistant, dental nurse
DL	Dental Technician	Dental technician, laboratory staff (no patient contact)
S	Student	Student, in front of any of the above codes e.g. SDO includes persons undertaking study to become a dentist etc.

6.6.3 Adding personalised healthcare worker codes

Organisation administrators can add their own HCW codes into the HHCApp system. These codes will need to be listed under one of the HCW parent codes (see Section 6.7.2). For example, data could be collected specifically on surgical registrars by adding “Surgical Registrar” under the parent code of DR. This allows for facilities to run local reports for specific groups of HCWs.

Please see the [HHCApp Instructions for Use](#) for detailed instructions on how to add personalised HCW codes.

6.7 Conducting a NHHI hand hygiene compliance audit

This section details the steps required to conduct a hand hygiene compliance audit:

6.7.1 Timing of audits

Three NHHI hand hygiene compliance audits are conducted each year (see Section 7.3). It is recommended that auditing commences at least six to eight weeks prior to the due date for data submission. This allows time for feedback/reporting of results, education, or any other interventions to improve hand hygiene compliance to be implemented in the eight weeks prior to the next audit cycle.

Some facilities are required to report hand hygiene compliance results on a monthly basis, and are therefore required to audit on an ongoing basis throughout the year. If this is the case it is still important to feedback results and to implement new interventions at regular times throughout the year. If you need to report monthly, please consider reporting on your progress with your interventions/action plans rather than just “data” each month, then after the close of an audit period, report on your data (three times a year).

6.7.2 Time to complete a hand hygiene compliance audit

To achieve valid results, hand hygiene compliance should be assessed on a defined minimum number of hand hygiene observations (Moments). The time taken to complete the required number of observations will vary depending on the level of clinical activity in the observed area, the experience of the auditor, and the time of day the audit is conducted.

The data collection schedule will be influenced by the number of acute beds in each facility (see Section 7.3), the number of trained staff available to undertake hand hygiene observations, and the option taken for the selection of wards (See Section 5.7). Hand hygiene compliance rates should be reflective of a cross-section of the facility’s healthcare workers, rather than just repeated or prolonged observations on a small number of healthcare workers.

6.7.3 Preparation of the wards

Unit managers should be notified prior to commencing compliance auditing. Wards/departments should be asked to ensure alcohol-based handrub products are in all the appropriate places before auditing commences. If there are barriers to hand hygiene (for example, no available alcohol-based handrub, soap or paper towels), this should be recorded in the notes section of the audit tool, then reported to the shift or unit manager prior to leaving the area.

6.7.4 Conducting a hand hygiene compliance audit

The following steps are involved when conducting a hand hygiene audit:

- Arrive at target ward/department and introduce yourself to the shift manager and inform them of your role
- Always perform hand hygiene upon entering a ward to audit. It is very important to lead by example
- Hand hygiene auditors are encouraged to be open and honest about what they

are doing, and show the audit tool and how the data collected is de-identified; this may be for staff, patients or visitors

- There needs to be at least one patient and one HCW present in a room to start auditing; if neither are present, move to another room
- Auditors need to position themselves to view the patient bed, sink, and alcohol-based handrub area; however, they must remain out of the workflow area of the observed staff. The presence or absence of a convenient location from which to observe patient beds and hand hygiene facilities may impact on which patient bays are selected for observation
- When a patient's bed curtains are drawn, permission should be sought from the relevant HCW and patient to allow auditors to continue to view activities in the area. Although there may be some occasions when this is not appropriate, these are rare. Observing HCW activities behind closed curtains in the ICU is often necessary
- Hand hygiene compliance should be assessed on all categories of HCWs who enter observed ward bays; try not to observe the same HCW for the entire audit session
- The number of HCWs observed at one time depends on their level of activity and the competency of the auditor. More than one HCW can be observed simultaneously, provided their hand hygiene Moments can be accurately observed and recorded. If this is not possible, then the compliance of additional HCWs should not be recorded until the index HCW has left the bay, or has ceased activity. It is better to record fewer Moments accurately than many Moments inaccurately.
- A hand hygiene Moment is only documented when the field observer can accurately observe the HCW and the Moment that has been completed. If an auditor is unsure whether the observed HCW performed hand hygiene, then such Moments should not be recorded. The only exception is when a HCW is observed to enter a room and go directly to the patient.
- A Moment finishes when a HCW:
 - Moves from one patient to another
 - Leaves the room on completion of patient care
 - Touches the curtain partition in a multi-patient room
 - Moves from touching a patient to doing a procedure or vice versa.
- A Moment can finish in another area outside a patient room if patient care is not yet completed; for example, transporting a bedpan to the pan room
- The observational audit session has no specific time frame, it can be conducted for as long or as little time as the auditor has allocated

- At the conclusion of an audit session the following needs to be completed:
 - Thank the shift manager and highlight any problems that need addressing immediately; for example, no hand hygiene product available
 - If data is collected on a mobile device a report can be generated immediately to provide feedback to the ward.

There can be circumstances where it is not appropriate to conduct a hand hygiene observation session; these include:

- Emergency situations where hand hygiene is secondary to patient safety (for example, when any hospital 'code' is called)
- End-of-life care
- If the patient, or patient's family object
- During private discussions between HCWs and patient/ patient's family.

6.8 How to use the hand hygiene audit tool

All hand hygiene compliance data should be recorded for each of the 5 Moments either via a mobile device that syncs data directly into the NHHI HHCAApp database, or on the standard NHHI paper data collection form (see Appendix 1) and later manually entered.

The NHHI hand hygiene compliance audits can only be conducted by trained and validated staff. Data collection can be via paper or mobile device. However, the use of mobile devices for data collection is strongly recommended, as this removes duplication of data entry.

6.8.1 Data collection via a mobile device

If using a mobile device, user instructions can be found on the [NHHI website](#).

In particular, please read the mobile device troubleshooting guide. Versions are available for both [Apple](#) and [Android](#) devices.

Access to the mobile data entry site is via a mobile phone/tablet device, using this URL: <https://nhhi.safetyandquality.gov.au/mobile>

There are multiple data validation codes within the mobile data entry system that will ensure that the required information is entered correctly.

To enable practice using either version of HHCAApp, without harming your data set, you can use the following practice login:

Auditor Username: Ignaz

Password: Ignaz1

Each trained auditor requires an individual login to enter hand hygiene data. Logins must never be shared.

6.8.2 Paper based data collection – Using the NHHI Audit Tool

For each session fill in the demographic details on arrival at target ward

- Health Service = Hospital or facility name
- Session number = The audit number for that particular ward which is then transferred to the hand hygiene ward summary sheet (see Appendix 9)
 - The first audit on a specific ward will be session number 1
 - The second audit on the same ward will be session number 2
 - The first audit on a different ward will be session number 1 on that ward
- Start and Finish times are for your own personal statistics to enable you to calculate the amount of time it takes to conduct each audit. This information can then be reported to your senior management to assist with staffing requirements.

For each Moment observed the following should be recorded on the audit form:

- HCW code – needs to be filled in every time a Moment is observed
- Moment – fill in the Moment observed.
 - Only one Moment should be filled in per box. If multiple Moments are observed, a new box needs to be filled in for each moment (see Appendix 3)
- Action – needs to be filled in for every Moment observed or missed:
 - If no hand hygiene action is observed then it is recorded as a missed action
 - If the HCW performs hand hygiene then proceeds to touch their face/nose/mouth or touches items in the healthcare environment prior to touching the patient then this should be recorded as a missed hand hygiene action
 - If a HCW is observed to do hand hygiene incorrectly (for example, one handed, minimal volume alcohol-based handrub or no soap) this should be recorded as a missed action
- Gloves – are only recorded if the HCW puts gloves on in a Before Moment (1 or 2), takes gloves off in an after Moment (3, 4, or 5), or continues from one Moment to another with the same pair of gloves:
 - Even if gloves are worn for patient care, hand hygiene still needs to be performed and recorded before and after glove use
 - If no gloves are worn, then the “gloves” box is left blank.

6.8.3 Tips for accurate data collection and entry

On a mobile device each new auditing session should be started on the Sessions page by pressing the Add Session button.

For paper-based data collection each session on each ward should be recorded on a new data collection form.

6.8.4 At the conclusion of the ward visit:

For mobile data collection:

- Ensure you press the Done button, and press OK to the message asking if you have finished with this session.
- Sync your data
- Logout by pressing the Logout button and accept and confirm the logout.

For paper based data collection:

- Check that all demographic fields on each NHHI 5 Moments audit sheet are correct and legible
- Check that there is a HCW/Moment/Action (+/- Gloves) in each box, if one item is missing that Moment needs to be crossed out as it is incomplete and it cannot be used
- Add up total number of Moments, and the total number of correct Moments (rub or wash) collected and write the total on the bottom right corner of audit sheet (see [Appendix 1](#))
- Fill in HHA ward summary sheet for each session on each ward ensuring that all fields are filled in (see [Appendix 9](#)).

6.9 Patient safety and privacy during hand hygiene audits

Any unsafe practices that are observed during hand hygiene auditing should be addressed immediately or reported to the appropriate manager for follow-up; otherwise, compliance rates should be reported after an audit has been fully completed.

Observation does not justify infringing the principle of patient privacy. Auditors should show discretion regarding where they place themselves and their movements whilst conducting audits. It is recommended that patients be informed on admission that hand hygiene audits are regularly conducted as a quality improvement activity. Patients or their family may request they not be involved in an audit.

6.10 Hand hygiene and healthcare workflows

No HCW deliberately chooses not to perform hand hygiene as it is required for patient, staff and environmental safety. Non-compliance with hand hygiene according to the 5 Moments may be as a result of the HCW's environment or workflow. If a HCW doesn't have the right equipment, or hand hygiene product easily available they will be unable to perform hand hygiene as required.

Two common clinical activities where hand hygiene compliance is often suboptimal have been mapped out below. This process mapping identifies workflows to maximise hand hygiene compliance by making it easier for staff to comply with the 5 Moments for Hand Hygiene. Examples available on the NHHI website include:

Blood Collection

- Practice Guidelines
- Audit Guidelines

Dialysis

- Practice Guidelines
- Audit Guidelines

When auditing hand hygiene compliance, it is worthwhile to note if there are particular activities of patient care where hand hygiene is regularly suboptimal. To address this, ask the relevant staff to assist you to map out the required task (see above examples), and to design a solution themselves to make hand hygiene by the 5 Moments easier to comply with. Involving staff in this process promotes a sense of ownership of hand hygiene and hand hygiene improvement.

7 Data submission, validation and reporting

7.1 Aim

To enable correct data entry, data submission to HHA, and accurate reporting of hand hygiene compliance results.

To ensure all data collected is validated as a correct representation of hand hygiene compliance.

7.2 Hand Hygiene Compliance Application

The HHCApp has been developed for use by Australian hospitals to conveniently report their hand hygiene compliance rates as part of the NHHI. The HHCApp is an online web-based application for hand hygiene monitoring, consistent with the WHO hand hygiene observation method.

The HHCApp is the portal to the NHHI database for data entry and reporting of all hand hygiene audit data. Data can only be collected and entered by trained and validated hand hygiene auditors. Once auditor training has been completed the trainer is responsible for supplying a personalised login for each auditor to use to enter data into the HHCApp.

All new healthcare facilities joining the NHHI need to contact the Commission to be set up in the HHCApp database and to be given login access. A pre-requisite to being given access to HHCApp is having a trained auditor at the facility who is able to manage data collection and reporting.

There are two options for data entry into HHCApp:

[HHCApp Desktop](#)

The desktop version allows the user to enter hand hygiene compliance data that has been collected on paper. If a user has administrator access, HHCApp desktop can also be used to access reports and administrator functions.

[HHCApp Mobile](#)

The mobile version allows an auditor to enter hand hygiene data in real time as they audit. **HHCApp Mobile is not an App**; it is a webpage that can be accessed via the internet browser of a mobile device. If using this option to enter data, please ensure you login to begin, and when finished, sync your data and use the 'logout' button on completion to minimise errors.

7.3 Requirements for national data submission

National hand hygiene compliance audits should be undertaken at three **set** times each year.

National Audit Periods:

Audit One: 1 November to 31 March

Audit Two: 1 April to 30 June

Audit Three: 1 July to 31 October

Entry of data via the HHCApp is required by the last day of each audit period. No late data entry will be accepted.

Data can only be collected by trained and valid hand hygiene auditors.

Each organisation needs to ensure that the data they submit is correct. Failure to verify data may result in hand hygiene compliance data not being accepted into the NHHI data set.

The hand hygiene lead for each organisation is required to press the 'submit for approval' button in HHCApp to demonstrate that data collection has been completed. Data submission can be completed anytime in the lead up to the final day of the audit period, but must be completed by the last day. For further information: [How to submit a completed audit](#)

Please note: By pressing the 'submit for approval' button you are closing off the audit for your organisation, which does not allow for further data entry for that audit period.

7.3.1 Acute hospital data submission

Both public and private acute hospitals are required to follow the department selection process (See Section 5.7.1), collect the required number of moments as per Table 7.3.1.1 below, and then submit their data to the NHHI three times a year. See: [Guidelines for Data Submission](#).

Table 7.3.1.1

Number of acute inpatient beds	Minimum Total number hand hygiene moments per audit
> 400	2,450
301 to 400	2,100
201 to 300	1,750
151 to 200	800
101 to 150	600
51 to 100	200
25 to 50	100
<25 **	50

** Auditing in hospitals with <25 beds is dependent on jurisdictions. See Table 7.3.1.2 below.

Table 7.3.1.2

Jurisdiction	Auditing required in hospitals <25 beds
New South Wales	Yes
Victoria	Yes
Queensland	No
South Australia	No – refer to jurisdictional representative for options
Western Australia	No – further information here
Tasmania	Yes
Northern Territory	Yes
Australian Capital Territory	Yes

7.3.2 Day hospital data submission

Day hospitals are required to collect the required number of moments as per Table 7.3.2.1 below, and then submit their data to the NHHI three times a year. See the recommendations for data collection in [day hospitals](#) and [Guidelines for Data Submission](#).

Table 7.3.2.1 Day hospital size categories and required number of moments by hospital size

Day Hospital Size	Definition	Required number of hand hygiene audits per year	Required number of hand hygiene observations per facility
Large	Standalone facility performing >5,000 procedures per annum	3	350
Medium	Standalone facility performing 2,000 - 5,000 procedures per annum	3	200
Small	Standalone facility performing <2,000 procedures per annum	3	100

7.3.3 Standalone/Satellite Dialysis/Oncology data submission

Standalone/satellite dialysis/oncology centres are required to collect the required number of moments as per Table 7.3.3.1 below, and submit their data to the NHHI three times a year. See the recommendations for data collection in [dialysis/oncology centres](#) and [Guidelines for Data Submission](#).

Table 7.3.3.1 Standalone/Satellite Dialysis/Oncology size categories and required number of moments per category

Peer Group	Definition	Required number of hand hygiene audits per year	Required number of hand hygiene observations per facility per audit
Large	Facility performing $\geq 5,000$ procedures per annum	3	200
Small	Facility performing $< 5,000$ procedures per annum	3	100

7.3.4 Dental data submission

Where sites deem hand hygiene auditing to be appropriate Table 7.3.4.1 below provides guidance regarding the collection of representative hand hygiene compliance data by solo, group and hospital based dental services as part of the NHHI. See also [Guidelines for Data Submission](#).

Table 7.3.4.1 Dental service description and required number of moments by size

Peer Group	Definition	Required number of hand hygiene audits per year	Required number of hand hygiene observations per facility per audit
Solo practice, solo practitioner or very small oral health service	An oral health/dental practice with a single dentist or an oral health service with a single dental chair/surgery	Hand hygiene compliance auditing not appropriate	
Small oral health service/dental practice	Oral health/dental practice with a total of 2 - 5 dental chairs/surgeries in one or more locations	3	50
Medium sized oral health service/dental practice	Oral health/dental practice with between 6 and 10 dental chairs/surgeries in one or more locations	3	100
Large oral health service/ dental hospital	Any dental oral health services/dental hospitals with more than 10 dental chairs/surgeries in one or more locations	3	200

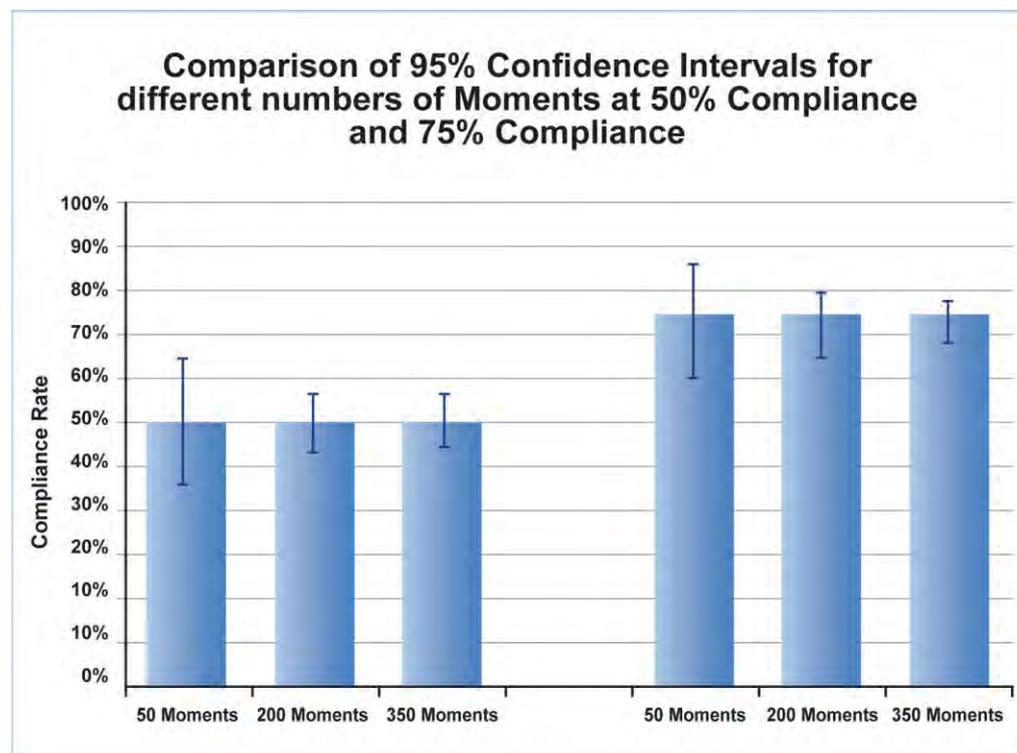

7.4 Rationale for number of Moments to be collected

Compliance data will be used for comparison, be it at a ward, hospital, jurisdictional or national level. When data is used for comparison, it is important to note that a higher number of Moments audited will generate a more reliable compliance rate.

For example, consider a ward that has audited 50 moments, generating a compliance rate of 50%, and an exact binomial 95% confidence interval (95%CI) of 36% to 64%. This means the real compliance rate could be anywhere between 36% and 64%. If another ward audits 350 Moments and generates a compliance rate of 50%, the 95%CI is 45% to 55%. In this latter case, because the 95% confidence interval is narrower, we have more confidence that the real rate is close to 50%.

It is recommended that 95% confidence intervals are included when reporting compliance rates. See Chart 7.4.1 below for a further demonstration on the effect on confidence intervals when the numbers of Moments are increased.

Chart 7.4.1 Confidence Intervals and Moments Audited

7.5 HHCApp roles and administration

Several roles are available in HHCApp with differing functionality. The role assigned determines what each user can see and do and at what level. Users cannot access data or administrative functions above the level that they are assigned.

7.5.1 User Roles

Jurisdictional Administrators – can access all data and perform all administrative functions for their state.

Region Group/Region/Organisation Group Administrators – can access all data and perform all administrative functions for all organisations within their region group, region or organisation group.

Organisation Administrators – can access data and perform administrative function for their organisation(s) only.

Auditors – can audit only.

Reporters – can access reports for their department, organisation or region.

Data entry – can enter data for their department or organisation.

Role	Action					
	Data Entry	Reports	Departments <ul style="list-style-type: none"> • Add • Remove • Inactivate 	HCW Type <ul style="list-style-type: none"> • Add • Remove • Inactivate 	Audit Periods <ul style="list-style-type: none"> • Add • Submit 	Auditors <ul style="list-style-type: none"> • Add • Remove • Reset logins
State Administrator	✓	✓	✓	✓	✓	✓

Quick Start Guide

Review the [Quick Start Guide for the HHCApp](#).

7.5.1.1 Primary Contacts

Organisations that have more than one Organisation Administrator need to assign a Primary Contact. This indicates the hand hygiene program lead.

7.5.1.2 Automatic Update of Users

There are two automatic updates that occur overnight for all HHCApp users:

Deletion of user

HHCApp users who meet the following criteria will be deleted from HHCApp:

- Created >1 year
- No data
- Never logged in OR hasn't logged in for >1 year

If you need to reinstate a deleted user please contact the [NHHI Helpdesk](#).

Removal of role

HHCApp users who meet the following criteria will have their 'role' removed (for example, auditor is one of the assigned roles in HHCApp):

- Created > 1 year ago
- Has session data but no data added for >18 months
- Never logged in OR Hasn't logged in for >18 months.

Administrators in HHCApp are able to reinstate auditor roles once the auditor has passed the [lapsed auditor pathway](#).

7.5.2 Managing Users

Organisations are responsible for users attached to their organisation, and the roles that they are assigned to. Appropriate consideration of data governance needs to be given when allocating roles within HHCApp.

Users only require one login which remains with them if they move to another facility. This login should be personalised and not generic.

Administrators can also export a list of users using the 'Users' tab at the top right of the HHCApp home page.

For further information on how to manage users in HHCApp please see the [HHCApp instructions](#) webpage.

Please note: The Organisation Administrator is responsible for ensuring all Auditors attached to their organisation meet the [Annual Auditor Validation](#) requirements.

7.5.3 Managing Departments

Organisations are responsible for the set-up, and management of wards/departments within their organisations. Currently, there are 22 Department Types; see [Data Definitions](#) webpage.

Careful consideration must be given to any changes to departments in HHCApp.

The following steps are suggested:

- Create a new department if your organisation has expanded and a new department is being opened.
- Edit the name of a department if a department has changed name, but the case mix remain the same. This is important for historical reporting and ensuring the data is still for the same department.
- Archive (inactivate) a department if the department has closed

OR

If the case mix has changed significantly, archive the department and create a new department.

Parent departments can be created to give the ability to group a number of departments for reporting purposes.

For further information on how to manage departments in HHCApp please visit the [HHCApp web page](#).

7.5.4 Managing HCW types

There are set national HCW types listed in HHCApp for all organisations, based on classifications set by the Australian Institute of Health and Welfare (AIHW) data dictionary. Currently there are 21 Parent HCW Types; details can be found on the [Data Definitions](#) webpage.

Administrators are able to create 'local' categories for stratified local reporting if required. For example, AH (Allied Health) can be split into PT (Physiotherapy), OT (Occupational Therapy) etc.

For further information on how to manage HCW types in HHCApp please see the [HHCApp webpage](#).

7.5.5 Managing Audit Periods

National audit periods are automatically added to each organisation providing that organisation submitted data in the previous audit period. If an audit period was missed, the national audit period will need to be added manually by the organisation.

An Organisation Administrator can also add 'Local Audits'. Data entered into a local audit is for local use only and is not included in the national data set.

For further information on how to manage Audits in HHCApp please see the [HHCApp webpage](#).

7.6 Data validation

Each individual who is responsible for the submission of hand hygiene compliance data to the NHHI should validate their healthcare facility data prior to submission to eliminate errors.

Data validation is required to be completed before final submission of data to the NHHI database. While an audit is active in HHCAApp, changes can be made to data if errors are found. Once an audit is submitted and the status in HHCAApp is pending approval, then changes can only be made after discussion with your jurisdictional coordinator, or the Commission.

The following should be used as a guide to assist recognition of data errors, whether it is data input, auditor, or other errors.

7.6.1 Correct number of moments

The first data validation check is to ensure that the right number of moments have been collected for your facility. Please refer to Section 7.3 to find the required number of moments for submission per organisation.

If you work at an acute hospital you may need to collect a specific number of moments for each ward, depending on your choice of ward selection (see Section 5.7.1).

7.6.1.1 For those with Organisation Administrator access

Login via [HHCAApp](#) desktop (rather than the [HHCAApp mobile](#))

From the home screen, under the Reports heading banner

- Click on “Compliance rate by Department”

In the search filters - select:

- National Audit Period - the current audit period
- Organisation – the required facility (This is only applicable if you are an organisation administrator at multiple facilities)
- Check the box ‘Include departments with no data’.
- Click Run Report

This report details the overall facility Total Moments, and below that, each department’s Total Moments. Does it match your required number of moments overall? Does it match your required number of moments per ward? Are there departments that have significantly higher HHC than other departments, and can this be explained by known hand hygiene practices or may it be due to auditor differences?

If the required number of moments have not been met check that data hasn’t been entered for a “local” audit period instead of a “National” audit)

From the home screen, under the Reports heading banner

- Click on “Compliance rate by department”

In the search filters select:

- Local Audit Period – select all available in turn
- Organisation – The required facility (This is only applicable if you are an organisation administrator at multiple facilities)
- Click Run Report
- If there is data here that should be a part of the National audit then:
 - Click on Sessions from the top horizontal menu
 - In the search filters select Audit type – Local
 - Click on the specific session
 - In the Session Details section – Change the audit filter to “current National audit name
 - Click Save.

Check that data hasn’t been entered against the wrong department by running the Compliance rate by department report as described at the start of this section. If there is data entered against a department that wasn’t part of the facility data collection this audit period then:

- Click on Sessions in the top horizontal menu
- Click on the department name where the data has been entered inaccurately
- In the Session Details section - Change the department filter to “the required department”
- Click Save

If data you believe has been collected is not found please contact the Commission via handhygiene@safetyandquality.gov.au

7.6.1.2 For those with Region or Organisation Group Administrator access

Login via [HHCApp](#) desktop (rather than the [HHCApp mobile](#))

From the home screen, under the Reports heading banner

- Click on “Compliance rate by Organisation”

In the search filters - select:

- National Audit Period - The current audit period
- Click Run Report

This report details the overall group “Total Moments”, and below that each organisation “Total Moments”. Are all members of your group visible in this report? If a facility in your group is not visible in the report this is due to no data being entered for that facility for the data period searched. Secondly, have all of your organisations submitted their required number of moments?

7.6.2 Compliance rate by individual auditor

- The Auditor and sessions report can be run at an organisational level or above. This report provided details on the data collected by each auditor at an organisation, including number of moments collected and compliance rate collected by an individual auditor.

The auditor and sessions report can be used to:

- Confirm auditors have collected 100 moments in a year for annual auditor validation
- Identify if a review of auditing processes is required

A review of auditing processes should be conducted if the following are identified:

- An auditor has >95% hand hygiene compliance
- Any auditors with hand hygiene compliance significantly higher or lower than the majority of auditors

To review auditing processes:

- Consider department type where data is collected; for example, high hand hygiene compliance and all data collected in NICU, low hand hygiene compliance and all data collected in emergency department, or high hand hygiene compliance but all other auditors that audited the same wards had similar results.
- Ensure auditor is currently validated
- Conduct side by side audit with auditor
- Follow-up with extra theory if required.

7.6.3 Further data validation checks

7.6.3.1 Compliance rate by Moment report

When reviewing the Compliance Rate by Moment report the general spread of Moments is: a larger amount of Moment 1 and Moment 4 data, approximately 10–15% Moment 2 data, approximately 10–15% Moment 3 data, and a variable amount of Moment 5 data.

Look for any anomalies, for example Moments that have 100% compliance; is this an accurate reflection of your organisation's practices?

Also review the Moment by HCW data - do you have administrative/clerical (AC) doing procedures? Which auditor collected this data?

7.6.3.2 Compliance rate by healthcare worker

When reviewing the Compliance Rate by HCW report, look for any anomalies including: HCW groups that have 100% compliance, is this an accurate reflection of your organisation's practices?

7.7 Data Submission

Once data validation has been completed or the organisation, it is a requirement of each organisation to formally submit the data to the NHHI database.

Only users with Organisational Administrator (or higher) access are able to submit the data. Data submission is completed by pressing the “submit for approval” button.

Please see these [instructions](#) on how to complete the submission process.

Once data submission is completed, the “status” of the audit changes from “active” to “pending approval”. No further data can be entered for the audit. If an auditor tries to sync mobile data at this stage the data will be synced as local data, with the audit name in the following format: AuditorName_temp_audit_date_time.

After completion of data validation at a jurisdictional and national level the audit status changes to “complete”.

7.8 Reporting results

Feedback of results to all concerned is fundamental to any data collection process. Feedback is an essential part of every quality cycle, and feedback of improved audit results assists in maintaining local support and enthusiasm for the hand hygiene program. More importantly feedback of poor compliance rates that remain unchanged requires intervention to avoid a complacent workforce.

[Guidelines](#) are available for step by step instructions on how to generate reports from the NHHI HHCApp.

Reports for organisations can be produced at any time from HHCApp. The hand hygiene organisation administrator can choose to report by national audit period, local audit period, or by a specific date range e.g. Monthly.

7.8.1 Standard Reports

The following reports are available to all users with reporting access:

- **Compliance rate by State** – only available to users with access to a jurisdiction.
- **Compliance rate by Region Group** – only available to users with access to a Region Group; for example, health service level within a jurisdiction.
- **Compliance rate by Region** – only available to users with access to a Region; for example, a specific group of organisations within a Region Group.
- **Compliance rate by Organisation Group** – only available to users with access to an Organisation Group; for example, a specific group of organisations that are across more than one jurisdiction.
- **Compliance rate by Organisation** – only available if you have access to multiple organisations.

- **Compliance rate by Department** – an organisation report with hand hygiene compliance for all departments on one report. This report can be filtered for 'Department Type'.
- **Compliance rate by HCW Type** – a report with hand hygiene compliance for each HCW type on one report. Can be run at an organisation level, or for a specific department.
- **Compliance rate by Moment** – report with hand hygiene compliance for each Moment on one report. Can be run at an organisation level, or for a specific department. This report can also be filtered for 'HCW type'.
- **Compliance rate by Department Type** – groups hand hygiene compliance data by department type, rather than individual departments; for example, all medical department hand hygiene compliance combined.
- **Combined Compliance rate by Moment and HCW type** – includes both the HCW type report and Moment report into one file.
- **Auditor and sessions** – this report provides details on the data collected by each auditor at an organisation, including number of moments collected and compliance rate collected by an individual auditor.
- **Action by Moment** – a report detailing which hand hygiene action was used for each moment, rub, wash, missed. Can be run at an organisation level, or for a specific department.
- **Export CSV Line Data** – this report provides a file of the raw line data for each moment.
- **Required Moments** – this report provides a one line summary for each organisation including the number of moments required, the number submitted and the difference between the two.
- **Poster report** – this report provides a one page summary of hand hygiene for the selected region/organisation/department relevant to the user's level of access. The report details overall hand hygiene compliance, hand hygiene compliance by moment, and hand hygiene compliance by HCW in the selected area. This report is useful as a summary report for management, or as a poster to display hand hygiene results for the public.
- **Zero reports** – most of the above reports now have the option to include entities without data. This allows for gaps in data collection to be easily found.

7.8.2 Custom Reports

If the standard reports do not provide the hand hygiene data in a format you require you may be able to create the report you require using the custom reports.

The following reports are available to all users with reporting access:

Snapshot report

- Step 1 – Choose the date range of the data for the report
- Step 2 – Choose which data set you require
- Step 3 – Decide how you want the data presented

Trend report

- Allows reporting change in performance over time

7.9 State/territory reporting of hand hygiene compliance

Hand hygiene compliance rates for each jurisdiction are released by the relevant health departments in each state/territory. Please contact your HHA jurisdictional coordinator for further details.

7.10 National reporting of hand hygiene compliance

Overall rates of hand hygiene compliance (including 95% confidence intervals) will be reported nationally three times per year. All data submitted is analysed by the Commission, fed back to each jurisdiction and submitted to the AIHW.

Data entered into HHCApp is only reported by the Commission as national aggregate data. No identifying data is published by the Commission.

7.11 National hand hygiene benchmark

The national hand hygiene benchmark is set by the Australian Health Ministers' Advisory Council (AHMAC). Since 2017, the benchmark has been 80%.

The 2017 benchmark of 80% relates to all 5 Moments for Hand Hygiene. All health services, especially those with lower rates of Moments 1 and 2 are encouraged to take action to raise compliance in these critical areas.

Since 2010, the rate of compliance for individual health services across Australia has been reported on the [MyHospitals](#) website.

8 Sustaining a hand hygiene program

8.1 Aim

To maintain and continuously improve a hand hygiene program.

8.2 Key features of long-term sustainability include the following:

8.2.1 Hospital-wide rollout

For this program to be successful the enthusiastic and continued support of your facility executive is essential. Healthcare worker acceptance and ownership of the NHHI program assists sustainability.

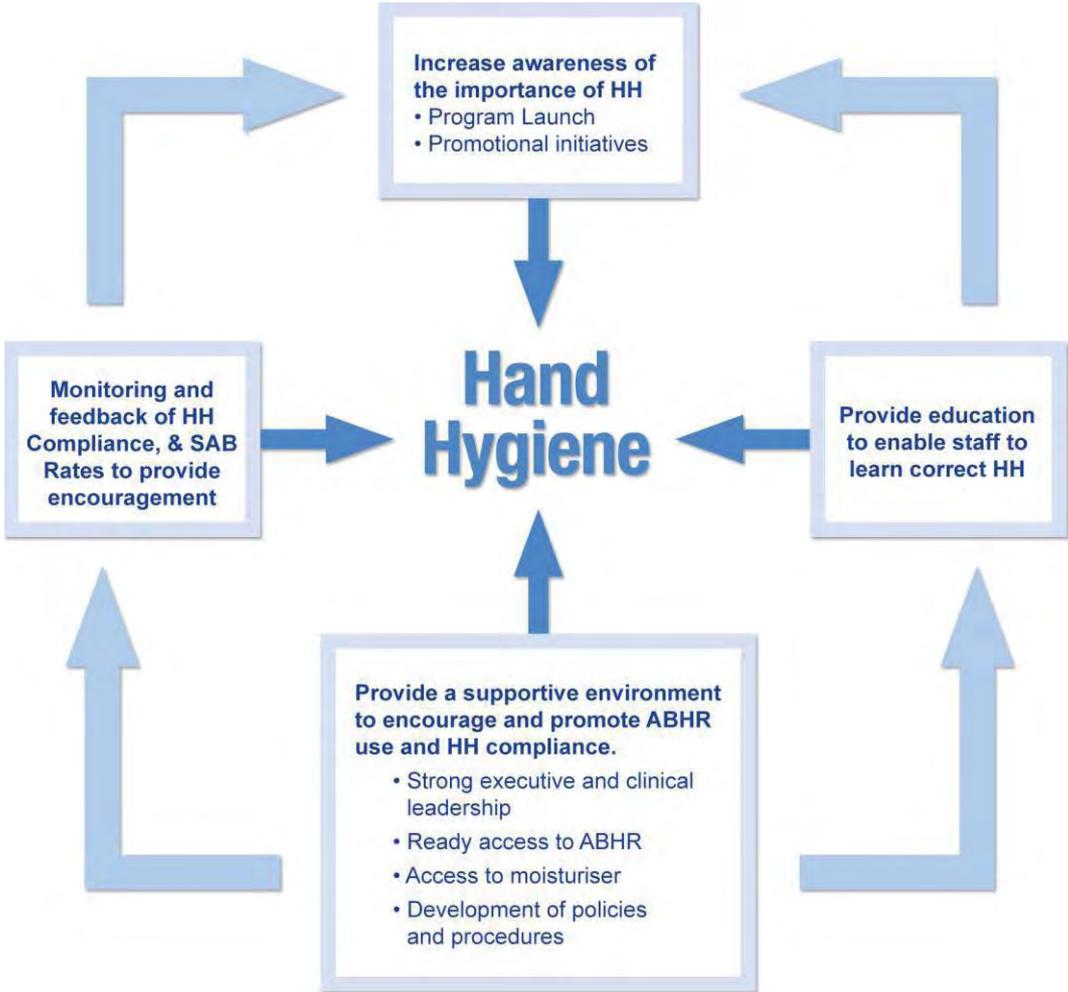

Ongoing tasks of hand hygiene project team:

1. Initiate reporting of hand hygiene compliance results as a regular infection control or quality report to the chief executive officer/health facility board
2. Extend program to wards that have not been audited for the national program
 - Ensure healthcare facility ownership by progressing the hand hygiene education and auditing program to **all** wards/departments. For continued improvement and sustainability of the hand hygiene program, it is imperative that all departments are included in the program.
3. Report results back to wards
 - As per any quality activity, it is important after conducting an audit to feedback the results to the relevant groups; for example, hand hygiene compliance rate per ward or HCW group. This will encourage ownership of the program at an individual level (see Section 7 on how to run data reports)
4. Evaluate hand hygiene program performance
 - See Section 8.3

8.2.2 Region/jurisdiction level involvement

The support of all Australian health ministers for the objectives of the NHHI and the hand hygiene benchmark provide the framework for participation by all healthcare facilities in the program.

Figure 8.2.2.1 Hand hygiene culture change

8.2.3 Hand hygiene culture change and sustainability of the hand hygiene program

Once a hand hygiene program is firmly established within a healthcare facility it is important to review and continually refresh it. When relaunching your program, please remember that the hand hygiene program is **not** just about hand hygiene auditing, or completing an online learning package. It is a program of education, monitoring and feedback that results in a behavioural and cultural change across all staff.

The following section suggests ways, as detailed in Figure 8.2.2.1, to create sustainability within the hand hygiene program:

8.2.3.1 Increase the awareness and importance of hand hygiene

It is important to evaluate and relaunch a hand hygiene program every one to two years to revitalise existing staff enthusiasm and to capture the attention of new staff. The [WHO Hand Hygiene Self-Assessment Framework is a useful tool for hand hygiene program evaluation](#).

See Section 8.3 for further detail.

The following are questions to ask, or suggestions to follow, to relaunch a hand hygiene program:

- Have you written an improvement plan? Did you write this in conjunction with the Self-Assessment Framework and your hand hygiene compliance reports?
- Have you reviewed your hand hygiene program data? Is your hand hygiene compliance increasing over time? Are your infection rates decreasing over time?
- From your hand hygiene data: what areas need addressing for the relaunch? Which HCW group or particular Moment has the lowest compliance? This will help to prioritise education requirements
- Re-engage with your major stakeholders about the importance of the hand hygiene program; for example, chief executive officer, heads of departments
- Promote awareness of the hand hygiene program to all staff via newsletters or payslip messages etc.
- Provide latest evidence based practice updates.

8.2.3.2 Provide education

Aim to provide education to **all** healthcare worker groups annually, with additional education sessions regularly throughout the year to target clinical staff and high risk groups.

Utilise the [NHHI promotional resources](#) or resources provided by your jurisdiction, including:

- Video in-service – The 5 Moments Explained
- Online learning modules for various HCW groups
- There are also many other educational resources on the NHHI website, including the PowerPoint presentations aimed at specific healthcare worker groups.

8.2.3.3 Provide a supportive environment to encourage and promote alcohol-based handrub use and hand hygiene compliance

- Conduct staff surveys on awareness of the hand hygiene program, and ask staff for suggested improvements.
- Conduct [product availability surveys](#)
 - Product availability should be reviewed regularly to ensure correct placement and full containers
 - Over time the frequency can be decreased, with an annual survey recommended.

8.2.3.4 Using the hand hygiene evaluations for culture change

In a facility where the hand hygiene program is being implemented for the first time, data indicating gaps in good practices and knowledge, or a poor perception of the problem, can be used to raise awareness and convince HCWs that there is a need for improvement.

This feedback helps to promote local area ownership of hand hygiene issues, and should encourage changes to practice where indicated from the feedback. Discussing hand hygiene compliance data at the local level should promote the development of local initiatives to address the specific issues.

Subsequently, after implementation, regular and timely reporting of data is crucial to demonstrate improvement; thereby sustaining the motivation to perform good practices and making continuous individual and institutional efforts. See Section 7 on how to generate hand hygiene compliance reports.

The hand hygiene compliance reports can be used to compare healthcare worker categories against each other. It could be used as a competition for staff to improve their hand hygiene compliance; for example, nurses versus medical staff, students versus qualified staff. They may be used to stimulate competition between wards, or, if in a network, hospital against hospital. This will encourage ownership of the program by these groups. The hand hygiene compliance reports could be used to target education for those with lower scores, or to give prizes for the best performances.

8.2.3.5 Improving culture-change in specific settings; an Emergency Department example

Hand hygiene practices in the emergency department setting represent a unique challenge with distinct environment, staff and patient factors compared with inpatient wards.

Interventions, including the placement of hand hygiene products within the point-of-care and staff education may be more complex in this setting.

The WHO Hand Hygiene Self-Assessment framework has been adapted to support the improvement of hand hygiene compliance in the ED setting. See: [Emergency Department Self-Assessment Framework](#).

Self-assessment frameworks may also be developed for use in other specific settings in the future.

8.3 WHO Self-Assessment Framework

According to the [WHO Self-Assessment Framework](#), an ideal hand hygiene culture change program should include:

- An easily available and continuous supply of alcohol-based handrub that meets the recommendations of HHA
- Appropriate availability of sinks, soap, and paper towel
- Mandatory hand hygiene training of all healthcare workers on commencement of employment, with ongoing education throughout the year
- Staff available to conduct hand hygiene education throughout the facility
- Validated staff to conduct hand hygiene compliance assessments (where applicable)
- Regular hand hygiene compliance audits (where applicable)
- Regular feedback of hand hygiene compliance audit/program measures, including immediate feedback and data trends over time, to:
 - healthcare workers
 - facility leaders
- Hand hygiene promotional materials throughout the facility
- Establishment of a hand hygiene project team that has dedicated time to regularly promote hand hygiene
- Clear commitment from the CEO, Director of Nursing, and Medical Director
- Patient engagement programs
- Initiatives to support local continuous improvement; for example online learning programs, hand hygiene newsletters.

8.3.1 Is your facility a hand hygiene leader?

The WHO has developed an additional section to the Self-Assessment Framework, for organisations that wish to be considered a leader in hand hygiene. The section includes criteria for a very comprehensive hand hygiene program that can be held as an example for other facilities to aspire to.

Facilities may wish to review these leadership criteria as part of their hand hygiene program evaluation.

9 Other useful interventions

9.1 Aim

Other infection prevention interventions are available to complement the successful implementation, and sustainability of a hand hygiene culture change program.

9.2 Additional audit tools to complement the hand hygiene program

In the NHHI hand hygiene compliance tool, neither the duration of the hand hygiene action, nor other quality aspects of hand hygiene such as the quantity of product used, technique of hand hygiene, donning/doffing of gloves, type of gloves used, length of fingernails, or presence of jewellery are assessed. Once the hand hygiene program has been well established in your facility these are items you may wish to address whilst conducting the hand hygiene compliance audit, but they will not be reportable to the NHHI database.

A number of additional audit tools available for each healthcare facility on the [NHHI website](#).

9.3 Bare below the elbows

Some hand hygiene culture change programs advocate a 'Bare below the Elbows' policy for all HCWs. Whilst there is currently limited evidence to promote this as a formal recommendation, WHO recommends that long sleeves be avoided. Long sleeves have been found to be contaminated with organisms, and can impede appropriate hand hygiene.

9.4 Hand hygiene in shared patient areas

There are many shared patient areas within healthcare facilities; for example, waiting rooms, group based therapy rooms. Staff within these areas may move between patients regularly.

If a HCW has contact with patients within a shared area then the principles of the 5 Moments for Hand Hygiene remain.

Patients should also be instructed to perform hand hygiene on entering and leaving a

shared area.

Personal alcohol-based handrub packs for staff may be more appropriate in these areas.

If patients are sharing equipment appropriate cleaning protocols should be followed. However, this may not be practicable where equipment is passed between patients quickly; for example, passing a ball in an exercise class. Ensure that all shared equipment is cleaned between sessions/groups.

Glossary

The following terms are referred to throughout this manual:

Alcohol-based handrub

A TGA-listed alcohol-containing preparation designed for reducing the number of viable micro-organisms on the hands without the use or aid of running water, and which is listed on the ARTG as a medicinal product.

Alcohol wipes

An alcohol-containing wipe used to clean non-soiled shared patient equipment in between each patient use e.g. Blood pressure cuffs.

Aseptic technique

An aseptic technique aims to prevent microorganisms on hands, surfaces and equipment from being introduced to susceptible sites. Therefore, unlike sterile techniques, aseptic techniques can be achieved in typical ward and home settings.

Bacteraemia

The presence of bacteria in the blood.

Body fluids

Any substance secreted by the body with the exception of sweat. These include: blood, lochia, saliva, secretions from mucous membranes, pus, gastric and respiratory secretions, semen, tears, wax, breast milk, colostrum, urine, faeces, meconium, vomitus, pleural fluid, cerebrospinal fluid, ascites fluid, biliary fluid, bone marrow, pus, organic body samples – for example, biopsy samples, organ and cell samples.

Body fluid exposure risk

Any situation where contact with body fluids may occur. Such contact may pose a contamination risk to either healthcare worker or the environment.

Contact

The touching of any patient or their immediate surroundings or performing any procedure.

Curtains

Patient bed curtains are outside the patient zone and are frequently contaminated with microorganisms foreign to the patient inside.

Touching the curtains after caring for a patient is considered to be equivalent to leaving the patient zone.

Hand hygiene should be performed between touching the curtains and touching the patient and vice versa.

Decontaminate hands

Application of either an antimicrobial soap/solution and water or an alcohol-based hand rub product, to the surface of the hands. This process reduces microbial counts on hands.

Detergent wipes

A detergent-containing wipe used for cleaning lightly soiled shared patient equipment in between each patient use.

Emollient/humectant

Ingredient(s) added to hand hygiene products to moisturise and protect the skin from frequent product use.

Glove use

Glove use by HCWs is recommended for two main reasons: to prevent microorganisms which may be infecting, commensally carried, or transiently present on healthcare worker's hands from being transferred to patients and from one patient to another; and to reduce the risk of healthcare workers acquiring infections from patients.

Hand care

Actions to reduce the risk of skin damage or irritation. For example, using a moisturiser regularly throughout the day.

Hand hygiene

A general term applying to processes aiming to reduce the number of microorganisms on hands. This includes: application of a waterless antimicrobial agent (e.g. alcohol-based handrub) to the surface of the hands; and use of soap/solution (plain or antimicrobial) and water (if hands are visibly soiled), followed by patting dry with single-use towels.

Hand hygiene action

A hand hygiene action can be undertaken either by rubbing with an alcohol-based handrub, or hand washing with soap and water.

Hand hygiene compliance

Is a measurement of appropriate hand hygiene. It is defined when hand hygiene is considered necessary and is classified according to one of the 5 Moments.

If the action is performed when there is no indication and it has no impact in terms of preventing microbial transmission, then it is not considered to be an act of hand hygiene compliance.

The number of Moments constitutes the denominator for assessing hand hygiene compliance. The actual hand hygiene actions undertaken are compared to the number of *Moments* observed to calculate the rate of hand hygiene compliance.

Hand hygiene non-compliance is defined when there is an indication for hand hygiene (a Moment) and yet no hand hygiene was undertaken.

Hand hygiene moments

Moments are based on those defined by the WHO Guidelines on Hand Hygiene. Some minor modifications have been made for Australian healthcare settings. A Moment is when there is a perceived or actual risk of pathogen transmission from one surface to another via the hands. Healthcare workers' hands will come in contact with many different types of surfaces while undertaking a succession of tasks.

The 5 Moments for hand hygiene are:

- Moment 1:** Before touching a patient
- Moment 2:** Before a procedure
- Moment 3:** After a procedure or body fluid exposure risk
- Moment 4:** After touching a patient
- Moment 5:** After touching a patient's surroundings

Hand hygiene opportunity

In Australia the term 'Moment' is used.

However, the WHO define a hand hygiene opportunity as the time between the moment when hands becoming colonised after touching a patient/surface and the moment in which hands touch the next patient/surface; i.e. the opportunity when hand hygiene should be performed.

Hand hygiene product

Any product used for the purpose of hand hygiene, including soap and water

Hand washing

The application of soap and water to the surface of the hands.

Healthcare-associated infections (HAIs)

Infections acquired in healthcare facilities ('nosocomial' infections) and infections that occur as a result of healthcare interventions ('iatrogenic' infections), and which may manifest after people leave the healthcare facility.

Healthcare zone

Refers to all regions outside of the patient zone. This includes the curtains, partitions and doors between separate patient areas.

The healthcare zone can include shared patient areas as these areas are not cleaned between patients. Assumptions are generally made that within the healthcare zone there are organisms that are potentially harmful to all patients, and that transmission of these pathogens to the patient results in exogenous infection.

Healthcare workers

All people delivering healthcare services, including students and trainees, who have contact with patients or with blood or body substances.

Immunocompromised

Having an immune system that has been impaired by disease or treatment

Inter-rater (or observer) reliability

A measure of agreement or consistency of ratings by two or more observers on a series of common subjects.

Intra-rater reliability

A measure of agreement or consistency of two or more ratings by a single observer on a series of common subjects.

Invasive medical device

Devices which, in whole or part, enter the body through an orifice or through any surface of the body. This includes penetrating skin, mucous membranes, organs or internal cavities of the body. Examples include surgical instruments, implantable devices, dental equipment, intravascular devices, medical and therapeutic devices.

Methicillin-resistant *Staphylococcus aureus* (MRSA)

Strains of *Staphylococcus aureus* that are resistant to many of the antibiotics commonly used to treat infections. Epidemic strains also have a capacity to spread easily from person-to-person.

Methicillin-susceptible *Staphylococcus aureus*

Staphylococcus aureus that is susceptible to methicillin/flucloxacillin.

Work, Health and Safety (WH&S)

Is an area concerned with protecting the safety, health and welfare of people engaged in work or employment. The goal of all work, health and safety programs is to foster a safe work environment.

Outcome measure

A feature used to describe the effects of care on the health status of patients and populations (for example, infection rate).

Patient

A person who is receiving care in a health service organisation.

Patient contact

Involves touching the patient and their immediate surroundings, or performing any procedure on the patient.

Patient surroundings

All inanimate surfaces that are touched by or in physical contact with the patient (such as bed rails, bedside table, bed linen, invasive devices, dressings, personal belongings and food) and surfaces frequently touched by healthcare workers while caring for the patient (such as monitors, knobs and buttons).

Patient zone

Includes the patient and the patient immediate surroundings.

The patient zone is the area dedicated to an individual patient for their care. The patient zone is cleaned after one patient leaves, and before the next patient arrives.

Assumptions are generally made that within the patient zone the patient flora rapidly contaminates the entire patient zone; and the patient zone is cleaned between patients.

Point-of-care

The place where three elements come together: the patient, the healthcare worker, and the care or treatment involving contact with the patient or his/her surroundings. A hand hygiene product should be easily accessible and as close as possible – within arm's reach of where patient care or treatment is taking place. Point-of-care products should be accessible without having to leave the patient zone.

Procedure

An act of care for a patient where there is a risk of direct introduction of a pathogen to the patient.

Process measure

An index of the degree to which a service or procedure is performed correctly and

appropriately, e.g. timing of surgical antibiotic prophylaxis, measuring how many times staff wash their hands.

Recommendation

A guideline; sample suggestion; to advise.

Reliability

The extent to which a measurement is consistent and free from error.

SAB

Staphylococcus aureus bacteraemia

Separations

A separation from a healthcare facility occurs anytime a patient leaves due to discharge, death, or transfer

Standard aseptic technique

Clinical procedures managed with standard aseptic non-touch technique will characteristically be technically simple, short in duration (approximately less than 20 minutes), and involve relatively few and small key sites and key parts. Standard aseptic technique requires a main general aseptic field and non-sterile gloves. The use of critical micro-aseptic fields and a non-touch technique is essential to protect key parts and key sites.

Sterile task

A task performed in such a way as to avoid microbial contamination or inoculation.

Structured observation

A method to quantify healthcare worker behaviour using a format that is structured in a manner that is likely to avoid bias and improve consistency. Structured observations provide information on what people actually do, rather than on what they say they do or did. They also provide information on the associated activities and behaviours that precede and follow hand hygiene compliance.

Surgical aseptic technique

Surgical aseptic technique is demanded when procedures are technically complex, involve extended periods of time, large open key sites or large or numerous key parts. To counter these risks, a main critical aseptic field and sterile gloves are required and often full barrier precautions. Surgical aseptic technique should still utilise critical micro aseptic fields and non-touch technique where practical to do so.

Surgical hand preparation

The process of eliminating transient and reducing resident flora prior to surgery. This comprises removal of hand jewellery, performing hand hygiene with liquid soap if

hands are visibly soiled, removing debris from underneath fingernails and scrubbing hands and forearms using a suitable antimicrobial formulation.

Validity

Refers to the accuracy of a measure. It is the extent to which a measuring instrument actually measures what it is supposed to measure.

Signature of witness

ADELAIDE NANCY ROSENTHAL, 447 COLLINS STREET, MELBOURNE VIC 3000
An Australian Legal Practitioner within the meaning of the Legal Profession Uniform Law (Victoria).
A person authorised under section 19(1) of the Oaths and Affirmations Act 2018 to take an affidavit.

Risk Assessment and Prediction Tool (RAPT)

Instructions for use

The RAPT form is completed by the patient.

Take the RAPT form when you:

- Visit your orthopaedic surgeon
- Attend the Pre-admission Clinic
- The form can be stored in your hospital medical record

Risk Assessment and Prediction Tool (RAPT)

Background

Developed by Dr. Leonie Oldmeadow at the Alfred Hospital in Victoria in 2001 to predict the discharge destination of patients undergoing elective hip and knee arthroplasty surgery.

Predictions based on objective factors provide confidence in decision making regarding discharge for patients and staff.

Purpose of the tool

- The ability to indicate before surgery, the most likely discharge destination after surgery, which allows appropriate patients to prepare themselves and their families for their return home.
- Assists in aligning patient's expectations about what is needed following surgery.
- Allows the acute hospital to commence early discharge planning for discharge destination goal
- RAPT helps to identify patients who will need the most help after discharge;
- Score <6—Admit to overnight rehabilitation program
- Score 6-9—Additional intervention to discharge directly home (e.g. Rehabilitation in the Home)
- Score >9—Discharge directly home.

To be completed by the patients undergoing elective Hip or Knee replacement surgery prior to discussion with your orthopaedic surgeon or attending Pre-admission Clinic

Name.....

DOB.....

Address.....

Surgeon.....

	Value	Score
1. What is your age group?	50-65 years 66-75 years >75 years	=2 =1 =0
2. Gender?	Male Female	=2 =1
3. How far on average can you walk? (a block is 200 metres)	Two blocks or more (+/-rest) 1-2 blocks (+/-rest) Housebound (most of time)	=2 =1 =0
4. Which gait aid do you use? (more often than not)	None Single-point stick Crutches/frame	=2 =1 =0
5. Do you use community supports? (home help, meals on wheels, district nursing)	None or one per week Two or more per week	=1 =0
6. Will you live with someone who can care for you after your operation?	Yes No	=3 =0
Your score (out of 12)		

Key: Destination at discharge from acute care predicted by score.

- Scores <6 — extended inpatient rehabilitation
- Score 6-9 — additional intervention to discharge directly home (e.g. *Rehabilitation in the Home*)
- Score >9 — directly home.

Patient's preference	Prediction Score	Agreed destination
